Fires can occur at construction sites. Factors affecting fire risk at construction sites include, but are not limited to, stockpiling construction materials and electrical, plumbing, and mechanical systems installation. A large amount of wood framing is expected to be used on the Project site during its 20-year buildout period. In association with the framing operations, electrical, plumbing, communications, and ventilation systems would be installed in each structure. It is expected that the electrical, plumbing, and mechanical systems would be properly installed during framing operations (i.e., they would be subject to County codes and inspections by County personnel prior to installing dry wall). In addition, construction sites would also be subject to County requirements relative to water availability and accessibility to fire-fighting equipment. During each phase of construction over the 20-year buildout period, construction activities would be required to comply with all applicable building and fire code requirements for such items as roofing materials, building construction, brush clearance, water mains, fire hydrant flows, hydrant spacing, access and design, and other hazard-reduction programs for areas identified within the Very High Fire Hazard Severity Zone (VHFHSZ),<sup>1</sup> as set forth by the County Forester and Fire Warden. During each phase of construction, the Construction Contractor, the Applicant, and the County would coordinate to determine the most feasible locations for construction staging and equipment/materials storage.

---

<sup>1</sup> As discussed in Section 5.3.3, Fire Safety, of Section 5.3 (Hazards and Fire Safety), portions of the Project site are located in a VHFHSZ and, therefore, the site is considered to have a high fire potential.

Fire services and emergency response for fire incidents during the initial construction phases of the Project would be provided from LACFD Fire Station 77, located at 46833 Peace Valley Road in Gorman, which is currently staffed with a three-person engine company. Emergency access to the construction sites would be provided and maintained. As stated in Section 4.5.4, Mobility Plan, National Cement Plant Road would be realigned at the southern segment but the existing road would remain in place and would be available for use for emergency access during construction.

Therefore, adherence to County fire codes and requirements (see Section 5.3, Hazards and Fire Safety) and coordination between the Construction Contractor, Project Applicant, and the County during construction would reduce potential impacts related to fire hazards at the Project site to a less than significant level.

### Operational Impacts

The Project would result in the development of a maximum of 19,333 residential units, approximately 57,150 residents, and over 10.0 million square feet of non-residential development creating approximately 23,675 jobs. This development would introduce people and structures into currently undeveloped areas. With a greater number of people and structures, there is a greater potential for activities and accidents involving the use of fire, flammable/combustible materials, and electrical systems, along with the creation of fire hazards from candles, cooking, electrical and heating sources, and smoking and the use of equipment, appliances, and materials that may cause fire, explosion, or the release of smoke, gas, and/or hazardous materials. Thus, new development on the site would substantially increase the likelihood of incidents requiring LACFD response and calls for service over existing conditions. This would create a significant impact if not mitigated as required by the County of Los Angeles.

The LACFD has indicated that each additional development creates greater demands on their existing resources. They estimate that up to four additional fire stations could be needed to provide adequate fire service to the Project and meet its response time goals, with the actual number of stations determined by the LACFD based on the road network (LACFD 2015a). The Project would construct up to four stations (three medium stations and one large station) on the Project site to the LACFD's specifications. A medium station would consist of an approximate 10,000-square-foot (sf) building on an approximate 1.25-acre lot. A large station consists of an approximate 15,500-sf building on an approximately 4.00-acre lot. The large station lot is sized to also accommodate training facilities for fire fighters. It should be noted that fire station size requirements are continually modified to meet federal, State, and local requirements. The actual square footage of each fire station would be determined by the LACFD at the time of Project development.

As discussed in Section 4.0, Project Description, the Project includes conceptual site locations for three new fire station sites, with a potential fourth location to be determined on the Project site. However, without the development of the on-site fire stations on the Project site, there would be significant fire-related impacts to people and structures. As required by MM 16-1, these new fire stations are projected to provide an average five-minute response time for the first arriving unit for fire services and an eight-minute response time

for advanced life support (paramedics) to the Project site at buildout. Because MM 16-1 would ensure that fire station sites are located to meet the LACFD goal of a five-minute response time for fire and an eight-minute response time for paramedics, the impact on response times for fire protection would be reduced to a less than significant level.

Until such a time that the first fire station is conveyed to the Fire District (1,000<sup>th</sup> dwelling unit), the Project Developer would be required to pay developer fees. The County of Los Angeles requires the Applicant to pay fees as detailed in the County Fire Department Developer Fee Program (MM 16-2). Upon completion of the first fire station, the Project Developer would be issued a developer fee credit and, at the completion of the 6,000<sup>th</sup> residential occupancy, the second fire station would become operational and be conveyed to the Fire District; at this time, the Project Developer would be issued a developer fee credit (and so on) until all required fire stations are constructed. As previously stated, the Project Applicant has agreed to dedicate the land and construct and equip up to four new fire stations. Construction of these fire stations will be subject to approval by the LACFD and costs would be borne solely by the Applicant (MM 16-3). The LACFD would assign a project manager to liaison with the Applicant and/or the designated contractor and architect. The Project includes conceptual fire station sites to serve the Project's residents and non-residential development, as shown on Exhibit 4-1, Centennial Project – Conceptual Land Use Plan.

Property tax revenues, which would increase annually as the Project is built out over time, would provide funds for the operation and staffing of the fire stations. Ultimately, it would be the LACFD's responsibility to ensure that staffing and resource service levels balance with the rate of Project development. Because the Project accommodates adequate opportunities for the development of on-site fire stations to serve Project development and because MMs 16-2 and 16-3 would ensure that funding and fire station sites are provided for these new fire stations as part of the implementation of the Project (as discussed below), the impact on the demand for new fire stations would be reduced to a less than significant level.

Fire services and emergency response for fire incidents during the initial development phases of the Project would be provided from Fire Station 77. This station would serve the Project until such time that the 1,000<sup>th</sup> dwelling unit is built on the site (at which time the first on-site fire station shall be operational) (MM 16-3). The KCFD may also provide fire service and emergency response under the mutual aid agreement with LACFD.

As discussed in Section 5.3, Hazards and Fire Safety, the Project roadways would be built to County of Los Angeles standards or would be modified by the Project for unique types of roadways. The internal roadways would be designed to ensure that proper access for emergency ingress and egress would be provided for evacuation and for emergency vehicle access. The National Cement Plant Road would be part of the Project's circulation system. The southern segment of this road would be realigned to connect to SR-138 west of Quail Lake, but the existing southern segment of the roadway would be improved to become an access point into the Project site (east of Quail Lake). There would be no impact with the continued use of National Cement Plant Road.

To ensure that future residents, visitors, employees and other people on the Project site are informed regarding evacuation routes and other aspects of an emergency response, the Project Applicant has prepared an Emergency Response Plan for the Project; in accordance with MM 3-8 in Section 5.3, Hazards and Fire Safety, this Evacuation Plan will be reviewed and approved by the County of Los Angeles Department of Regional Planning, the LACFD, and the LASD. The Emergency Response Plan would be distributed to each property tenant or purchaser in accordance with MM 3-8 in Section 5.3, Hazards and Fire Safety.

Land uses in the Business Park land use category planned on the Project site may use substances and/or chemicals considered to be hazardous/flammable by the State of California. Refer to Section 5.3, Hazards and Fire Safety, for a discussion of hazardous materials that are potentially associated with the Project. Impacts related to hazardous materials use would be less than significant with implementation of the MMs.

As stated in Section 5.3, Hazards and Fire Safety, the Project shall comply with all applicable LACFD code and ordinance requirements for building construction, access, water mains, fire flows, and hydrants. Thus, development on the site would be constructed to prevent the creation of fire hazards; to have the necessary fire alarm and sprinkler systems; and to have adequate emergency fire access.

As stated in the Project Description (Section 4.5.9), the Project includes a domestic (potable) water supply, treatment, storage, and distribution system (Potable Water System). The design, construction, and operation of the Potable Water System would be required to comply with standards set by the California Department of Health Services and Los Angeles County Department of Public Works. The planned domestic water facilities are depicted on Exhibit 4-13, Centennial Project – Conceptual Domestic Water System, and include the following: water treatment facility, storage tanks, booster pump stations, pressure reducing stations, recharge basins, wells, and distribution lines. It should be noted that the potable water distribution system requires four pressure zones, each of which would provide an appropriate water pressure to meet peak demand and County-required fire flow requirements. The domestic water system would provide the necessary fire flows for fire incidents at the site.

#### Wildland Fires

The Project would introduce urban development into an undeveloped area that is subject to wildfire hazards. Portions of the Project site are within a VHFHSZ, which includes areas that are subject to high fire hazards due to the presence of high brush, woodlands, and steep slopes. The Project's potential to result in wildland fire hazards is addressed in Section 5.3, Hazards and Fire Safety. As discussed in Section 5.3.3, the Project will comply with all Very High Fire Hazard Severity Zone and High Fire Hazard Severity Zone code and ordinance requirements for fuel modification. As required by Section 4908.1 of the County of Los Angeles Fire Code, a Fuel Modification Plan must be submitted to the Forestry Division and be preliminarily approved prior to issuance of a permit for any permanent habitable structure. The Project will comply with all applicable LACFD code and ordinance requirements for construction, access, water mains, fire flows, and hydrants. MM 3-10 requires the Property Owner/Developer to provide all new Property Owners with recorded

Covenants, Conditions, and Restrictions (CC&Rs) or disclosure statements that identify the responsibilities for maintaining the fuel modification zone(s) on their property, as defined in the approved Fuel Modification Plan. The Project, for fire protection, is required to be compliant with State and County fire regulations, standards, and guidelines. This would ensure that the Project would not result in an increased potential for wildland fire hazards, and impacts would be less than significant.

The Project Description (Section 4.5.14) provides more detail regarding the Project's landscape concept and Fuel Modification Plan. The landscape concept and fuel modification plan would reduce the potential for wildland fire and brush fire hazards on the Project site.

The existing heliport at Fire Station 77 would be operational for refueling and patient pick up and could be used to scoop water from Quail Lake for brush fire protection. On site, a fire hydrant system would be constructed to fight fires within the development area. Development would eliminate the potential for brush fires, and the on-site water system and fire hydrants would be available to provide fire flows for fire suppression. Therefore, there would be a less than significant impact on brush fire protection services.

#### Response Times

According to the Insurance Service Office (ISO), using a Fire Suppression Rating Schedule (FSRS), a five-minute response time is typically the standard for adequate fire protection. The development of up to four new fire stations, in combination with Fire Station 77, are projected to provide an average five-minute response time within the Centennial development at Project buildout (MM 16-1). This is consistent with the LACFD goal of a five-minute or less average first-due response time in urban areas (LACFD 2015a).

#### ***Off-Site Impacts***

The off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, would not, by themselves, generate population growth that would result in additional demand for fire protection services. Additionally, the installation of the proposed well system as part of the Project would assist fire protection and emergency response capabilities by assuring adequate fire flows and pressures at the site. There would be no impact on fire protection services and no mitigation is required.

Where off-site features would necessitate construction activity within a roadway right-of-way, implementation of MM 10-8 from Section 5.10, Traffic, Access, and Circulation, would ensure that Traffic Management Plans are prepared and submitted to the County of Los Angeles Public Works Department for review and approval. The Traffic Management Plans would describe traffic-control measures that would be implemented to maintain traffic flow in all directions including where utilities and other improvements are being implemented in existing roadways. Because impacts to circulation would be minor and temporary and because traffic-control measures would be detailed in the Traffic Management Plans, traffic movements would not be disrupted and emergency vehicles would be accommodated. Therefore, less than significant impacts would occur.

**Impact Summary:** Development of the Project site would introduce people and structures into currently undeveloped areas resulting in an increase in the demand for fire services, which is considered a significant impact. Adherence to County fire codes and requirements during construction would reduce the potential for fire hazards at the Project site. The presence of Station 77, which is located approximately two miles from the Project site, and the proposed on-site fire station sites would adequately serve the Project. Up to four on-site fire stations would be built and equipped as part of the Project (MM 16-1 and MM 16-3). Project development fees would also generate tax revenue (MM 16-2) to provide funding for staffing of fire service resources; therefore, no significant impact would result related to fire protection services. Compliance with MMs 16-1 through 16-3 would provide for sites and funding for fire protection; therefore, the impact to fire services would be less than significant.

## **Mitigation Measures**

The following mitigation measures reflect the consideration of fire services as part of the Project. MMs 16-1 through 16-3 provide fire station sites and funding for fire protection services to serve the Project.

- MM 16-1** At buildout, the Los Angeles County Fire Department (LACFD) fire stations shall be located such that response times to the Project site shall be 5 minutes or less for fire service responses and 8 minutes or less for the advanced life support (paramedic) unit responses within the Project site.
- MM 16-2** The Project Applicant/Developer shall pay developer fees in effect at the time of building permit issuance, in accordance with the LACFD Developer Fee Program until such time the Project Applicant/Developer has conveyed an approved, operational fire station to the LACFD. As an alternative to fee payment, the Developer Fee Program allows the LACFD and the Project Applicant to agree on a program whereby the Project Applicant would provide land and would construct and equip the fire stations required for the Project in exchange for a credit towards the Project's fee payments.
- MM 16-3** The Project Applicant/Developer shall provide land, convey title, and shall construct and equip to the specifications and requirements of the LACFD, for up to four new Fire Stations to the LACFD. The approved final plans and specifications for the Project shall identify locations of the fire stations. The LACFD shall have final approval over the fire station site locations. The timing for the construction of the on-site fire stations shall be established by the LACFD dependent upon the phasing of development, with the first on-site fire station operational no later than the time the 1,000<sup>th</sup> dwelling unit is built on site.

## Level of Significance After Mitigation

Implementation of MMs 16-1 through 16-3 would reduce potentially significant impacts related to fire protection services to levels that are less than significant.

### 5.16.3 LAW ENFORCEMENT SERVICES

The following analysis is based on information provided by the Los Angeles County Sheriff's Department (LASD) and the California Highway Patrol (CHP).

## Relevant Plans, Policies, and Regulations

### *Federal*

No federal plans and policies have been identified related to Law Enforcement Services.

### *State*

No State plans and policies have been identified related to Law Enforcement Services.

### *County*

#### Law Enforcement Facilities Mitigation Fee

On June 24, 2008, the Los Angeles County Board of Supervisors approved Ordinance No. 2008-0033, which amends Title 22 (Planning and Zoning) of the Los Angeles County Code with the addition of Chapter 22.74, Law Enforcement Facilities Fee. This Ordinance became effective August 23, 2008. This amendment established a Law Enforcement Facilities Mitigation Fee (LEFMF) plan for new residential, commercial, office, and industrial development in the unincorporated Santa Clarita, Newhall, and Gorman areas. The adoption of the ordinance established a fee to be imposed upon new development projects. This fee serves to finance land acquisition, engineering, construction, installation, purchasing, and other direct costs related to capital law enforcement facilities and equipment, as required to serve new development in unincorporated areas of North Los Angeles County.

#### County of Los Angeles General Plan and Antelope Valley Area Plan

The *County of Los Angeles General Plan* and *Antelope Valley Area Plan* address issues affecting the provision of law enforcement services. Relevant goals and policies in the Antelope Valley Area Plan include:

#### *Public Safety, Services and Facilities Element*

**Goal PS 4:** Protection of public safety through law enforcement and crime prevention strategies.

**Policy PS 4.1:** Support an increased law enforcement presence in every Antelope Valley community and explore new funding mechanisms to expand law enforcement services.

**Policy PS 4.2:** Support a strong law enforcement presence on highways and streets to strictly enforce speed limits and other vehicle safety laws.

**Policy PS 4.3:** Promote and support neighborhood watches to create more eyes and ears in the community.

**Policy PS 4.4:** Educate the public on crime prevention programs and resources offered by the Sheriff's Department.

A consistency analysis of the Project's specific goals and policies with the County's relevant plans, policies and regulations is provided in the Land Use, Entitlements, and Planning Section (Section 5.8) of this document.

## **Environmental Setting**

### ***Los Angeles County Sheriff's Department***

The Santa Clarita Valley Station of the LASD is responsible for providing general law enforcement for all crimes against persons or property in the Project area, and the CHP provides traffic control and accident investigation. The closest LASD Station is located near the intersection of Magic Mountain Parkway and Valencia Boulevard at 23740 Magic Mountain Parkway in Valencia, approximately 28 miles south of the Project site, as shown on Exhibit 5.16-2, Existing Law Enforcement Station Locations. This station's service area includes the Angeles National Forest and the communities of Bouquet Canyon, Canyon Country, Castaic, City of Santa Clarita, Gorman, Hasley Canyon, Newhall, Neenach, Sand Canyon, Saugus, Six Flags Magic Mountain, Sleepy Valley, Southern Oaks, Stevenson Ranch, Sunset Point, Tesoro del Valle, Valencia, Val Verde, West Hills, and Westridge. This area is generally bound on the north by the Kern County Line, on the east by the township of Agua Dulce, on the south by the Los Angeles City limits, and on the west by the Ventura County line.

The Santa Clarita Valley LASD Station provides general law enforcement services, including patrol and response, a crime prevention unit, investigation, and traffic control. It provides these services via patrol units, detectives, a Special Problems Unit, a homeless program, school deputies, business alliance programs, valley force tram, and a juvenile team. Their service area also includes the City of Santa Clarita, which contracts with the LASD for law enforcement services. The Santa Clarita Valley LASD Station maintains a staff of 200 sworn deputies and 43 civilian employees and is equipped with patrol vehicles, aircraft, search and rescue assets, mounted patrols, and emergency operations assets.

The Santa Clarita Valley LASD Station administers various community-based programs, including the Volunteers on Patrol, Explorer, Neighborhood Watch, Vital Intervention and Directional Alternatives (VIDA), and Drug Abuse Resistance Education (DARE) programs. The Search and Rescue (SAR) operations are conducted by the Sheriff's Department Reserve Forces Bureau from seven stations, including the Santa Clarita Valley LASD Station, which has a Mounted SAR team that uses specially-trained horses and riders in terrain that is not accessible by motorized vehicles or helicopters. The LASD provides facilities, some vehicles, and some life-saving equipment to perform core functions but not operating funds. Rather, SAR teams are largely reliant on donations of their time and equipment.

D:\Projects\3CEN\Centennial\MXD\EIR\Ex\_police\_stations\_20150901.mxd

## Existing Law Enforcement Station Locations

Centennial Project

Exhibit 5.16-2

The LASD staff has indicated that the generally accepted service ratio is 1 deputy for every 1,000 residents. The resident population in the Santa Clarita Valley LASD Station's service area is approximately 279,000 people and that Station currently has 1 deputy per 2,364 residents, well below the standard.

Generally accepted response times for law enforcement agencies are 10 minutes or less for emergency situations (i.e., a crime or incident that is in progress and includes a life-threatening situation); 20 minutes or less for priority incidents (i.e., a crime or incident that is in progress but does not include a life-threatening situation); and 60 minutes or less for routine or non-emergency situations (i.e., a crime or incident that has already occurred and does not include a life-threatening situation). The response time is measured by the Station as being from the time a call is received until the time a responding unit arrives at the incident location.

The Station's anticipated response times to the Project site for emergency, priority, and routine incidents are 1 to 10 minutes; 1 to 20 minutes; and 1 to 60 minutes respectively. Response times are variable because the responding patrol units may be deployed elsewhere within the Station's service area and not necessarily dispatched from the Station itself.

Current demand for LASD services to the Project site are limited due to its largely undeveloped condition. Part 1 crime data for Reporting Districts 0681 and 0685, which are located in the unincorporated northwest portion of Los Angeles County and which include the Project site, included 1 aggravated assault, 2 burglaries, and 1 larceny (excluding motor vehicle theft) from January 1 to June 30, 2015.

Mutual aid agreements with various other law enforcement agencies in and beyond Los Angeles County allow for reciprocal services to be provided across jurisdictional boundaries in the event of disaster or other crises. These agreements are organized through the State's Office of Emergency Services, with associated costs for mutual aid servicers subject to reimbursement by the assisted agency.

### ***California Highway Patrol***

The CHP is the traffic law enforcement organization for California and is divided into eight geographical regions throughout the state. The primary responsibilities of the CHP are to enforce traffic laws on County and State highways; to assist in emergencies exceeding local capabilities; to provide disaster and life-saving assistance; to complete truck and bus inspections; to perform air operations and vehicle theft investigation and prevention measures; to protect State property and employees; and to complete public education on driver safety (CHP 2015a). The CHP has mutual aid agreements with the Los Angeles and Kern County law enforcement agencies and provides service and assistance when requested.

The CHP stations in the vicinity of the Project site are the Newhall Area, Fort Tejon Area, and Antelope Valley Area stations. The locations of these three CHP stations are shown on Exhibit 5.16-2. The Newhall Area and Antelope Valley Area CHP stations are located in the CHP's Southern Division, which serves the Los Angeles County area. The Southern Division includes 10 area offices, 1 commercial inspection facility, 1 communication and dispatch center, and 1,024 officers. The Fort Tejon Area CHP station is located in the CHP's Central

Division. The Central Division includes 15 Area Offices and 2 commercial inspection facilities.

The Newhall Area CHP station is located at 28648 The Old Road in Valencia, near the I-5 and SR-126 interchange. This station has 76 officers, and patrols 204 miles of freeway and 224 miles of unincorporated roadways within a 674-square-mile area (CHP 2015b). The Fort Tejon Area CHP station is located at 1033 Lebec Road in Lebec. This station has 30 officers and patrols 1,300 miles of freeways, roadways, and unincorporated areas in 3 counties. The Antelope Valley Area CHP station is located at 2041 West Avenue I in Lancaster. This station patrols freeways and County roadways in the Antelope Valley.

There are no long-range planning documents or uniform staffing requirements used by the CHP to project future needs in each service area. Rather, each station determines its own staffing allocation relative to the geographical needs within the station area's boundaries based on the service area's unique requirements and budget constraints. The CHP does not receive or base its deployment on the revenues that may be generated within its service area. The primary funding source for CHP facilities and staffing is State motor vehicle registration fees. Allocation of these fees to each service area is determined by CHP Headquarters in Sacramento. The Newhall CHP Area, which includes the Project site, has submitted requests for future staffing; however, there are no immediate plans to increase either Newhall Area-based personnel or equipment (Miler 2016).

## Project Design Features

No PDFs have been identified for this environmental issue.

## Threshold Criteria

The following significance threshold criterion is derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

**Threshold 16-2** Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need of new or physical altered governmental facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: sheriff protection.

## Environmental Impacts

**Threshold 16-2** Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need of new or physical altered governmental facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: sheriff protection?

## ***On-Site Impacts***

### Los Angeles County Sheriff's Department

#### *Construction-Related Impacts*

The LASD would be responsible for providing general law enforcement services to the Project site during construction, including response to calls for service in the cases of trespassing, theft, and vandalism that can occasionally occur at construction sites. Security fencing and private security would be provided by the Applicant in construction areas within the Project site and would reduce the need for LASD services. With these services, short-term, construction-related impacts would be less than significant.

#### *Operational Impacts*

Buildout of the Project would result in a maximum of 19,333 residential units, approximately 57,150 residents, over 10.0 million square feet of non-residential development creating approximately 23,675 jobs (refer to Section 5.9, Population, Housing and Employment). Based upon the generally accepted standard for officer-to-population ratio, as provided by the LASD (i.e., 1 field deputy per 1,000 residents), the Project would require 56 additional field deputies. This increase in field personnel would necessitate a concurrent increase in support resources such as detectives, complaint desk officers, support staff, vehicles, and portable radios which, if not provided, would result in a significant impact.

The Project would have to Law Enforcement Facilities Mitigation Fee (LEFMEF) in compliance with MM 16-4, which would reduce this potentially significant impact. The LEFMEF, which would be paid by the Applicant, will provide sufficient revenues to pay for land acquisition, engineering, construction, installation, purchasing, and any other direct costs necessary to provide the capital law enforcement facilities and equipment needed to serve new development in unincorporated areas of North Los Angeles County.

In addition, the Project includes the construction of a permanent LASD station on the Project site, as shown in Exhibit 4-1, Centennial Project – Conceptual Land Use Plan. The proposed LASD station would be located in the Business Park area along the north side of the SR-138. This LASD station, its precise location, its timing, and its associated staffing levels would be developed at a future time to be determined by the LASD and the Applicant based on the Project site's development rate.

The LASD's operating budget is generated through tax revenues, penalties and services, and allowed government assistance. Facilities, personnel, and equipment expansion and acquisition are tied to the County budget process and rely on tax-base expansion. Tax-base expansion would occur with development of the Project. The additional tax-base generated by the Project would offset the increased costs of providing LASD personnel and other support resources to the Project and therefore would not result in a significant impact related to LASD protection services.

Prior to development of the permanent LASD Substation, the LASD could operate out of "store front" sub-station at the first development area – Village 1 (MM 16-4). This "store front" sub-station would be properly outfitted in accordance with applicable occupancy

requirements of the LASD for such “store front” facilities, and would become operational before the first certificate of occupancy for the Project is issued. Upon approval of the applicable future tract map, the Applicant and the LASD will coordinate to finalize plans for a permanent LASD Station. The costs associated with the construction of this temporary sub-station would be paid by the Applicant and credited toward the LEFMM (LASD 2016).

With the addition of the “store front” LASD station and the permanent LASD Station on the Project site by buildout, response times to the Project site for emergency and non-emergency calls would improve due to the decreased distance from the site to the station. It is expected that the number of service calls and the types of incidents at the Project site and surrounding areas as the Project is built out would be similar in frequency and character to those experienced throughout the Santa Clarita Valley service area or other urbanized areas. Aside from the demand generated by the daytime and nighttime populations associated with the residential, commercial, and business park uses and public facilities, the Project does not provide for land uses that would create any new or unique types of law enforcement requirements. Any illegal on-site off-road vehicular activity would not present a law enforcement issue, as the LASD has determined that the proposed on-site facilities would adequately serve the Project (LASD 2016). The Hungry Valley State Vehicular Recreation Area, located approximately five miles west of the Project site, is a motorcycle, four-wheel drive, and all-terrain vehicle use area that provides a legal off-road alternative to illegal use of the site.

The placement of development adjacent to open space areas would result in increased use of these areas. In the event of an emergency, the Search and Rescue team from the Santa Clarita Valley LASD Station may be asked to assist. According to the LASD, the Search and Rescue team is adequately staffed and equipped to perform Search and Rescue operations and can, if necessary, obtain assistance from other equipped Search and Rescue teams located both in and outside Los Angeles County through the Los Angeles County Office of Emergency Services. The Santa Clarita Valley LASD Station’s Search and Rescue Team has resources at its disposal, both in terms of personnel and equipment, to carry out its operations. Increased encroachment into Special Management Areas as a result of the Project would not place undue requirements on the Santa Clarita Valley LASD Station’s Search and Rescue Team in the event of an emergency, and no significant impacts would occur.

The Project would provide for one permanent LASD station (MM 16-4). The timing for implementation of this station would be determined by the LASD in coordination with the Applicant, and would depend upon the development rate on the Project site and in its vicinity. In addition, prior to development of this permanent LASD station, the LASD would operate out of a “store front” station within the first development area. MM 16-4 would ensure that this “store front” sheriff’s facility would be developed pursuant to applicable occupancy requirements of the LASD for such facilities and that it is fully operational prior to the issuance of the first certificate of occupancy for the Project. With the “store front” and permanent on-site LASD Station, the LASD has indicated that optimal response times to the Project site can be met (LASD 2016).

Compliance with MM 16-4 would reduce the potential impacts on demand for law enforcement services to the Project site to less than significant levels. No additional impacts would occur related to the construction or expansion of LASD facilities.

#### California Highway Patrol

During development and upon Project buildout, demand for CHP services on the area's freeways and highways would increase due to vehicular traffic generated by the Project. This would result in potentially significant impacts on CHP services. While the Newhall Service Area station would be most impacted by Project-generated traffic because its service area includes the Project site and it handles I-5 traffic west and south of the Project site, there would also be increased traffic on the I-5 north of the SR-138 in the CHP's Fort Tejon Area and on SR-138 east of the Project site in the CHP's Antelope Valley Area. In addition, the CHP would be responsible for enforcing traffic regulations, responding to traffic accidents, and providing service and assistance for disabled vehicles in the Project area.

The Project will increase traffic volumes on SR-138 and I-5, affecting the CHP's Fort Tejon, Antelope Valley, and Newhall Areas. Refer to Section 5.10, Traffic, Access and Circulation, for more information regarding Project-related traffic generation. The CHP may need to increase staffing levels, adjust boundaries, and purchase new equipment in order to address increased demand for services. However, implementation of the Project would not require new or physically altered CHP facilities to maintain acceptable service ratios, response times, or other performance objectives (Miler 2016). The additional revenues from car registration fees generated by the Project would provide funding for additional staffing and equipment, which would partially offset any increased demand on CHP services associated with the Project.

As stated above, there are no long-range planning documents or uniform staffing requirements used by the CHP to project future needs in each service area. Rather, each station determines its own staffing allocation relative to the geographical needs within its boundaries based on the service area's unique requirements and budget constraints. Each CHP Station, under the direction of the Area Commander, drafts an annual report that includes demographic data, the number of calls received, and response times. In the report, a recommendation would be made to add additional staff, equipment, and/or facilities if needed. The decision to add additional stations is determined at the local level and largely depends on response times.

