**DRAFT FIVE-YEAR REVIEW REPORT**

**FORMER LUBRICATION COMPANY OF AMERICA**  
**CANYON COUNTRY, CALIFORNIA**

This Five-Year Review Report for the Former Lubrication Company of America located in Canyon Country, California, was prepared by URS Corporation on behalf of the Department of Toxic Substances Control. The report was prepared in a manner consistent with the level of care and skill ordinarily exercised by professional engineers, geologists, and environmental scientists. This report was prepared under the technical direction of the undersigned registered professional, who can be reached at (213) 996-2200.

Appendix B	SVE Remedial System Data
Appendix C	Historical Soil Data
Appendix D	Historical Groundwater Data
Appendix E	Site Visit Form

As requested by the California Environmental Protection Agency Department of Toxic Substances Control (DTSC), URS has conducted a Five-Year Review of the Former Lubrication Company of America (the “Site”) is located at 12500 Lang Station Road in Canyon Country, California. The Site location and Site layout is illustrated on figures 1 and 2, respectivley.

The purpose of a Five-Year Review is to determine whether remedial actions performed at a site are protective of human health and environment. The methods, findings, and conclusions of reviews are documented in Five-Year Review reports. In addition, Five-Year Review reports identify issues found during the review, if any, and recommendations to address them.

The DTSC is overseeing this Five-Year Review pursuant to the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) § 121, 42 United States Code (USC) Section 9621(c), and the National Contingency Plan (NCP). CERCLA § 121 states:

*If the President selects a remedial action that results in any hazardous substances, pollutants, or contaminants remaining at the site, the President shall review such remedial action no less often than each five years after the initiation of such remedial action to assure that human health and the environment are being protected by the remedial action being implemented. In addition, if upon such review it is the judgment of the President that action is appropriate at such site in accordance with Section 9604 (CERCLA § 104) or Section 9606 (CERCLA § 106) the President shall take or require such action. The President shall report to the Congress a list of facilities for which such review is required, the results of all such reviews, and any actions taken as a result of such reviews.*

The United States Environmental Protection Agency (USEPA or EPA) interpreted this requirement further in the NCP, as stated in 40 CFR §300.430(f)(4)(ii):

*If a remedial action is selected that results in hazardous substances, pollutants, or contaminants remaining at the site above levels that allow for unlimited use and unrestricted exposure, the lead agency shall review such action no less often than every five years after the initiation of the selected remedial action.*

The remedial action objectives (RAOs) identified for the Site in the Remedial Action Plan (RAP; DTSC, 1999) were the following:

- Air RAOs: Protect human health and the environment by preventing release and migration of subsurface volatile organic compounds (VOCs) in the ambient air in excess of South Coast Air Quality Management District (SCAQMD) requirements.
- Soil RAOs: Prevent exposure through ingestion, inhalation, and direct contact of soil contaminated at levels that may pose a risk to human health and the environment. Minimize production and migration of contaminants from soil to air, surface water, or groundwater. Minimize erosion of contaminated soil by wind or water.
- Groundwater RAOs: Prevent exposure through ingestion, inhalation, and dermal absorption of groundwater contaminated at levels that may pose a risk to human health and the environment.

This is the first Five-Year Review for the Site. The Five-Year Review is required due to the fact that contaminants remain onsite above risk-based levels that allow for unlimited use and unrestricted exposure. Chemicals of concern include VOCs associated with petroleum

hydrocarbons such as benzene, toluene, ethylbenzene, and xylene (BTEX); chlorinated compounds such as tetrachloroethylene (PCE), trichloroethylene (TCE), and dichloroethane (DCA); and other chlorinated degradation products such as vinyl chloride.

### 1.1 PROJECT UNDERSTANDING AND APPROACH

The purpose of the Five-Year Review is to evaluate the implementation and performance of the remediation efforts to determine if the remedy is or will continue to be protective of human health and the environment. The Five-Year Review has been performed by URS Corporation (URS) on behalf of the DTSC utilizing Site data through September 2010.

### 1.2 SCOPE OF WORK

The scope of work for the Five-Year Review is summarized in the following subsections.

#### 1.2.1 Document Review

URS reviewed available data and reports from the last five years, including but not limited to, operation and maintenance (O&M) reports, agency correspondence, and readily available electronic laboratory data that document remedy performance at the Site in accordance with the USEPA Five-Year Review Guidance Document. The following documents were reviewed:

- Supplemental Remedial Investigation/Feasibility Study (Woodward-Clyde, 1999)
- Remedial Action Plan (DTSC, 1999)
- USEPA, *Comprehensive Five-Year Review Guidance* dated June 2001 (Guidance Document; USEPA, 2001)
- Tank Removal Report (Tetra Tech, 2002)
- Cap Installation Completion Report (Tetra Tech, 2004)
- SVE System Final Design Report (Tetra Tech, 2004)
- SVE System Installation and Start Up Report (URS, 2009)
- SVE System Operation Reports (URS, 2008-2010).

#### 1.2.2 Notification

Potentially interested members of the community were notified prior to commencing the Five-Year Review in accordance with the Guidance Document. For purposes of this Five-Year Review, the community was assumed to include DTSC. URS assumed that residential notification was not required since the area is isolated and primarily rural/industrial.

#### 1.2.3 Site Inspection

The Site was inspected as required by the Five-Year Review process. The selected remedy for the Site is a pavement cap and soil vapor extraction (SVE) system. Hence, the Site inspection focused on the integrity of the pavement cap and operation of the SVE system.

### **1.2.4 Interviews**

Interviews regarding the historical performance of the pavement cap and SVE system were not deemed necessary for this Five-Year Review.

### **1.2.5 Five-Year Assessment**

A technical assessment of remedy effectiveness was completed in accordance with Section 4.0 of the Guidance Document. The purpose of the technical assessment is to examine the following questions:

- Is the remedy functioning as intended by the decision documents?
- Are the exposure assumptions, toxicity data, cleanup levels, and RAOs used at the time of the remedy selection still valid?
- Has any other information come to light that could call into question the protectiveness of the remedy?

The answers to these questions were used to organize and evaluate data and information and ensure that all relevant issues were considered when assessing the protectiveness of the remedy.

### **1.2.6 Report**

Results of the Five-Year Review have been summarized in this report in general conformance with Section 3.6 of the Guidance Document.

## SECTION TWO

### Site Chronology

The following table lists the chronology of significant events at the Site.

Event	Dates
DTSC issued Remedial Action Order (Docket # HAS 86/87-02 RA), requiring site characterization and remediation	March 16, 1987
Removal action: removal and disposal of contents of 61 tanks	1989-1992
Imminent and Substantial Endangerment Determination for the Lubrication Company of America (Docket # ISE 90/91-001)	September 27, 1990
Soil sampling as part of Remedial Investigations and Feasibility Study Report (LETTRO JV)	June 25, 1992
One groundwater monitoring well (MW-1) installed as part of Groundwater Monitoring Well Installation and Sampling Report (Bryan A. Stirrat & Associates, Inc.)	September 12, 1995
Final Supplemental Remedial Investigation/Feasibility Study Work Plan (Woodward-Clyde)	January 15, 1998
Five soil gas (SG-1 through SG-5) and three groundwater monitoring wells (MW-2 through MW-4) installed as part of Supplemental Remedial Investigation/Feasibility Study (Woodward-Clyde, March 5, 1999)	March-April 1998
Remedial Action Plan (DTSC)	April 1999
Aboveground structures removed, on-site tanks cleaned and recycled, asbestos containing materials and lead removed from infrastructure	2001
Site graded, engineered remedial cap installed – Cap Installation Completion Report (Tetra Tech, May 2004)	March 13-May 13, 2003
SVE pilot test (Tetra Tech)	December 11, 2003
SVE and Treatment System Design Report (Tetra Tech, Inc.)	October 19, 2004
Eleven (11) soil vapor extraction wells installed at the Site (URS)	December 12-15, 2005
One soil gas well installed at the Site (URS)	December 15, 2005
SVE system equipment installed, including two VPGAC vessels and two potassium permanganate-impregnated media vessels. (URS)	April 2006-November 2007
Operation of SVE system, and weekly operation and maintenance Site visits during operation	November 2007-Present
SVE System Installation and Start Up Report (URS)	June 11, 2009

### 3.1 PHYSICAL CHARACTERISTICS

The Former Lubrication Company of America Site is a 4-acre parcel that was used as an oil processing and recycling facility located in Canyon Country, California. The Site has no adjacent residential properties. The nearest residential area is approximately 0.4 mile to the northwest of the Site, and additional residential areas are approximately two miles to the west. The Angeles National Forest is south of the Site. The Site is currently a vacant lot.