While the Project would increase demand for services from the CHP, this demand would not require the construction of new CHP facilities, nor would it require the expansion of existing facilities that would result in physical environmental impacts. Although implementation of the Project would require additional officers, this is not considered a significant environmental effect. As stated above, each CHP area station ultimately recommends the timing of hiring and number of new officers hired as part of its standard staffing practices. Therefore, impacts on the CHP would be less than significant.

### ***Off-Site Impacts***

The off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, would not, by themselves, generate population growth that would result in additional demand for law enforcement services. The presence of the off-site wells may result in occasional security-related calls for service. However, the level of this demand compared to the anticipated routine daily calls for service from development on the site would be negligible, particularly in light of the law enforcement facilities that would be constructed as part of the Project. There would be no impact on law enforcement services and no mitigation is required.

Where off-site features would necessitate construction activity within a roadway right-of-way, implementation of MM 10-8 from Section 5.10, Traffic, Access, and Circulation, would ensure that Traffic Management Plans would be prepared and submitted to the County of Los Angeles Department of Public Works' Traffic Division for review and approval. The Traffic Management Plans would describe traffic-control measures that would be implemented during construction to maintain traffic flow in all directions, including where utilities and other improvements are being implemented in existing roadways. Because impacts to circulation would be minor and temporary and because traffic-control measures would be detailed in the Traffic Management Plans, traffic movements would not be disrupted and emergency vehicles would be accommodated. Therefore, less than significant impacts would occur.

***Impact Summary:*** The Project would result in a maximum of 19,333 residential units, approximately 57,150 residents, and over 10.0 million square feet of non-residential development creating approximately 23,675 jobs; this would result in an increase in the demand for services from the LASD. This would also potentially result in significant impacts on the LASD's ability to provide law enforcement services. However, with the provision of a "store front" temporary sub-station and construction of a permanent LASD Station at the site (MM 16-4), response times to the site for emergency and non-emergency calls would be within the County guidelines. The additional tax-base generated revenues by Project development would also offset increased demands on the LASD. In addition, payment of LEFMF, as required by County Ordinance No. 2008-0033, would provide funding to mitigate impacts to the LASD for services needed by the Project (MM 16-4). Therefore, impacts would be reduced to levels that are less than significant.

As with the LASD, the CHP would have increased responsibilities with the implementation of the Project. The CHP is funded out of revenues from car registration fees. The increase in registrations from development at the site would partially offset the impact so that the increased demand for CHP services would not be significant.

## Mitigation Measures

**MM 16-4** The Project Applicant/Developer shall pay Law Enforcement Facilities Mitigation Fee (LEFMF) to the Los Angeles County Sheriff's Department (LASD) pursuant to the requirements established in County Ordinance No. 2008-0033. The amount of fees to be paid will be determined based on the established fee in Section 22.74.030 of the County Code. The Project incorporates a temporary "store front" sub-station, followed by construction of a permanent LASD Station included on the Project site, in lieu of a portion of the LEFMF, as allowed under Section 22.74.090 (Consideration in Lieu of Fee) of the County Code. Costs associated with the construction of the temporary "store front" sub-station and permanent LASD Station would be credited against the LEFMF.

Prior to completion of the permanent LASD Station, the "store front" sub-station may be located on site in Village 1 on the north side of the SR-138. This temporary sub-station shall be properly outfitted in accordance with applicable occupancy requirements of the LASD for such "store front" facilities and shall be operational prior to the issuance of the first certificate of occupancy for the first phase of Project development.

The Centennial Land Use Plan identifies a conceptual location for one LASD Station in the Business Park area on the Project site north of the SR-138. The permanent LASD Station shall be constructed immediately following completion of the first phase of development. The LASD shall have final approval over the temporary sub-station and permanent LASD Station site locations.

## Level of Significance after Mitigation

Implementation of MM 16-4 would reduce potentially significant impacts related to LASD protection and law enforcement services from the Project to levels that are less than significant.

## 5.17 OTHER PUBLIC SERVICES

### 5.17.1 INTRODUCTION

#### **Purpose**

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that the physical impacts related to public services be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criteria for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### **Summary**

The analysis in this section focuses on the Project's demand for public services and the facilities necessary to meet this demand that are not addressed in other sections. The physical environmental impacts related to the implementation of necessary library and solid waste services and facilities are addressed as part of the Project analysis provided throughout this Environmental Impact Report (EIR).

#### ***Library Services***

The Project would create less than significant impacts to the existing County of Los Angeles Public Library ("County Library") facilities with the implementation of the recommended mitigation measures (MMs 17-1 through 17-8). As described in the mitigation measures, the Project shall fulfill the obligations required by the County Library Facilities Mitigation Fee ordinance. Specifically, the Project Applicant/Developer will set aside land, and contribute the funds to build and equip a turnkey permanent library in the Town core area in Village 3, north of SR-138, which would meet or exceed County Library service guidelines for the Project's anticipated population. The sizing, design and programming of the Permanent Facility, including the influence of technology on library services, will be agreed upon by representatives from County Library and the Project Applicant/Developer. Also, as discussed in PDF 17-1, the Project would include internet and intranet infrastructure, to provide access to all readily available library resources.

#### ***Solid Waste Services***

Implementation of the Project would generate solid wastes (including hazardous wastes) during construction and operation. Adopted plans and regulations to manage solid waste disposal and recycling efforts generally mandate actions by the State, County, and/or local municipality rather than individual project applicants. For the Project, the County of Los Angeles is the agency responsible for providing solid waste disposal facilities. As such, the significance of the Project's solid waste generation would be determined by the degree to which the Project's solid waste generation and management features affect the County's

disposal facilities and programs designed to meet its goals and comply with waste management regulations.

The Project has committed to diverting 100 percent of soil during grading activities, and at least 70 percent of non-hazardous construction and demolition waste, which exceeds the 65 percent diversion requirement with the Tier I voluntary measure in Section A5.408.3.1 of the California Green Building Standards (CALGreen) Code (PDF 17-2, MM 17-9). This goal also exceeds the 50 percent reduction required by Section 20.87.040 of the County Code and Sections 4.408.5/5.408.1.4 of the CALGreen Code.

To achieve a goal of diverting at least 75 percent of operational solid waste requiring landfill disposal, the Project incorporates a Solid Waste Management Plan (PDF 17-3, MM 17-10), which includes numerous interrelated components such as implementation of a three-bin system for waste collection; a Green Waste Recycling Plan; required use of California Air Resources Board- approved or electric landscape equipment; seasonal (at least two times a year) pickup of household hazardous wastes and less common wastes (such as electronics and appliances); semi-annual exchange days; and an education and outreach program. In addition, the Project will set aside a minimum of 5 acres for a future Materials Recovery Facility/Transfer Station (MRF/TS) that includes a household hazardous waste permanent collection and reuse center and allows for mulching/composting operations. The Project Applicant/Developer will prepare and grade the site, and install basic mainline infrastructure fronting the property prior to the issuance of any occupancy permits associated with the first phase of project implementation. The Developer will continually encourage a waste management company to build these facilities on this build ready site, and the CC&R for the future MRF/TS site will require the land to be set aside for the MRF/TS in perpetuity. Through these features of the Solid Waste Management Plan, the Project would assist the County in meeting its solid waste diversion goals.

However, permitted Class III landfill capacity cannot be guaranteed at the time of Project buildout and through the life of the Project, which are beyond the Los Angeles County Department of Public Works' (LACDPW's) 15-year planning horizon for solid waste disposal. Therefore, while the County is committed to handling all solid wastes generated within the County now and in the future, to be conservative, this EIR concludes that the Project buildout would result in a significant impact on the County's anticipated Class III landfill capacity. PDFs 17-2 and 17-3, and MMs 17-9 and 17-10, reflect all feasible measures to reduce and divert the Project's municipal solid waste generation. Therefore, the Project would result in significant and unavoidable impact related to municipal solid wastes during long-term operation of the Project.

### ***Other Public Facilities***

Implementation of the Project would require County services for the maintenance of on-site public roadways, parks, and other public infrastructure. In order to facilitate the maintenance of County-owned facilities that would be developed as part of the Project, land would be provided to the County for the development of two on-site maintenance yards County of Los Angeles Departments of Public Works and Parks and Recreation. The County may also construct, equip, and operate a permanent new animal control facility adjacent to

the maintenance yards, if such a permanent facility is needed in the Project area. Impacts on other public facilities would be less than significant.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format

## 5.17.2 LIBRARY SERVICES

### Relevant Plans, Policies, and Regulations

#### *Federal*

No federal plans and policies have been identified related to Library Services.

#### *State*

No State plans and policies have been identified related to Library Services.

#### *County*

##### Los Angeles County Code, Chapter 22.72: Library Facilities Mitigation Fee

The County of Los Angeles has established a uniform fee (known as the Library Facilities Mitigation Fee) within each library planning area, which is based on the estimated cost of providing the projected library facility needs (i.e., land, building, equipment, furniture, books and other library materials) in each library planning area. The Mitigation Fee Program was established in 1998 to mitigate impacts from residential development in the unincorporated areas of Los Angeles County that would be served by the County Library. The Project Applicant/Developer or its successor in interest is required to pay the Mitigation Fee at the time a building permit is issued for each new residential unit.

The Mitigation Fee for Planning Area 2 (Antelope Valley), within which the Project site is located, is currently \$858.00 per dwelling unit (*Los Angeles County Code*, Chapter 22.72.030), based upon the County Library's mitigation fee per building permit amount established on October 27, 1998, and last updated on July 1, 2016. The fee does not vary based on dwelling type but is subject to an annual Consumer Price Index (CPI) adjustment on July 1 of each year. Library Facilities Mitigation Fees have increased from the amounts originally established in 1998 consistent with the original approval of the County Board of Supervisors. However, over time the annual increase authorized by the CPI adjustment has not kept pace fully with significant increases in cost of construction, changes in planning guidelines and increases in other project related costs. The Public Library is in the process of reviewing and potentially updating the Library Facilities Mitigation Fees to incorporate these changes and will seek the Board of Supervisors approval for implementation of these fees.

Pursuant to Chapter 22.72.090 of the *Los Angeles County Code*, the County Librarian is authorized to accept substitute consideration in lieu of the payment of the Library Facilities Mitigation Fees.

---

County of Los Angeles General Plan and Antelope Valley Area Plan

The *County of Los Angeles General Plan* and *Antelope Valley Area Plan* address issues related to library services and facilities in the County. Relevant goals and policies in the Antelope Valley Area Plan include:

*Public Safety, Services and Facilities Element*

**Goal PS 11:** Antelope Valley residents enjoy easy access to public library services.

**Policy PS 11.1:** Maintain existing public libraries and make improvements as necessary. Ensure adequate funding on an ongoing basis.

**Policy PS 11.2:** Expand public library collections and services to meet community needs.

**Policy PS 11.3:** Provide new public libraries as additional development occurs or as the population grows.

**Policy PS 11.4:** Encourage new public libraries to locate in rural town center areas, rural town areas, and economic opportunity areas, where they will be accessible by pedestrian walkways, trails, bikeways, and bicycle routes.

**Policy PS 11.5:** Provide bookmobile services in areas that are not served by permanent public libraries.

**Policy PS 11.6:** Encourage the use of technology in library operations to increase efficiency and accessibility.

A consistency analysis of the Project with the goals and policies in the County's relevant plans, policies and regulations is provided in the Land Use, Entitlements, and Planning section (Section 5.8) of this document.

## **Environmental Setting**

### ***County of Los Angeles Public Library***

The County Library operates facilities and services within a 3,032-square-mile area in both unincorporated and incorporated areas of Los Angeles County. The Project site is located in the northwestern corner of unincorporated Los Angeles County within the County Library's Antelope Valley Bookmobile Service Area.

The Antelope Valley Bookmobile, based at the Lancaster Library at 601 West Lancaster Boulevard in Lancaster, currently serves the Project area, including the communities of Lake Hughes, Leona Valley, Lake Elizabeth, Holiday Valley, Antelope Acres and Green Valley, with scheduled stops in Lancaster, Pearblossom, Llano, Three Points, Lake Hughes, and Leona Valley. The Antelope Valley Bookmobile's library collection includes books, videos, audio books, music CDs, and magazines (County Library 2015a).

Use of any County Library is free to all California residents. Thus, while there are other libraries in the County Library system that serve the Antelope Valley area east of the Project site and in the greater Lancaster and Palmdale area (Lancaster, Lake Los Angeles, Quartz Hill,

and Littlerock libraries), these libraries would not realistically serve the Project site due to their approximate 30-mile distance to the site. The Lake Los Angeles and Littlerock libraries are also small libraries.

A replacement Quartz Hill Library of 12,514 square feet was approved by the Board of Supervisors on August 19, 2014 and was open in November 2016. The new Quartz Hill Library is about 35 miles from the Project site. This facility contains a 100-seat meeting room with an audio-visual system, children's area, teen space and study rooms. The Lancaster Library is a regional facility that was constructed at its current location in 1994, and is located approximately 30 miles southeast of the Project site. This facility is 48,721 square feet in size and contains a meeting room for 200 persons, children's area, teen space, study room, computers, and book drop. Its collection includes books, magazines, newspapers, DVDs, large print collection, children's special collection, and online collections (County Library 2015b). Antelope Valley area libraries are listed below in Table 5.17-1.

**TABLE 5.17-1  
AREA LIBRARIES**

<b>Library</b>	<b>Address</b>	<b>Facility Size (sf)</b>
Lancaster	601 W Lancaster Blvd Lancaster, CA 93534	48,721
Lake Los Angeles	16921 E Ave O, Ste A Palmdale, CA 93591	4,250
Littlerock	35119 80 <sup>th</sup> St E Littlerock, CA 93543	3,680
Quartz Hill	5040 W Ave M-2 Quartz Hill, CA 93536	12,514
sf: square feet Source: County Library 2015b, 2015c, 2015d, 2015e		

In addition to physical library facilities, the County Library offers numerous online services for library card holders. These include, but are not limited to an online catalog; a compilation of online databases and resources (e.g., business and career resources, citizenship information, online learning, tax information, health information, newspaper and magazine indexes, and other reference materials); downloadable audiobooks, music, and eBooks; free WiFi; public access computers; streaming movies, audiobooks and music; email a librarian; and live homework help. The County Library's website also offers location and operation information for all facilities; a searchable events calendar; and access to a librarian by email, phone, chat, or text message.

#### Funding and General Level of Service

Primary funding sources for the County Library consist of, in descending proportions: property taxes; County General Fund allocation; a County Library Special Tax; and revenue from fines and fees. The County had operating expenditures of over \$145 million for the fiscal year 2015–2016 and a budget of nearly \$201 million for fiscal year 2016–2017.

In 1992, the State shifted property tax revenues from library operations to help finance education. In response to this lost revenue, the County Board of Supervisors adopted a Community Facilities District (CFD No. 8) in 1994. The revenue generated from the CFD augmented library services for 11 cities and the unincorporated areas of the County. The CFD was discontinued after June 30, 1997, as a result of the passage of Proposition 218. On June 3, 1997, Proposition L was passed by a  $2/3$  majority; this proposition approved a County Library Special Tax for library services. In 2005–2006, the Public Library received an allocation from the Utility Users Tax, through Proposition 62, for enhanced library services to residents of the unincorporated areas of Los Angeles County. The County Library Special Tax is levied within the cities of Cudahy, Culver City, Duarte, El Monte, La Cañada Flintridge, Lakewood, Lomita, Lynwood, Maywood, and West Hollywood, and within the unincorporated County excluding the unincorporated areas within the boundaries of the Altadena Library District and the Palos Verdes Library District. For fiscal year 2016–2017, the tax is \$30.36 per parcel. This special tax may be increased annually on July 1 based either on the Consumer Price Index (CPI) or a maximum of two percent, whichever is lower.

The Board of Supervisors has, for several years, made an allocation to library services from the County General Fund. However, there is no guarantee of ongoing funding from the County General Fund as a specific budget allocation. Funding decisions for the County Library are made on an annual basis by the Board of Supervisors based on total available funding for all County services.

The County Library's current service level planning guidelines are as follows: 2.75 items (including books, magazines, movies, etc.) per capita for the collection and 1.0 computer per 1,000 people served. The current planning guideline for library facility space is a minimum of 0.5 square foot per capita and 2.0 square feet of land per capita (County Public Library 2015g).

## Project Design Features

**PDF 17-1** The Green Development Program as included in the *Centennial Specific Plan* (Appendix 4.0-A of this EIR) requires that the Project provide internet infrastructure and a community intranet with access for homeowners associations; interest groups; local event scheduling; schools, library, carpool and transit services; and other on-site entertainment and amenities for residential land uses. The internet and intranet will guarantee that all future residents will have access to all readily available library resources and reduce the need for people to use automobile travel to obtain the information that is provided by both. Internet access will be provided to residents through the payment of their homeowner fees.

## Threshold Criteria

The following significance threshold criterion is derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if the Project's demand for library services would:

**Threshold 17-1** Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: libraries.

## Environmental Impacts

**Threshold 17-1** **Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: libraries?**

### *On-Site Impacts*

The Project residents would generate a demand for library services from the County Library. Payment of the County's Library Mitigation Fee would provide the County Library with funds to provide library services to the Project. These fees would be used to construct, equip, and operate an on-site library (MMs 17-1 through 17-5). Based on the County Library service level planning guideline of 0.5 square foot per capita and an anticipated Centennial population of approximately 57,150 people, the Project could generate a demand for up to a 28,575 gross square foot library. Based on the 2.0 square feet of land per capita standard, an 114,300-square-foot site (2.62 acres) would be needed to serve the Project.

To meet this projected library demand, the Project includes a conceptual location for a public library in the Town Core in Village 3, just north of SR-138 (refer to Exhibit 4-1, Centennial Project – Conceptual Land Use Plan), which would be part of the County of Los Angeles Public Library. While the location is conceptual and may change as determined in coordination with the County Library, the proposed inclusion of a library on the Project site is definitive. The Project proposes a public library that would be on an approximate 2.5-acre site at the Town Core. The Library would be completed and operational on a date mutually agreed to between the County Librarian and the Applicant, taking into account the demands on library services within and adjacent to the Project Site, as per MMs 17-1 through 17-8.

The size of the proposed permanent County library would meet the projected demand based on the County Library's planning guidelines. The net buildable library site conceptualized in the Centennial Conceptual Land Use Plan is of adequate size and in a central location that would meet the County's library siting requirements, including related parking areas.

Library and information services planned for the Project site would be supplemented by the community internet and intranet, which would provide online access and easy access to use of library resources for all residents (PDF 17-1). It is anticipated that residents would be able to order books and conduct other library-related transactions from the Los Angeles County Libraries website via the Centennial intranet, which would be part of Project-wide telecommunications system; this is discussed further in Section 5.20, Dry Utilities. In addition to the community intranet, as discussed above, the County Library provides several online services to library card holders via the internet (for those who have online access); these services supplement the services available at the physical library locations. Online services provide information and access to the public library services without affecting the physical facilities and staff to the degree that would occur if a person is utilizing these same services in person at the local library. The Project also anticipates utilizing a bookmobile for local residents until a permanent facility is built. Impacts would be less than significant with implementation of MMs 17-1 through 17-8.

### ***Off-Site Impacts***

The off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, would not, by themselves, generate population growth that would result in additional demand for library services. There would be no impact and no mitigation is required.

***Impact Summary:*** The Project would have less than significant impacts to the existing County Library facilities with implementation of MMs 17-1 through 17-8. The Project would provide library facilities and equipment on site, which meet or exceed County Library service guidelines for the Project's anticipated population. The Project includes a conceptual location for a public library at the Town Core in Village 3. The Applicant would also set aside land (or building space); construct the permanent library; and provide the furniture, fixtures, equipment, and materials according to the Development Agreement between the County and the Developer. The value of the Developer's funding of the permanent library's construction and materials (including any furnishings, fixtures, equipment and materials for the library) would be provided at a level that would meet the required library service standards of the anticipated population.

### **Mitigation Measures**

With implementation of the following mitigated measures, there would be less than significant impacts to library services.

**MM 17-1** The *Los Angeles County Code* (Chapter 22.72 of Title 22) ("Library Ordinance") imposes a Library Facilities Mitigation Fee on new residential development projects in the unincorporated areas of the County of Los Angeles served by the County Library (the "Library Facilities Mitigation Fee"). The Library Facilities Mitigation Fee that is in effect for the designated County Library planning area is charged upon issuance of each residential building permit and

is based on the estimated reasonable cost of providing the projected library facility needs in the applicable library planning area. The Project is located within Planning Area 2: Antelope Valley and, as of the date of this EIR, the Library Facilities Mitigation Fee is \$858.00 per residential building permit (based upon the County Library's mitigation fee per building permit amount established on October 27, 1998, and last updated on July 1, 2016). The Project provides for the development of a maximum of 19,333 residential dwelling units. Based on the current fee, the total Library Facilities Mitigation Fee that would be due from the Project Applicant/Developer (or its successors in interest) is \$16,587,714. Consistent with the Library Ordinance, the amount of the Library Facilities Mitigation Fee that shall apply to the Project shall be the fee payable on the date the County issues each building permit for a residential dwelling unit. The amount of the Library Facilities Mitigation Fee may be increased from time to time pursuant to Section 22.72.040 of the County Code and State law; provided, however, the Library Facilities Mitigation Fee applicable to residential dwellings within the Project shall be no more than the amount of the Library Facilities Mitigation Fee applicable to residential dwellings outside of the Project but within Planning Area 2. The aggregate Library Facilities Mitigation Fees payable for all of the residential dwelling units within the Project for which building permits have been issued shall be referred to herein as the "Project-Wide Fee Total." The ordinance allows that, in lieu of the payment of Library Facilities Mitigation Fees, Centennial shall fulfill the obligations required by the mitigation measures in this EIR to satisfy the requirements of the Library Ordinance.

- MM 17-2** Section 22.72.090 of the Library Ordinance permits the County Librarian to accept substitute consideration in lieu of the Library Facilities Mitigation Fee if the proposed substitute consideration (such as land, facility construction, and/or materials) (i) has a value that is equal to or greater than the applicable Library Facilities Mitigation Fee that is otherwise due; (ii) is in the form acceptable to the County Librarian; and (iii) is within the scope of the applicable library facilities project. Because the Library Facilities Mitigation Fee only allows for an incremental accumulation of funds for future library facilities as building permits are issued and fees are collected pursuant to Section 22.72.060 of the County of Los Angeles Code, the County Library will implement a strategy that will better serve the residents of Centennial by ensuring that the timing and scope of public library facilities will meet the demands of the community. Centennial desires to cooperate with the County Library in meeting its goals and also seeks certainty with respect to the amount and timing of the Project's financial commitment to the County Library. Therefore, the parties' objectives will be satisfied if, in lieu of the Project Applicant/Developer's payment of Library Facilities Mitigation Fees at the time residential building permits are pulled in accordance with Section 22.72.060 of the County Code, the Project Applicant/Developer will instead set aside the land and contribute the funds required to build and equip a turnkey Permanent Facility, all in accordance with the terms and conditions of the Development Agreement. As discussed in MM 17-1, the Project

Applicant/Developer's provision of such land and funding will, in accordance with the required mitigation measures, be credited against Library Facilities Mitigation Fees that would otherwise be due.

**MM17-3** The Project Applicant/Developer shall dedicate to the County Library up to 2.62 acres within Village 3 of the Project (the "Dedicated Land") for public library purposes or other location for the permanent facility mutually agreed upon by the County Librarian and the Project Applicant/Developer. The Project Applicant/Developer shall receive a credit against unpaid Library Facilities Mitigation Fees in an amount equal to the fair market value of all Dedicated Land as of the date of the dedication to the County of Los Angeles for County Library purposes. The Dedicated Land shall be conveyed to the County concurrently with the filing and recordation of the final map within which the Dedicated Land is located. If the County Library desires to increase the size of the Dedicated Land, it shall make such request of the Project Applicant/Developer no later than the date that the County approves the tentative map for the proposed subdivision in which the Dedicated Land is located. the Project Applicant/Developer agrees to increase the size of the Dedicated Land upon the County's request provided (i) the County cooperates with the Project Applicant/Developer in any related land use boundary changes, transfers or conversions necessary to accommodate the larger library site, subject to the requirements of CEQA and (ii) the County either pays the fair market value for such land with either (A) U.S. funds or (B) a dollar-for-dollar credit against unpaid Library Facilities Mitigation Fees, so long as the Project-Wide Fee Total has not already been offset pursuant to MM 17-4 through MM 17-7. "Fair market value" for the land described in this paragraph shall be determined based on the value of such land had it been entitled for institutional office purposes and the property had a maximum floor area ratio (FAR) of 0.25. If the County Library at any time changes the use of the Dedicated Land from that of a County-owned public library facility, then the Dedicated Land will revert back to Centennial.

**MM 17-4** The Project Applicant/Developer shall cause to be designed and constructed on the Dedicated Land a one or two-story, turn-key public library building (the "Permanent Facility"). The Permanent Facility may be constructed in phases. The size and scope of the Permanent Facility will be determined by the County Librarian in consultation with the Project Applicant/Developer provided, however, that the Project Applicant/Developer's maximum financial contribution shall not exceed the Project-Wide Fee Total, less any offsets pursuant to Mitigation Measures 17-4, 17-6, and 17-7 in this EIR. The sizing, design and programming of the Permanent Facility, including the influence of technology on library services, will be agreed upon by representatives from County Library and the Project Applicant/Developer A report shall be prepared by an independent library consultant selected by the County Library that will solicit input from the community with respect to the types of library services desired at the Permanent Library Facility. The consultant's report shall be paid for by the Project Applicant/Developer and the Project

Applicant/Developer shall receive a credit against the Project-Wide Fee Total for the Project Applicant/Developer's payment of such costs. The Permanent Facility and Permanent Library furniture, fixture, and equipment (FF&E, as defined below) will be substantially similar in quality and materials to the Quartz Hill branch of the County Library on November 2016. The design of the Permanent Library will be performed by an architect mutually selected by the Project Applicant/Developer and the County Librarian. The Permanent Facility must comply with all requirements of the County Library's Low Voltage Specifications in effect on the date the design contract for the Permanent Facility is fully executed. The County Library shall be responsible for all costs of design and construction of the Permanent Library in excess of the Project Applicant/Developer's Library Facilities Mitigation Fee obligations hereunder. If, after application of the fee credits against Library Facilities Mitigation Fees to which the Project Applicant/Developer is entitled, there is insufficient funds to construct the Permanent Facility and purchase the Permanent Library FF&E, the Project Applicant/Developer shall not be required to fund construction of the Permanent Facility until additional and sufficient funds are authorized by the County to construct the Permanent Facility and to procure the Permanent Library FF&E. The Permanent Facility will be completed and operational on a date agreed to between the County Librarian and the Project Applicant, subject to force majeure and events within the control of the County (such as, for example, the County's failure to pay any funding shortfalls if credits against the Project-Wide Fee Total are exhausted). The size of the Permanent Facility will be proportionately reduced in size and materials if the County approves less than the 19,333 residential units proposed for the Centennial Project.

**MM 17-5** The Project Applicant/Developer agrees to install furniture, fixtures and equipment ("Permanent Library FF&E") and purchase library materials in connection with the Permanent Facility, provided that the Project Applicant/Developer's financial contribution toward the cost of the Permanent Library FF&E and library materials shall not exceed the Project-Wide Fee Total when taken together with all other Project Applicant/Developer expenses then credited against the Project-Wide Fee Total. The County Library shall be responsible for all costs of Permanent Library FF&E and library materials in excess of the Project-Wide Fee Total. The Permanent Library FF&E specifications will be provided by the County Library. Any FF&E purchased shall remain the property of the County Library.

**MM 17-6** The Project Applicant/Developer shall provide on-site parking for library patrons at a ratio of 4 parking spaces per 1,000 gross square feet of library space. The parking lot shall also include two spaces adjacent to the staff entrance of the library for County library service vehicles. Parking may be shared with adjacent uses with the consent of the County Library.

**MM 17-7** If the Project Applicant/Developer has satisfied its obligations in Mitigation Measures 17-1 through 17-7, above, and the Project Applicant/Developer

continues to pull building permits within the Project, then the Project Applicant/Developer (or its successors in interest) shall pay any Library Facilities Mitigation Fees still owing as construction permits are issued, which shall be expended by the County Library for the benefit of the Permanent Facility on library materials, FF&E, facility enhancements or library programs as determined by the County Librarian.

- MM 17-8** No later than December 1 and July 1 of each calendar year, the Project Applicant/Developer shall deliver to the County Library a report in writing providing the number of residential building permits actually issued to date. Within 30 days from the date the report is received, the County Library will deliver, or cause to deliver, to the Project Applicant/Developer a report on the revised Project-Wide Fee Total.

### **Level of Significance after Mitigation**

There will be less than significant impacts identified for library services, with implementation of MM 17-1 through MM 17-8.

## **5.17.3 SOLID WASTE SERVICES**

### **Relevant Plans, Policies, and Regulations**

#### ***Federal***

No federal plans and policies have been identified related to Solid Waste.

#### ***State***

#### **California Integrated Waste Management Act/Assembly Bill 939**

In 1989, the California legislature passed a bill (Assembly Bill [AB] 939), which requires jurisdictions to reduce the amount of solid waste disposed of in landfills by 50 percent by the year 2000 and thereafter. The purpose of AB 939 is to “reduce, recycle, and reuse solid wastes generated in the State to the maximum extent feasible” (California 20013). As such, AB 939 (also known as the California Integrated Waste Management Act) mandates the preparation of a Source Reduction and Recycling Element (SRRE) as part of the City or County’s Solid Waste Management Plan. The SRRE should outline how such a diversion goal will be accomplished. AB 939 also requires jurisdictions to prepare a Household Hazardous Waste Element (HHWE), which needs to detail how the County would manage the use and disposal of household hazardous materials. Noncompliance with the goals and timelines set forth in the Act can be severe, as the bill imposes fines up to \$10,000 per day for jurisdictions (Cities and Counties) that are not meeting these recycling and planning goals.

The term “integrated waste management” refers to the use of a variety of waste management practices to safely and effectively handle the municipal solid waste stream with the lowest adverse impact on human health and the environment. AB 939 has established a waste management hierarchy as follows:

1. Source Reduction
2. Recycling
3. Composting
4. Transformation
5. Disposal

CalRecycle estimates that the statewide diversion rate for the year 2014 was 65 percent, with a per resident disposal rate of 4.5 pounds per resident per day. The per employee disposal rate was 10.6 pounds per employee per day, which is equivalent to a diversion rate of 66 percent (CalRecycle 2015a).

#### California Health and Safety Code, Section 25218

The Section 25218 of the *California Health and Safety Code* governs Cities' and Counties' disposal of household hazardous wastes. It identifies the State as the responsible governing entity "to provide for an expedited and streamlined permitting and regulatory structure for household hazardous wastes and conditionally exempt small quantity generator waste collection and handling". CalRecycle has instituted a Household Hazardous Waste Program to develop alternatives to the illegal disposal of household hazardous wastes, including universal wastes such as batteries, fluorescent lamps, and electronics. The goals of this program includes (1) providing the public with convenient collection locations; (2) encouraging efforts to use recyclable materials in products and design products to facilitate their recyclability; and (3) encouraging producers to assume responsibility for "cradle-to-cradle" stewardship of their products and materials.

CalRecycle also has a Used Oil Recycling Program that provides public information on the benefits of used oil recycling, oil filter recycling, and the use of re-refined oil; existing regulations on the recycling and disposal of used oil; and listings of certified collection centers. This program is intended to motivate the public to recycle their used oil and oil filters.

#### California Solid Waste Reuse and Recycling Access Act of 1991

Subsequent to AB 939, additional legislation was passed to assist local jurisdictions in accomplishing the required waste reduction goals. The California Solid Waste Reuse and Recycling Access Act of 1991 directs CalRecycle to draft a "model ordinance" relating to adequate areas for collecting and loading recyclable materials in development projects.

#### Solid Waste Disposal Measurement Act of 2008 (Senate Bill 1016)

The purpose of the Solid Waste Disposal Measurement Act of 2008 (Senate Bill [SB] 1016) is to make the process of goal measurement (as established by AB 939) simpler, more timely, and more accurate. SB 1016 builds on AB 939 compliance requirements by implementing a simplified measure of jurisdictions' performance. SB 1016 accomplishes this by changing to a disposal-based indicator—the per capita disposal rate—which uses only two factors: (1) a jurisdiction's population (or in some cases employment) and (2) its disposal as reported by disposal facilities (CalRecycle 2012).

Each year CalRecycle will calculate each jurisdiction's per capita (per resident or per employee) disposal rates; the per capita disposal rate will be used for most jurisdictions. If business is the dominant source of a jurisdiction's waste generation, CIWMB may use the per employee disposal rate. Each year's disposal rate will be compared that jurisdiction's 50 percent per capita disposal target. As such, jurisdictions will not be compared to other jurisdictions or the statewide average, but they will only be compared to their own 50 percent per capita disposal target. Among other benefits, per capita disposal is an indicator that allows for jurisdiction growth because as residents or employees increase, report-year disposal tons can increase and still be consistent with the 50 percent per capita disposal target. A comparison of the reported annual per capita disposal rate to the 50 percent per capita disposal target will be useful for indicating progress, or other changes, over time. The unincorporated County's per resident disposal rate target is 7.4 pounds per day (PPD) and the per employee disposal rate target is 41.5 PPD (CalRecycle 2016).

### 75 Percent Initiative

In 2011, Governor Brown signed AB 341, which sets a goal of 75 percent recycling, composting, or source reduction of solid wastes by 2020. It also mandates commercial recycling by 2012. The 75 percent goal will shift the focus from local diversion to a Statewide approach that would decrease reliance on landfills. CalRecycle has been holding workshops with stakeholders since May 2012 to identify existing programs and new ways to reduce the waste streams. Six focus areas have been identified:

- Moving Organics Out of the Landfill
- Continuing Reform of the Beverage Container Recycling Program
- Expanding the Recycling/Manufacturing Infrastructure: Permitting/Compliance Assistance and Financing
- Exploring New Models for State and Local Funding of Materials Management Programs
- Promoting State Procurement of Postconsumer Recycled Content Products
- Promoting Extended Producer Responsibility

A number of programs will be implemented under this initiative, including continued local jurisdiction diversion; commercial recycling; mattress recovery; greenhouse gas reduction grant and loan program; commercial organics recycling; potential packaging reduction activities; and other new programs that are under development.

### Mandatory Commercial Organics Recycling Bill (AB 1826)

In 2014, Governor Brown signed AB 1826, requiring businesses to recycle their organic waste on and after April 1, 2016, depending on the amount of waste they generate per week. This law also requires that on and after January 1, 2016, local jurisdictions across the State to implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units. Organic waste means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste. The minimum

threshold of organic waste generation by businesses decreases over time, which means an increasingly greater proportion of the commercial sector will be required to comply.

### **County**

#### Los Angeles County Roadmap for a Sustainable Waste Management Future

On April 22, 2014, the Board of Supervisors adopted a motion directing the development of a Roadmap to achieve a Sustainable Waste Management Future for the County unincorporated communities. Accordingly, the Sustainable Waste Management Future Working Group was formed to collectively develop the Roadmap. The intent of the Roadmap is to guide the County in implementing the four strategies identified by the Working Group, which are as follows: (1) Programs and Services, (2) Measuring Results, (3) Facilities and Infrastructure, and (4) Outreach and Education. By implementing these strategies the Roadmap sets to achieve 80 percent diversion from landfills by 2025; 90 percent diversion from landfills by 2035; and 95 percent (or higher) diversion from landfills by 2045. To accomplish these goals, the Working Group identified specific recommended initiatives, which will be expanded in detailed implementation plans. Although the Roadmap does not contain currently enforceable regulations, development under the *Centennial Specific Plan* will comply with any implementation plans once adopted.

#### Countywide Integrated Waste Management Plan (CIWMP)

In accordance with AB 939, the County adopted its Countywide Integrated Waste Management Plan (CIWMP) in 1996, which was approved in 1999 by CalRecycle. The CIWMP combines the Source Reduction and Recycling, Non-Disposal Facility, Household Hazardous Waste, and Countywide Siting Elements of the County and various cities in the County. The CIWMP must be reviewed every 5 years; the 2014 review indicated that measurable diversion has occurred in the County (from 6.6 pounds per person per day in 1999 to 4.8 pounds per person per day in 2013)(LACDPW 2014). Although the County does not have 15 years of remaining disposal capacity within its boundaries, it has strategies for obtaining 15 years of disposal capacity through diversion and export programs. Changes to the Siting Element are necessary to remove proposed landfill sites, expand existing landfills, promote alternative technologies and the waste-by-rail project, and update goals and policies to reflect current and upcoming solid waste management processes and technologies.

The County of Los Angeles Department of Public Works also publishes an annual report on the CIWMP's implementation status. The latest (2015) Annual Report states that the County would meet its disposal capacity requirements through the 15-year planning period with through County landfill expansions, use of out-of-County disposal facilities, infrastructure improvements to facilitate the export of wastes to out-of-County landfills, conversion and other alternative technologies, enhanced diversion programs, and increased diversion rates (LACDPW 2016b).

#### *County of Los Angeles Source Reduction and Recycling Element (SRRE)*

The County of Los Angeles Source Reduction and Recycling Element (SRRE) was prepared in response to AB 939. It describes policies and programs that the County must implement for its unincorporated areas to achieve the State's mandates of 25 and 50 percent waste disposal

reductions by the years 1995 and 2000, respectively (LACDPW 1993a). The SRRE provided estimates of solid waste generation and composition, as well as diversion quantities to meet State mandates. It includes source reduction, recycling, composting, special waste, and education and public information programs that would be implemented by the County, along with estimates of potential diversion in the short-term (by 1995) and medium-term (by 2000).

#### *County of Los Angeles Household Hazardous Waste Element (HHWE)*

In compliance with AB 939, the County adopted a Household Hazardous Waste Element (HHWE) for the unincorporated portions of Los Angeles County that outlines programs for the safe management of household hazardous waste generated by the residents within its jurisdiction (LACDPW 1993b). The HHWE seeks to reduce household hazardous waste generation and provide resident with a means to properly dispose of these wastes. County programs include household hazardous waste collection centers and events, public education/information fliers, and load-checking programs at landfills and transfer stations.

#### *County of Los Angeles Countywide Siting Element*

In June 1997, Los Angeles County prepared the Los Angeles County Countywide Siting Element to project waste generation and waste disposal capacity in the County (LACDPW 1997). The Siting Element addressed existing solid waste disposal facilities, disposal rates and disposal capacity needs, alternative disposal technologies, facility siting criteria, proposed facility locations, and out of county disposal facilities. The Siting Element established goals and policies for the siting of solid waste transformation and land disposal facilities to serve the solid waste generation and disposal needs of the County for the next 15 years. The County is in the process of updating the Countywide Siting Element, and anticipates releasing the draft document for review in mid-2016 (LACDPW 2015b).

#### *County of Los Angeles Non-Disposal Facility Element (NDFE)*

AB 939 requires every City and County in the state to prepare and adopt a Non-disposal Facility Element (NDFE) that identifies all existing, expansions of existing, and proposed new non-disposal facilities that will be needed to implement the local jurisdiction's SRRE (LACDPW 1994). The County's NDFE for the unincorporated portions of Los Angeles County identifies 20 existing materials recovery facilities/transfer stations, and 9 proposed material recovery facilities as non-disposal facilities that the County intends to utilize in order to implement its SRRE and meet the diversion requirements of AB 939. In addition, the County's NDFE also identifies the utilization of four landfill facilities (operated by the Sanitation Districts of Los Angeles County [LACSD]) for diversion of yard/green wastes that are used as alternative daily cover at the landfills.

#### County of Los Angeles Solid Waste Ordinance

Division 4, Solid Waste, of Title 20 of the County Code is the County's Solid Waste Ordinance. This ordinance contains the County standards for solid waste handling and disposal and creates a fee structure for solid-waste facilities, waste collectors, waste recovery operations and waste collection trucks. It requires permits for solid waste facilities, self-haulers and waste collectors so as to allow the County to set operating conditions that would prevent

environmental damage and promote the long-term protection of the environment. Property owners and occupants in the High Desert area are required to utilize private solid waste collection services and construction and demolition (C&D) debris are required to be recycled and/or reused.

#### Construction and Demolition Debris Recycling and Reuse Ordinance

On January 4, 2005, the County of Los Angeles adopted the Construction and Demolition Debris Recycling and Reuse Ordinance (Chapter 20.87 of the County Code), pursuant to the California Integrated Waste Management Act of 1989 (AB 939). This ordinance requires most development projects in unincorporated areas to recycle or reuse at least 50 percent (by weight) of all construction and demolition debris, soil, rock, and gravel removed from a project site. A Recycling and Reuse Plan (RRP) is required and must be submitted to the Department of Public Works, Environmental Programs Division after an application for a permit has been filed for a project. The RRP must contain a project description; the estimated total weight of C&D wastes; the total weight that would be recycled or reused; vendors for the recycled or reused C&D wastes; and the percentage to be recycled and reused. Upon County approval of the RRP, annual progress reports and a final compliance report showing documentation and receipts that the RRP was implemented must be submitted to the County.

#### County Green Building Standards Code

The County adopted by reference the 2016 California Green Building Standards Code (CALGreen Code) in 2010 and adopted the current (2016) CALGreen Code as Title 31, Green Building Standards Code, of the County Municipal Code. As part of this adoption, the County revised the construction waste management standard (Section 5408.1) to require that newly constructed projects and additions and alterations to existing buildings shall recycle and/or salvage for reuse a minimum of 65 percent of the non-hazardous construction and demolition debris or meet a local construction and demolition waste management ordinance, whichever is more stringent. The amount of materials diverted shall be calculated by weight or volume, but not by both.

#### County Roadmap to a Sustainable Waste Management Future

The County adopted the Roadmap to a Sustainable Waste Management Future (Roadmap) in 2014. The Roadmap lays out the general framework for the strategies and initiatives that the County can implement in County Unincorporated Communities, Regional/Countywide, and at County Operations to decrease reliance on landfills by maximizing the recovery of products, materials, and energy from waste that would otherwise be disposed at landfills, and provides direction to the Department of Public Works and other County departments to initiate the implementation of the Roadmap.

The intent of the Roadmap is to guide the County in implementing the four strategies and supporting initiatives to maximize the recovery of products, materials, and energy from waste that would otherwise be disposed of at landfills. In doing so, the County hopes to achieve the following intermediate and long-term disposal targets:

- 80 percent diversion from landfills by 2025

- 90 percent diversion from landfills by 2035
- 95 percent or more diversion from landfills by 2045

### County of Los Angeles General Plan and Antelope Valley Area Plan

The *County of Los Angeles General Plan* and *Antelope Valley Area Plan* (AVAP) address solid waste issues that affect the County. Relevant goals and policies in the AVAP include those listed below.

#### *Conservation and Open Space Element*

**Policy COS 9.4:** Promote recycling and composting throughout the Antelope Valley to reduce air quality impacts from waste disposal activities and landfill operations.

**Goal COS 10:** Diverse energy systems that utilize existing renewable or waste resources to meet future energy demands.

**Policy COS 10.6:** Encourage the development of Conversion Technologies such as anaerobic digestion and gasification for converting post recycled residual waste into renewable fuels and energy.

A consistency analysis of the Project with specific goals and policies in the County's relevant plans, policies, and regulations is provided in the Land Use, Entitlements, and Planning Section (Section 5.8) in this document.

## **Environmental Setting**

### ***Disposal Volumes***

#### Statewide

California's 2015 per resident disposal rate was 4.7 PPD and the employee disposal rate was 11.1 PPD. Total solid waste disposal in 2015, after diversion through a combination of source reduction, recycling, and reuse, was 33.2 million tons with a population of 38.9 million residents. This results in a diversion rate equivalent of 63 percent (CalRecycle 2017a).

#### Los Angeles County

The unincorporated area of Los Angeles County had a 2015 resident disposal rate of 3.8 PPD and an employee disposal rate of 19.7 PPD, which exceeds the resident and employees disposal targets of 7.4 PPD and 41.5 PPD, respectively (CalRecycle 2017b).

The volume of solid waste disposal by Los Angeles County has decreased through the years, despite increasing population and economic growth. The majority of these wastes are disposed in landfills in the County, supplemented with the use of out-of-County landfills. The distribution of solid waste disposal, after waste diversion, among various types of disposal facilities is shown below in Table 5.17-2, 2015 Los Angeles County Solid Waste Disposal.

**TABLE 5.17-2  
2015 LOS ANGELES COUNTY SOLID WASTE DISPOSAL**

<b>Disposal Facilities</b>	<b>Quantity Disposed (million tons)</b>
In-County Class III landfills	4.77
Transformation facilities	0.56
Exports to Out-of-County Class III landfills	4.13
<b>Solid Waste Disposed</b>	<b>9.46</b>
Permitted Inert Waste Landfills	0.26
<b>Total Disposed</b>	<b>9.72</b>
Source: LACDPW 2016b.	

### Project Site

The Project site currently supports ranching operations with limited agricultural activities. These operations contribute a nominal amount of solid wastes to the County's total waste stream.

### ***Solid Waste Collection***

For many years, <sup>2</sup>/<sub>3</sub> of the unincorporated areas' (primarily the San Gabriel and Antelope Valleys) residential and commercial solid waste collection services were provided through an open-market system whereby each resident/business directly arranged for trash collection services, with no County involvement. Due to changes in federal and State laws regarding waste reduction, changing public attitudes toward protecting the environment and increasing consumer demands for better service, the open-market system was unable to fully adapt to these conditions. In response, beginning in 2007, the County gradually implemented a residential trash collection franchise system to replace the open-market system. Under the franchise system, the County signs an agreement with waste haulers to authorize them to provide exclusive services for individual communities; under this system, the County establishes minimum service standards and institutes rate-control measures.

As a result, the franchise system has helped to improve customer service, increase accountability, develop cleaner neighborhoods, and increase diversion rates. As of early 2011, 14 residential franchises have been established throughout the San Gabriel and Santa Clarita Valleys. However, there is no exclusive residential franchise for the unincorporated areas in the Antelope Valley. Rather, it remains an open market system, as previous plans for an exclusive franchisee have been put on hold. Commercial waste collection services in this area are provided by 43 companies under a non-exclusive franchise system, where each company is required to provide services and rates in accordance with County standards. Waste Management (at 1200 West City Ranch Road in Palmdale) is the largest provider of commercial and residential waste hauling services in the Antelope Valley (LACIWMTF 2015).

### ***Solid Waste Disposal***

Approximately 65 percent of the solid waste generated in Los Angeles County in 2015 was diverted through recycling, source reduction, and other means, and approximately 35 percent (9.72 million tons) was disposed of in local landfills (LACDPW 2016b).

Currently, the County manages its solid waste stream with the following in-County facilities: 10 municipal solid waste landfills (6 major and 4 minor); 12 inert waste (i.e., asphalt, concrete, dirt and rock) landfills (11 of which operate as Inert Debris Engineered Fill Operations and do not require a Solid Waste Facility Permit); 2 waste-to-energy (transformation) facilities; 17 Composting/Chipping and Grinding Facilities permitted to receive 100 tons or more of waste per day; 2 Anaerobic Digestion Facilities; 55 permitted Large Volume Transfer/Processing and Direct Transfer facilities (including construction and demolition debris recyclers and Clean Material Recovery Facilities) (LACDPW 2016b).

As part of the LACDPW's annual solid waste reporting, a total of seven scenarios combining the various options for solid waste management were compared for the Annual Report's required 15-year planning horizon (2015 through 2030). All scenarios assume that no new in-County landfills will be permitted within the planning horizon, and two scenarios assume that landfill expansions would occur. Six of the seven scenarios would result in the maintenance of adequate solid waste disposal capacity through 2030, and require, at a minimum, use of existing permitted in-County disposal capacity, attainment of a 75 percent diversion rate by 2020, expansion of out-of-County disposal capacity. Additional scenarios that would also meet disposal needs include some combination of: proposed expansions of in-County landfills, additional alternative technology, and increased out-of-County exports (LACDPW 2016b). Therefore, the County is focusing on a strategy of using a diversified mix of solid waste disposal options, including in-county landfill expansions, continued out-of-county exports, waste-by-rail facilities, as well as continued development of transformation facilities and alternative solid waste disposal technologies to meet the solid waste disposal needs of the County for the next 15 years (LACDPW 2016b).

### ***Solid Waste Disposal Locations and Capacity***

As discussed above, most solid waste collected within Los Angeles County by private haulers is disposed of within the County. However, independent solid waste haulers are also able to take solid waste over the County line.

There are ten Class III (non-hazardous/municipal solid waste only) landfills operating within Los Angeles County. Of these, seven facilities could accept solid waste generated by the Project (four major landfills and three minor landfills). The remaining three landfills have statutory limits on the wastesheds from which they will accept solid wastes. Table 5.17-3, Major Landfills in Los Angeles County Serving the Project Area, summarizes the operations of the four major landfills that could accept waste from the Project site as of December 2014.

In addition to the major landfills above, San Clemente Landfill, Whittier (Savage Canyon) Landfill, and Pebbly Beach Disposal Site are small-volume facilities, defined as minor landfills by the County, which could technically accept wastes generated in the Project area. However,

because of distance and/or small daily capacity, these minor landfill facilities are not considered likely disposal locations for wastes generated on the Project site.

Solid waste generated in the Antelope Valley area primarily goes to the Antelope Valley Landfill in Palmdale and the Lancaster Landfill in Lancaster, as the nearest facilities. As with the solid waste haulers, these landfills operate in a free-enterprise system. Their operating expenses and profits are obtained by collecting disposal fees from the haulers on a per ton basis. The capacities of the landfills are regulated for the most part through the amount of solid wastes that each particular facility is permitted to collect per day and in their total capacity.

**TABLE 5.17-3  
MAJOR LANDFILLS IN LOS ANGELES COUNTY  
SERVING THE PROJECT AREA**

Facility Name and Location	Approximate Distance to Project Site (miles)	Permitted Daily Capacity (tons)	Remaining Permitted Capacity (mcy)	Estimated Closure Date

### ***Hazardous Materials Collection and Disposal***

Certain uses and activities generate hazardous waste that must be disposed of at locations other than Class III or unclassified landfills. These hazardous materials need to be disposed of or transported to a licensed disposal or treatment facility. However, the disposal and transport of hazardous materials is more complicated than that of typical Class III solid waste because there are many forms of hazardous materials. Generators that use hazardous materials and/or generate hazardous wastes are responsible for the disposal of their wastes. There are many licensed private contractors that transport and dispose of hazardous wastes.

As discussed above, there are ten landfills within the County of Los Angeles, and all are Class III facilities. There are no Class I or Class II landfills, which are hazardous waste landfills, in

the County. (Class I landfills have stricter controls than Class II landfills and can accept wastes not permitted in Class II facilities.) However, there are two Class I and Class II landfills in Central and Southern California that can accept hazardous wastes generated within Los Angeles County:

- **Kettleman Hills Landfill, Kettleman City, Kings County, California.** This is a Class I permitted landfill that accepts both hazardous and non-hazardous waste with a daily permitted capacity of 8,000 tons per day and a remaining capacity of 6 million cubic yards (CalRecycle 2017c). It is located at 35251 Old Skyline Road, approximately 105 miles northwest of the Project site.
- **McKittrick Waste Treatment Site, McKittrick, Kern County, California.** This facility is a Class II permitted landfill that accepts both hazardous and non-hazardous waste with a daily permitted capacity of 3,500 tons per day and a remaining capacity of approximately 769,790 cubic yards (CalRecycle 2017d). It is located at 56533 Highway 58 in McKittrick, approximately 60 miles northwest of the Project site.

The LACSD and the LACDPW co-sponsor household hazardous waste and electronic waste collection events to provide Los Angeles County residents with “a legal and cost-free way to dispose of unwanted household chemicals and electronic wastes that cannot be disposed of in the regular trash”. In addition to collection events, there are several permanent collection centers including the Antelope Valley Environmental Collection Center (AVECC) located at the Antelope Valley Public Landfill in the City of Palmdale. Permitted household hazardous waste items include lawn and garden-care products, paint-related products, automotive fluids and batteries, household cleaners, swimming pool chemicals, fluorescent lights, mercury thermometers, batteries, and electronic equipment (LACDPW 2016a).

### ***County Smart Gardening Program Learning Center***

For compostable organic materials such as green waste and food waste, the development of compost facilities, anaerobic digesters, biomass conversion facilities, and/or engineered municipal solid waste conversion facilities is needed to manage the thousands of tons generated Countywide each day. Although State legislation (AB 1826) has addressed organics diversion from commercial properties, there are currently no laws addressing organics diversion from residential properties.

The County Smart Gardening Program operates 10 Learning Centers countywide. The Santa Clarita Learning Center location within the property of Castaic Lake Water Agency is the closest Program Learning Center, over 30 miles away from the Project area.

**TABLE 5.17-4  
AREA LEARNING CENTERS**

<b>Learning Center</b>	<b>Address</b>
Castaic Lake Water Agency	27234 Bouquet Canyon Road, Santa Clarita
Source: LACDPW 2017.	

Countywide programs are funded by the Solid Waste Management Fee (SWMF). This fee is charged on every ton of waste which is disposed of at an in-County or out-of-County facility such as a landfill, refuse to energy facility, or inert engineered landfill. As the County Roadmap to a Sustainable Waste Management Future aims to invert the Traditional Waste Hierarchy to place a greater emphasis on maximizing the benefits and use of materials over landfill disposal, this Project can initiate a shift to focus on building infrastructure and facilities to reduce, reuse, recycle, convert/compost, and transform solid waste over disposing into landfills. As this Project includes a Green Development Program (GDP) intended to meet or exceed state, regional, and local requirements for green building ordinances, residents who apply knowledge gained from workshops at the County Smart Gardening Learning Center can incorporate sustainable resource management of yard trimmings and food scraps.

Learning centers are equipped with educational and demonstration materials designed for County Smart Gardening workshops. Each has various backyard and worm composting bins, and drought-tolerant plants. Some include grasscycling demonstrations to show how easy and beneficial grasscycling can be.

Admission to Smart Gardening workshops is free. At some locations, there may be a parking or venue admission fee. Thus, while there is a Learning Center that is part of the County Smart Gardening Program in Santa Clarita, it would not realistically serve the Project site due to the approximate 30-mile distance to the site. As an alternative, smaller County Smart Gardening Information Centers may be built within public venues and facilities within the Project area. Information Centers typically only provide signage and demonstration compost bins on-site, and act as a passive educational center.

The current planning guideline for Learning Center space is a minimum of 4,000 square feet, and includes an ADA pathway, entry sign, benches made from recycled material, native and drought-tolerant landscaping, planter boxes, a drip-irrigation system, bioswales, a cistern, demonstration compost bins contained within an enclosure, shade structure, educational signage, a California Redemption Value (CRV) container recycling bin and a trash bin.

## **Project Design Features**

**PDF 17-2** The Project has committed to diverting from landfill disposal 100 percent of soil during grading activities, and at least 70 percent of nonhazardous construction and demolition waste, which exceeds the 65 percent diversion requirement with the Tier I voluntary measure in Section A5.408.3.1 of the California Green Building Standards (CALGreen) Code.. This goal also exceeds the 50 percent reduction required by Section 20.87.040 of the County Code and Sections 4.408.5/5.408.1.4 of the CALGreen Code. During all construction phases, wastes would be managed with the use of recycling bins for various debris materials that would be sent to existing recycling and/or processing facilities in accordance with all provisions of the County Construction and Demolition Debris Ordinance. This would include submitting and implementing a Recycling and Reuse Plan to Public Works in connection with obtaining a building or grading permit.

**PDF 17-3** The Project includes a Solid Waste Management Plan to achieve the goal of diverting 75 percent of operational solid waste generated from Project requiring landfill disposal. Property Owners shall process on-site, contract with a waste management company and/or recyclers, and/or self-haul to waste and recycling facilities to properly recycle, divert, and dispose of solid wastes generated on-site, such as metals, paper, household plastics, glass, cardboard, food waste, and green waste. Throughout the Project's operation, the waste hauler shall be required by contract to maintain records showing the diversion of not less than 75 percent of the operational waste generated by the Project. The Solid Waste Management Plan has many interrelated components, including, but not limited to:

- Implementation of a "three bin system" for waste collection and recycling for both residential (both single-family and multi-family uses) and commercial businesses. The three-bin system for residential areas will require separate receptacles for yard, such as leaves and tree trimmings (and possibly food waste, per property's hauler) into the green bin, recyclables into the blue bin, and permitted, nonrecyclable and non-compostable solid waste into the third bin..

The mandatory recycling for businesses will require that businesses divert from landfill disposal the recyclables that they generate, including food and green waste. Each non-residential building owner shall implement a recycling program including food and green waste recycling, where applicable. Businesses will provide appropriate number and placement of trash and recycling receptacles for visitor use in public areas and provide an easily accessible area that serves the entire building and is dedicated to the collection and storage of non-hazardous materials for recycling, including but not limited to: paper, food waste, green waste, corrugated cardboard, glass, plastic, and metals. Each owner of a commercial property, including multi-family residence, school, and place of worship, shall submit to the County a site plan of the property that depicts how solid wastes would be collected and stored for on-site processing, curbside collection, and/or self-hauling. Prior to sale, lease, or rental of commercial property, including portions of a multi-family residential structure, each owner shall provide to each prospective purchaser or tenant a notice explaining how that property collects and stores recyclables, compostables, universal waste, hazardous waste, and electronic waste for on-site processing, curbside collection, and/or self-hauling.

- The waste management contract will establish dedicated cans for green waste and a Green Waste Recycling Plan that must be adhered to by landscape maintenance companies as part of the Covenants, Conditions, and Restriction (CC&Rs). The CC&Rs will require the use of mulching mowers or mowers with mulching blades for common lawn areas and placing three to five inches of mulch in common areas'

planting beds each year as part of the Landscape Maintenance Plan for all non-residential and multi-family buildings.