### 3.2 LAND AND RESOURCE USE

The Lubrication Company of America received, stored, and processed waste oils between 1956 until 1989. Waste oil was transported to the Site by rails and tanker trucks and reclaimed by adding sulfur monochloride and sulfuric acid to precipitate metals contained in the waste oils. Cutting oils produced through this process were then skimmed off the top, treated with acid, and sold. Byproducts of the recycling processes conducted at this Site included lard oil, active and inactive sulfur, sulfur monochloride, pale oil, and acidic liquids.

The current and future land use designation of the Site is industrial. An engineered asphalt cap covers the entire Site with an underlying geosynthetic clay liner (GCL). The Site was redeveloped in 2007 for use as additional space for the adjacent SSA Terminal. The redevelopment included new asphalt pavement over much of the parcel and installation of paved truck ramps to support the storage of flat-bed truck trailers that are used to transport containers. The Site is currently used for the storage of flat-bed truck trailers and transport containers.

#### 3.2.1 Surface Water

Surface waters in the vicinity of the Site include the Santa Clara River north of the Site and rock quarry operations to the west and southwest.

#### 3.2.2 Site Geology/Hydrogeology

Soils underlying the Site generally consist of gravels, course-grained sand, silty sand, and clayey sand (Woodward-Clyde, 1999). Generally, interbedded gravels and sands are found in the northern portion of the Site, while the southern portion of the Site is mainly interbedded sand to clayey sand.

Three groundwater monitoring wells were installed in 1999 (Woodward-Clyde, 1999). During that time, groundwater was encountered at the Site at depths of 35 to 37 feet below ground surface (bgs). Any wells at the Site could become dry, however, especially in drought conditions, such as the one experienced during the remedial investigation (LETTRO JV, 1992). The groundwater table can be deeper than 70 feet bgs during a drought (LETTRO JV, 1992). Woodward-Clyde (1999) reported that groundwater flows to the northwest with a gradient of 0.007 feet/foot.

### 3.3 HISTORY OF CONTAMINATION

During its operation from 1956 to 1989, the waste oil recycling facility received, stored, and processed/reclaimed waste oils. From November 1980 to March 1986, DTSC inspectors observed releases or threatened releases at the Site, and confirmed these releases by conducting

soil and water sampling. Additionally, DTSC inspectors noted various violations of the Interim Status Document (ISD), a temporary permit to operate a hazardous waste facility. DTSC issued a Notice of Violation and Schedule of Compliance to the facility in November 1986 and a Remedial Action Order in March 1987. DTSC issued a Notice of Final Determination of Non-Compliance in October 1987.

### 3.4 INITIAL RESPONSE

DTSC performed a removal action at the Site between 1989 and 1992. DTSC removed waste from 61 aboveground tanks, disposed of 358 drums containing waste, and removed all asbestos containing material from the Site.

### 3.5 SUMMARY OF BASIS FOR TAKING ACTION

Releases of hazardous substances during waste oil recycling operations at the Site posed a risk to human health and the environment and formed the basis for DTSC taking action. DTSC completed a remedial investigation in 1992. The RI revealed extensive contamination, including petroleum hydrocarbons and aliphatic oils, VOCs (ethylbenzene, toluene, xylenes), volatile halogenated organics [1,1-dichloroethane (1,1-DCA), 1,1,1-trichloroethane (1,1,1-TCA), TCE, PCE], polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), lead, and acids. Concentrations in soil were detected to a depth of 70 feet bgs. High concentrations in soil gas were detected in the northeastern portion of the Site. VOCs were detected in groundwater beneath the Site. On-site groundwater monitoring wells adjacent to the waste showed VOC concentrations above Maximum Contaminant Levels (MCLs), although testing of downgradient groundwater monitoring wells did not reveal any contamination.

The groundwater investigation conducted in 1995 revealed elevated concentrations of VOCs. DTSC determined that an additional groundwater and soil gas investigation was necessary to define the full extent of contamination. DTSC completed a supplemental remedial investigation in 1998. Between March and June 1998, DTSC installed four groundwater monitoring wells (three on Site, one downgradient/off Site) and five multi-level soil gas monitoring wells on Site. Sampling conducted in July 1998 revealed high VOC concentrations in soil gas in the northeastern portion of the Site and VOCs in groundwater beneath the Site.

### 4.1 REMEDY SELECTION

The Site was investigated to determine the extent of contamination. Based on results of the remedial investigations, a RAP was developed (DTSC, 1999). The RAOs identified for the Site were:

- Air RAOs: Protect human health and the environment by preventing release and migration of subsurface VOCs in the ambient air in excess of South Coast Air Quality Management District (SCAQMD) requirements.
- Soil RAOs: Prevent exposure through ingestion, inhalation, and direct contact of soil contaminated at levels that may pose a risk to human health and the environment. Minimize production and migration of contaminants from soil to air, surface water, or groundwater. Minimize erosion of contaminated soil by wind or water.
- Groundwater RAOs: Prevent exposure through ingestion, inhalation, and dermal adsorption of groundwater contaminated at levels that may pose a risk to human health and the environment.

The remedy was selected based on nine evaluation criteria specified in the NCP, including overall protection of human health and the environment; compliance with state and federal requirements; long-term effectiveness and permanence; reduction of toxicity, mobility, and volume through treatment; cost (30-year present worth); short-term effectiveness; implementability; regulatory agency acceptance; and community acceptance.

The remedy selected was Alternative 6 in the RAP which consisted of the following:

- Dismantle on-site structures
- Excavate and dispose of contaminated off-site soil in the railroad spur area
- Backfill to grade
- Cap the on-site soil
- Construct and operate an SVE system
- Perform groundwater monitoring
- Treat groundwater using air sparging
- Conduct bioventing in conjunction with SVE to enhance biodegradation of heavy end hydrocarbons in soil.

The selected remedy was determined to be protective of human health and the environment, and compliant with ARARs. The remedial actions would reduce toxicity or volume of contaminants, as well as prevent/minimize off-site migration in soil gas and groundwater. Cleanup goals as established in the RAP are presented in Appendix A.

### 4.2 REMEDY IMPLEMENTATION

This section provides a summary of the remediation implementation activities conducted at the site since submittal of the RAP.

### 4.2.1 Site Demolition and Waste Disposal

The initial remedy implementation activities consisting of site demolition and waste disposal began in January 24, 2001 and were completed on July 27, 2001. These scope of work associated with these activities is summarized below and presented in the RACR (Tetra Tech, 2002).

- Asbestos Abatement
- Lead Paint Mitigation.
- Process Piping Removal
- Process Tank Cleaning
- Tank Recycling
- Waste Disposal
- Site Cleanup
- Building Demolition
- Vehicle and Tire Removal
- Surface Soil Survey.
- Fence Installation
- Site Grading

### 4.2.2 Engineered Cap

During 2003, an engineered cap was installed at the Site (Tetra Tech, 2004). The cap consisted of the placement of a 4-inch thick layer of imported sand over compacted soil, installation of a geosynthetic clay liner (GCL), placement and compaction of a 12-inch thick layer of sand and a 4-inch thick layer of aggregate base gravel, followed by a final layer of asphalt concrete pavement.

### 4.2.3 Soil Vapor Extraction

During 2005 through 2007, a SVE system was installed and began operation at the Site (URS, 2009). The remedial system consists of eleven vapor extraction wells (SVE-1A and SVE-2 through SVE-11), aboveground vapor extraction conveyance pipe, two 5,000 pounds of vapor phase granular activated carbon (GAC) vessels, and two 10,700 pounds of potassium permanganate-impregnated vessels, and 1,200 cfm regenerative blower (50 hp). The SVE system extracts volatile organic vapors from the vadose zone present in the subsurface between 10 and 50 feet bgs. The target compounds are VOCs including chlorinated compounds and petroleum hydrocarbons. The SVE system operates under the revised SCAQMD Permit to Operate No. F92744.

As part of the remedial system installation activities, one new soil gas well was installed in the south eastern portion of the site. Well construction details for the SVE and soil gas wells are presented in Table 1.

### **4.2.4 Groundwater Monitoring**

Groundwater monitoring has not been conducted at the site since 1998.

### **4.2.5 Air Sparge and Bioventing**

To date, neither air sparging (AS) or bioventing has been conducted at the Site.

## **4.3 OPERATION AND MAINTENANCE (O&M)**

This section provides a summary of the operation and maintenance activities conducted at the Site to maintain the engineered cap and the SVE system.

### **4.3.1 Engineered Cap**

During the monthly site visit for the SVE system, the engineered cap is inspected by field staff to ensure cap integrity. On occasion, weed growth is present at various areas at the site and surface cracks are observed. Site maintenance includes weed abatement and applying sealant to surface cracks.

### **4.3.2 SVE System**

O&M monitoring has been underway since the SVE system began operation in 2006. Weekly site visits are conducted to determine compliance with the site-specific SCAQMD permit. The remedial system generally operates during the day for 6 to 8 hours due to the effects of high humidity, ranging between 90 and 100 percent, in the vapor stream on the GAC media. The influent process stream humidity is diluted down to approximately 65 percent during the day to increase the life of the GAC using ambient air. The effects of high RH in the vapor stream can be a significant reduction in the life cycle of the GAC media as water acts like a contaminant and competes for pore space on the adsorbent media.

During quarterly site visits, preventative maintenance is conducted on the SVE equipment to ensure proper operation and minimize equipment repair/replacement costs. Maintenance activities include inspection of equipment, blower motor oil changeout, air filter inspection and as needed replacement, and inspection of site gauges and instrumentation.

This is the first Five-Year Review for the Site. As such, progress since the last review cannot be evaluated. However, semi-annual O&M reports have been completed since the SVE system began operation in 2006 to document remedial progress. This section includes a discussion of remedial system operation and performance through the semi-annual reporting period ending June 2012.

### **5.1 SYSTEM PERFORMANCE**

Remedial system performance through the June 2012 reporting period is summarized below.

#### **5.1.1 Operational Parameters**

Based on O&M data as of June 26, 2012, the SVE system has operated for 9,684 hours. As previously mentioned, the remedial system generally operates during the day for 6 to 8 hours due to the effects of high humidity in the vapor stream. System flow rates ranged from 464 to 751.4 SCFM, with an average of approximately 651 SCFM. Vapor flow rate from the well field ranged from 111 SCFM to 440.9 SCFM, with an average flow rate of 370 SCFM. System field data is presented in Appendix B.

#### **5.1.2 Well Field Configuration**

Initially, all eleven (11) SVE wells (SVE-1A and SVE-2 through SVE-11) were open during the initial remedial system startup testing period. Thereafter, specific wells were closed and others were opened to balance individual well flow rates and optimize remedial system performance. As of May, 2012, open SVE wells included SVE-8, SVE-9, SVE-10, and SVE-11 and all other wells were closed to focus remedial efforts in the central portion of the Site.

#### **5.1.3 Well Field Concentrations**

Vinyl chloride, 1,1-DCA, 1,2 dichloroethane, and methylene chloride concentrations, as measured from the well field, have shown an overall decline with continued operation of the SVE system. Vinyl chloride, 1,1-DCA, 1,2 dichloroethane, and methylene chloride concentrations were initially 66,000 ppbv, 2,900 ppbv, 31 ppbv, and 170 ppbv, respectively, as measured on May 12, 2006. These compounds have since declined to non-detect.

PCE and TCE concentrations, as measured from the well field, increased after startup of the SVE system. The maximum PCE concentration was 620 ppbv on February 14, 2012 and the maximum TCE concentration was 2,200 ppbv on April 26, 2007. PCE and TCE have since declined to non-detect.

Benzene concentrations, as measured from the well field, were erratic from startup of the SVE system. Initially, benzene concentrations were 710 ppbv as measured on May 12, 2006 and then either declined to levels below the initial concentration detected at start up or increased to new

maximum concentrations (800 ppbv on February 7, 2007 and 790 ppbv on February 19, 2008). As of June 26<sup>th</sup>, 2012, benzene has declined to non-detect and has shown an overall decline in concentration.

C<sub>2</sub> through C<sub>6+</sub> concentrations, as measured from the well field, are declining with continued operation of the SVE system. C<sub>2</sub> through C<sub>6+</sub> concentrations were initially 603 ppmv as measured on May 12, 2006, then increased to 886 ppmv on February 19, 2008 and then declined to 139 ppmv as measured on December 20, 2011. On May 22, 2012, SVE-8, SVE-9, SVE-10, and SV-11 were opened and all other wells were closed. This well field configuration change has caused an increase in the concentration of C<sub>2</sub> through C<sub>6+</sub>.

Methane concentration, as measured from the well field, has declined with continued operation of the SVE system. Methane concentration was initially 37,000 ppmv and then increased to 49,000 ppmv as measured on May 12, 2006 and February 12, 2007, respectively. Methane has since declined to 250 ppmv as measured on June 26, 2012.

Time series plots illustrating the change in concentrations with time are presented as Figures 4 through 12. Laboratory analytical data is summarized in Appendix B.

### 5.2 MASS REMOVAL

A summary of the mass removal for C2 through C6+ and select VOCs including benzene, 1,1-DCA, 1,2-dichloroethane, methylene chloride, PCE, TCE, and vinyl chloride presented in the table below. This data captures the mass removal since system startup through June 2012.

Compounds	Cumulative Mass Removed (pounds)
C <sub>2</sub> through C <sub>6+</sub>	16,764.51
Benzene	8.72
1,1-DCA	12.84
1,2-dichloroethane	1.50
Methylene Chloride	1.43
Tetrachloroethene	9.90
TCE	36.66
Vinyl Chloride	32.14

Mass removal for the SVE system is summarized in Figures 13 and 14 and Appendix B. Figures 13 and 14 continued mass removal of VOCs and carbon chains, with some constituents beginning to approach asymptotic levels.

### **6.1 ADMINISTRATIVE COMPONENTS**

The Five-Year Review consisted of the following components:

- Community Involvement
- Document Review
- Data Review
- Site Inspection
- Local Interviews
- Five-Year Review Report Development and Review.

### **6.2 COMMUNITY NOTIFICATION AND INVOLVEMENT**

The DTSC requested that a Five-Year Review be conducted for this Site. Since the area is isolated and primarily industrial, community notification was not conducted.

### **6.3 DOCUMENT REVIEW**

The SVE System Operation Reports for the past five years were reviewed, as well as other relevant reports, including the following:

- Remedial Investigation/Feasibility Study (RI/FS) (LETTRO JV, 1992)
- Supplemental RI/FS (Woodward-Clyde, 1999)
- RAP (DTSC, 1999)
- Tank Removal Report (Tetra Tech, 2002)
- Cap Installation Completion Report (Tetra Tech, 2004)
- SVE System Final Design Report (Tetra Tech, 2004)
- SVE System Installation and Start Up Report (URS, 2009).

### **6.4 DATA REVIEW**

This data review section discusses recent data collected since implementation of the RAP. Where applicable, the recent data is compared to the available historical data and Site specific cleanup goals.

#### **6.4.1 Soil**

There have been no Site investigations conducted since 1992. Therefore, no recent soil data has been collected since the implementation of the RAP. A summary of historical soil analytical data collected from the Site is presented in Appendix C.

#### 6.4.2 Soil Gas

In July 1998, soil gas samples were collected from five (5) triple-nested soil gas wells SG-1 through SG-5. All of the soil gas samples were analyzed for VOCs, methane, and fixed gases. A second soil gas sampling event was conducted in March 2010 from soil gas wells SG-1 through SG-4, and SG-6 to evaluate remedial progress. All soil gas samples were analyzed for VOCs and carbon chains (C<sub>4</sub>-C<sub>12</sub>). Soil gas samples were not collected from SG-5 due the presence of water during purging of the 5 feet and 30 feet screened intervals and damage of the 20 feet screened interval. A summary of soil gas data from the two sampling events is included in Tables 2 and 3. A comparison of the two soil gas sampling events is presented below.