- All landscaping companies shall utilize California Air Resources Board- (CARB) approved or electric mowing equipment (e.g., mowers, string trimmers, leaf blowers) and shall divert organic wastes to a mulching and composting facility or anaerobic digestion facility. The CC&Rs shall describe the residential recycling program to facilitate recycling and reuse and to educate residents and consecutive buyers (i.e., buyers after the initial home buyer) regarding the availability of and requirements for using the recycling program.
- Household hazardous wastes and less commonly disposed materials (such as electronics and appliances) would have seasonal pickup (at least two times a year) and residents would be notified of upcoming events.
- Semi-annual “exchange days” would be organized, publicized, and paid for by the Master Homeowners Association (HOA). Community members would be able to exchange with their neighbors items they no longer want. Homeowners would then be encouraged to do spring cleaning and major yard trimming and deliver usable items to a central location where they could be displayed for the weekend and picked up by others who are interested. As part of the event, large dumpsters, including green waste dumpsters, could also be brought for trash and green waste that cannot be reused. Neighborhood volunteers would monitor the dumpsters to make sure they are used efficiently and that only authorized waste is discarded in them.
- The Project Applicant/Master Developer shall set aside a minimum of 5 acres for a future Materials Recovery Facility/Transfer Station (MRF/TS) that includes a household hazardous waste permanent collection and reuse center and allows for mulching/composting operations. The site shall be located in a suitable location with the capacity to manage the nonhazardous solid waste and household hazardous waste generated by the Centennial Development Project at buildout. The Project Applicant/Master Developer shall prepare and grade the site, and install basic mainline infrastructure fronting the property prior to the issuance of any occupancy permits associated with the first phase of project implementation. The Master Developer shall continually encourage a waste management company to build these facilities on this build ready site. The CC&R for the future MRF/TS site shall require the land to be set aside for the MRF/TS in perpetuity.
- A seasonal collection and/or a mulching and composting facility could be included in the MRF/TS to allow for most green waste to be diverted from landfill disposal with the goal of a 100 percent green waste diversion from landfills. The landscape concept and turf limits are, in

part, designed to reduce the amount of green wastes generated by the Project and to reduce the demand for irrigation water.

- A MRF/TS can include organics processing equipment to allow for the recycling of food and green waste.

## Threshold Criteria

The thresholds of significance criteria listed below and used in the analysis is based on criteria derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant on solid waste impact if the Project would:

**Threshold 17-2** Be served by a landfill with insufficient permitted capacity to accommodate the project's solid waste disposal needs.

**Threshold 17-3** Not comply with federal, state, and local statutes and regulations related to solid waste.

## Environmental Impacts

**Threshold 17-2** **Would the project be served by a landfill with insufficient permitted capacity to accommodate the project's solid waste disposal needs?**

**Threshold 17-3** **Would the project comply with federal, state, and local statutes and regulations related to solid waste?**

Adopted plans and regulations to manage solid waste disposal and recycling efforts generally mandate action by the State, County, and/or local municipality rather than individual project applicants. For the Project, the County of Los Angeles is the responsible party for ensuring that waste reduction goals are met and that federal, State, and County regulations are enforced on private projects. Therefore, the following analysis focuses on the Project's anticipated solid waste generation during construction and operation, as well as the Project's Solid Waste Management Plan that would assist in meeting the County's goals. The Project's net solid waste generation assumes that the County of Los Angeles will continue its compliance with these requirements and would meet or exceed its resident disposal target of 7.4 PPD and employee disposal target of 41.5 PPD.

### *On-Site Impacts*

Implementation of the Project would generate solid wastes (including hazardous wastes) during construction and operation. Where solid wastes are disposed of and how they are recycled is driven by economics and adopted State and County of Los Angeles regulations. As previously discussed, solid waste disposal in Southern California is based on the free-enterprise system. Theoretically, waste can be disposed of at almost any landfill depending upon the preference of individual solid waste haulers and other factors such as proximity to the collection area, tipping fees, and daily capacities at the landfill sites.

Additionally, the amount of solid waste entering landfills versus the amount generated would be based upon a number of variables, including regulations such as AB 939; market demand for recyclables (fluctuations in prices for recyclables will affect willingness to recycle certain materials); product packaging; purchase of reusable products (e.g., cloth diapers); and disposal alternatives (incineration within cogeneration plants).

### Construction

It is estimated that site-preparation (vegetation removal and grading activities) and construction activities would generate approximately 602,910 tons total (or approximately 30,146 tons per year [tpy] over 20 years or 115.94 tons per day [tpd] over 260 days per year) of construction wastes over the 20-year buildout of the Project without the implementation of recycling or other diversion of construction waste.<sup>1,2</sup> The waste materials generated during site preparation and grading are expected to include typical construction debris including packaging, building material wastes (e.g., excess wood, tile, steel), organic materials, and green wastes. As described in PDF 17-2 and ensured by MM 17-9, the Project has committed to diverting from landfill disposal 100 percent of soil during grading activities, and at least 70 percent of nonhazardous construction and demolition waste, which exceeds the 65 percent diversion requirement with the Tier I voluntary measure in Section A5.408.3.1 of the California Green Building Standards (CALGreen) Code. This goal also exceeds the 50 percent reduction required by Section 20.87.040 of the County Code and Sections 4.408.5/5.408.1.4 of the CALGreen Code. This would result in less than approximately 180,873 tons of construction wastes requiring disposal over the 20-year Project buildout period, or approximately 9,044 tpy or 34.8 tpd (based on a 260-day per year construction schedule). As noted above, the nearest and most likely landfills to receive construction and demolition debris from the Project site are the Lancaster and Antelope Valley Landfills, approximately 30 miles and 32 miles from the Project site, respectively. However, Project-related construction waste may ultimately be disposed of at any of the available facilities described above.

The combined daily permitted capacity of the 4 major in-County landfills serving the Project area is 25,000 tpd. The estimated 34.8 tpd of construction wastes from the Project represents approximately 0.14 percent of this capacity. It is noted that the 34.8 tpd figure is an aggregate of construction wastes, including soils, which would not be disposed of in landfills. This provides a conservative analysis. This also does not consider the potential use of minor landfills, remote landfills, and out-of-County landfills. Of the 4 major landfills currently serving the Project area, 2 landfills (Chiquita Canyon and Sunshine Canyon Landfills) are anticipated to potentially close at some time prior to the Project's 20-year buildout horizon.

The combined remaining capacity of the Antelope Valley and Lancaster Landfills (which are likely to be used by the Project) is approximately 32.0 million cubic yards (23.08 million tons), and the permitted daily capacity is 6,900 tpd (LACDPW 2016b). If only these two landfills were utilized to dispose of the entirety of construction waste from implementation

- 
- 1 Assumes a generation rate of 90 tons per acre of construction waste. Project gross developable acreage is 6,699 acres (12,323 acres minus 5,624 acres of Open Space [OS]). Refer to Section 4.0, Project Description.
  - 2 The average tpd estimate is based on a 5-day work week at 52 weeks totaling 260 days a year of construction.

of the Project (180,873 tons), it would represent approximately 0.78 percent of the total remaining capacity and 0.50 percent of the permitted daily capacity (assuming 34.8 tpd requiring landfill disposal). While the combined daily rate of disposal of operating landfills would be different in the future, this analysis illustrates that the Project's incremental contribution to the County's solid waste stream during construction, which is a finite waste stream, would be nominal in comparison (i.e., less than one percent) and would be considered a less than significant impact. Construction activities may generate hazardous waste products during the construction phases of the Project. Hazardous waste disposal would be handled and disposed of in accordance with all appropriate State and federal laws. Because of the numerous laws and regulations associated with the disposal of hazardous wastes, it would be determined at the time of disposal where particular hazardous wastes would be taken based on the type and amount that must be disposed. However, hazardous wastes would be only a small proportion (less than 1 percent by weight) of the total solid wastes generated on the Project site during construction. This minimal contribution of solid waste at the Kettleman Hills Landfill or McKittrick Waste Treatment Site would not be significant.

### Operation

It is estimated that buildout of the Project would take approximately 20 years. As shown in Table 5.17-5, Annual Solid Waste Generation, on the following page, the Project would generate approximately 55,394 tons of solid wastes per year at buildout. This estimate uses the disposal rates in 2000 and 2008 and would not represent increased diversion of solid wastes based on current and future regulations and the Project's Solid Waste Management Plan. As described in PDF 17-3 and ensured by MM 17-10, the Project includes a goal to divert at least 75 percent of the operation waste generated by the Project. This would result in approximately 13,849 tons per year of solid waste requiring landfill disposal.

As noted above, the responsibility for meeting waste reduction/diversion goals and other regulations lies with the County. However, the Project incorporates a Solid Waste Management Plan, described above, which includes several components aimed at facilitating recycling and otherwise reducing solid waste generation at the source (the Project site). As discussed in PDF 17-3, the Project would set aside a minimum of five acres for an MRF/TS that includes a household hazardous waste permanent collection and reuse center and allows for mulching/composting operations, in the Utility land use designation, which could be constructed and operated by a private or public entity. The MRF/TS would represent the only such facility in northern Los Angeles County. Through this and other proposed features (PDF 17-3), the Solid Waste Management Plan supports the County in meeting its statutory waste management goals to the maximum extent feasible. The Project would also include a County Smart Gardening Program Learning Center, and the specifications for this facility would be provided by the County of Los Angeles Department of Public Works (MM 17-10).

**TABLE 5.17-5  
ANNUAL SOLID WASTE GENERATION**

<b>Land Use</b>	<b>Quantity<sup>a</sup></b>	<b>Units</b>	<b>Disposal Rate (per year)<sup>b</sup></b>	<b>Total Waste Generation (tons/year)</b>
Residential	55,701	residents	0.32 tons/capita <sup>c</sup>	17,824.3
Commercial	2,913	employees	2.5 tons/employee	7,282.5
Business Park	14,813	employees	1.61 tons/employee	23,848.9
Hotels	300	employees	1.17 tons/employee	351.0
Institutional/Civic				
Sheriff's Station	147	employees	0.52 tons/employee	76.4
Fire Stations	44	employees	0.39 tons/employee	17.2
Library	10	employees	0.82 tons/employee	8.2
Schools <sup>d</sup>	11,863	students	0.12 tons/student	1,423.6
Medical Facilities	2,907	employees	0.54 tons/employee	1,569.8

<sup>a</sup> Placeworks 2017. <sup>b</sup> CalRecycle 2000. <sup>c</sup> CalRecycle 2009. <sup>d</sup> Assumes highest student generation estimate				

As with the construction debris, the Project's operational solid waste stream after diversion may ultimately be disposed of at any in-County facility. A portion may also be disposed of at remote out-of-County facilities. As discussed above, the combined permitted capacity of the 4 major in-County landfills serving the Project area is 25,000 tpd. The Project's estimated annual solid waste volume requiring landfill disposal of 13,849 tons per year (approximately 44.4 tpd based on 312 days per year, which is 6 days a week that most solid waste facilities operate) would represent approximately 0.18 percent of the landfills' permitted daily capacity. Even if the entirety of the Project's estimated solid waste generation was assumed to require landfill disposal, meaning that no diversion had occurred, this volume (51,582 tons per year, 177.5 tpd) would require approximately 0.7 percent of these landfills' daily permitted capacity. Also, this does not consider the use of minor landfills, remote landfills, and out-of-County landfills. Therefore, the nominal increase in waste disposal from the Project would not be expected to result in the exceedance of any landfill's daily permitted capacity.

However, permitted Class III landfill capacity cannot be guaranteed at the time of Project buildout and through the life of the Project, which are beyond the required 15-year LACDPW planning horizon for solid waste disposal (currently from 2015 to 2030). Therefore, while the County is committed to handling all solid wastes generated within the County now and in the future, to be conservative, this EIR concludes that the Project would result in a significant impact on the County's anticipated Class III landfill capacity. PDFs 17-2 and 17-3 and MMs 17-9 and 17-10, which discuss the management of construction and operational

solid waste, respectively, reflect all feasible measures to reduce and divert the municipal solid waste generation of the Project. Additionally, as discussed further in Section 5.5, Land Resources, the Project would accommodate a total of 50 acres of small-scale agriculture and agriculture-related uses, including, but not limited to community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, and commercial greenhouses. These types of uses that support fresh food contribute to less packaged food, and therefore reduced solid waste. Finally, the goals of 75 percent operational non-hazardous solid waste diversion and 100 percent green waste diversion are consistent with the goals of the State's 75 Percent Initiative; and including organics processing equipment as a permissible feature of the MRF/TS and the mandatory diversion of recyclables, including food and green waste as applicable, generated by businesses is consistent with both the 75 Percent Initiative and the Mandatory Commercial Organics Recycling Bill (AB 1826). Regardless, there are no additional, feasible mitigation measures to further reduce the Project's solid waste stream that would require disposal in County facilities. Therefore, the Project would result in a significant and unavoidable impact related to municipal solid waste during operation of the Project.

Hazardous wastes generated by the residential land uses on the Project site may include such materials as household cleaners, paints and thinners, batteries, electronic equipment, and motor oil, among others. The Project's Solid Waste Management Plan (PDF 17-3 and MM 17-10) also includes features to facilitate appropriate disposal of hazardous materials by the community, such as semi-annual "exchange days" and seasonal (at least two times a year) pickup of household hazardous wastes and less commonly disposed materials (e.g., electronics and appliances). These household hazardous wastes may also be brought into the County's collection centers and collection events. Proposed commercial and business park land uses that would involve generating, treating, or disposing of hazardous wastes would be required to comply with applicable State and County hazardous waste regulations. It is anticipated that the volume of hazardous materials generated by the Project could be accommodated by the permitted Class I and Class II landfills currently in operation within California, and there would be a less than significant impact to hazardous waste disposal facilities.

### ***Off-Site Impacts***

The off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, would not generate solid waste once developed. However, construction of these features would generate a minimal and finite volume of solid wastes, including removed vegetation, spoils (displaced soils), and construction material remnants and packaging. The planned 70 percent diversion for non-hazardous construction and demolition waste (PDF 17-2, MM 17-9) would apply to the off-site Project features. The volume of waste from the construction of these features would be far smaller than the total construction waste for the Project as a whole, which, in turn, would represent less than one percent of the total for the daily landfill capacity currently available for the Project area and, thus, is considered less than significant. Disposal of the comparatively nominal construction waste from off-site Project features would also be less than significant.

**Impact Summary:** As described in PDF 17-2 and ensured by MM 17-9, the Project has committed to diverting 100 percent of soil during grading activities, and at least 70 percent of nonhazardous construction and demolition waste, which exceeds the 65 percent diversion requirement with the Tier I voluntary measure in Section A5.408.3.1 of the California Green Building Standards (CALGreen) Code. This goal also exceeds the 50 percent reduction required by Section 20.87.040 of the County Code and Sections 4.408.5/5.408.1.4 of the CALGreen Code. . The Project's incremental contribution to the County's solid waste stream during construction, which is a finite waste stream, would be nominal in comparison to available capacity (i.e., less than one percent) and would be considered a less than significant impact.

The Project incorporates a Solid Waste Management Plan (PDF 17-3 and MM 17-10) with numerous interrelated components that would facilitate on-site recycling and other solid waste diversion, supports the County in meeting its statutory waste management goals to the maximum extent feasible, and is consistent with the State's most recent, aggressive solid waste management goals. However, the permitted Class III landfill capacity in the County cannot be guaranteed at the time of Project buildout and through the life of the Project, which are beyond the LACDPW's 15-year planning horizon (currently through 2030) for solid waste disposal. Therefore, while the County is committed to handling all solid wastes generated within the County now and in the future, to be conservative, this EIR concludes that the Project buildout would result in a significant impact on the County's anticipated Class III landfill capacity. PDF 17-17-3 and MM 17-10 reflect all feasible measures to reduce and divert the municipal solid waste generation of the Project. Therefore, the Project would result in significant and unavoidable impact related to municipal solid waste during operation of the Project.

Hazardous wastes generated by the residential land uses on the Project site would be limited compared to the total municipal waste stream is expected to be accommodated by the permitted Class I and Class II landfills currently in operation within California and there would be a less than significant impact.

## **Mitigation Measures**

**MM 17-9** The Project Applicant/Developer shall be responsible for implementing the following construction waste reduction requirements to ensure that 100 percent of soil is diverted during grading activities, and that at least 70 percent of nonhazardous construction and demolition waste is diverted from landfill disposal. During all construction phases, wastes would be managed with the use of recycling bins for various debris materials which would be sent to existing recycling and/or processing facilities in accordance with all

provisions of the County Construction and Demolition Debris Ordinance. This would include submitting and implementing a Recycling and Reuse Plan to Public Works in connection with obtaining a building or grading permit.

**MM 17-10** The Project shall incorporate the Solid Waste Management Plan (Section 7.3 of the *Centennial Specific Plan*) and the Property Owner/Developer shall be responsible for implementation of the following operational waste reduction requirements to ensure that at least 75 percent of operational waste is diverted from landfill disposal:

- The Property Owners shall process an on-site contract with a waste management company and/or recyclers, and/or self-haul to waste and recycling facilities to properly recycle, divert, and/or dispose of solid waste generated on-site. Throughout the Project's operation, the waste hauler shall be required by contract to maintain records showing the diversion of not less than 75 percent of the operational waste generated by the Project.
- The waste management contract will establish dedicated cans for green waste and a Green Waste Recycling Plan that must be adhered to by landscape maintenance companies as part of the CC&Rs. The CC&Rs will require the use of mulching mowers or mowers with mulching blades for common lawn areas; use of California Air Resources Board-(CARB) approved or electric maintenance equipment; placing three to five inches of mulch in common areas' planting beds each year as part of the Landscape Maintenance Plan for all non-residential and multi-family buildings; and diverting organic wastes to a mulching and composting facility or anaerobic digestion facility.
- The CC&Rs will require the Property Owner to recycle and divert from the waste bin, solids such as metal, glass, paper, plastic, cardboard, food and yard waste; and divert from the waste bin hazardous waste, electronic waste, and universal waste. Information on items prohibited from landfill disposal and on recycling and composting will be provided to Property Owners.
- Household hazardous wastes and less commonly disposed materials (such as electronics and appliances) shall have seasonal pickup (at least two times a year) and residents would be notified of upcoming events.
- Semi-annual "exchange days" shall be organized, publicized, and paid for by the Master Homeowners Association (HOA).
- The Project Applicant/Master Developer shall set aside a minimum of 5 acres for a future Materials Recovery Facility/Transfer Station (MRF/TS) that includes a household hazardous waste permanent collection and reuse center and allows for mulching/composting operations. The site shall be located in a suitable location with the

capacity to manage the nonhazardous solid waste and household hazardous waste generated by the Centennial Development Project at buildout. The Project Applicant/Master Developer shall prepare and grade the site, and install basic mainline infrastructure fronting the property prior to the issuance of any occupancy permits associated with the first phase of project implementation. The Master Developer shall continually encourage a waste management company to build these facilities on this build ready site. The CC&R for the future MRF/TS site shall require the land to be set aside for the MRF/TS in perpetuity.

- The Smart Gardening Learning Center specifications will be provided by County of Los Angeles Department of Public Works.
- Parking for the Learning Center and the MRF/TS may be shared with adjacent uses with the consent of the property owners and County Public Works.

### **Level of Significance After Mitigation**

Permitted Class III landfill capacity cannot be guaranteed at the time of Project buildout and through the life of the Project. Therefore, to be conservative, this EIR concludes that operation of the Project would result in a significant impact on the County's anticipated Class III landfill capacity. The Project includes a proposed Solid Waste Management Plan that would reduce and divert the solid waste generation. There are no feasible mitigation measures remaining to further reduce the Project's solid waste stream requiring disposal in County facilities. Therefore, the Project would result in a significant and unavoidable impact related to municipal solid waste during operation of the Project.

### **5.17.4 OTHER PUBLIC FACILITIES**

#### **Relevant Plans, Policies, and Regulations**

##### ***County Revenue and Finance***

Title 4 of the Los Angeles County Code establishes the fees, taxes and funds that are imposed by the County for various services and uses and that are used for County operations. Other fees and charges are also imposed by the County to pay the cost of services and to implement County regulations and monitor compliance with the County Code. The County of Los Angeles Department of Public Works (LACDPW) annual operating budget is funded by restricted revenues, such as gas excise and sales tax, benefit assessment, water and sewer sales, user fees, and contract cities revenues (LACDPW 2011). The County of Los Angeles Department of Parks and Recreation (LACDPR) annual operating budget is funded by the County general fund, park in-lieu fees funds (including Quimby funds), and special revenue funds.

#### **Environmental Setting**

There are no County facilities on the Project site. Headquartered in Alhambra, the LACDPW has 77 field facilities throughout the unincorporated Los Angeles County area as well as

contract cities. The LACDPW is responsible for the design, construction, operation, maintenance, and repair of roads, traffic signals, bridges, airports, sewers, water supply, flood control, water quality, and water conservation facilities, and for the design and construction of capital projects. Headquartered in Los Angeles, the LACDPR is responsible for maintaining approximately 66,528 acres of recreational and open space acreage throughout Los Angeles County, which includes local, community, and regional parks; botanical gardens; nature centers; and golf courses (LACDPR 2010).

Information about County-owned facilities that may be impacted by Project implementation are discussed throughout this EIR in Section 5.2, Hydrology and Flood; Section 5.10, Traffic, Access, and Circulation; and Section 5.14, Parks and Recreation.

## Project Design Features

**PDF 17-4** The Project includes land allocated for two maintenance yards for the Los Angeles County Department of Public Works and the Department of Parks and Recreation, located adjacent to the permanent wastewater reclamation facility site along the northeastern boundary of the Project site. The maintenance yards will operate as a joint use service yard and will include both a road maintenance yard and a maintenance yard for parks.

## Threshold Criteria

The threshold of significance criteria listed below and used in the analysis is based on criteria derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant on other public facilities if the Project would:

**Threshold 17-4** Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: other public facilities.

## Environmental Impacts

**Threshold 17-4** **Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: other public facilities?**

---

***On-Site Impacts***

The Project will rely upon the provision of County services for various amenities, including public park and facility maintenance, County-owned roadway maintenance, public right-of-way maintenance, flood-control infrastructure maintenance, and maintenance of other facilities. The Applicant/Developer and/or Project resident, business, or other individual that will benefit from these services will pay via taxes and fees.

There are no County maintenance yards on the Project site and there are no yards located in the region that have adequate capacity to provide County services to the Project. Project demand for the maintenance of future County-owned facilities and infrastructure would be met by the provision of land for two on-site maintenance yards (PDF 17-4) and the payment of fees and taxes that fund these services. The maintenance yards will operate as a joint use service yard and will include both a road maintenance yard and a maintenance yard for parks. The County may also construct, equip, and operate a permanent new animal control facility adjacent to the maintenance yards, if such a permanent facility is needed in the Project area. Provision of land for these County services, as set forth in PDF 17-4 would ensure that impacts to other public facilities would be less than significant.

The Project may require the creation of an entity to operate and maintain the water supply, water treatment, and wastewater reclamation facilities, as well as the storm water facilities if annexation of the Project site into the Golden Valley Municipal Water District (GVMWD) does not occur. Should a private entity be created or a public utility district (PUD) be required to handle the operation and maintenance of these systems and facilities, then service fees that would be generated by development on the site would fund the operations of the private entity. Alternatively, a public entity (e.g., Community Facilities District, Community Services District, California Water District, or other agency approved by Los Angeles County) may operate the on-site water supply, water treatment, and wastewater reclamation facilities, as well as the storm water facilities. This public entity would also operate through fees and taxes that would be paid by development on the site. This would avoid impacts on existing County services and facilities.

***Off-Site Impacts***

The off-site water Tejon Water Bank infrastructure would be part of the on-site water system that would be maintained and operated by the GVMWD or a PUD or other agency approved by Los Angeles County. Since an independent utility will operate the water system, no impacts to County facilities would occur. Roadway maintenance would be provided by the County for County-owned roads, and Caltrans would maintain Caltrans-owned properties. Impacts would be less than significant.

***Impact Summary:*** The Project's demand for other public services and facilities of the County will be subject to the payment of fees established by the County. The Project will also provide two maintenance yards on the site, which will be used by the employees of the County Department of Public Works and Department of Parks and Recreation for equipment storage and offices associated with the maintenance activities for roads, parks and other on-site public facilities (see PDF 17-4). The County may also

construct, equip, and operate a permanent new animal control facility adjacent to the maintenance yards, if such a permanent facility is needed in the Project area. This will reduce demand at existing County facilities, and impacts would be less than significant.

## Mitigation Measures

No significant adverse impacts on other public facilities will occur with the Project. Thus, no mitigation is required.

## Level of Significance after Mitigation

Impacts on other public facilities will be less than significant and no mitigation is required.

## 5.18 WATER RESOURCES

### 5.18.1 INTRODUCTION

#### Purpose

The County of Los Angeles Department of Regional Planning (DRP) Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that water resources issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

This section analyzes the water resources available to support the Project and the impacts associated with providing adequate water supplies for the proposed development. The analysis in this section complies with the provisions of Sections 10910 et seq. of the *California Water Code* (Senate Bill [SB] 610) for assessing water supplies for CEQA purposes. The analysis is presented for Years 1 through 20 of the Project from first occupancy in Year 1 through buildout in Year 20. The analysis also extends to Year 25 (i.e., 5 years after buildout) when return flow water supplies from use within the Antelope Valley groundwater basin will mature for Project use.

#### Summary

Implementation of the Project would result in a maximum of 19,333 housing units, the creation of an estimated 23,675 permanent jobs, and a maximum resident population of approximately 57,150 persons at buildout. As discussed in detail below, at buildout the Project is estimated to require 11,365 acre-feet per year (afy) of water for residential, commercial, landscaping and other purposes, of which 6,788 afy would be treated for potable use, and 4,577 afy would consist of recycled water treated in on-site wastewater treatment facilities to State standards under Title 22 of the *California Code of Regulation* (CCR) for unrestricted reuse.

The Project's potable and recycled water infrastructure, including potable and recycled water treatment, delivery, metering and monitoring, will be managed by a water district or public utility district (PUD) that will serve the Project (the "Project Water Purveyor"). The on-site water system shall comply with the federal and California Safe Drinking Water Acts and related regulations and recycled water will be treated to *California Code of Regulations* Title 22 unrestricted reuse standards. To ensure that projected demand levels are achieved, water demand will be minimized through the use of low-flow indoor fixtures; irrigation equipment with electronic sensors; water-wise landscaping; water budget based water rates consistent with well-established rate structures used by water districts in California; full metering of all water use; and monitoring, enforcement, and response measures as required. The Project will also maximize opportunities for groundwater recharge and groundwater banking. Wastewater generated by indoor use will be treated to State unrestricted reuse standards and recycled for non-potable outdoor irrigation uses and for wastewater and

cooling purposes in the proposed Business Park. The Project's per capita water demand will be lower than comparable water use rates in existing Antelope Valley developed areas that were not built to current water-conservation standards; have not implemented water budget based rates; and that do not incorporate newer water-efficient fixture and irrigation technologies.

The Project will utilize several water supplies and on- and off-site water banking facilities to meet potable demand. Available supplies include groundwater and imported water return flows in accordance with the approved Antelope Valley adjudication Judgment and Physical Solution; State Water Project (SWP) supplies secured for Project use and imported to the site under an agreement with the Antelope Valley – East Kern Water Agency (AVEK); and AVEK service area deliveries. Indoor wastewater will be conveyed to one of two Project on-site treatment facilities; will be treated to State unrestricted reuse standards; and will be distributed to meet approximately 40 percent of buildout water demand. The Project's water supplies will sustainably meet buildout potable and recycled water demands and will maintain an average annual reserve supply of more than 79,000 acre-feet, or more than 11 years of full-buildout potable water demand, after buildout has been achieved.

All potable and recycled water use will be metered throughout the Project. The metering data will be compiled by the Project Water Purveyor into two water use reports and submitted to the Los Angeles County DRP at the end of the fifth year following first occupancy or the occupancy of the 4,000<sup>th</sup> dwelling unit, and at the end of the 10<sup>th</sup> year or the occupancy of the 10,000<sup>th</sup> unit, whichever occurs later. The reports will utilize the metering data to verify that the projected water use efficiencies are being achieved and that available supplies are sufficient to meet demand as development occurs. In the event that future water demands are determined to exceed available supplies, the Project Water Purveyor must implement measures to ensure that supplies will be adequate to meet future demand, including such measures as enhanced water budget based rates consistent with applicable legal requirements, increased enforcement, faculty repairs or upgrades, or obtaining supplemental water supplies. No additional development will occur until water use report response measures have been implemented and water supplies are determined sufficient to meet demand to the satisfaction of the DRP.

A Water Supply Assessment (WSA) for the Project was approved in accordance with Sections 10910 et seq. of the *California Water Code* by the Golden Valley Municipal Water District (GVMWD) in May 2011. In January 2017, the Potable Water, Wastewater, and Recycled Water Demands and System Plan (see Appendix 5.19-A of this EIR) for the Project was peer reviewed by Kennedy/Jenks in a report submitted to the County.