- Soil Gas Wells SG-1 and SG-2: The highest VOC compounds were detected in wells SG-1 and SG-2 during both sampling events. These wells are located in the northeastern portion of the Site. A comparison of VOC compounds indicates most constituents decreased an order of magnitude between the two sampling events. Substantial decreases were observed in the following compounds: TCE, 1,1-DCA, cis-1,2-dichloroethene (cis-1,2-DCE), trans 1,2-dichloroethene, toluene, 1,1,1-TCA, Freon 113, and vinyl chloride. Only three compounds (trichloroethene, cis 1,2-dichloroethene, and vinyl chloride) detected during the 2012 sampling event exceeded the Site soil gas preliminary cleanup goals of 4.6 ug/l, 70.1 ug/l, and 3, ug/l, respectively.
- Soil Gas Wells SG-3 and SG-4: In 1998, the only VOC detected in well SG-3 was 1,1-DCA (1.8 µg/L in SG-4 at 33 feet bgs). This concentration was well below the Site soil gas preliminary cleanup goal of 2876.2 ug/l. In 2010, all VOCs compounds were non-detect in wells SG-3 and SG-4.
- Soil Gas Well SG-6: In 2010, the only VOC detected in well SG-6 was TCE detected (0.87 µg/L at 7 feet bgs and 0.67 µg/L at 15 feet bgs). These concentrations are well below the Site soil gas preliminary cleanup goal of 4.6 ug/l.

Since the development of the RAP, the Office of Environmental Health Hazard Assessment (OEHHA, 2010) published soil gas California Human Health Screening Levels (CHHSLs) for two types of soils (base soil and engineered fill). For the purposes of this assessment, the base soil CHHSLs for residential and commercial receptors were used for screening. A comparison of soil gas CHHSLs for the 2010 data is performed in Table 4. Exceedances were noted for both commercial and residential settings for benzene, ethylbenzene, TCE, cis-1,2-DCE, PCE, and vinyl chloride. Detection limits were not always below their corresponding CHHSLs, which creates uncertainty in this evaluation.

For those chemicals exceeding CHHSLs in 2010 and where sampling locations were the same in 1998, a comparison of 2010 soil gas levels to 1998 soil gas levels was performed in Table 3. Significant decreases in soil gas concentrations were noted for vinyl chloride, TCE and cis-1,2-Dichloroethylene (cis-1,2-DCE) and at most sampling points. Less dramatic decreases in concentration were noted for PCE, benzene and ethylbenzene. As was noted in 1998, the highest concentrations of VOCs were found in SG-1 and SG-2 which are located in the northeastern portion of the site. Location SG-5, near the north site boundary, was not resampled in 2010 and had a vinyl chloride soil gas concentration of 81 ug/L at 25 feet in 1998. Although dramatic reductions in vinyl chloride concentrations were noted in SG-1 in 2010, which is located

approximately 80 feet to the south of SG-5, it is not known what the current concentration of vinyl chloride is at SG-5. However, since the shallow depths at SG-5 did not contain detectable vinyl chloride and there are no buildings in the area, this data gap is not considered significant.

### **6.4.3 Groundwater**

Groundwater sampling at the Site has not been conducted since July 1998. Therefore, no recent groundwater data has been collected since the implementation of the RAP. A summary of historical groundwater analytical data collected from the Site is presented in Appendix C.

## **6.5 SITE INSPECTION**

A Site visit for deed restrictions was conducted on February 25, 2010. The cap was deemed to be in very good condition with no disturbance. The SVE system was intact and not disturbed, but not operating at the time of the Site visit. The fence was also observed to be intact. The Site Visit Form is included in Appendix E.

## **6.6 INTERVIEWS**

Interviews were not conducted during this Five-Year Review.

The purpose of the technical assessment is to examine the remedy function, exposure assumptions, toxicity data, cleanup levels, and remedial action objectives, and determine if any changes to the remedy are required. Discussions of the relevant issues are provided in the following sections.

### 7.1 REMEDY FUNCTION

#### **Question A: Is the remedy functioning as intended by the decision documents?**

Yes, the following provides information in support of why the remedy is continuing to function as intended by the decision documents.

##### Remedial Action Performance and Monitoring Results:

Overall the cap is in good condition and sporadically requires maintenance to remove weeds and seal surface cracks. There are no signs of deterioration or depression of the asphalt cap that would allow migration of surface water into the subsurface. Thus, the cap continues to prevent downward migration of stormwater, as designed.

The SVE system is performing as expected, and petroleum hydrocarbon and VOC mass removal is effective.

Air sparging for groundwater remediation or bioventing technology for further remediation of heavy end hydrocarbons as proposed in the RAP have not been implemented at the site.

##### Costs of System Operations/O&M:

The O&M costs have remained approximately the same and reflect the low maintenance cost of the cap and SVE system. The combined annual cost to operate, maintain, sample, and report remedial system results is approximately \$175,000 per year.

Unless the cap significantly degrades or the SVE system requires upgrades or repairs, increased cost is not anticipated. However, if groundwater remediation is still deemed necessary, the remedial system may be expanded to include AS technology.

##### Opportunities for Optimization:

Continued operation of the SVE system is necessary to further reduce petroleum hydrocarbons and VOC concentrations in the vadose zone. All wells should be sampled quarterly to evaluate vapor concentrations from the well field and assist with system optimization. Current optimization of the SVE system consists of three well schemes to maximize mass removal and target remedial efforts in the known areas of impact. These well schemes include the following:

- Scheme 1: Wells SVE-8, SVE-9, SVE-10 and SVE -11 open. All others closed.
- Scheme 2: wells SVE-1A, SVE-2, SVE-3, and SVE-7 open. All others closed.
- Scheme 3: Wells SVE-4, SVE-5 and SVE-6 open. All others closed.

These well schemes will be rotated every three months or when well field concentrations ( $C_2$  through  $C_{6+}$ ) decline below or near 100 ppmv.

### Early Indicators of Potential Issues:

Degradation of the asphalt cap has not occurred. Minor repairs including weed abatement and sealant applied to surface cracks are conducted as needed. In addition, analytical results of soil gas samples collected from the well field as well as soil gas wells indicate that overall VOC compounds have declined since implementation of the soil vapor extraction system.

### Implementation of Institutional Controls and Other Measures:

The current industrial use of the Site is appropriate for the remedy. Access is controlled with fencing and locks. The cap precludes direct exposure to any remaining impacted soil or groundwater.

## 7.2 EXPOSURE ASSUMPTIONS

### **Question B: Are the exposure assumptions, toxicity data, cleanup levels, and remedial action objectives (RAOs) used at the time of the remedy still valid?**

Yes, the following provides information the exposure assumptions, toxicity data, cleanup levels, and RAOs used at the time of the remedy are still valid.

### Changes in Exposure Pathways:

Exposure pathways have not changed since implementation of the remedy. The Site remains a paved industrial facility; therefore, there are no direct exposure pathways. New routes of human health or ecological exposures have not been identified that could affect the protectiveness of the remedy.

### Changes in Land Use:

There have been no changes in land use.

### New Contaminants and/or Contaminant Sources:

There are no new contaminant sources. Based on the availability of soil gas CHHSLs, ethylbenzene has been identified as an additional contaminant of concern.

### Remedy Byproducts:

Not applicable.

### Changes in Standards, Newly Promulgated Standards, and TBCs:

The cap is functioning properly and precludes direct exposure to any remaining impacted soil or groundwater.

### Changes in Toxicity and Other Contaminant Characteristics:

Ethylbenzene has been identified as a potential carcinogen and changes to risk practices surrounding vapor intrusion have been implemented. For this reason, a screening evaluation using CHHSLs was performed. However, none of these changes affect the protectiveness of the remedy.

### Changes in Risk Assessment Methods:

Changes in standardized risk assessment methodologies would not affect the protectiveness of the remedy due to the type of remedy (cap to eliminate direct exposures and containment to protect groundwater quality). Using the site-specific PRGs for soil gas, only three contaminants of concern were identified (TCE, cis-1,2-DCE and vinyl chloride). However, using current CHHSLs, benzene, ethylbenzene and PCE would also be identified as contaminants of concern. Updating the site-specific PRGs for these six contaminants is recommended.

### Expected Progress Towards Meeting RAOs:

The results of the soil gas sampling and Site inspections demonstrate that the RAOs continue to be met and that conditions are stable. Potential human health risks have been reduced by capping of the Site and contaminant mass is being removed by the SVE system. However, the current groundwater wells should be sampled to determine current conditions and if groundwater treatment for the Site is required.

### Risk Recalculation/Assessment (As Applicable):

Updating the site-specific PRGs for these six contaminants is recommended. Thereafter a determination will be made if a risk recalculation is required.

## 7.3 OTHER INFORMATION

### **Question C: Has any other information come to light that could call into question the protectiveness of the remedy?**

No, however, the air sparge and bio-vent systems as proposed in the RAP have not been implemented at the Site. Therefore, groundwater should be sampled from existing groundwater monitoring wells to determine if additional groundwater assessment and/or air sparging is required for Site cleanup.