In 2014 and 2015, the County of Los Angeles Board of Supervisors published a draft and certified Final Environmental Impact Reports (EIRs) for updates to the *Antelope Valley Area Plan (AVAP)* and to the County General Plan (General Plan Update) and approved the updated AVAP and County General Plan. The approved General Plan update incorporated the previously approved AVAP update, which reduced the level of future growth in unincorporated portions of the Antelope Valley from levels that would have occurred under prior General Plan designations. Antelope Valley regional water supplies and demands were considered in the EIRs prepared for the AVAP and the General Plan Updates.

In 2013, a regional water users group in the Antelope Valley prepared an update to the Antelope Valley Integrated Regional Water Management Plan (AVIRWMP) in accordance with State law. In December 2015, the Superior Court of California approved an adjudication Judgment and Physical Solution that regulates the Antelope Valley groundwater basin. In June 2016, AVEK adopted an update to the Agency's Urban Water Management Plan (UWMP), which incorporates SWP supplies that would be used by the Project and demand and supply projections through 2035. In June 2015, the California Department of Water Resources (DWR) published the State Water Project Final Delivery Capability Report 2015 (DCR), which includes the most recent analysis of SWP current and future reliability. From 2014 to 2016, the Governor of California, other State agencies, and the California legislature implemented several water conservation and management measures in response to a historic drought. A public review draft of proposed permanent state water conservation measures was published by five state agencies in November 2016.

This section updates the information in the 2011 WSA to implement the recommendations in the peer review of the Project's water supply and demand assessment and to include the AVAP and General Plan updates and related CEQA water supply analyses; the AVIRWMP; the approved Judgment and Physical Solution for the Antelope Valley groundwater basin; the AVEK 2015 UWMP; the DCR; and State drought emergency and proposed permanent water conservation measures.

The Project's water facilities will be owned and operated by a Public Water Purveyor or organized as a Community Services District, a statutory water district or PUD with the appropriate capacity to own, operate, and maintain the Project's water system. The Project Water Purveyor will be funded through a rate-payer system and fees. Until the Project Water Purveyor is established, the Project Applicant/Developer will be responsible for all Project-related water services. All of the Project's water supplies and the design, permitting, financing and construction of all treatment, collection and distribution infrastructure will be provided by the Project Applicant/Developer.

## **Section Format**

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with Article 9 of the State CEQA Guidelines (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations

- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## 5.18.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

### Federal

#### *Drinking Water Quality Standards*

##### Safe Drinking Water Act

The federal Safe Drinking Water Act (SDWA, 42 *United States Code*, Sections 300f et seq. [1974]) is intended to protect public health by regulating the nation's public drinking water supply. The Act authorizes the United States Environmental Protection Agency (USEPA) to set national standards for drinking water supplied by public water systems (generally, water systems that serve at least 25 people or 15 service connections for at least 60 days per year) to protect against both naturally occurring and man-made contaminants. These National Primary Drinking Water Regulations set enforceable maximum contaminant levels for particular contaminants in drinking water or required ways to treat water to remove contaminants. Each standard also includes requirements for water systems to test for contaminants in the water to make sure standards are achieved. The most direct oversight of water systems is conducted by State drinking water programs. States can apply to USEPA for "primacy", which is the authority to implement the SDWA within their jurisdictions, if they can demonstrate that they will adopt and enforce standards at least as stringent as the federal requirements. All states and territories, except Wyoming and the District of Columbia, have received primacy. The Drinking Water Division of the State Water Resources Control Board (SWRCB) has the primary responsibility for implementing the SDWA and related California drinking water laws and regulations in the state.

##### National Primary Drinking Water Regulations

The National Primary Drinking Water Regulations (NPDWRs or primary standards), also known as maximum contaminant levels (MCLs), are legally enforceable standards set and enforced by the USEPA that apply to public water systems. Primary standards protect public health by limiting the levels of contaminants in drinking water.

##### National Secondary Drinking Water Regulations

The National Secondary Drinking Water Regulations (NSDWRs) are non-enforceable guidelines regulating contaminants that may cause cosmetic effects (such as skin or tooth discoloration) or aesthetic effects (such as taste, odor, or color) in drinking water. The USEPA recommends secondary standards to water systems, but does not require that systems comply with them. However, States may choose to adopt secondary MCLs as enforceable standards. Title 22 of the *California Code of Regulations* (CCR, specifically, Division 4, Chapter 15, Domestic Water Quality and Monitoring Regulations) provides the regulatory requirements for potable water quality in California.

---

## State

### ***California Safe Drinking Water Act***

The California Safe Drinking Water Act (Chapter 4, Part 12 of the California Health and Safety Code) improves upon the minimum requirements of the federal Safe Drinking Water Act and outlines the regulations and standards for ensuring that water delivered by public water systems is pure, wholesome, and potable at all times. This Act assigns the responsibilities of the State Water Resources Control Board and other State agencies for implementing the Act, including the establishment of primary drinking water standards and system and operational requirements on affected public water systems and water districts. Regulations related to drinking water are also contained in Titles 17 and 22 of the California Code of Regulations for water operator certifications, water system permits, water quality standards, treatment, and sampling/monitoring, and public notification.

### ***California Energy Commission Appliance Efficiency Standards***

The California Energy Commission has been delegated the authority to enact Appliance Efficiency Regulations that include standards for appliances that are and are not federally regulated. The most recent version of the Appliance Efficiency Regulations is codified at in the *California Code of Regulations* (specifically, Title 20, Sections 1601 through 1609, dated July 2015) and contain amendments that were incorporated due to changes in state standards (CEC 2015). The regulations are updated on a regular basis and currently provide efficiency standards for 23 categories of appliances that are sold or offered for sale in California, except appliances sold wholesale in California for final retail sale outside the state or those designed and sold exclusively for use in recreational vehicles or other mobile equipment. The Appliance Efficiency Regulations specify efficiency requirements for several appliances related to residential or other water uses, including plumbing fixtures, faucets, toilets and urinals, clothes washers, water heaters, refrigerators and icemakers, and cooling equipment. Section 1609 of the Appliance Efficiency Regulations establishes a process for imposing administrative civil penalties for violations of the Appliance Efficiency Regulations and became effective on July 1, 2015. The Project will meet or exceed all applicable State appliance efficiency regulatory requirements.

### ***California Green Building Standards Code***

The California Green Building Standards Code (CALGreen) was first authorized as a voluntary code by the Department of Housing and Community Development (HCD) and was approved by the California Building Standards Commission (CBSC) in January 2008, with an effective date of August 2009. In a September 2015 report to the state legislature, the HCD stated that the code continues to be improved by considering technologies being developed to complement current practices that help reduce the overall impact on the earth and to preserve current resources; to implement environmentally responsible and resource efficient processes; to reduce negative environmental impacts; and to enhance positive environmental impacts by encouraging more sustainable construction. The CALGreen Code has been amended several times since 2008. In 2011, the code became mandatory throughout the state and, for the first time, established mandatory minimum requirements.

The mandatory provisions of the code were also incorporated into the scoping plan developed by the California Air Resources Board to implement the California Global Warming Solutions Act. In 2013, the Code was amended to include all residential buildings in addition to low-rise buildings (i.e., up to two stories). The HCD has indicated that the 2013 amendments expanded the scope of the regulations to include additions and alterations to conditioned areas, volumes, or sizes and to include additions and alterations to existing buildings that increase the effectiveness of enforceable, sustainable building standards that have a positive impact on the environment (HCD 2016a).

In response to Executive Order B-29-15 (see below), the HCD, in coordination with other State agencies, adopted emergency building standards that require a landscaping water budget that conforms with the more stringent of either a local water efficient landscape ordinance, or the state Model Water Efficient Landscape Ordinance (MWELO), as amended by the DWR. The HCD's emergency CALGreen provisions also modified the formula for calculating allowable water use for residential landscaped areas to reduce potable water landscape use below MWELO requirements. The emergency regulations became effective on June 1, 2015. In 2016, the HCD adopted new residential mandatory requirements in the CALGreen Code that regulate water fixture efficiency and which became effective on January 1, 2017 (HCD 2016b). The Project will meet or exceed all applicable State CALGreen code requirements.

### ***Urban Water Management Planning Act***

The Urban Water Management Planning Act (*California Water Code*, Division 6, Part 2.6, Sections 10610–10656) requires water suppliers serving more than 3,000 customers or water suppliers providing more than 3,000 acre-feet (af) of water annually to prepare an urban water management plan (UWMP) to promote water demand management and efficient water use. A UWMP provides a succinct summary of an agency's water supplies, demands, and plans to ensure future reliability, including a discussion of potential water transfers and exchanges, desalination, and recycled water opportunities over a 20-year planning horizon. In 2010, the California legislature amended the *California Water Code* to require that UWMPs include, for the first time, per capita water use reductions of 20 percent by 2020 (*California Water Code*, Section 10608.16). Most of the current UWMPs in California, including the AVEK 2015 UWMP, were most recently updated in 2016.

### ***Integrated Regional Water Management Planning Act***

In 2002, the California Legislature enacted the Integrated Regional Water Management (IRWM) Act (*California Water Code*, Sections 10530 et seq.). The purpose of the Act is to encourage local agencies to work cooperatively to manage local and imported water supplies to improve water supply quality, quantity, and reliability. The legislation provides that an IRWM plan may be prepared and adopted by a "regional water management group" (RWMG) consisting of three or more local public agencies, at least two of which have statutory authority over water supply, that participate in the planning process by means of a joint powers agreement, a memorandum of understanding, or other written agreement.

Proposition 50, the Water Security, Clean Drinking Water, Coastal and Beach Protection Act of 2002 (*California Water Code*, Sections 79560–79565), provided \$500,000,000 to fund competitive grants for projects consistent with an adopted IRWM plan. In 2006, Proposition 84, the Safe Drinking Water, Water Quality, and Supply, Flood Control, River and Coastal Protection Bond Act (*California Public Resources Code*, Sections 75001–75130), provided \$1,000,000,000 for IRWM planning and implementation. In the same year, California Proposition 1E, the Disaster Preparedness and Flood Prevention Bond Act (*California Public Resources Code*, Sections 5096.800–5096.967), provided \$300,000,000 for IRWM storm water flood management planning and implementation.

### ***Sustainable Groundwater Management Act***

In 2014, California enacted the Sustainable Groundwater Management Act (*California Water Code*, Sections 10720 et seq.). The Act, and related amendments to California law, require that all groundwater basins designated as high- or medium-priority in the DWR California Statewide Groundwater Elevation Monitoring program and that are subject to critical overdraft conditions must be managed under a new Groundwater Sustainability Plan (GSP) or a coordinated set of GSPs by January 31, 2020. High- and medium-priority basins that are not subject to critical overdraft conditions must be managed under a GSP by January 31, 2022. Where GSPs are required, one or more local groundwater sustainability agencies must be formed to cover the basin and prepare and implement a GSP. The Act is inapplicable to basins that are subject to a Court-approved groundwater adjudication. Section 10720.8(b) of the *California Water Code* provides that the Sustainable Groundwater Management Act is inapplicable to any portions of the Antelope Valley Basin subject to a final adjudication judgment, order, or decree in the Antelope Valley Groundwater Cases proceeding. As discussed below, in December 2015 the Superior Court of California approved a Judgment and Physical Solution that regulates groundwater use in the Antelope Valley Basin and surrounding watershed, including most of the Project site (see Appendix 5.18-D).

### ***State Drought Executive Orders and Emergency Water Conservation Regulations***

On January 17, 2014, California Governor Jerry Brown proclaimed a drought state of emergency and directed state officials to take all necessary actions to prepare for drought conditions (State of California 2014). On April 1, 2015, Governor Brown issued an executive order directing the SWRCB to implement mandatory water reductions in urban areas and to reduce California potable urban water use by 25 percent. The order imposed varying degrees of cutbacks on water use affecting homeowners, farms, and other businesses, as well as the maintenance of cemeteries and golf courses. The order included additional water conservation and planning measures, and the potential installation of salinity barriers in the Sacramento Delta (State of California 2015a). Executive Order B-29-15 also requires that groundwater elevation monitoring be implemented throughout the state by the end of 2015.

In May 2015, the SWRCB adopted emergency regulations requiring an immediate statewide 25 percent reduction in potable urban water use measured in terms of residential gallons per capita per day (R-gpcd). The regulation includes variable cutback requirements intended to reduce compliance burdens for water districts and communities that previously reduced water consumption relative to other locations. Certain communities, for example, had

achieved significant indoor water use reductions, while others used significantly more water. The regulations and conservation requirements were designed to result in greater per capita cutbacks in locations that used relatively more water compared with more efficient communities. On November 13, 2015, the Governor directed the SWRCB to extend, and potentially modify, the drought emergency water conservation regulation if drought conditions persist through October 2016.

The emergency drought regulations require that each local water provider with more than 3,000 service connections submit monthly residential potable water usage figures to the SWRCB. The SWRCB uses the monthly R-gpcd rates for each provider compared with the provider's 2013 usage for that same month to verify that the mandated reduction level is being achieved. Smaller suppliers were required to report residential water for June through November 2013 and June through November 2015 in December 2015. The regulations allow local water agencies to determine and implement the most cost-effective and locally appropriate methods for reducing water use. The SWRCB publishes the monthly R-gpcd figures for over 400 larger California water suppliers and each supplier's compliance status with applicable conservation requirements online (SWRCB 2015b). In May 2016, the SWRCB modified the emergency regulations and replaced the percentage reduction-based water conservation standard with a localized "stress test" approach that mandates urban water suppliers ensure at least a three year supply of water (SWRCB 2016a).

Executive Order B-37-16 was issued in May 2016 to establish long-term water conservation measures and improve planning for more frequent and severe droughts based on the State's emergency drought conservation success (State of California 2016). The order also requires that the State's urban water suppliers meet new water use targets. In November 2016, the DWR, the SWRCB, the CPUC, the California Department of Food and Agriculture, and the California Energy Commission issued a report on framework for implementing the order. This Framework Report includes an extension of certain emergency regulations and proposed permanent regulations to establish new water use targets, permanent monthly water use reporting, and standards and enforcement to eliminate water waste; improve drought resilience; and improve agricultural water use efficiency and drought planning. The Framework Report also proposes to establish residential, commercial, industrial, and institutional water use performance measures and standards, including a per capita daily water budget for residential indoor and outdoor use, plus losses. The Framework Report states that, until a final standard is established, the State residential indoor water use standard is 55 gallons per capita per day (DWR et al. 2016a).

### ***Senate Bill 610***

Section 21151.9 of the *California Public Resources Code* and Sections 10631, 10657, 10910, 10911, 10912, and 10915 of the *California Water Code* (frequently referred to as "Senate Bill [SB] 610") require the County to obtain, utilize in a project's CEQA review process, and provide to the public certain information concerning water supply for residential developments of more than 500 dwelling units and other comparable projects. The amendments enacted by SB 610 require that a CEQA lead agency (in this case, the County of Los Angeles) request a water supply assessment (WSA) from a water supply entity that could provide water for an applicable project. The WSA must analyze the sufficiency of the water

supplies available to the potential water supplier to meet existing and anticipated future demands, including the demand associated with the proposed Project, over a 20-year horizon that includes normal (average), single-dry, and multiple-dry years. If required, the WSA must be included and considered by a lead agency in a project's CEQA review documentation, including an EIR. A WSA for the Project was prepared and approved by the GVMWD and is attached as Appendix 5.18-A. The approval of a WSA by a potential water supplier in accordance with SB 610 does not create a right or entitlement to water service or impose, expand, or limit any duty concerning the obligation of a public water system to provide certain service. The County has a separate and independent obligation to assess the sufficiency of water supplies for the Project.

The California Supreme Court has provided additional guidance regarding a lead agency's consideration of water supplies for CEQA purposes (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* [2007] 40 Cal.4th 412,) (*Vineyard*). *Vineyard* states that CEQA does not require assurances of certainty regarding long-term future water supplies at an early phase of planning for large land development projects, such as the approval of a specific plan prior to subsequent construction permits, subdivision map, or similar development entitlement approvals. Requiring water supply certainty at an initial approval stage of a long-term, large-scale development project would likely be unworkable because water planning would far outpace land use planning. Consequently, the certainty required for potential water sources for a project varies with the stage of project approval and is much lower when a conceptual plan is approved than at the time of building permit issuance (*Vineyard*, 40 Cal.4th at 434).

Consistent with these holdings, the Supreme Court identified four principles for conducting a water supply analysis in an EIR (*Vineyard*, 40 Cal.4th at 431–434):

1. An EIR cannot ignore or assume a solution to water supply.
2. An EIR cannot limit the water supply analysis to the first stage of a project.
3. Future water supplies identified and analyzed must bear a likelihood of actually being available.
4. If the uncertainties inherent in long-term land use and water planning make it impossible to confidently identify future water supply sources, the EIR should discuss the uncertainty of the future water supply sources, reasonably foreseeable alternatives (including alternative water sources and the option of restricting future phases of development if sufficient water is not available for future phases), and the significant foreseeable environmental impacts of each alternative water supply source and related mitigation measures to reduce each impact, if any.

This EIR incorporates and considers the *Vineyard* case principles in the analysis of the Project's water supplies.

---

**Senate Bill 221**

Section 11010 of the *California Business and Professions Code* and Sections 65867.5, 66455.3, and 66473.7 of the *California Government Code* (frequently referred to as “SB 221”) require land use planning agencies, such as the County, to include, as a condition in any tentative map that includes a subdivision involving more than 500 dwelling units, a requirement that a sufficient water supply shall be available. SB 221 provides that proof of the availability of a sufficient water supply to meet the tentative map condition may be requested by the subdivision applicant or local agency, at the discretion of the local agency, and shall be based on written verification from an applicable public water system within 90 days of a request. The statute defines a sufficient water supply as the total water supplies available during normal, single-dry, and multiple-dry years within a 20-year projection that will meet the subdivision’s projected demand in addition to existing and planned future uses, including agricultural and industrial uses.

A subdivision map verification issued in accordance with SB 221 must consider (1) the availability of water supplies over a historical record of at least 20 years; (2) the applicability of an urban water shortage contingency analysis prepared pursuant to Section 10632 of the *California Water Code* that includes actions to be undertaken by the public water system in response to water supply shortages; (3) the reduction in water supply allocated to a specific water use sector pursuant to a resolution or ordinance adopted, or a contract entered into, by the public water system, as long as that resolution, ordinance, or contract does not conflict with Section 354 of the *California Water Code*; and (4) the amount of water that the water supplier can reasonably rely on receiving from other water supply projects, such as conjunctive use, reclaimed water, water conservation, and water transfers. A verification completed in compliance with SB 221 must be supported by substantial evidence. As discussed in Section 4.0, Project Description, the Project does not include proposed subdivision maps, and a water supply verification is not required for Project approval.

**Recycled Water Regulations**

The State of California has implemented laws that provide for and encourage the use of recycled water. Section 461 of the *California Water Code* states, “It is hereby declared that the primary interest of the people of the state in the conservation of all available water resources requires the maximum reuse of recycled water in the satisfaction of requirements for beneficial uses of water”. The State also encourages Californians to develop water recycling projects to help meet potable water demands and to augment surface and groundwater supplies through the provisions of Sections 13500–13556 of the *California Water Code*.

In 2014, regulatory authority over engineering reports for recycled water projects and for regulations applicable to the design of recycled water systems was transferred from the California Department of Public Health to the SWRCB Drinking Water Program. Sections 13500–13557 of the *California Water Code* regulate the protection of the potable water supply through the control of cross-connections with potential contaminants, including recycled water. Water quality standards and treatment reliability criteria for recycled water are codified in Title 22 of the *California Code of Regulations* (Title 22). Title 22 establishes

quality and/or treatment processes required to use recycled water for non-potable applications. Title 22 also addresses sampling and analysis requirements at a treatment plant; preparation of an engineering report prior to production or use of recycled water; and general treatment design requirements, reliability requirements, and alternative methods of treatment. Permits are issued to each water recycling project by one of the nine Regional Water Quality Control Boards (RWQCBs). These permits include water quality and public health protections, as detailed in Title 22.

On February 3, 2009, in Resolution No. 2009-0011, the SWRCB adopted a Recycled Water Policy (Policy) (SWRCB 2009). The Policy states, “In the face of an unprecedented water crisis due to the collapse of the Bay-Delta ecosystem, climate change, continuing population growth combined with a severe drought on the Colorado River and failing levees in the Delta, the SWRCB has adopted a Recycled Water Policy in an effort to move aggressively towards a sustainable water future”. The SWRCB Policy also states “we declare our independence from relying on the vagaries of annual precipitation and move towards sustainable management of surface waters and groundwater, together with enhanced water conservation, water reuse and the use of stormwater”. The following goals were included in the Policy:

- Increase use of recycled water over 2002 levels by at least 1 million afy by 2020 and at least 2 million afy by 2030.
- Increase the use of storm water over use in 2007 by at least 500,000 afy by 2020 and at least 1 million afy by 2030.
- Increase the amount of water conserved in urban and industrial areas by comparison to 2007 by at least 20 percent by 2020.
- Substitute as much recycled water for potable water as possible by 2030.

The SWRCB Policy provides direction to the RWQCBs regarding appropriate criteria to be used in issuing permits for recycled water projects and is intended to streamline recycled water project permitting, while providing the RWQCBs with sufficient authority and flexibility to address site-specific conditions. The Policy encourages other public agencies to consider the benefits of using recycled water in evaluating the impacts of recycled water projects on the environment as required by CEQA. The Policy also acknowledges that the SWRCB shares jurisdiction over the use of recycled water with the RWQCBs and recognizes that the DWR and California Public Utilities Commission (CPUC) have important roles in encouraging the use of recycled water. The Policy provides guidance concerning these roles. The Policy also includes incentives for using recycled water.

The Policy notes that (1) some groundwater basins contain salts and nutrients that exceed or threaten to exceed water quality objectives established in Basin Plans; (2) all salts and nutrients should be managed on a basin-wide or watershed-wide basis through development of regional or sub-regional management plans; (3) every groundwater basin/sub-basin in California is to have a consistent, locally driven salt/nutrient management plan developed by water and wastewater entities, together with contributing stakeholders in collaborative processes, including compliance with CEQA and participation by RWQCB staff. The Policy describes the components of these salt and nutrient management plans. Finally, the Policy addresses the control of incidental runoff from landscape irrigation

projects, recycled water, groundwater recharge projects, antidegradation factors, control of emerging constituents, and chemicals of emerging concern.

In 2009, the SWRCB adopted a General Permit for landscape irrigation uses of recycled water to facilitate the California Legislature's intent to promote the use of recycled water (SWRCB Order No. 2009-0006-DWQ). The General Permit streamlines the regulatory process for the irrigation use of disinfected tertiary recycled water produced by a public entity at a municipal wastewater treatment facility. Such uses include parks, greenbelts, and playgrounds; school yards; athletic fields; golf courses; cemeteries; residential landscaping in common areas; commercial and industrial landscaping, except eating areas; and freeway, highway, and street landscaping. In June 2016, the SWRCB adopted General Order No. 2016-0068-DDW. The order provides a streamlined Notice of Intent process for the beneficial, non-potable use of recycled water consistent with the California Uniform Statewide Recycling Criteria, except recycled water use to replenish groundwater resources, the disposal of treated wastewater in percolation ponds, and excessive hydraulic loading of recycled water in use areas where the primary purpose of the activity is disposal of treated wastewater and direct potable reuse (SWRCB 2016b).

## **Regional**

### ***Basin Plans***

The *California Water Code* requires that each RWQCB regulate water quality in accordance with adopted basin plans. The applicable basin plans adopted by the RWQCBs with jurisdiction in the Antelope Valley are described in Section 5.2.2 of Section 5.2, Hydrology and Flood, of this EIR.

### ***Water Management Plans***

Current water management plans that analyze demand and supply in the Antelope Valley on a regional basis include the *2015 Urban Water Management Plan* adopted by AVEK and the 2013 AVIRWMP prepared under a memorandum of understanding (MOU) by an 11-member Regional Water Management Group consisting of the AVEK, the Antelope Valley State Water Contractors Association, the City of Lancaster, the City of Palmdale, the Littlerock Creek Irrigation District, Los Angeles County Sanitation District Nos. 14 and 20, Los Angeles County Waterworks District 40 (LACWWD40), the Palmdale Water District (PWD), the Quartz Hill Water District (QHWD), and the Rosamond Community Services District (RCSD).

An IRWM plan for the Antelope Valley was first prepared and adopted in 2007. The 2007 AVIRWMP was subsequently updated in 2013 to include new information required by the 2012 Integrated Regional Water Management Proposition 84 Guidelines adopted by DWR and more current water demand and supply information. The 2013 AVIRWMP analyzes water supplies and demands in the Antelope Valley region, including imported water, groundwater, local supplies, and urban and agricultural demand, for average, single-dry, and multiple-dry years through 2035.

AVEK is the largest SWP contractor in the Antelope Valley region and provides imported water on a wholesale basis to local and retail purveyors in incorporated and unincorporated areas of Antelope Valley. As discussed below, AVEK has also executed an agreement with the Tejon Ranch Company (TRC) to import water purchased by TRC for Project use. The Project site is located within the existing AVEK service and assessment area. The 2015 UWMP adopted by AVEK in 2016 analyzes anticipated SWP imported supplies (including potential banked and stored imports) and demand through 2035.

LACWWD40 provides water for urban use throughout the Antelope Valley and is governed by the Los Angeles County Board of Supervisors. In January 2017, the LACWWD40 published an approved final draft of the 2015 UWMP. The Project is not located within the LACWWD40 service area and will not be served by the District. The District's 2015 UWMP includes a discussion of several of the regional water supplies that will be used to meet Project demand, such as SWP imports through AVEK and groundwater in accordance with the adopted Judgement and Physical Solution for the Antelope Valley Groundwater Basin.

### ***Antelope Valley Groundwater Adjudication Judgment and Physical Solution***

The Antelope Valley Groundwater Basin is regulated in accordance with a Court-approved adjudication Judgment and Physical Solution entered in December 2015 in the consolidated complex proceedings commonly known as the "Antelope Valley Groundwater Cases". The procedural history of the litigation dates from a 1999 lawsuit filed by a farming company and a general groundwater adjudication for the Antelope Valley Groundwater Basin that was initiated by LACWWD40 in 2004. In 2005, the Judicial Council of California consolidated several related lawsuits (Judicial Council Coordination Proceeding No. 4408), which were assigned to the Hon. Jack Komar in the Santa Clara County Superior Court (Case No. 1-05-CV-049053). Four trial phases were completed in the proceeding, including the determination of the adjudication basin boundaries (Phase 1); the determination that all of the basin is hydrologically connected for adjudication purposes (Phase 2); the determination that the basin is overdrafted and that the total sustainable yield, including native groundwater and return flows, is approximately 110,000 afy (Phase 3); and the determination of groundwater production amounts for parties to the proceedings during 2011 and 2012 (Phase 4).

A "physical solution" refers to an agreed upon or judicially imposed resolution of conflicting groundwater claims in a manner that advances the California constitutional rule of reasonable and beneficial use of the state's water supply (*City of Santa Maria v. Adam* [2012] 211 Cal. App. 4th 266, 288). To achieve these objectives, a physical solution establishes an equitable remedy designed to alleviate overdrafts and the consequential depletion of water resources in a particular area, consistent with the constitutional mandate to prevent waste and unreasonable water use and to maximize the beneficial use of limited resources (*California American Water v. City of Seaside* [2010] 183 Cal. App. 4th 471, 480).

The Judgment and Physical Solution adopted for the Antelope Valley establishes a regional watermaster to regulate groundwater use consistent with applicable law and the total sustainable yield of the basin under the auspices of the court. As of January 2016, all groundwater users in the basin are required to begin a 7-year "rampdown" period during which groundwater production will be reduced to levels consistent with the total sustainable

yield of approximately 110,000 afy. Among other provisions, the Judgment and Physical Solution allows for interbasin groundwater transfers subject to watermaster approval; water banking in accordance with storage agreements with the watermaster; the production of return flows from imported water use in the Antelope Valley; the production of return flows from imported water use in the watershed surrounding the basin subject to watermaster approval; and the carryover and storage of unused groundwater allocations (see “Antelope Valley Groundwater Basin” in Section 5.18.3). The Judgment and Physical Solution approved by the court is attached as Appendix 5.18-D.

### ***Los Angeles County General Plan and Antelope Valley Area Plan***

The Los Angeles County General Plan and the Antelope Valley Area Plan (AVAP), a component of the General Plan, include goals and policies that address water supply issues in the unincorporated County. The Los Angeles County Board of Supervisors approved updates to the General Plan and the AVAP and certified the CEQA environmental impact reports for these updates in 2014 and 2015. The General Plan provides goals and policies to achieve countywide planning objectives and serves as the foundation for all community-based plans (including the AVAP), which focus on land use and policy issues that are specific to a planning area. The AVAP update was approved prior to the approval of the General Plan update and effectively implements the Antelope Valley Reduced Intensity Alternative analyzed in the General Plan Update Draft EIR. The Public Services and Facilities Element of the General Plan includes general policies related to water supply. The Conservation and Open Space (COS) section of the AVAP sets forth substantially similar water supply and related goals and policies, including the following:

**Goal COS 1:** Growth and development are guided by water supply constraints.

**Policy COS 1.1:** Require that all new development proposals demonstrate a sufficient and sustainable water supply prior to approval.