## 7.4 SUMMARY OF TECHNICAL ASSESSMENT

Based on the results of the visual inspection and SVE system operation, the RAOs identified for the Site (reducing human health risks associated with chemical constituents within the soil column and minimizing potential future impacts to groundwater quality) continue to be met. Thus, the remedy is functioning as intended.

Issues and assumptions that affect the protectiveness of the remedy for the Site are presented in the table below. Additional tasks that should be carried out, but do not necessarily affect the protectiveness of the remedy, are also included in the table.

	Issue	Affects Current Protectiveness	Affects Future Protectiveness
1.	Lack of recent soil data.	N	N
2.	Lack of recent groundwater monitoring data.	Y	Y
3.	Outdated site-specific soil gas cleanup goals	N	N

## SECTION NINE

## Recommendations and Follow-Up Actions

Recommendations and follow-up actions are included in the following table.

	Recommendations/ Follow-up Actions	Responsible Party	Agency with Oversight Authority	Milestone Date
<b>General Recommendations</b>				
1.	Continue with Five-Year Reviews.	DTSC	DTSC	4/30/17
2	Continue operating the existing SVE system using the well scheme as outlined in Section 7.1 of this Five-Year Review to optimize mass removal and continue site cleanup.	DTSC	DTSC	On-going
3	Evaluate changes in toxicity factors for site contaminants and risk assessment methodologies since the RI/FS and RAP were prepared. Update Site specific cleanup goals as needed.	DTSC	DTSC	06/1/13
<b>Soil Gas and SVE System</b>				
4.	Sample existing soil gas probes and groundwater monitoring wells to determine current conditions. Compare results to site specific cleanup goals and updated cleanup goals. Refine detection limits to meet cleanup goals.	DTSC	DTSC	4/30/13
5	Sample the existing groundwater monitoring wells to evaluate current concentrations.	DTSC	DTSC	4/30/13
6	Conduct soil confirmation sampling at the site in areas where the highest petroleum hydrocarbon and VOC concentrations have been detected. Compare results to the pre-remedial data collected during the Phase I and Phase II site investigations.	DTSC	DTSC	5/31/13
7	Evaluate the need to install additional dual-nested SVE wells and connect to the existing SVE system to enhance remedial activities.	DTSC	DTSC	6/28/13
<b>Groundwater</b>				
8	If needed, define the limits of the VOC impacts to groundwater by installing additional monitoring wells.	DTSC	DTSC	8/30/13
9	Evaluate the need to install an air sparge system to remediate impacted groundwater per the RI/FS and RAP.	DTSC	DTSC	5/31/13

The current remedy is protective of human health and the environment. Exposure pathways that could result in unacceptable risks are being controlled and institutional controls are preventing exposure to contaminated soil and soil gas. Threats at the Site have been addressed through removal actions, engineered surface cap installation, SVE system operation, and fencing installation.

The Site will continue to be visually inspected to ensure the integrity of the surface. Additionally, weekly O&M activities will continue to be conducted during operation of the SVE system. While soil gas levels for some VOCs have declined by an order of magnitude from 1998 to 2010, concentrations for many constituents remain well above their corresponding CHHSLs. Time plots and CHHSLs can be used to monitor soil remediation effectiveness during on-going SVE operations, although site-specific cleanup goals should be derived based on the ultimate future land-use scenario for the site.

Due to the absence of recent groundwater monitoring data, the nature and extent of groundwater impacts cannot accurately be evaluated. Assessing the current groundwater conditions is necessary to determine if the proposed remedy is functioning properly or if groundwater remediation is required for the Site.

The next Five-Year Review will be for the period of January 1, 2013 through January 1, 2018. The review will include the results of the visual inspections and SVE system operation review as well as any additional work performed at the Site.

NOTES:

For SG-1, 5 feet, the maximum concentration in 1998 is presented regardless of purge volume.

For SG-2, 5 feet, the maximum concentration in 2010 is presented regardless of purge volume. For SG-2 at 20 feet and SG-4 at 5 feet for 2010, the maximum of the normal or duplicate is presented.

**Yellow highlight indicates an exceedance of commercial and residential CHHSLs. Italics indicates exceedence of residential CHHSL only.**