**Policy COS 1.2:** Limit the amount of potential development in areas that are not or not expected to be served by existing and/or planned public water infrastructure through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy COS 1.3:** Limit the amount of potential development in groundwater recharge areas through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy COS 1.4:** Promote the use of recycled water, where available, for agricultural and industrial uses and support efforts to expand recycled water infrastructure.

**Goal COS 2:** Effective conservation measures provide an adequate supply of clean water to meet the present and future needs of humans and natural ecosystems.

**Policy COS 2.1:** Require new landscaping to comply with applicable water efficiency requirements in the County Code.

**Policy COS 2.2:** Require low-flow plumbing fixtures in all new developments.

**Policy COS 2.3:** Require onsite stormwater infiltration in all new developments through the use of appropriate measures, such as permeable surface coverage,

permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.

**Policy COS 2.4:** Discourage water intensive recreational uses, such as golf courses, unless recycled water is used to sustain these uses.

**Policy COS 2.5:** Discourage the use of potable water for washing outdoor surfaces.

**Policy COS 2.6:** Support experiments in alternate forms of water provision and re-use, such as “air to water technology” and gray water systems.

**Policy COS 2.7:** Limit use of groundwater sources to their safe yield limits.

**Policy COS 2.8:** Coordinate with federal, state, regional and local agencies to develop and implement new technologies in water management.

**Goal COS 3:** A clean water supply untainted by natural and man-made pollutants and contaminants.

**Policy COS 3.1:** Discourage the use of chemical fertilizers, herbicides and pesticides in landscaping to reduce water pollution.

**Policy COS 3.2:** Restrict the use of septic systems in areas adjacent to aqueducts and waterways to prevent wastewater intrusion into the water supply.

**Policy COS 3.3:** Require a public or private sewerage system for land use densities that would threaten nitrate pollution of groundwater if unsewered, or when otherwise required by County regulations.

**Policy COS 3.4:** Support preservation, restoration and strategic acquisition of open space to preserve natural streams, drainage channels, wetlands, and rivers, which are necessary for the healthy functioning of ecosystems.

**Policy COS 3.5:** Protect underground water supplies by enforcing controls on sources of pollutants.

**Policy COS 3.6:** Support and encourage water banking facilities throughout the Antelope Valley, including within Significant Ecological Areas.

The Project will comply with the water-related goals and policies in the AVAP. Section 5.8, Land Use, Entitlements, and Planning, presents an in-depth analysis of the Project’s consistency with relevant plans, policies, and regulations. Section 5.2, Hydrology and Flood, and Section 5.4, Water Quality, discuss the Project’s potential impacts to groundwater, surface flows, and related AVAP goals and policies.

### ***Los Angeles County Green Building and Low Impact Development Standards***

In 2008, the County adopted the Green Building Program, which included the Drought-Tolerant Landscaping, Green Building, and Low Impact Development Ordinances (the Ordinances), and created an Implementation Task Force and Technical Manual. In November 2013, in response to the mandates set forth in the 2010 California Green Building Standards (CALGreen) Code, the Board of Supervisors adopted the Los Angeles County Green Building Standards Code (Title 31). The CALGreen Code and the Ordinances adopted in 2008 comprise the County’s primary green building and low impact development (LID) standards.

### 5.18.3 ENVIRONMENTAL SETTING

This section discusses the water supply and demand in the Antelope Valley region. Water in the Antelope Valley is supplied from three primary sources: (1) naturally occurring water accumulated as surface water or groundwater from rain and snow; (2) imported surface water collected in Northern California and conveyed through the SWP to the region; and (3) a smaller quantity of surface water stored in the Littlerock reservoir located to the south of Palmdale on the north side of the San Gabriel Mountains (DRP 2014). The first section below discusses groundwater in the Antelope Valley and the effects of the Antelope Valley Groundwater Basin adjudication Judgment and Physical Solution on regional groundwater supplies. The second section below discusses the reliability of the SWP system with reference to the DCR published by the DWR in June 2015 and the 2015 AVEK UWMP. The third section summarizes the regional water supply and demand projections in the AVIRWMP, the most recent regional analysis, and the AVEK 2015 UWMP (AVEK 2016). The fourth section discusses regional water quality.

#### Antelope Valley Groundwater Basin

The Antelope Valley is located in the southwestern portion of the Mojave Desert in Southern California, about 40 miles north of the city of Los Angeles. Approximately  $\frac{2}{3}$  of the Valley is located in northern Los Angeles County, and the remainder is located in southeastern Kern County. The Valley is bound on the south and west by the San Gabriel and Tehachapi Mountains; on the north by the Rosamond and Bissell Hills; and on the east by the Hi Vista area buttes and alluvial fan. The Fremont Valley is located to the north and the Victor Valley to the east of the Antelope Valley Basin (DRP 2014).

The Antelope Valley is considered to be a closed hydrologic basin because water drains into, but not out of, the Valley. It extends over approximately 1,390 square miles. The Antelope Valley is comprised of relatively flat valley land and dry lake beds, with coalescing alluvial fans and scattered buttes around the periphery. The basin is topographically closed on the north and northwest by the Garlock Fault at the base of the Tehachapi Mountains, and on the south and southwest by the San Andreas Fault at the base of the Transverse Ranges, which include the San Gabriel Mountains. Surface elevations in the Valley range from about 2,300 feet to nearly 3,500 feet above mean sea level. Several creeks, including the perennial Big Rock and Little Rock Creeks, drain the surrounding mountains, cross the alluvial fans, and become dry washes in the Valley. The Los Angeles Aqueduct traverses the western end of the Valley, and the California Aqueduct runs along the Valley's southern edge, flanking the San Gabriel Mountains (DRP 2014).

Urban centers in the Antelope Valley include the cities of Lancaster, Palmdale, and Rosamond along State Route (SR) 14, as well as a large portion of Edwards Air Force Base (AFB) in the Valley's northeast corner. The Palmdale and Lancaster urbanized area has grown rapidly since the 1980s and has a current population of approximately 280,000 residents. Agricultural lands occupy various areas near the cities and Edwards AFB, and comprise approximately 25,000 acres (DRP 2014). Exhibit 5.18-1, Primary Features in the Antelope Valley Groundwater Basin, provides an aerial photograph that depicts the Project site in relation to the primary topographic features of the Antelope Valley Groundwater Basin.

# Primary Features in the Antelope Valley Groundwater Basin

# Exhibit 5.18-1

Centennial Project

The Antelope Valley Groundwater Basin's storage capacity has been reported to range from 68 million af to 70 million af (DWR 2004). Agricultural and urban uses have been the primary sources of extraction from the groundwater system. The Project site overlays the far western portion of the basin, and is located approximately 20 miles to the east of these subsidence areas.

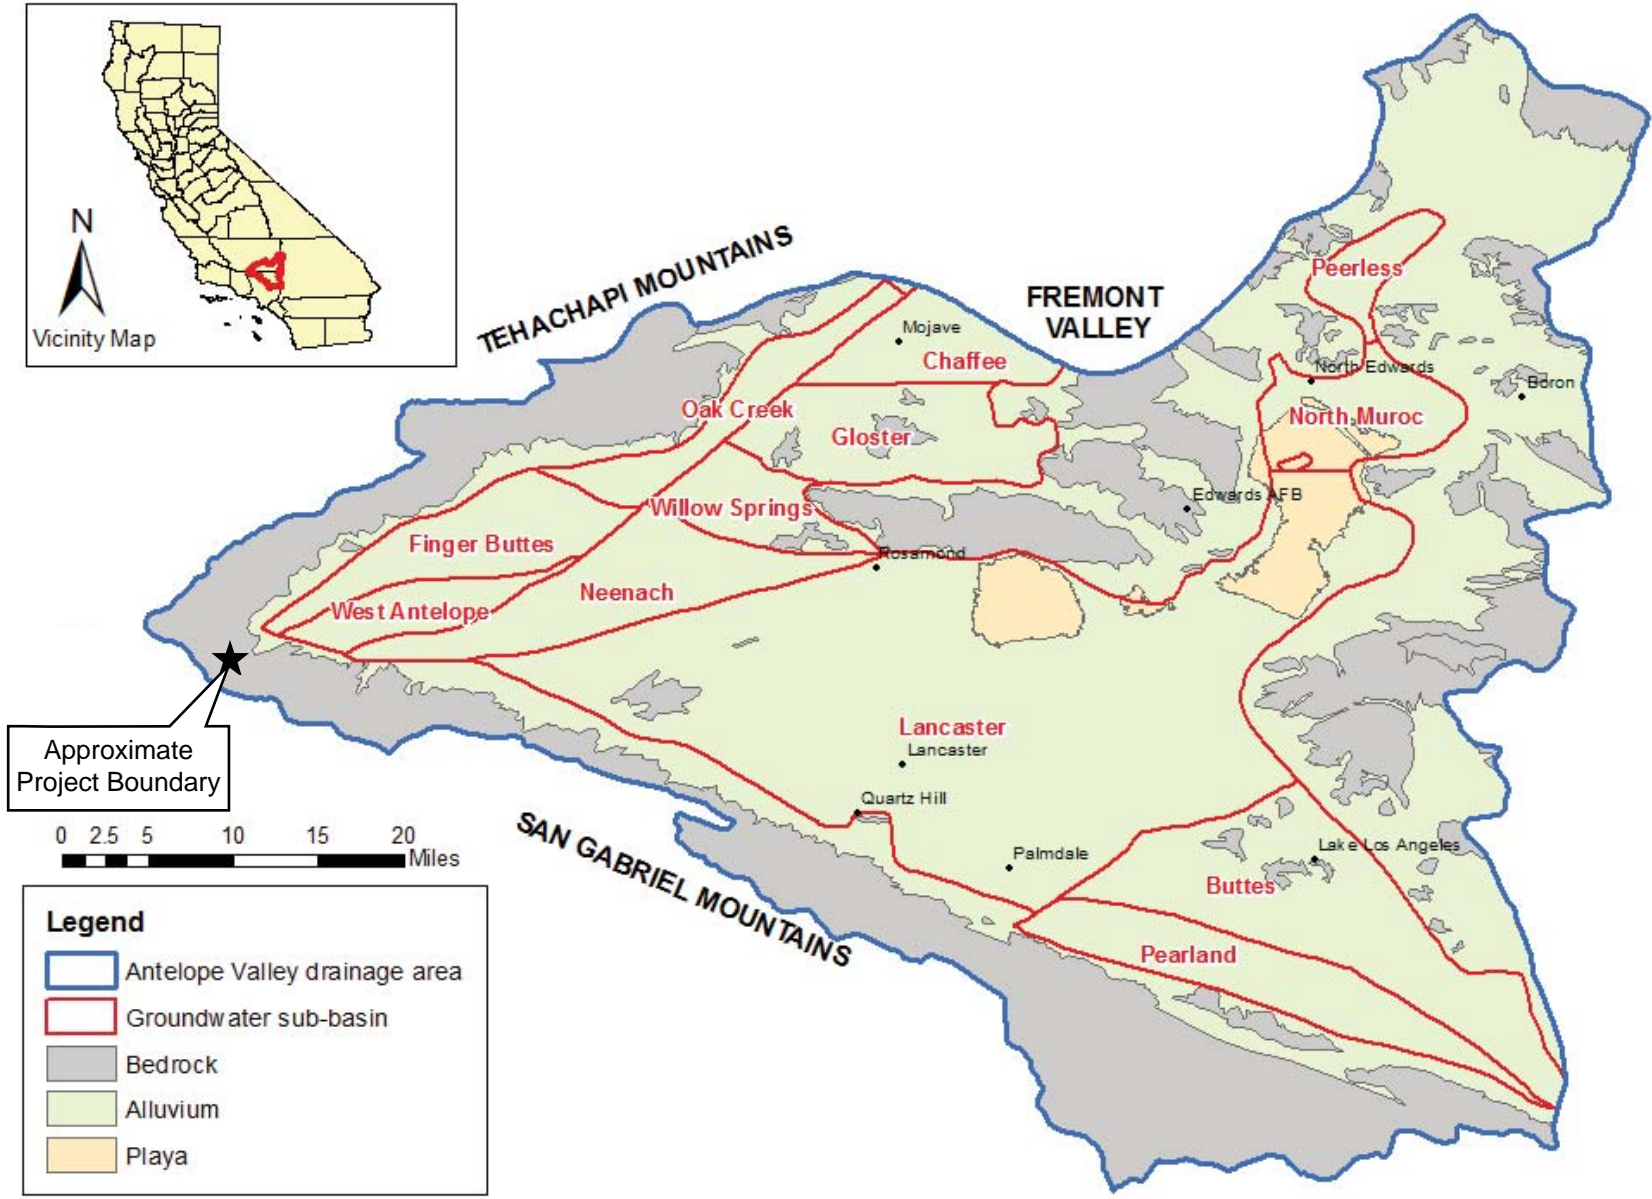

The basin includes two primary aquifers: (1) the principal aquifer and (2) the deep aquifer. The principal aquifer is an unconfined aquifer. The basin is principally recharged by deep percolation of precipitation and runoff from the surrounding mountains and hills. Separated from the principal aquifer by clay layers, the deep aquifer is generally considered to be confined. The principal aquifer is typically thickest in the southern portion of the Valley near the San Gabriel Mountains, while the deep aquifer is thickest in the vicinity of the dry lakes on Edwards AFB. The basin is divided into 12 subunits: Finger Buttes, West Antelope, Neenach, Willow Springs, Gloster, Chaffee, Oak Creek, Pearland, Buttes, Lancaster, North Muroc, and Peerless (LACWWD40 2017). The Project site is located in the extreme western portion of the Antelope Valley groundwater basin, and overlies the Finger Buttes and West Antelope subunits (see Exhibit 5.18-2, Groundwater Sub-basins in the Antelope Valley Groundwater Basin, and Exhibit 5.18-5, Location of Study Area, Tejon Ranch Company Land, and the Project Site). The locations of the 12 subunits in the Antelope Valley Groundwater Basin are shown in Exhibit 5.18-2.

Substantial groundwater pumping in the Antelope Valley began in the early 1900s and peaked in the 1950s. In some localized areas, the rate of decline has slowed. Groundwater levels have increased slightly in the rural western and far northeastern areas of the region (DRP 2014).

In approximately 1999, agricultural interests in the Antelope Valley initiated litigation seeking to determine certain rights to groundwater. In 2004–2005, the litigation was consolidated and certain public water suppliers, including Los Angeles County Waterworks District 40, sought an adjudication of groundwater rights in the basin. Four trial phases were subsequently completed and, in December 2015, a Judgment and Statement of Decision adopting a Judgment and Physical Solution for the basin were entered by the Court (CSC 2015; see Appendix 5.18-D). The adjudication determined that the Antelope Valley Basin was in a state of overdraft for over 50 years and that the total sustainable yield of the basin, including both native groundwater safe yield and return flows from imported water use, is approximately 110,000 afy. Pursuant to the Judgment and Physical Solution, a watermaster appointed under the auspices of the court will monitor and regulate groundwater use in the basin. The Judgment and Physical Solution also includes the following provisions (CSC 2015):

- (1) An allocation of overlying rights to the basin's adjusted native safe yield to specific parties in Exhibit 4 of the Judgment and Physical Solution that will be implemented over a seven-year rampdown period starting in January 2016. The Tejon Ranch Company and Tejon RanchCorp are allocated a post-rampdown right to 1,634 afy in Exhibit 4 of the Judgment and Physical Solution.
- (2) Parties that import water through AVEK and that are identified on Exhibit 8 of the Judgment and Physical Solution may produce return

flows from imported water used for municipal and industrial purposes within the Antelope Valley Basin equal to 39 percent of the average amount of imported water used in the preceding five years. Parties that use imported water on lands outside the basin but within the basin watershed are entitled to produce return flows to the extent they can establish, to the satisfaction of the watermaster, that such return flows augment the basin groundwater supply. The Tejon Ranch Company and Tejon RanchCorp are included in Exhibit 8 of the Judgment and Physical Solution.

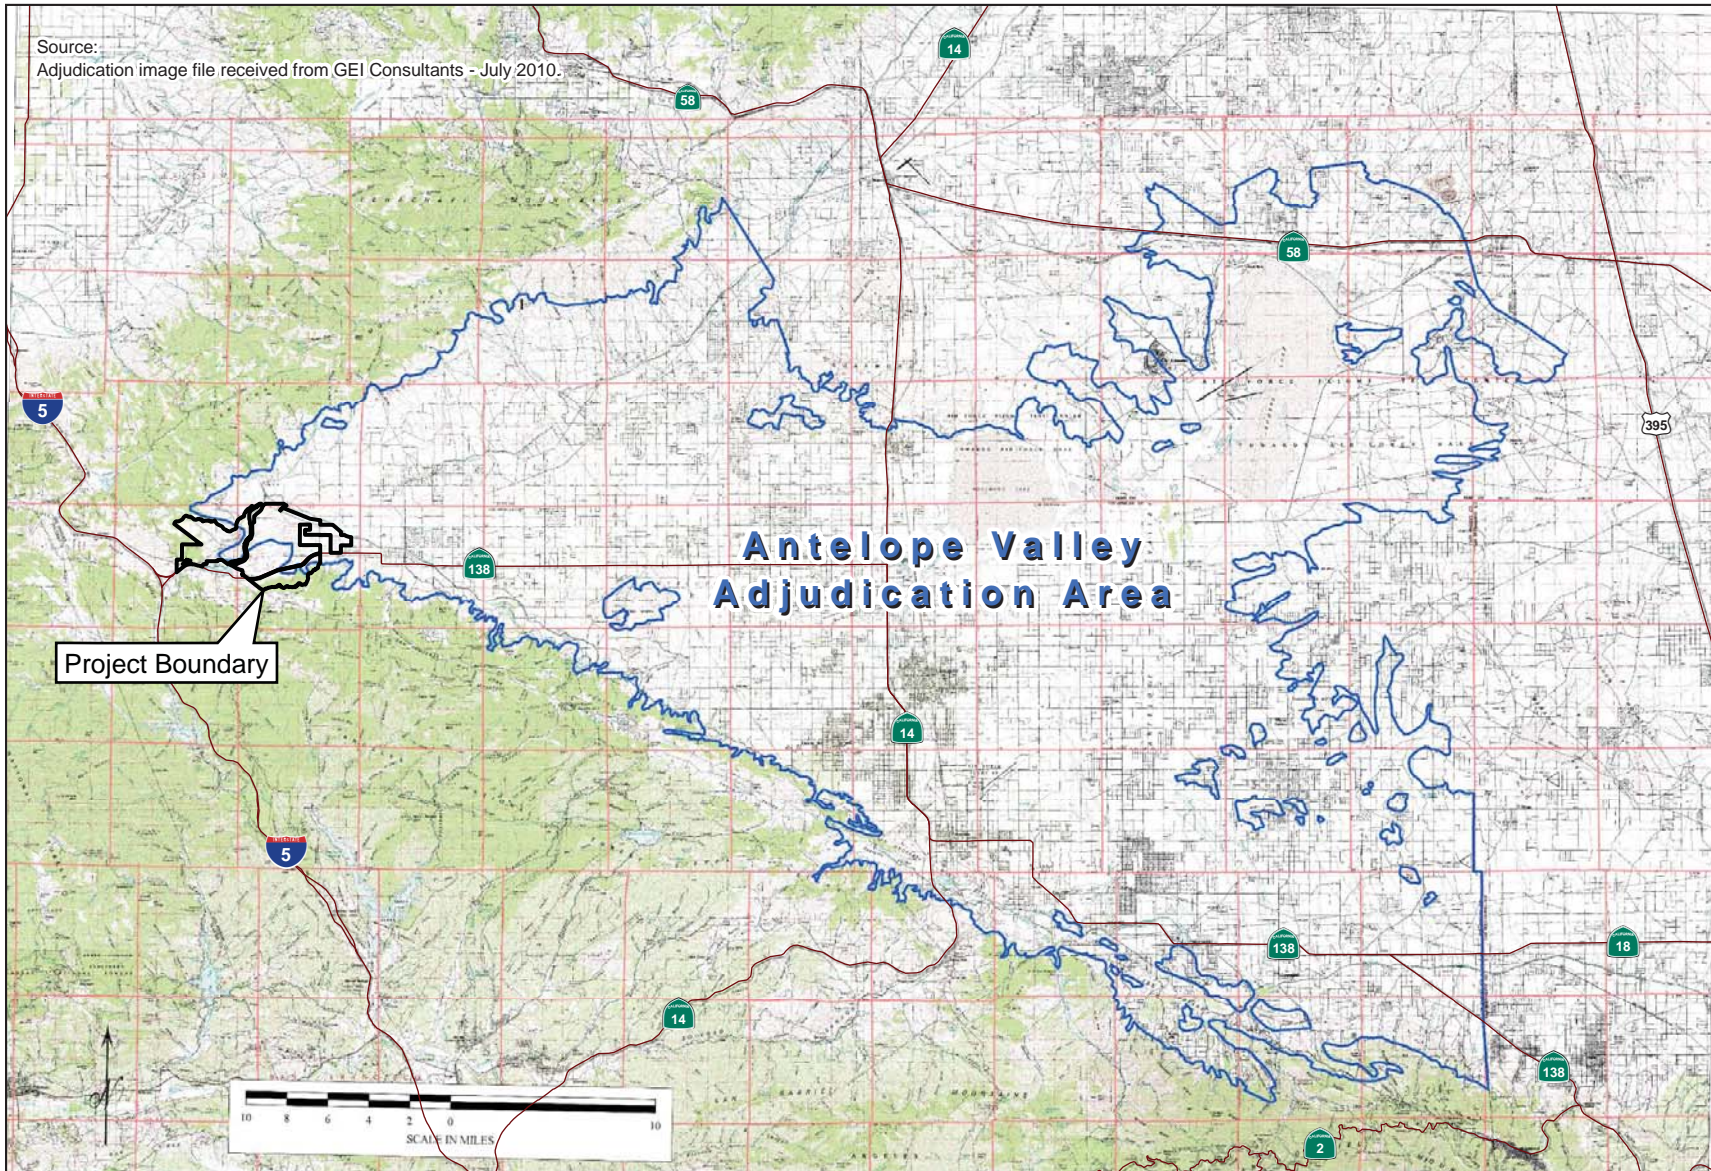

- (4) All parties have the right to store water in the basin pursuant to a storage agreement with the watermaster. The Judgment and Physical Solution does not limit or modify the operation of preexisting banking projects or the performance of preexisting exchange agreements, including existing water banks operated by the Tejon Ranch Company and Tejon RanchCorp.
- (5) Unproduced portions of a groundwater allocation may be carried over for 10 years and stored after the carry-over period subject to the terms and conditions of a storage agreement approved by the watermaster.
- (6) Pursuant to terms and conditions established by the watermaster and subject to hydrologic review by an engineer retained by the watermaster, a party may transfer all or any portion of its applicable groundwater production rights to another party so long as the transfer does not cause a “material injury”, as defined in the Judgment and Physical Solution.
- (7) The Tejon Ranch Company and Tejon RanchCorp are included in the list of parties that conduct business and that may produce and transport groundwater for use on lands outside the basin and within the watershed of the basin, as shown in Exhibit 9 of the Judgment and Physical Solution.

Exhibit 5.18-3, Antelope Valley Adjudication Area, depicts the boundaries of the adjudication area in relation to the Project site boundaries. Exhibit 5.18-4, Project Site and Tejon Ranch Company Land Ownership within the Antelope Valley Adjudication Area, shows a more detailed depiction of the Project site and Tejon Ranch Company (TRC) land ownership in the Antelope Valley Adjudication Area. Exhibit 5.18-5, Location of Study Area, Tejon Ranch Company Land, and the Project Site, shows the Project site in relation to the extreme western portion of the Antelope Valley Groundwater Basin, overlying the Finger Buttes and West Antelope subunits.

The purpose of the Antelope Valley Adjudication Judgment and Physical Solution is to allow for groundwater use in a manner that avoids overdraft and fosters sustainable beneficial uses by limiting production to the basin’s total sustainable yield of approximately 110,000 afy. As a result, groundwater production in accordance with the Judgment and Physical Solution is considered a very reliable supply for the Antelope Valley region even in short-term and during multiple-year droughts (RWMG 2013).

## Imported State Water Project (SWP) Water Supplies

### *State Water Project Overview*

In 1959, California approved a \$1.75 billion general obligation bond that enabled the Department of Water Resources (DWR) to commence construction of the State Water Resources System, commonly known as the SWP. The SWP is the nation's largest State-built water and power development and conveyance system; it includes 660 miles of aqueduct and conveyance facilities extending from Lake Oroville in the north to Lake Perris in the south. In addition to these facilities, the system includes pumping and power plants, reservoirs, lakes, storage tanks, canals, tunnels, and pipelines that capture, store, and convey water throughout the state. The DWR operates and manages the SWP facilities. The SWP was designed and built to (1) deliver water; (2) control floods; (3) generate power; (4) provide recreational opportunities; and (5) enhance fish and wildlife habitats (DWR 2010).

SWP water originates in various streams that are tributary to the Sacramento – San Joaquin River Delta (Delta). A portion of water derived from the Feather River is stored in Lake Oroville, which releases previously stored water back into the Feather River and then to the Sacramento River. These flows and other natural, unstored Sacramento River flows reach the Delta, where water is pumped into the California Aqueduct from SWP facilities located on the southern edge of the Delta. The pumping plant also diverts natural flows from the San Joaquin River and various east-side streams. The SWP aqueduct system, which includes several south-of-the-Delta reservoirs, delivers water to the base of the Tehachapi Mountains, where a pumping system lifts the water through a series of pipelines to the south. Just north of the Project site, the Aqueduct branches into the West Branch, which conveys water south through the greater Los Angeles area, and the East Branch, which traverses the northern side of the San Gabriel Mountains.

At the inception of the SWP, the DWR entered into individual water supply contracts with agricultural and urban water agencies (SWP contractors) throughout California. The contracts were the method used to repay the costs of construction and operation of the SWP facilities for the delivery of water to the SWP contractors. Each such contract sets forth a maximum annual allocation of SWP water to that contractor, which is stated in Table A in the contract. As a result, each contractor's allocation of SWP water is referred to as a "Table A Amount".

Article 21 of the SWP contracts allows a contractor to receive surplus SWP water that may exist in the Delta on an unscheduled and interruptible basis ("Article 21 water"). This water supply has historically been available only in average to wet years, and generally only for a limited time in the late winter. As discussed below, species and water quality regulatory constraints have increasingly affected the reliability of Delta water supplies, including the potential availability of Article 21 water. According to the AVIRWMP, Article 21 water is generally delivered most readily to agricultural contractors and to San Joaquin Valley banking programs and is not considered a long-term reliable supply for the Antelope Valley region (RWMG 2013). Although the DWR continues to project that Article 21 water will be available in the future, the analysis of Project water supplies in Section 5.18.6 conservatively assumes that no such water will be used to meet demand.

There are 29 SWP contractors, including three in the Antelope Valley region: the AVEK, the Palmdale Water District (PWD), and the Littlerock Creek Irrigation District (LCID). The SWP delivers water to each contractor in accordance with the system's supply availability and contractor demands. By October 1 of every year, each contractor provides the DWR with a request for water delivery that cannot exceed its full Table A Amount. Actual deliveries may be less than a contractor's request due to hydrology, stored water availability, and regulatory or operating constraints. When available SWP water is less than what a contractor requests, each contractor receives a percentage of its Table A Amount based on SWP supplies (RWMG 2013).

The SWP is contracted to deliver up to 4.17 million afy of Table A water. AVEK is the state's third largest water contractor and has a Table A Amount of approximately 144,844 afy. The AVIRWMP estimates that approximately three percent of AVEK's Table A deliveries have historically been supplied to customers outside the Antelope Valley. As a result, the AVIRWMP estimates that a maximum of 137,150 afy of the total AVEK Table A Amount is available for delivery in the Antelope Valley. As discussed below, certain Table A Amounts have been secured for Project use from two Central Valley water districts and were assigned to AVEK in accordance with SWP rules and regulations. The AVEK wholesale demands for TRC in Table 4-2 of the 2015 UWMP (AVEK 2016) and in the AVIRWMP do not include these Project-specific amounts. The PWD has a Table A Amount of 21,300 afy, and the LCID has a Table A Amount of 2,300 afy (RWMG 2013). The Project is not located within the service area of, and would not be served by, the PWD or the LCID.

Due to several factors, the total volume of SWP Table A Amounts delivered each year is subject to annual variation. The DWR publishes an assessment of the SWP system's existing and future reliability on a biannual basis. The most recent assessment by the DWR is the DCR published in June 2015. The following sections discuss the primary regulatory and other factors affecting SWP reliability identified in the DCR.

#### Endangered Species Protection Measures Affecting Delta Water Exports

Several species protected under the Federal Endangered Species Act (FESA) are located in the south Delta and are potentially affected by the SWP and nearby federal water project extraction pumps. As a result, the operation of the SWP and federal pumps requires FESA incidental take permits pursuant to biological opinions (BiOps) issued by the U.S. Fish and Wildlife Service (USFWS) for freshwater fish and the National Marine Fisheries Service (NMFS) for anadromous fish (ocean-dwelling fish that spawn in fresh water, such as salmonids) and marine mammals. Certain of these species are also protected under the California Endangered Species Act (CESA) and require state incidental take authorizations from the California Department of Fish and Wildlife (CDFW). CESA allows the CDFW to authorize State incidental take for species also protected under the FESA by making a determination that a federal incidental take permit is consistent with CESA requirements (this is known as a CESA "consistency determination").

Since 1993, several BiOps have been issued for SWP Delta operations that restrict SWP exports from the Delta to specific amounts at certain times and conditions to protect listed species. In February 1993, the NMFS issued a BiOp for winter-run Chinook salmon, and the

USFWS issued a BiOp in March 1995 for the delta smelt and splittail. These BiOps imposed Delta inflow, Delta outflow, and export pumping restrictions, many of which were incorporated by State water quality regulators in the 1995 Water Quality Control Plan for the San Francisco Bay/Sacramento – San Joaquin Delta (see the discussion of water quality regulations below).

In 2005, the USFWS issued a BiOp concluding that certain proposed coordinated SWP and federal water project operations in the Delta would not jeopardize the continued existence of the delta smelt or result in the destruction or adverse modification of smelt critical habitat. In response to lawsuits, the 2005 BiOp was vacated and the USFWS was ordered to prepare a new opinion. The USFWS issued a revised BiOp in 2008, which determined that the proposed water project operations in the Delta would jeopardize the delta smelt.

Similarly, in 2004, the NMFS issued a BiOp concluding that the proposed coordinated SWP and federal Delta water project operations would not jeopardize protected salmonids, green sturgeon, or “southern resident” killer whales. The 2004 BiOp was also vacated after legal challenge and, in June 2009, the NMFS issued a revised BiOp concluding that the operations would jeopardize the species.

In accordance with the FESA, the BiOps identified “reasonable and prudent alternatives” that would avoid jeopardy to the species, including several Delta operational limitations that further reduce the potential amount of SWP supplies that can be delivered to system contractors. The USFWS BiOp limits SWP exports in 10 of 12 months of each year, including Delta flow restrictions that are adaptively managed as determined by USFWS staff on the basis of flow and fish population monitoring data. Delta target flows are primarily accomplished by reducing SWP and federal water exports. The USFWS BiOp also includes additional salinity requirements in September and October for wet and above-normal water years that require increased releases from SWP and federal reservoirs upstream of the Delta. The NMFS BiOp limits exports during April and May in all but extremely wet years.

The 2008 USFWS and 2009 NMFS BiOps were invalidated in federal court on various grounds, including the failure to use the best available science in the development of the opinions. Both decisions were appealed to the Ninth Circuit Court of Appeals and subsequently reversed in 2014 (March 2014 for the USFWS BiOp and December 2014 for the NMFS BiOp). The CDFW issued consistency determinations for both federal BiOps under Section 2080.1 of the *California Fish and Game Code* to provide for state incidental take coverage under the CESA. The SWP system is currently subject to the 2008 USFWS and 2009 NMFS BiOps that were upheld by the Ninth Circuit in 2014 and the CESA consistency determinations issued by the CDFW.

### Delta Inflows

SWP deliveries are affected by the volume of Delta inflows, which vary considerably from season to season and from year to year. In an above-normal year, nearly 85 percent of the total Delta inflow comes from the Sacramento River; more than 10 percent comes from the San Joaquin River; and the rest comes from the 3 eastside streams (i.e., the Mokelumne, the Cosumnes, and the Calaveras Rivers). Water years are designated by DWR as “wet” (W),

“above normal” (AN), “below normal” (BN), “dry” (D), or “critical” (C). In general, much less water will flow into the Delta during a dry or critical water year than during a wet or above-normal water year. Fluctuations in inflows affect Delta water quality and fish habitat which, in turn, trigger regulatory requirements that constrain SWP Delta pumping.

About 80 percent of annual precipitation occurs between November and March, and very little rain typically falls from June through September. Upstream reservoirs regulate inflow variability by reducing flood flows during the rainy season and by storing water to be released later in the year to meet water demands and flow and water quality requirements.

### Water Quality Objectives

In its 1995 Water Quality Control Plan for the San Francisco Bay/Sacramento – San Joaquin Delta (WQCP), the SWRCB set water quality objectives to protect beneficial uses of water in the Delta and Suisun Bays. The objectives include minimum Delta outflows, limits on SWP and federal Delta exports, and maximum allowable salinity levels and are enforced through the provisions of Water Right Decision 1641 (D-1641), issued in December 1999 and updated in March 2000 by the SWRCB.

The WQCP and D-1641 include certain “X2” objectives, which establish allowable salinity levels in the Delta expressed as the distance in kilometers from the Golden Gate Bridge where the salinity concentration reaches two parts per thousand. The purpose of the X2 objective is to regulate the salinity gradient in the Delta between February and June by ensuring that freshwater from the east is sufficient to prevent saltwater intrusion from the west beyond certain locations to protect Delta water quality and beneficial uses. The objective requires that the X2 line must remain downstream of Collinsville in the Delta, and downstream of other locations on a certain number of days each month from February through June. Depending on annual hydrological conditions, SWP operations, including exports, may be limited or curtailed to retain freshwater in the Delta and to meet applicable X2 objectives.

The WQCP and D-1641 also establish an export/inflow (E/I) ratio that affects SWP reliability to provide protection for fish and wildlife beneficial uses in the Delta. The E/I ratio limits the fraction of Delta inflows that may be exported when other WQCP and D-1641 restrictions are not in effect. In general, the E/I ratio limits Delta exports to 35 percent of total Delta inflow from February through June and 65 percent of inflow from July through January.

Several Delta planning and improvement efforts have been initiated to facilitate the protection of Delta habitats and the reliability of SWP and other water supplies, including the Delta Plan, the Bay Delta Conservation Plan, and the Delta Risk Management Strategy, as discussed further below.

### *Delta Plan*

In 2009, California enacted the Delta Reform Act of 2009, which created the Delta Stewardship Council. The purpose of the Act is to achieve the “coequal goals” of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem (*California Water Code*, Section 85054). A final Delta Plan was adopted by the Council on May 16, 2013, which includes 14 regulatory policies and 73 recommendations.

The State Office of Administrative Law approved regulations to implement the Delta Plan regulatory policies on September 1, 2013. The Plan's policies and recommendations include the following:

- Requiring Delta water users to certify in water management plans that all feasible efforts to use water efficiently and that efforts to develop additional local and regional water supplies are being implemented.
- Reserving six high-priority areas for habitat restoration.
- Protecting agricultural land by requiring developers to locate new residential, commercial, or industrial development in areas planned for urban use.
- Requiring State and local agencies to locate, when feasible, water management facilities, ecosystem projects, and flood-management infrastructure in ways that would reduce or avoid conflicts with agriculture and other existing planned uses and requiring those agencies to consider locating the facilities on public land before using private land.
- Prohibiting encroachment on floodways and floodplains.
- Requiring developers of new residential subdivisions to include a level of flood protection that anticipates sea levels rising due to climate change.
- Setting priorities for State investment in Delta flood levees.
- Updating statewide water-use efficiency goals and groundwater management plans for areas using Delta water; streamlining water transfer procedures; and developing a statewide system for reporting how much water is used.
- Having the SWRCB update water quality objectives for the Sacramento and San Joaquin Rivers; controlling or reducing other Delta stressors such as contaminants and invasive species; expanding floodplains and riparian habitats; and locating habitat restoration to accommodate sea-level rise.
- Encouraging agritourism, wildlife-friendly farming practices, and recreational opportunities in the Delta.
- Creating a Delta Flood Risk Management District to provide adequate funding for flood control and emergency preparedness.

In 2014, the Delta Stewardship Council launched a Delta Levees Investment Strategy to identify funding priorities and assemble a comprehensive investment strategy for maintaining Delta levees that protect water quality from seawater intrusion and to provide flood control. The investment strategy will be developed in collaboration with State agencies, local reclamation districts, Delta landowners and businesses, and other important stakeholders.

---

*Bay Delta Conservation Plan (BDCP) and Cal WaterFix*

The Bay Delta Conservation Plan (BDCP) is a comprehensive plan prepared by local water agencies, environmental and conservation organizations, State and federal agencies, and other stakeholders to implement a suite of habitat restoration measures, other Delta water quality and habitat stressor reduction activities, and water operations criteria that will facilitate the issuance of long-term permits to operate the SWP and other projects and water operations in the Delta. As defined in Section 85053 of the *California Water Code*, the BDCP is a multispecies conservation plan that is being developed to allow for the issuance of a habitat conservation plan (HCP) under the FESA and a Natural Communities Conservation Plan (NCCP) that will provide CESA incidental take coverage.

The BDCP has been in development since 2006. A draft BDCP and a joint environmental impact report and environmental impact statement (EIR/EIS) in accordance with CEQA and the National Environmental Policy Act (NEPA) were released for public review in late 2013. The lead agencies for the project are the DWR and the U.S. Bureau of Reclamation (Reclamation). Public comments were received through mid-2014. A Partially Recirculated Draft EIR/EIS (RDEIR/SDEIS) was made available for public review and comment from July 10, 2015, to October 30, 2015. The RDEIR/SDEIS was prepared to review engineering refinements made to the proposed water conveyance facilities; to consider additional subalternatives; and to update the environmental analysis in response to issues raised in more than 12,000 comments received on the 2013 EIR/EIS. The RDEIR/SDEIS includes a new Alternative 4A, which the lead agencies have identified as the CEQA and NEPA preferred alternative. Alternative 4A includes three new intakes along the Sacramento River and dual-bore tunnels to convey water to existing state and federal pumping facilities; it also includes habitat restoration measures and other environmental commitments necessary to comply with state and federal environmental law such as the FESA and CESA.

In December 2016 the lead agencies released a Final EIR/EIS for the project, which was renamed the “BDCP/California WaterFix”, in part to reflect the decision to obtain FESA coverage under Section 7 rather than Section 10 of the Act. Certain delta restoration projects were also separated from the proposed conveyance system improvements. The preferred project alternative (the “California WaterFix”) in the Final EIR/EIS is Alternative 4A, which retains the three new intakes along the Sacramento River and dual-bore tunnels extending south to the delta export pumping facilities. The Final EIR/EIS describes project alternatives; discusses potential environmental impacts; and identifies mitigation measures that would help avoid or minimize impacts. It also provides responses to all substantive comments received on the 2013 EIR/EIS and 2015 RDEIR/SDEIS. As of January 2017, a Record of Decision under NEPA by Reclamation and certification of the EIR and final decision-making under the CEQA by DWR remained pending. No final decision will be made to implement the Cal WaterFix until the CEQA and NEPA review process is complete.

---

*Delta Risk Management Strategy*

The Delta includes over 1,100 miles of levees that surround approximately 700,000 acres of lowlands (many of which are constructed) and artificial islands located throughout the estuary. Levee construction began approximately 150 years ago to prevent flooding on farmland in the region. In the 1860s, gold miners upstream from the Delta used high-pressure water jets to wash significant volumes of soil and rock into local streams and rivers. The resulting silt and debris accumulated in the Delta, raised riverbed elevations, and stimulated levee construction along the affected river channels to keep water velocity high and scour away mining-related sediment. The levee system, however, continually erodes the levee faces exposed to the constrained rivers while the accumulated peat soils protected behind levees contract over time as they dry. Many of the Delta islands and other lowlands behind levees are now 20 feet below sea level. Due to these factors, the Delta levee system is increasingly vulnerable to failure caused by storms; earthquakes; and water, wind, and animal-generated erosion. Levee failures allow seawater to intrude east into the Delta and put at risk major highways, railroad lines, water supply and energy pipelines and other infrastructure in the Delta, including the SWP facilities (DWR 2008)

In 2005, the *California Water Code* was amended to require the DWR to evaluate the potential impacts on Delta water supplies associated with continued land subsidence, earthquakes, floods, and climate change over 50-, 100-, and 200-year projection periods and to identify measures to reduce identified risks. In response, the DWR initiated a two-phase Delta Risk Management Strategy (DRMS). DRMS Phase 1 evaluated the risks associated with levee failures and was completed in a 2008 report to the legislature. The Phase 2 report for the DRMS, issued in June 2011, evaluated alternatives to reduce the risk to the Delta and adverse consequences from levee failure. The Phase 2 report identified several potential levee improvements and evaluated the extent to which these improvements would reduce the consequences of potential levee failures in four scenarios.

The Metropolitan Water District of Southern California, the largest SWP contractor, also conducted levee risk analyses indicating that water exports could be resumed after a major levee failure in the Delta by placing structural barriers at certain channel locations to create an emergency freshwater conveyance “pathway” to SWP and other water project pumping facilities. After the Phase 2 report was issued, a Delta Knowledge Improvement Program (DKIP) was implemented to further refine the DRMS studies, including complete bathymetry surveys of the Delta. Other DKIP projects include an economic study to assist the Delta Stewardship Council in developing a comprehensive investment strategy for the Delta levees; a feasibility study for the implementation of a potential delta flood risk management assessment district; and peat soil seismic loading and setback levee design studies to enhance stability and improve habitats.

## Climate Change and Sea Level Rise

According to the most recent California Water Plan Update 2013, climate change may increase water supply uncertainties, including the reliability of SWP deliveries, by affecting the frequency, magnitude, and duration of extreme storm events and by reducing annual snowpack storage (DWR 2014). Rising sea levels would also increase the risk of coastal flooding, Delta levee integrity, and water quality. Adverse changes in Delta water quality due to sea level rise, levee failures, more frequent and intense rainfall patterns and droughts could further constrain SWP exports. Potential climate change impacts to SWP delivery reliability were evaluated in the DCR and are discussed in more detail in the following section.

### ***State Water Project Delivery Capability and Reliability***

The DWR estimates the average or normal year, single-dry year and multiple-dry year SWP delivery reliability under current and projected future conditions every two years. The most recent estimates are provided in the 2015 DCR. To evaluate SWP delivery volumes under future conditions, the DCR uses a computer model that incorporates the historic range of hydrologic conditions, including precipitation and runoff that occurred during the 82-year period from 1922 through 2003. The model allows for the adjustment of historic hydrologic condition to account for land-use changes, export limitations required to meet regulatory objectives, potential climate change effects and other factors over a range of relatively wet to critically dry years. The volume of water that the SWP is projected to deliver each year is compared with the maximum delivery capacity of the system from the Delta, which the DWR estimates to be approximately 4.132 million afy (CNRA 2015). The results of the 82-year analysis are used to derive the percentage of maximum SWP capacity that would be delivered for the following scenarios: (1) on average, over the 82-year analysis period; (2) during a single-dry year; and (3) during multiple-dry years (droughts). The DCR also calculates the annual percentage and volume of each contractor's Table A Amount that would be delivered over the 82-year analysis period.

The DCR includes five scenarios for future water delivery up to 2035. The "base scenario" analyzes the percentage of total demand that the SWP could deliver in average, single-dry, and multiple-dry years under 2015 regulatory, climate change, and SWP conveyance and other facility conditions. The base scenario is the only scenario used by the DWR to discuss future SWP reliability in the main body of the DCR.

Four alternative scenarios were included in the DCR appendices:

- An "early long-term" (ELT) scenario with generally similar operational assumptions as the DCR base scenario, but with additional and more aggressive climate change impacts, including 2025 emission levels and an assumed sea level rise of 6 inches (15 centimeters).
- An "existing conveyance high outflow" (ECHO) scenario that includes the climate change assumptions in the ELT scenario and also focuses on the potential impacts of additional water quality regulatory requirements that would further limit SWP

exports to maintain Delta flows, including certain south Delta operating restrictions and fall X2 and enhanced spring outflow requirements.

- An “existing conveyance low outflow” (ECHO) scenario that is based on the ECHO scenario, but without the implementation of fall X2 and enhanced spring outflow requirements.
- A “BDCP” scenario that analyzes the potential future delivery reliability of the SWP system assuming the climate change conditions in the ELT scenario plus the construction of an isolated facility with a 9,000 cubic feet per second (cfs) diversion capacity near Hood; the adoption of certain north and south Delta intake operation criteria; new Fremont Weir, control gates, and Yolo Bypass inundation criteria; additional Rio Vista minimum flow criteria; certain south Delta operating restrictions; up to 10,300 cfs capacity at the SWP south Delta pumping facilities; and the implementation of fall X2, but not enhanced spring outflow requirements.

DCR Appendices C through F provide 82-year model results for the ELT, ECHO, and BDCP scenarios for each of the SWP contractors, including AVEK. The ELT scenario incorporates more significant assumptions regarding potential climate change impacts than used in the base scenario, including 2025 emission levels and a 15-centimeter sea level rise. These assumptions could increase the Delta’s salinity levels and constrain future SWP exports to a greater extent than the climate change factors assumed in the DCR base scenario. The average year SWP delivery rate in the ELT scenario is also lower than the base scenario rate and represents a reasonable middle range between the BDCP and base scenario average year delivery percentages, which are higher than, and the ECHO and ECHO scenarios, which are lower than, in the ELT scenario.

As discussed in Section 5.18.6, the Project supplies include SWP water imported by AVEK and delivered within the Agency’s service area and SWP supplies purchased by TRC, transferred to AVEK and imported by AVEK for Project use under an agreement with TRC. The AVEK 2015 UWMP utilizes the ELT scenario developed for the Agency by the DWR to provide a more conservative assessment of SWP delivery reliability than the DCR base scenario. AVEK also reduced the ELT scenario single-dry year reliability rate to 5 percent, the 2014 delivery level that was the lowest in the Agency’s history to date. The analysis in Section 5.18.6 uses the same reliability factors developed from the ELT scenario in the AVEK 2015 UWMP, including the delivery of 59 percent of Table A amounts in a normal or average year; 5 percent of Table A amounts in a single-dry year; and 12 percent, 16 percent, and 24 percent of Table A amounts in a multiple-dry year period (AVEK 2016).

## **Antelope Valley Regional Supply and Demand Projections**

The AVEK 2015 UWMP (AVEK 2016) and the AVIRWMP (RWMG 2013) are discussed in this section to provide regional background information based on the most recently available water planning documents that consider existing and future regional water demands and supplies. The AVIRWMP was also utilized in the 2014 and 2015 AVAP and General Plan update CEQA analyses prepared by the County to analyze Antelope Valley regional water demand and supplies.

---

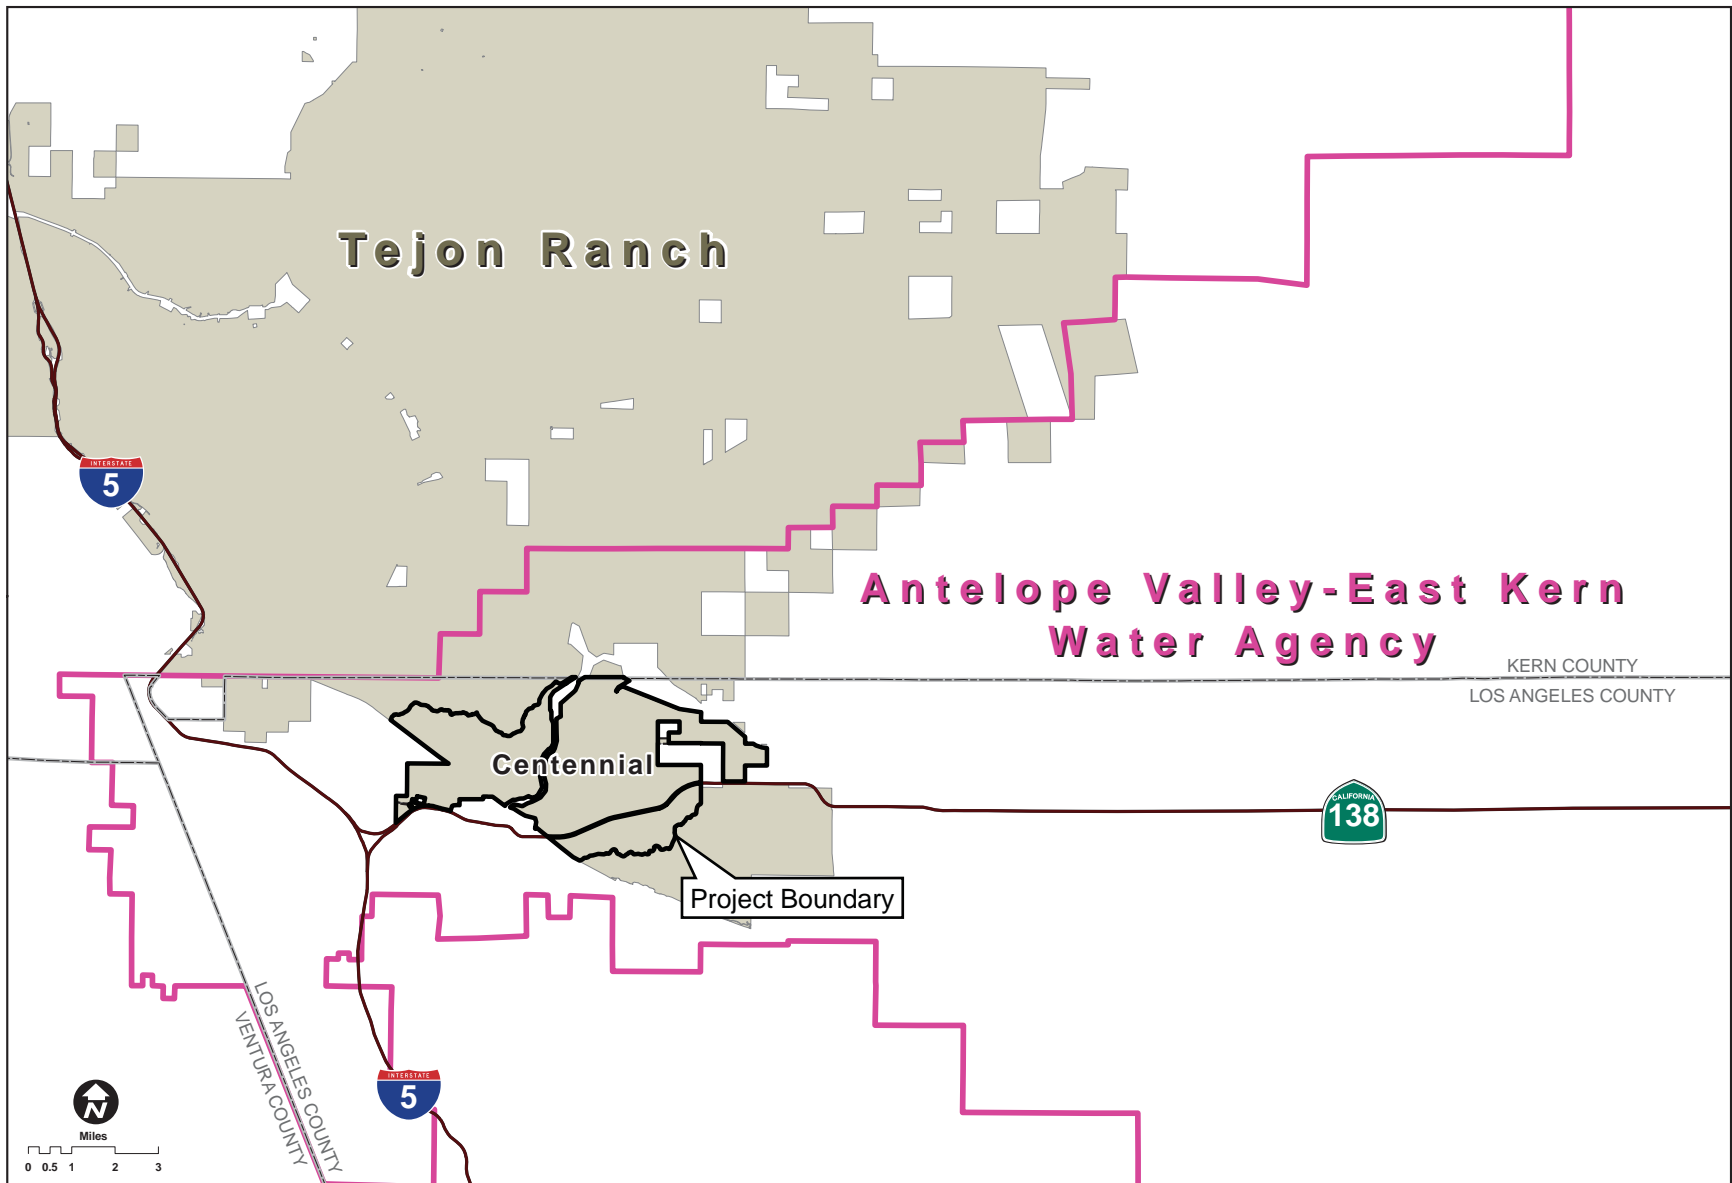

**State Water Project Deliveries to the Antelope Valley – East Kern County Water Agency (AVEK)**

The Project is located within the existing AVEK service area, and AVEK is the only SWP contractor in the Antelope Valley that would provide imported water for Project use. Exhibit 5.18-6, Project Site and Tejon Ranch Company Land Ownership within the AVEK Service Area, depicts the Project site and TRC lands in the context of the AVEK service area. AVEK is a wholesale supplier of SWP water to the Antelope Valley region; they have a service area of nearly 2,400 square miles in northern Los Angeles and eastern Kern Counties and a small portion of Ventura County. AVEK has a contract with the DWR to receive up to 144,844 acre-feet per year of SWP water. Based on the ELT delivery reliability scenario in the DCR, the Agency's average year supply would be 85,460 acre-feet (59 percent) of the SWP contract amount. In 2015, the AVEK service area had a population of 359,500 Antelope Valley residents (AVEK 2016).

Under the Antelope Valley Adjudication Judgment and Physical Solution, AVEK has an overlying pre-rampdown production right of 4,000 acre-feet per year (afy) and an overlying production right of 3,550 afy at the end of the 7-year production rampdown period. The Judgment and Physical Solution also provides AVEK with the right to produce an amount of imported water return flows in any year equal to 34 percent of agricultural imported water use and 39 percent of municipal and industrial imported water use multiplied by the average amount of imported water used by AVEK in the preceding 5-year period. The 2015 UWMP conservatively assumes that AVEK's annual supply of groundwater is 3,550 afy and does not include return flows that also may be available to the Agency (AVEK 2016).

AVEK has developed groundwater banking programs to increase the reliability of the Antelope Valley region's water supplies by storing excess water available from the SWP during wet periods and recovering these supplies for delivery to customers during dry and high demand periods or in the event the SWP system is disrupted. AVEK's Water Supply Stabilization Project No. 2 (Westside Water Bank) started operations in 2010, and currently includes approximately 400 acres of groundwater recharge basins and 9 groundwater recovery wells. Up to 20 new wells may be constructed as a part of the Westside Water Bank project. Five irrigation wells existing on the property at the time of development may also be used in the program. AVEK meters the water delivery and recovery amounts for the banking program and will not recover more than 90 percent of the amount recharged to account for evapotranspiration, other losses during recharge and conveyance, and metering accuracy. The Eastside Water Banking and Blending Project started operations in 2016 and includes three 2-acre recharge basins and three groundwater wells. The project allows for recharge of raw water that is later recovered and blended for delivery to the Eastside Water Treatment Plant (AVEK 2015).

The maximum recharge and recovery volumes for the Westside Water Bank are estimated to be approximately 36,000 afy. AVEK can also recover groundwater from the Eastside Water Bank (5,700 afy total estimated capacity) and from 3 potable groundwater wells in the Bench Ranch Well Field (total capacity of about 3,700 afy). The 2015 UWMP projects that AVEK will recover up to 36,000 afy from groundwater banking facilities during single-dry and multiple-dry years (AVEK 2016).

### Project Site and Tejon Ranch Company Land Ownership within the AVEK Service Area

### Exhibit 5.18-6

Centennial Project

AVEK operates four water treatment plants (WTPs). The Quartz Hill WTP is capable of producing 90 million gallons per day (mgd) or 270 acre-feet per day (afd) of treated Aqueduct water. The Eastside WTP is capable of producing 10 mgd (30 afd). The Rosamond WTP can produce 14 mgd (42 afd), and the Acton WTP can produce 4 mgd (12 afd) of treated water. AVEK does not provide supplemental treatment for recycled water and does not distribute recycled water. The bulk of AVEK's imported water is treated and distributed by water purveyors to customers throughout the Agency's service area. AVEK also provides untreated SWP water to local farmers and ranchers. All of the Project land, and more than 38,000 acres of land owned by TRC, are located within AVEK's jurisdictional boundaries and have been subject to AVEK assessments for several decades.

Consistent with *California Water Code* requirements, the 2015 UWMP provides population growth, water supply, and water demand projections through 2035 for AVEK. The analysis anticipates that the Agency's service area population will be 460,700, an increase of approximately 101,200 from 2015 (AVEK 2016). The 2015 UWMP estimates that AVEK's 2035 average year water supplies will be 89,010 afy, including 85,460 afy of SWP deliveries and 3,550 afy of groundwater produced in accordance with the Judgment and Physical Solution. AVEK's 2035 average year demand is estimated to be 86,250 afy, resulting in an average year surplus supply of approximately 2,760 acre-feet by 2035. The 2015 UWMP anticipates that AVEK's SWP deliveries, groundwater, and recovered banked water supplies will be less than demand during dry and multiple-dry years. The single-dry year shortfall in 2035 is estimated to be 39,500 acre-feet, and the maximum multiple-dry year period shortfall is estimated to be 29,300 acre-feet (AVEK 2016). Since AVEK provides a supplemental water supply to retail agencies, the UWMP anticipates that the supply difference in single-dry and multiple-dry years will be met by increased groundwater pumping (recovery of banked supplies or return flows), use of recycled water, and/or reductions in demand by the retail agencies and other Agency customers, such as the Project. As discussed below, the Project will be served by two water banks and will generate and use recycled water in a manner that will ensure single-dry and multiple-dry year water supply reliability in the Project area consistent with the Agency's UWMP.