CHHSL = California Human Health Screening Level

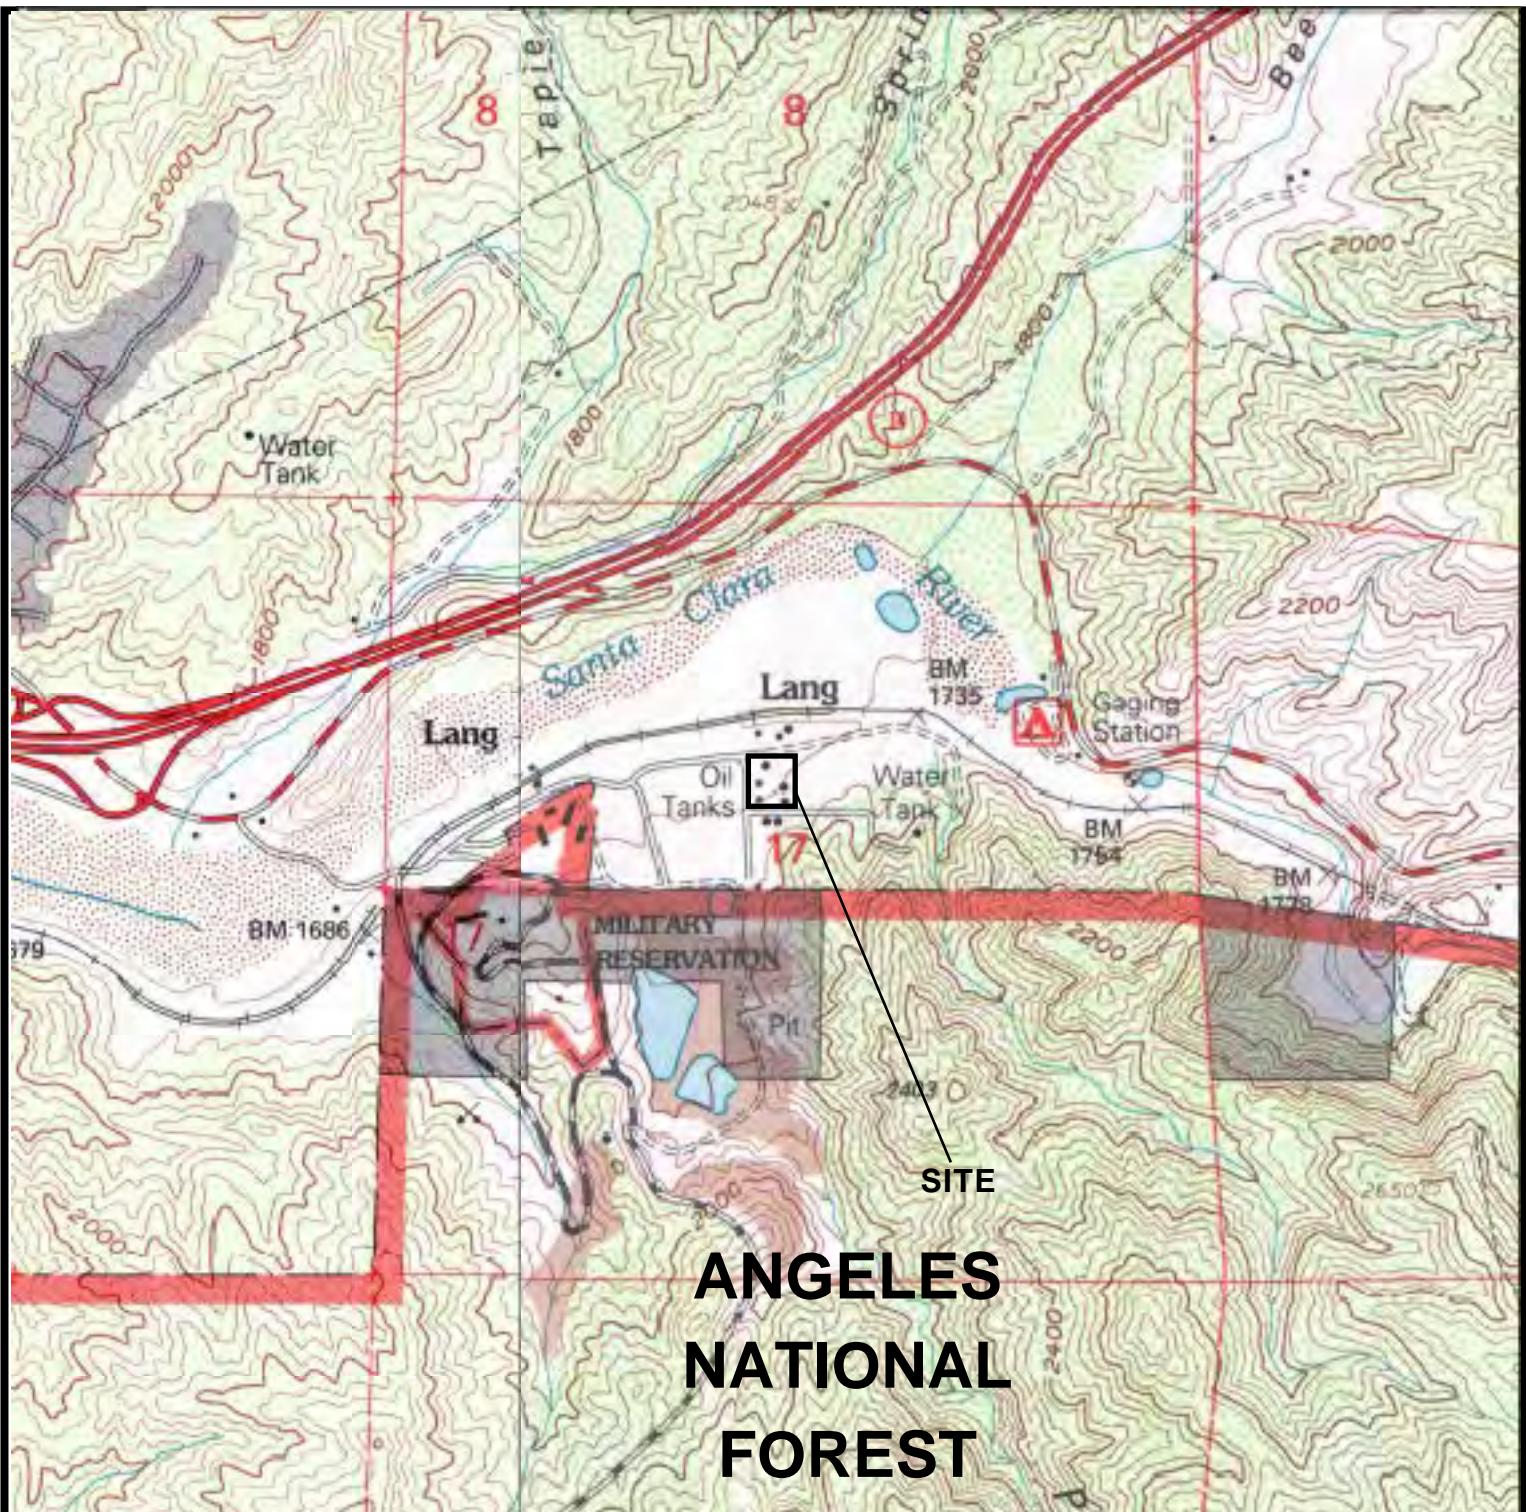

DTSC = Department of Toxic Substance Control.

ft bgs = Feet below Ground Surface

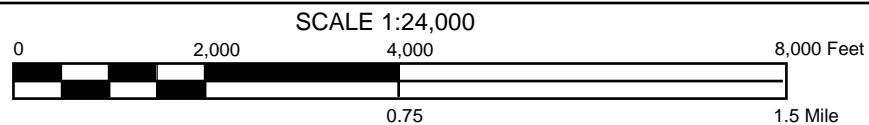

ug/l = microgram per liter

ND = Not detected at or above laboratory detection limit

Discharge Limits	-	NA	NA	210	450	NA	NA	NA	2270	NA	NA

Notes: ND = Not detected above laboratory reporting limit.

ppbv = parts per billion

NA = Not Applicable

(\* ) = All other constituent concentrations, if not listed, were "ND" for all samples

**Page (13 of 13)**

Date	Time	System Operational Data											Vinyl Chloride				
		Hour Meter (hrs)	Actual (hrs)	Cumulative Hours	Temp (°F)	Differential Pressure (inches of H <sub>2</sub> O)	System Static Pressure (psia)	System Vacuum (in Hg)	Flow Rate (acf m)	Flow Rate <sup>a</sup> (scfm)	Total Influent Concentration (ppbv) <sup>b</sup>	Notes	Influent Lab Concentration (ppbv) <sup>c</sup>	Notes	Removal Rate (lbs/hr)	Total Removal (lbs)	Cumulative Removal (lbs)

**Notes** \* = Lab concentrations are used when no adjustments are made to the system. When adjustments are made, then the estimated lab concentration is calculated (e).

$$\text{Estimated Lab Concentration (e)} = (\text{LC} / \text{FR}_o) * \text{FR}_i$$

LC = Lab Concentration of the compound in question

FR<sub>o</sub> = Field Concentration found at the time the lab sample was taken

FR<sub>i</sub> = Field Concentration corresponding to the Estimated Lab Concentration

$$\text{Removal Rate (lbs/hr)} = [(\text{Flow Rate in scfm}) * (28.31 \text{ L/ft}^3) * (60 \text{ min/hr}) * (\text{Influent Concentration in ppbv}/10^9) * ((\text{MW of Vinyl Chloride in g/mol})/24.04 \text{ L/mol})] / 454 \text{ g/lbs}$$

$$\text{Total Removal (lbs)} = \text{Removal Rate (lbs/hr)} * \text{Actual (hrs)}$$

When System Differential Pressure is available, the system flow rate is calculated as shown in Table 2

When System Differential Pressure is not available, the system flow is the value given by the sum of Well Field and Dilution flow rates as shown in Table 2

a = When System Differential Pressure is not available, the system flow is the value given by the sum of Well Field and Dilution flowrates as shown in the Field Summary Tables

b = Concentration reading is in ppmv and is multiplied by 1000 to get ppbv

CF<sub>i</sub> = A correction factor of 0.54 is used when the instrument is calibrated to Isobutylene instead of hexane

1) Due to incorrect field concentrations, the field concentrations found on 2/12/07 are not used as IFC<sub>o</sub> to calculate the estimated lab concentration (e).

The field concentration found on 2/23/07 at 9:30 AM, 244,000 ppb, is used as IFC<sub>o</sub> to calculate the estimated lab concentration (e)

2) An assumption is made that the Max Dilution Air value is 10 in H<sub>2</sub>O, until 3/29/07 when a new dilution filter was installed.

3) The average concentration is used to calculate the removal rate between the sample data when the time span between two readings is more than a day  
(and the SVE system is left running)

4) Although lab data was provided for this day, the detection limits are too high, thus making everything non-detect. So we will continue estimating the influent concentrations,  
unless a detection was found.

5) New Hour Meter was installed. 20 hours was the initial reading on the meter

6) A TVA or PID with a 10.6 ev lamp is used starting on 10/14/11

#### Definitions

hrs: hours

cfm: cubic feet per minute

scfm: standard cubic feet per minute

inches H<sub>2</sub>O: inches of water

ppbv: parts per billion by volume

lbs: pounds

NM: not measured

NA: not available

ND: non-detect

--: non-detect, not available, not measured

e: estimate made from lab data. This is used if a change was made to the system  
between lab data collection. This estimate will be used until lab data is collected.  
If no change is made to the SVE system, then lab data is used.

m : ND result, see using 1/2 MRL (or 1/2 PQL from ATL)

m+: a summation of ND (1/2 MRL) and actual concentrations

**italics:** Used 0.54 correlation factor to go from Isobutylene to Hexane

#### Constants and Conversions

24.04 L/mol = Molar volume constant

28.31 liters = 1 cubic foot

60 minutes = 1 hour

#### Molecular Weights

Vinyl Chloride = 62.499 g/mol

1,1-DCA = 98.96 g/mol

Methylene Chloride = 84.93 g/mol

Benzene = 78.11 g/mol

Tetrachloroethene = 165.83 g/mol

Trichloroethene = 131.40 g/mol

1,2-Dichloroethane = 98.96 g/mol

C2 through C6+ (MW of hexane) = 86.18 g/mol

	11:00 AM											For the granular activated carbon beds to be used more efficiently, the relative humidity of the influent vapor should not be above 50%. By mixing the well field vapor (approximately 100% relative humidity) with dilution air (relative humidity of ambient air), we are able to maintain a lower relative humidity at the influent. However, during humid days and nights (when relative humidity is ≥ 40%), the system will be shut down in order to maintain a relative humidity of < 50% at the influent. This

## **APPENDIX C**

Historical Soil Data

---

## **Appendix C**

### **I. Historical Soil Analytical Summary**

Subsurface soil samples were collected at the site from 1980 through 1992. In March of 1990, remedial investigations (RI) were initiated at the site. The RI's were performed in two phases. Phase I was intended to characterize the surface and near surface soils. The Phase I investigations utilized hollow-stem auger drilling techniques to obtain soil samples to depths of 15 to 35 feet. The boreholes were sampled every 5 feet until either refusal was encountered or when contamination was assessed not to exist by field evaluation methods. The objective of the Phase II study was to determine the vertical extent of contamination and to find ground water table below the site. Phase II site investigations utilized an air rotary rig to penetrate through the alluvium into the bedrock formation. During Phase II investigation, ground water was not encountered under the site; therefore, ground water wells could not be installed.

From the phased RI investigations, it was determined that petroleum hydrocarbon contaminated areas covered almost the entire Site surface and extend vertically to 60 feet bgs. Petroleum hydrocarbons and PAHs were generally detected together in the same areas within the Site's surface soil. The most contaminated area for petroleum hydrocarbons and PAHs was in the northern and central portions of the Site [LETTRO JV, 1992]. Total recoverable petroleum hydrocarbons (TRPH) concentration was generally greatest at the surface and near surface and decreased with depth. PCBs were detected generally in the surface and near surface soils; however, PCBs were also detected at depth in the northern portion of the Site [LETTRO JV, 1992]. Lead concentrations over background were detected generally in formerly bermed areas of the Site, including areas on the eastern boundary in the southeastern corner and in the northwest central portion of the Site [LETTRO JV, 1992].

The processing and storage areas located north of the Site were impacted with petroleum hydrocarbons up to 140,000 parts per million (ppm). Petroleum hydrocarbons detected in soil were generally of heavier molecular weight semi-volatile organic compounds (SVOCs). Ethylbenzene, toluene, and xylene are VOCs associated with petroleum hydrocarbons and were found to a depth of 50 feet bgs. The presence of TCE was detected at 65 feet bgs, while PCE and dichloethane (DCA) were detected sporadically in subsurface soil across the entire Site. However, PAHs were detected to 65 feet bgs. PCBs were generally limited to surface soil along the eastern fenceline, with concentrations to 2.1 ppm. A PCB concentration of 0.41 was detected at 60 feet bgs. Surface soil pH ranged from 3 to 5 pH units. Soil pH at depth is unknown.

Figures illustrating historical soil sampling locations, various chemical impacts at the Site, and cross sections are presented in Appendix C. A summary of these figures are presented below:

- Figure C-1 (Figure 4.1 of the 1992 RI) presents the historical sample locations.
- Figure C-2 (Figure 4 of the 1999 RAP) illustrates the lateral extent of hydrocarbon contamination.
- Figure C-3 (Figure 5 of the 1999 RAP) illustrates the organic contamination.
- Figure C-4 (Figure 6 of the 1999 RAP) illustrates the lead contamination.
- Figure C-5 (Figure 7 of the 1999 RAP) illustrates the PCB contamination.

- Figure C-6 (Figure 4.4 of the 1992 RI) illustrates locations of cross sections A-A, B-B', and C-C'.
- Figures C-7, C-8, C-9 (Figures 4.5, 4.6, and 4.7 of the 1992 RI) illustrates the vertical extent of petroleum hydrocarbons and halogenated VOC contamination on cross sections A-A, B-B', and C-C'.

## **APPENDIX D**

Historical Groundwater Data

---

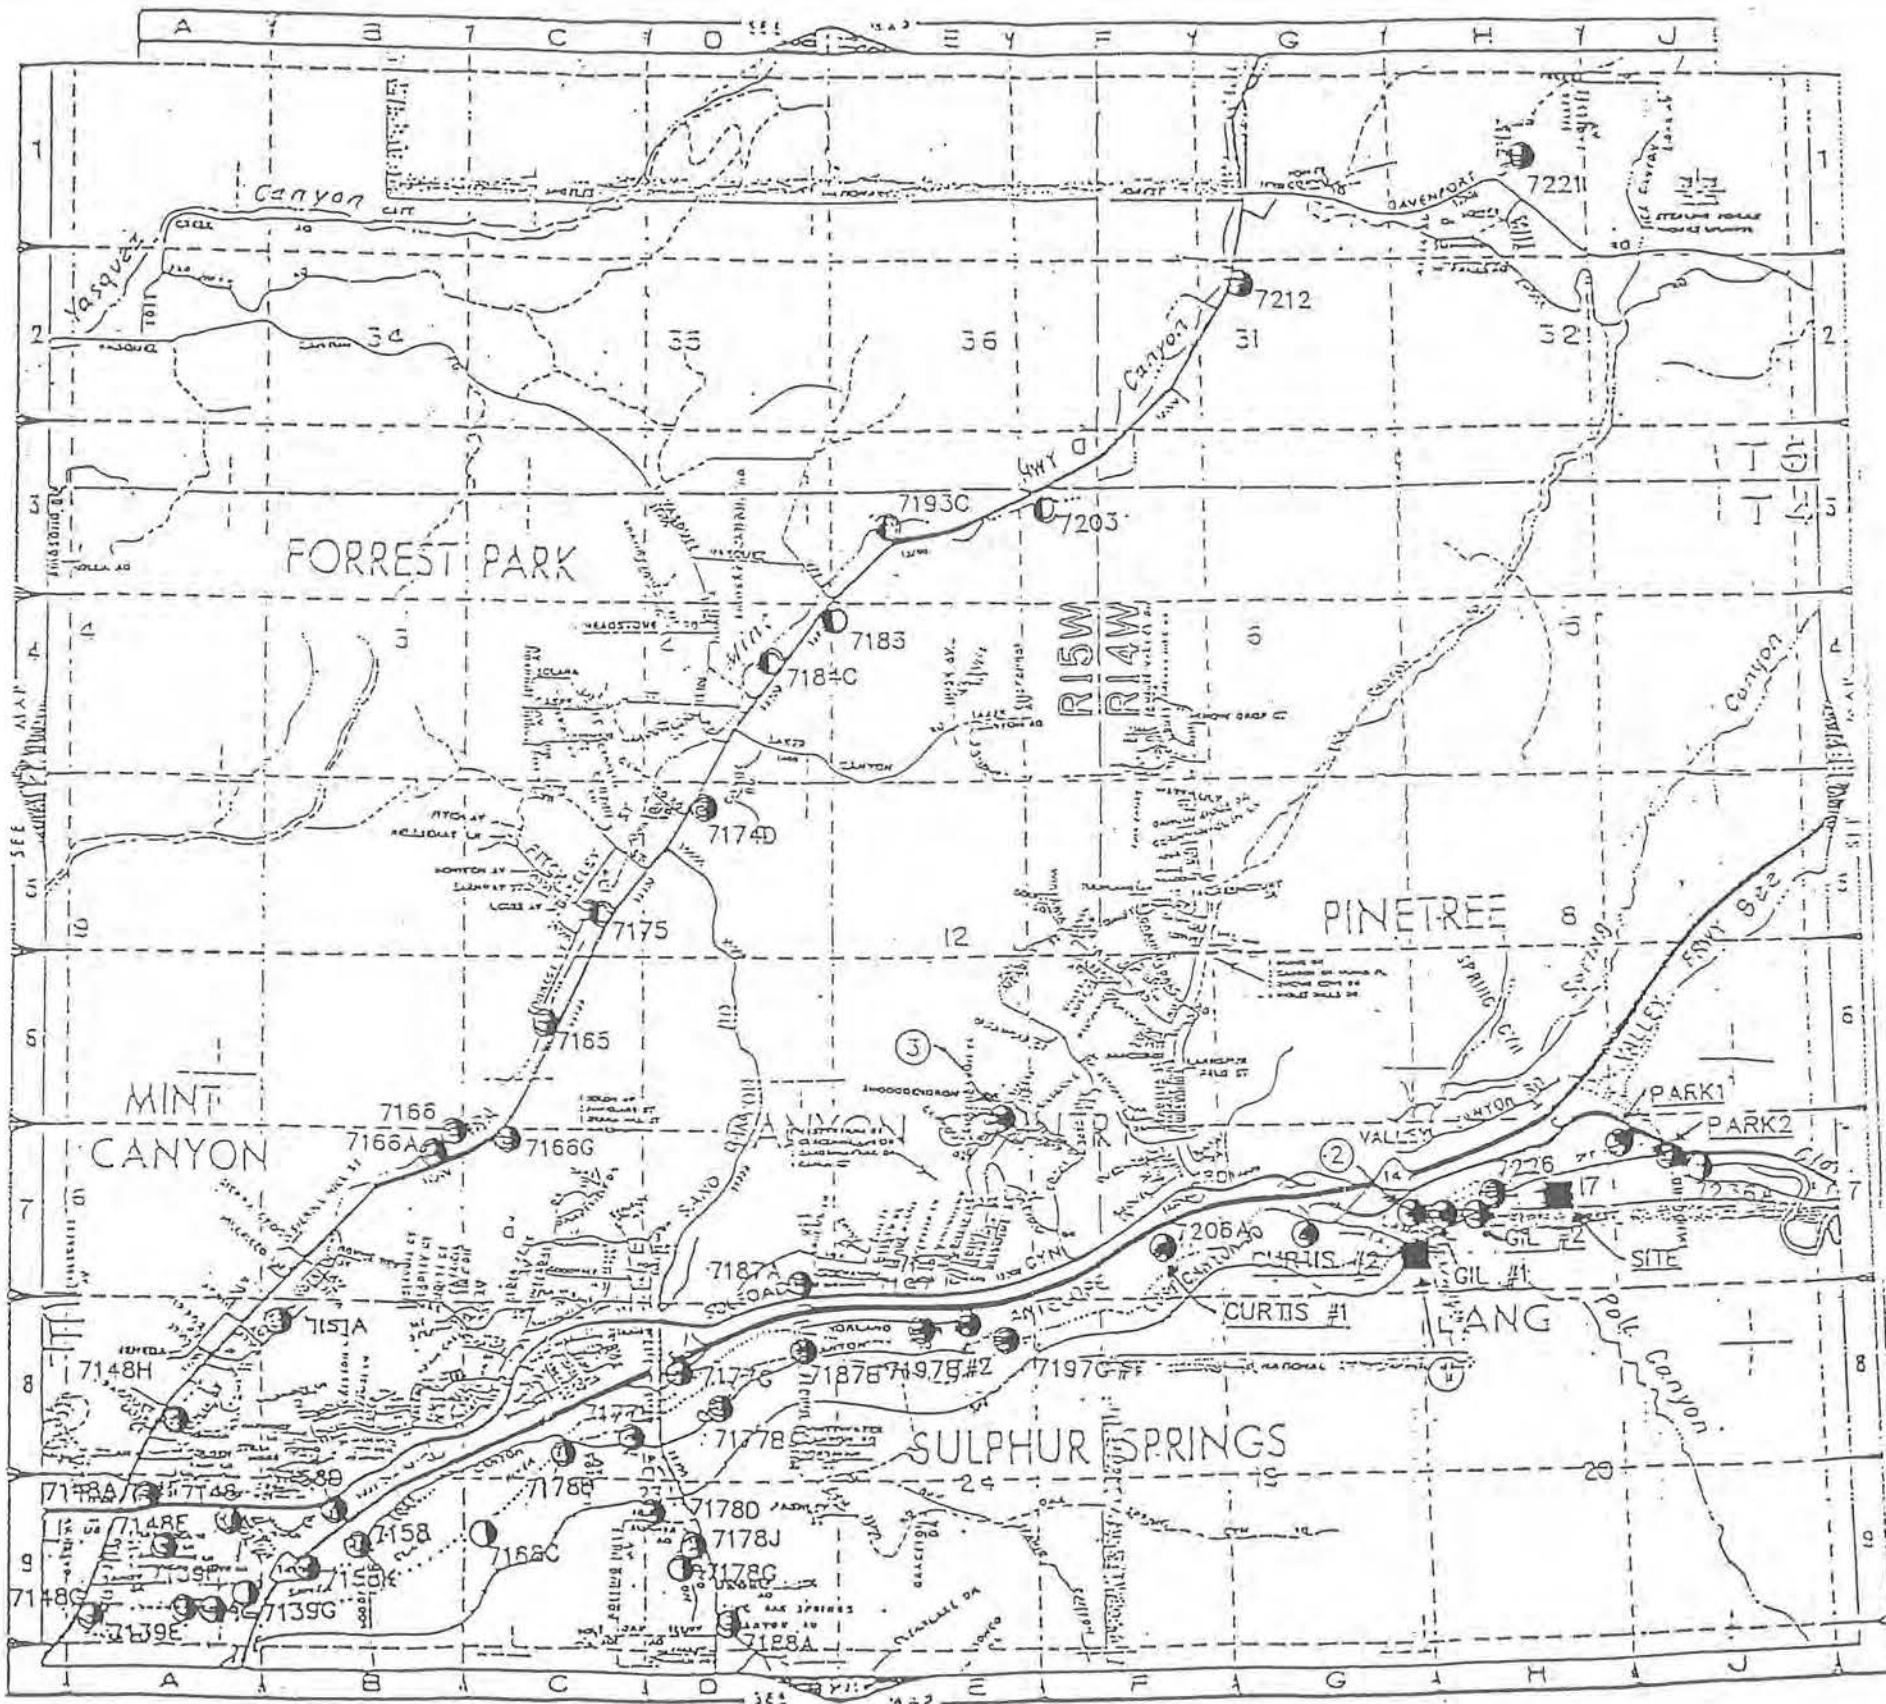

## **Appendix D**

### **I. Historical Groundwater Analytical Summary**

Groundwater samples were collected from municipal wells Curtis 1-A/1-B, Curtis 2-A/2-B, Gil 1-A/1-B, Gil 2-A/2-B, Park 1-A, and Park 2-A located around the Site in 1992. Samples were obtained from taps attached on top of the wells. No VOCs were detected in any of the wells. Figure D-1 presented in Appendix D shows the locations of the wells.

In August 1995 groundwater monitoring well MW-1 was constructed in the northwestern portion of the Site, and groundwater samples were collected from well MW-1. The groundwater investigation revealed elevated concentrations of VOCs. The DTSC determined that an additional groundwater investigation was necessary to fully define the extent of groundwater contamination at the Site (DTSC, 1999).

Between March and June 1998, three additional groundwater monitoring wells (MW-2 through MW-4) were installed at the Site. All Site wells MW-1 through MW-4 were subsequently sampled in July of 1998. VOC compounds were detected in groundwater samples collected from wells MW-1 and MW-4 located within the Site boundaries in the northwestern portion of the Site. Detected VOC compounds included benzene, n-Butylbenzene, sec-Butylbenzene, 1,1-DCA, cis-1,2-DCE, ethylbenzene, 1,1,2,2-tetrachloroethane, isopropylbenzene, 1,1,1-TCA, 1,1,2-TCA, vinyl chloride, and o-xylene. VOCs were not detected in groundwater samples collected from the downgradient well MW-3 or the upgradient well MW-2. Thus, the RI-FS (Woodward-Clyde, 1999) estimated the extent of VOC-impacted groundwater to be within Site boundaries. Compounds exceeding the Site specific groundwater cleanup goals included benzene, 1,1-DCA, cis-1,2-DCE, 1,1,2,2-tetrachloroethane, and vinyl chloride. Well casing survey data and groundwater analytical results for wells MW-1 through MW-4 are presented in Appendix D.

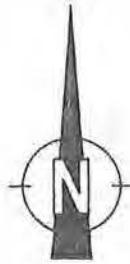

## NOTE

1. MAP IS MODIFIED FROM L.A. COUNTY DEPARTMENT OF PUBLIC WORKS' MAP.
  2. ALL WELLS THAT LETTRO SAMPLED ARE SHOWN AT APPROXIMATE LOCATIONS.
  3. CURTIS #2 IS ONE OF THREE WELLS IN A CLUSTER.
  4. IT IS NOT CLEAR WHETHER GIL #2 IS STATE WELL 7225 AND PARK 2 IS WELL 7236A. LETTRO IS INVESTIGATING.
  5. LETTRO SAMPLED WELLS PARK 1 AND 2, GIL #1 AND #2 AND CURTIS #1 AND #2.