### ***2013 Antelope Valley Integrated Regional Water Management Plan***

An integrated regional water management planning process has been conducted for several years in the Antelope Valley, and an integrated plan was first published in 2007 by an 11-member regional water management group. The AVIRWMP was most recently updated in 2013 and provides an analysis of average year, single-dry year, and multiple-dry year regional supply and demand conditions through 2035 (RWMG 2013). The AVIRWMP projections assume that the region's population will increase by about 157,000 residents from 2010 to 2035. Table 5.18-1 summarizes the population growth estimates used in the AVIRWMP projections.

Note: Projections Rounded to the nearest 1,000 people.

<sup>a</sup> Based on Geolytics Normalization of Past U.S. Census Tract Data to 2000 Census Tract Boundaries.

<sup>b</sup> Based on 1990 Census data, and normalized by percentage of area of Census Block Group or Census Place in the Region.

<sup>c</sup> Based on 2000 Census data, and normalized by percentage of area of Census Block Group or Census Place in the Region.

<sup>d</sup> Based on 2010 Census data, and normalized by percentage of area of Census Block Group or Census Place in the Region.

<sup>e</sup> Projections for Palmdale and Lancaster from the SCAG Adopted 2012 RTP Growth Forecast. For remaining areas, it is assumed the Antelope Valley Region would have a similar annual growth rate as the City of Lancaster, estimated as approximately 1.7 percent per year up to 2020, then 1.0% per year up to 2035.

<sup>f</sup> The portion of California City in the Antelope Valley Region has a population of less than 500 people, and therefore is rounded down to 0.

<sup>g</sup> The decrease in population in unincorporated Los Angeles County is likely due to the addition of Census Designated Places to the census County that had previously been counted as unincorporated area.

Source: RWMG 2013 (Table 2-3).

Tables 5.18-2 through 5.18-4 summarize the average year, single-dry year, and multiple-dry year supply and demand projections in the AVIRWMP for 2010–2035. The projections assume that urban demand will rise from 87,000 afy in 2010 to 118,000 afy in 2035. Agricultural demand is assumed to be 92,000 afy in an average year and 98,000 afy in single-dry and multiple-dry years. Using these assumptions, the AVIRWMP indicates that, by 2035, the region’s water supplies would be sufficient to meet demands in an average year (Table 5.18-2). Demand would exceed supply by approximately 61,200 afy in a single-dry

year (Table 5.18-3) and by approximately 41,200 afy during a multiple-dry year drought (Table 5.18-4).

Full bank storage is evenly distributed over the 4-year dry period, rounding to about 6,000 afy each year. <sup>b</sup> Recycled water demands for 2010–2035 reflect existing 2013 M&I demands (i.e., Division Street Corridor and McAdam Park). <sup>c</sup> Demand includes groundwater extractions.  Source: RWMG 2013 (Table 3-16).						

Table 5.18-5 summarizes the 2010 per capita urban water use estimated in the AVIRWMP for the portions of the AVEK service area not supplied by another large retail purveyor and for other large water purveyors in the Antelope Valley. The estimates range from 280 gallons per capita per day (gpcd) in the QHWD to 152 gpcd in the RCSD. For information purposes, Table 5.18-5 also calculates the urban gpcd levels that would correspond with a ten percent reduction from the 2010 estimates. As discussed above, in 2009, the California legislature amended the *California Water Code* to require a 20 percent reduction in per capita urban water use by 2020. In addition, in 2016, five California resource agencies published a framework report for implementing Executive Order B-37-16 include an initial residential standard of 55 gpcd (DWR et al. 2016b). The AVIRWMP states that, regardless of whether a water agency achieves the 20 percent reductions mandated by State law, all purveyors are required to design and implement water conservation programs to further reduce per capita

consumption. With the implementation of these programs, it is expected that the average per capita water use in the Antelope Valley region will decrease (RWMG 2013). The 10 percent reduction from 2010 levels shown in Table 5.18-5 indicates potential levels of regional water demand assuming only a 10 percent reduction and residential water use, in most instances, above 55 gpcd.

**TABLE 5.18-5

Antelope Valley Region <sup>e</sup>	403,000	90,000	0.223	199	179

AVIRWMP: Antelope Valley Integrated Water Management Plan; afy: acre-feet per year; gpcd: gallons per capita per day; AVEK: Antelope Valley – East Kern Water Agency; LCID: Littlerock Creek Irrigation District; LACWWD40: Los Angeles County Waterworks District No. 40; PWD: Palmdale Water District; QHWD: Quartz Hill Water District; RCSD: Rosamond Community Services District; UWMP: Urban Water Management Plan; CDPH: California Department of Public Health

Note: All numbers rounded to the nearest 1,000. Numbers do not include private well owners. It is assumed that the demand and population numbers reported in the UWMPs provide an approximate per capita estimate for the Region.

<sup>a</sup> As determined from data in the AVEK's 2010 UWMP. Values exclude population and demand numbers for LCID, LACWWD40, PWD, QHWD, and RCSD that fall inside the AVEK service area.

<sup>b</sup> Values exclude LCID agricultural demand. Demand verified by personal communication with Brad Bones at LCID on August 21, 2013. Population sizes from the Annual CDPH Drinking Water Program Report.

<sup>c</sup> Population size from the Annual CDPH Drinking Water Program Report. Water demand is based on values from the Antelope Valley 2010 Integrated UWMP (which is based on land use).

<sup>d</sup> Based on values provided in the 2010 UWMPs and 2009 actual water use.

<sup>e</sup> Antelope Valley Region per capita water use was determined by dividing total water demand by total population. These numbers do not include private well owners. Values in the Antelope Valley Region row may differ from the sum of district information due to rounding errors.

<sup>f</sup> Gallons per capita per day estimated by using afy per person reported in the AVIRWMP's Table 3-4. The afy per person estimates for specific purveyors in the AVIRWMP vary slightly from the amounts derived by dividing the reported service area population by water use. For consistency, the AVIRWMP values are used to estimate gpcd levels. Potential gpcd rates reflecting a 10% reduction from estimated 2010 gpcd levels are included for informational purposes.

Source: RWMG 2013 (Table 3-4).

The AVIRWMP indicates that conservation measures could substantially reduce the supply and demand projections for the 2015–2035 period. The plan states that aggressive

conservation could reduce urban water demands by ten percent by 2035 (RWMG 2013). Significant water conservation was achieved in the Antelope Valley during the recent drought. In 2015, for example, LACWWD40 water use was 165 gpcd, which is substantially below the 2010 level of 237 gpcd estimated in the AVIRWMP and the District's 5-year baseline (2003–2007) average use of 267 gpcd (LACWWD40 2017).

The AVIRWMP also discusses other water sources potentially available to the region, including Table A transfers from other SWP contractors; SWP Article 21 water; transfers from the Central Valley Project (CVP) system operated by the U.S. Bureau of Reclamation (USBR); transfers from other water rights holders in the Sacramento Valley; treated storm water captured and recharged into the ground; and desalinated water. Potential additional supplies identified in the AVIRWMP are briefly discussed below.

- **State Water Project Table A Transfers.** Certain SWP contractors, or their member agencies or subcontractors, hold a contractual right to SWP Table A Amounts and are required to make substantial annual payments to maintain these amounts regardless of whether SWP water is actually requested or delivered. SWP participants may desire to reduce these fixed costs by selling excess Table A Amounts to other users. As discussed in Section 5.18.6, approximately 3,444 afy of Table A Amounts were purchased from Central Valley water districts for Project use. Other potential Table A transfer opportunities for the Antelope Valley are reasonably likely to become available in the future.
- **Article 21 Water.** As discussed above, SWP Article 21 water is made available on an unscheduled and interruptible basis under Article 21 of the SWP contracts and is typically available only in average to wet years for a limited time in winter months. Although the development of local banking operations, including the Water Supply Stabilization Project No. 2 (WSSP-2) operated by AVEK, could increase the potential utility of Article 21 water for use in the Antelope Valley region, the AVIRWMP indicates that Article 21 water is not considered a long-term reliable supply (RWMG 2013).
- **Central Valley Project Water.** CVP supplies, if available, would be transported by AVEK via the SWP conveyance facilities on a low-priority basis and would be less reliable than SWP supplies. Like SWP supplies, CVP supplies are constrained by Delta species, water quality, and export system management issues. The transfer of CVP water from agricultural to urban use could also generate socioeconomic impacts, and most CVP contractor supplies have already been allocated for other uses, including environmental restoration projects. Consequently, the AVIRWMP indicates that CVP water is not available for long-term, reliable sale or exchange that would facilitate use in the Antelope Valley (RWMG 2013).

The General Plan Update EIR utilized the AVIRWMP 2035 regional supply estimate of 210,600 afy and estimated the incremental demand growth associated with General Plan implementation by assuming that the urban water demand would be approximately 142 gpcd in 2035 (DRP 2015c, Table 5.18-17). Based on this demand level and the higher amount of population growth anticipated prior to the adoption of the AVAP Update, the General Plan Update Draft EIR estimates that implementation of the General Plan would

result urban demand of approximately 170,400 afy in unincorporated Antelope Valley. The General Plan Update EIR concludes that, even with the planned future water supplies under consideration by Antelope Valley water agencies, water supplies in the Antelope Valley planning area would not be adequate to serve anticipated demand from growth and that impacts on Antelope Valley water supplies as a result of General Plan implementation would be significant and unavoidable (DRP 2015c).

The General Plan Update Final EIR states that the Los Angeles County Board of Supervisors adopted the AVAP Update after the General Plan Update Draft EIR was prepared and that the AVAP update was consistent with the buildout projections identified in the Antelope Valley Reduced Intensity Alternative in the General Plan Update Draft EIR. The buildout levels that would result from the implementation of the AVAP update are substantially lower than under the previous version of the County General Plan. As approved, the AVAP update would result in a plan buildout total of 106,180 dwelling units, a 405,410 resident population, 134,351 employees, and a jobs/housing ratio of 1.3 compared with the prior General Plan buildout of 278,158 dwelling units, 1,070,571 population, 51,219 employees and a jobs/housing ratio of 0.18. The Final EIR for the AVAP update utilized the AVIRWMP average Antelope Valley estimate of per capita water use (199 gpcd) to evaluate the water demand growth that could occur from implementing the plan. The General Plan Update Final EIR determined that the lower residential and related development associated with the AVAP update would reduce future water demand, but that the plan's water supply impacts would nevertheless remain significant and unavoidable (DRP 2015c).

## **Water Quality**

### ***Groundwater Quality***

Groundwater quality in the Antelope Valley Region is excellent within the principal aquifer but degrades toward the northern portion of the dry lakes areas. Groundwater is typically characterized by calcium bicarbonate near the surrounding mountains and is characterized by sodium bicarbonate or sodium sulfate in the central part of the basin. In the eastern part of the basin, the upper aquifer has sodium-calcium bicarbonate type water and the lower aquifer has sodium bicarbonate type water. The water in the principal aquifer has a total dissolved solid (TDS) concentration ranging from 200 to 800 milligrams per liter (mg/L) and is considered to be generally suitable for domestic, agricultural, and industrial uses. The deep aquifer typically has a higher TDS level. Hardness ranges from 50 to 200 mg/L, and high fluoride, boron, nitrates, chromium, and antimony are a problem in some areas of the basin. The groundwater in the basin is used for both agricultural and municipal and industrial (M&I) purposes (RWMG 2013).

Arsenic is closely monitored in the Antelope Valley region; it is a naturally occurring inorganic contaminant that is often found in groundwater and is occasionally found in surface water. Anthropogenic sources of arsenic include agricultural, industrial, and mining activities. Arsenic can be toxic in high concentrations, and is linked to increased risk of cancer when consumed for a lifetime at or above the regulated maximum contaminant level (MCL) of ten parts per billion (ppb). Arsenic levels above the MCL have been observed in the

Antelope Valley region. When detected in wells, local water districts typically blend the affected water with higher-quality supplies to reduce arsenic concentrations (RWMG 2013).

Hexavalent chromium or chromium-6 is also monitored in the Antelope Valley. Chromium-6 can occur in the environment from the erosion of natural chromium deposits, but can also be produced by industrial processes such as chrome plating, dyes and pigments, and leather and wood preservation. In June 2014, California adopted a 0.010 mg/L (10 ppb) MCL for Chromium-6 (SWRCB 2015a).

Other regional water quality concerns include nitrate levels above the current MCL of 45 parts per million (ppm) and high TDS levels in portions of the Antelope Valley Basin. Groundwater monitoring data from the mid-to-late 1990s indicate that nitrate (NO<sub>3</sub>) concentrations periodically exceed the primary MCL for drinking water in two wells located in the southern portion of the groundwater basin near the Palmdale Wastewater Reclamation Plant (WRP). Agricultural fertilization practices and discharge of treated wastewater has likely contributed to the elevated levels. Actions have been implemented to address these concerns and to minimize any impact from treated wastewater, including treatment upgrades, a change in effluent management practices, the implementation of a recycled water distribution system, and groundwater remediation activities near the Palmdale WRP site (RWMG 2013).

### ***Imported Water Quality***

SWP water quality is continuously monitored by the DWR. Table 3-18 of the AVIRWMP, which summarizes DWR testing data collected from SWP water samples over a two-year period (2010–2012), shows that SWP supplies prior to treatment generally meet or exceed all applicable MCLs. As previously discussed, SWP water is treated by one of four AVEK facilities prior to delivery to the existing water purveyors, including the Quartz Hill Water Treatment Plant (90 million gallons per day [mgd]), the Eastside Water Treatment Plant (10 mgd), the Rosamond Water Treatment Plant (14 mgd), and the Acton Water Treatment Plant (4 mgd). These facilities further ensure that SWP-supplied water achieves all applicable drinking water quality objectives (RWMG 2013).

### ***Recycled Water Quality***

Regional infrastructure required to produce and distribute tertiary-treated effluent from the region's three water reclamation plants continues to be developed in the Antelope Valley. The water will be treated to levels suitable for unrestricted reuse, including for irrigating freeway landscapes, parks, schools, senior complexes, and new home developments. The effluent will also meet all Waste Discharge Requirements (WDRs) issued by the Regional Water Quality Control Board for the region. Revised WDRs for the Lancaster WRP were issued in 2009 and in 2011 for the Palmdale WRP. When used to recharge groundwater, recycled water will be blended or subject to additional water quality requirements to protect regional groundwater. TDS and nutrients from recycled water will be managed in conjunction with the adopted 2014 Salt/Nutrient Management Plan for the Antelope Valley.

## 5.18.4 PROJECT DESIGN FEATURES

- PDF 18-1** All indoor appliances and potable and non-potable water distribution and application systems will conform to the water conservation requirements in the *Centennial Specific Plan* and the Centennial Green Development Plan. The Project will meet or exceed the indoor and outdoor residential and non-residential standards in the California Green Building Standards (CALGreen) and County Green Building Standards codes; State Appliance Efficiency Regulations; and State residential and non-residential indoor and outdoor water use standards, including standards that would be adopted under Executive Order B-37-16. All non-construction water use on the Project site will be metered and monitored. The Project Water Purveyor will implement water-based budget rates in conformance with all applicable laws and in a manner consistent with similar rate structures implemented throughout California, including the Irvine Ranch Water District, the Rancho California Water District, the Western Municipal Water District, and the Eastern Municipal Water District.
- PDF 18-2** All on-site landscaping and irrigation equipment will conform with the plant palette and irrigation efficiency requirements for specific land uses in Section 3.4 of the *Centennial Specific Plan* to ensure that outdoor water use achieves projected levels and to
- Retain the look and/or feel of a regionally appropriate landscape;
  - Minimize changes in soil types and the energy required to irrigate them;
  - Minimize irrigated areas; and
  - Minimize water demand in irrigated areas.
- PDF 18-3** Recycled water treated to *California Code of Regulations* Title 22 unrestricted reuse standards will be produced from on-site treatment facilities and used to meet Project demand and to reduce potable water and maximize recycled water use.
- PDF 18-4** Water Use Reports will be prepared and submitted to the County to verify that projected water use efficiencies are being achieved (1) at the end of the 5<sup>th</sup> year following first occupancy or occupancy of the 4,000<sup>th</sup> dwelling unit and (2) at the end of the 10<sup>th</sup> year following first occupancy or occupancy of the 10,000<sup>th</sup> dwelling unit, whichever occurs later. In the event that a Water Use Report indicates that consumption exceeds projected levels, response measures must be implemented to ensure that available supplies will be sufficient to meet future demand.

### 5.18.5 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

**Threshold 18-1** Have insufficient reliable water supplies available to serve the project demands from existing entitlements and resources, considering existing and projected water demands from other land uses.

**Threshold 18-2** Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted).

### 5.18.6 ENVIRONMENTAL IMPACTS

**Threshold 18-1** **Would the project have sufficient reliable water supplies available to serve the project demands from existing entitlements and resources, considering existing and projected water demands from other land uses?**

#### On-Site Impacts

The Project has been designed to achieve indoor and outdoor water demand and recycled water use levels that meet or exceed California regulatory requirements, including the CALGreen Code and the State's Appliance Efficiency Regulations; it has also been designed to be consistent with existing water use in the state's more efficient communities. Water demand will be sustainably met by using groundwater; in-basin return flows; recycled water; imported water supplies that have been secured for Project use; service area deliveries from AVEK that have been incorporated into the Agency's UWMP; and imported water stored in water banking facilities in accordance with the adjudication Judgment and Physical Solution. Recycled water produced from on-site wastewater flows will supply approximately 40 percent of demand at Project buildout.

All indoor and outdoor water use will be metered. The metering data will be compiled into Water Use Reports provided to the County after approximately 25 percent and 50 percent of the Project has been built, following first occupancy, to assess the extent to which planned water use efficiencies are being achieved. In the event that a Water Use Report indicates that consumption exceeds projected levels, the Project Water Purveyor must implement response measures to ensure that available supplies will be sufficient to meet future demand. Potential response measures include legally permissible cost-based adjustments to water and wastewater budget-based rates; additional enforcement; water system repairs or equipment upgrades; or obtaining supplemental water supplies. No additional development will be approved until sufficient response measures, if required, have been implemented to the satisfaction of the County.

Consistent with the peer review of the Project's water supply and demand (see Appendix 5.18-G) the Project Water Purveyor will implement water budget-based rates to ensure that applicable water indoor and outdoor water use standards are achieved in a fair and equitable manner (Kennedy/Jenks 2017). Water budget based rates for indoor and outdoor residential, commercial, industrial and other uses have been used throughout California, including the Irvine Ranch Water District (IRWD), the Rancho California Water District, the Eastern Municipal Water District, and the Western Municipal Water District. The rates are based on the costs associated with water consumption for specific uses, such as residential indoor; outdoor residential yard; and commercial, industrial, and institutional indoor and outdoor use. The IRWD rates, for example, incorporate a 50 gpcd baseline factor for residential use and residential yard irrigation in accordance with applicable landscape area and plants. The costs of supplying water increase with the volume of use because a supplier must utilize more expensive supplies to meet progressively higher marginal water demands. As a result, water-budget based rates used by the IRWD and other districts incorporate lower rates for use below the applicable indoor and outdoor budgets, and higher rates for use above the budgeted levels to reflect the marginal costs of supplying additional water.

Water budget based rates provide an effective means for discouraging overuse generally and for significantly reducing outdoor water use. For example, the IRWD implemented this type of rate structure in 1991 and has since achieved a 50 percent reduction in per capita water use for residential customers. Average IRWD residential indoor and outdoor water use is about 85 gpcd, among the lowest levels in the State, and IRWD is regarded as a statewide leader in water efficiency (IRWD 2017). A 2016 study found that water budget-based rates significantly reduce overall water demand, particularly by less efficient users, and are much more effective than watering restrictions, low-flow fixtures and appliances, turf removal subsidies, and information/education campaigns (Mukherjee et al. 2016).

In 2015, a California Court of Appeals decision found that a water district's tiered rate structure violated the state constitution because the rates in each tier were not related in any way to the water purveyor's marginal cost of service (*Capistrano Taxpayers Assn., Inc. V. City Of San Juan Capistrano* 235 Cal.App.4th 1493 [2015]). The Capistrano case emphasized, however, that water budget based or tiered rates are "thoroughly compatible" with the state constitution provided they reasonably reflect the cost of service to each parcel. The court also determined that water rates may also permissibly impose higher rates on high-use consumers whose extra use of water forces water agencies to incur higher costs to supply extra water. Several districts, including the IRWD, have determined that the water budget based rates comply with the requirements of the Capistrano case because they are properly based on documented costs of service (IRWD 2015; Western Municipal Water District 2015). The Project Water Purveyor will comply with all legal requirements in the establishment of water budget based rates.

### ***Project Water Demand***

The Project's water demand incorporates the recommendations of the Peer Review Report submitted by Kennedy-Jenks to the County in 2017 (Appendix 5.18-G). To reflect historical water use levels in the Antelope Valley and Santa Clarita areas where much of the existing housing and other developed infrastructure predates the installation of more efficient indoor

and outdoor water fixtures and irrigation technologies, the Peer Review Report recommends using a 60 to 65 gpcd range as the indoor residential water use factor for the Project. As discussed in Section 5.18.2, Relevant Plans, Policies, and Regulations, state law currently requires that water districts reduce per capita urban demand by 20 percent by 2020. Consistent with this objective, more stringent, low-flow fixture requirements have been implemented in the CALGreen Code, as adopted by Los Angeles County and the state in 2013, which include the emergency regulations adopted in response to Executive Order No. B-29-15. These building codes specify the maximum allowable flowrates for fittings and fixtures and are consistent with the *California Health and Safety Code*, the California Plumbing Code, and the California Energy Commission's proposed Appliance Efficiency Regulations. These building codes include the following standards, which have recently been updated in response to the Governor's Executive Order No. B-29-15:

- **Toilets:** 1.28 gallons per flush
- **Showers:** effective July 1, 2016, 2.0 gallons per minute (gpm) at 80 pounds per square inch (psi) decreasing to 1.8 gpm after July 1, 2018
- **Bathroom Faucets:** 1.2 gpm at 60 psi
- **Kitchen Faucets:** 1.8 gpm at 60 psi;
- **Common Area Bathroom Faucets:** 0.5 gpm at 60 psi
- **Urinals:** 0.125 gallon per flush

In November 2016, five state resource agencies published a framework report for implementing permanent water conservation measures, including indoor and outdoor residential, commercial, industrial, and institutional water use standards to implement Executive Order B-37-16. The report states that, until a new standard for indoor residential water use is adopted in 2025, the existing *California Water Code* standard of 55 gpcd will apply in California (DWR et al. 2016b). As noted in the framework report and in the current California Water Plan, the USEPA and the DWR have published studies demonstrating that standard homes built after 2001 that do not include the USEPA's more efficient WaterSense residential specifications consume 44.2 gpcd for indoor uses (DWR 2014; Aquacraft 2011a, 2011b). The studies also show that standard homes retrofitted or built to WaterSense or similar specifications can achieve indoor water use rates ranging from 35.6 to 39 gpcd (see Table 5.18-6).

**TABLE 5.18-6  
RESIDENTIAL INDOOR WATER USE RATES IN  
U.S. ENVIRONMENTAL PROTECTION AGENCY AND  
CALIFORNIA DEPARTMENT OF WATER RESOURCES  
NATIONAL AND CALIFORNIA STUDIES**

Type of Home	Indoor Water Use (gpcd)
USEPA study of nationwide homes built before 1995	62.2
California study of 93% of homes built before 1994 and 7% of homes built between 1995 and 2006	53.9
“Standard homes” built since 2001 not specifically designed for water use efficiency	44.2
Standard homes retrofitted to approximate USEPA WaterSense specifications	39
High efficiency homes built to USEPA WaterSense or similar specifications	35.6
gpcd: gallons per capita per day; USEPA: U.S. Environmental Protection Agency; DWR: California Department of Water Resources	
Sources: Aquacraft 2011a (Table 4-33), 2011b (Tables 63 and 73).	

The analysis of Project water supply and demand uses the most conservative residential indoor demand recommended in the Peer Review Report (i.e., 65 gpcd). This water use factor is 47 percent higher than the post-2001 standard home rate documented in the DWR and USEPA studies (44.2 gpcd) and 18 percent higher than the 55 gpcd standard in the multi-agency framework report and the statewide provisional standard set by the state legislature in 2009 (*California Water Code*, Section 10608.20[B]). The Project will comply with all applicable water conservation, fixture and irrigation efficiency standards, including existing and proposed standards that would result in or require lower water demands. Water budget based rates will be implemented by the Project Water Purveyor and will incorporate the more stringent of the existing state 55 gpcd or future adopted State or County use residential indoor use factors to ensure that Project demand will not exceed the projected levels. As a result, the Project’s water use may be lower than projected using the recommended water use factors in the Peer Review Report.

As discussed in Section 4.0, Project Description, at full buildout, the Project will include up to 19,333 dwelling units; a resident population of 57,150; and up to 10,097,208 square feet of commercial, business park, recreation, civic, institutional, and utility uses. The total potable water demand will be approximately 6,788 afy, including a 5 percent potable water system loss. Approximately 4,577 afy of recycled water will be generated by treating the Project’s wastewater flow. To account for losses in the wastewater treatment and recycled water distribution system, the demand estimates include a conservative ten percent loss between indoor water demand and wastewater flow volumes and the available recycled water supply. Recycled water will be used to irrigate parks, common areas, slopes, arterial roadways, landscaped non-residential areas, portions of larger residential lots, and for wastewater and cooling purposes in the business park. Total water demand at buildout will be approximately 11,365 afy, including potable system losses. Recycled water will supply approximately 40 percent of the Project’s buildout demand.

The Project Water Purveyor will continuously meter and monitor all on-site water use to identify and repair water system facility, equipment, fixtures and irrigation device leaks to conserve supplies. A water budget-based rate structure that meets applicable legal requirements will be utilized to create volumetric pricing incentives for greater water use efficiency based on the marginal cost of supplying water in excess of budgeted levels; to identify water users that are significantly exceeding planned consumption rates; and to allow for the remediation of malfunctioning equipment or enforcement to address chronic overuse. In addition, the Project Water Purveyor will monitor water use to ensure conformance with the plant palette and irrigation efficiency standards for specific land uses in Section 3.4 of the *Centennial Specific Plan*. These standards include the installation of water- and climate-sensing irrigation controllers that will reduce demand by applying outdoor water only on an as-needed basis.

Table 5.18-7 summarizes the projected water demand by land use for the Project. The water demand, loss, and other factors used in the analysis are consistent with the recommendations of the Peer Review Report submitted (see Appendix 5.18-G).

du/ac: dwelling units per acre; sf: square feet; du: dwelling unit; afy: acre-feet per year; K: Kindergarten; gpd: gallons per day

<sup>a</sup> Indoor Water Demand is estimated as gpd per dwelling unit for residential; gallons per thousand square feet for non-residential; gpd per student; and gpd per hotel room.

<sup>b</sup> Outdoor Potable Water Demand is estimated as gpd/unit for residential and gallons per thousand square feet for non-residential land uses.

<sup>c</sup> Common Area Irrigation Demand is estimated as gpd/unit for residential and gallons per acre per day multiplied by the applicable irrigation percentage shown for each land use.

<sup>d</sup> Building square footage for water district facilities is not included in the non-residential building area totals.

<sup>e</sup> Includes approximately 4,136,951 sf of irrigation for the 6-lane arterial roadway, 4-lane arterial collector and industrial collector included in the *Centennial Specific Plan*.

<sup>f</sup> Number here is 0.34 and was rounded to "0".

<sup>g</sup> The 200,000 sf for Public/Utility is not included in the total

All values subject to rounding.

In 2015, the DWR updated the state Model Water Efficient Landscape Ordinance (MWELo) to reduce the maximum level of potable outdoor water use that California should use for outdoor irrigation to reduce water demand. As amended, the MWELo requires the calculation of a Maximum Applied Water Allowance (MAWA) for outdoor water use that is no more than 55 percent of the reference evapotranspiration (ET<sub>o</sub>) rate for residential landscaping and 45 percent for commercial landscaping. Evapotranspiration (ET) is the loss of water to the atmosphere by the combined processes of evaporation from soil and plant surfaces and water taken up by the plants, used, and subsequently transpired as water vapor. The ET<sub>o</sub> rate is derived from the measured ET levels for standardized grass or alfalfa at weather stations in specific locations of the state. In general, the reference ET<sub>o</sub> rate is higher in drier and hotter regions than in wetter and cooler locations. Based on the reported ET<sub>o</sub> levels at 3 California monitoring stations closest to the site, the reference ET<sub>o</sub> rate for the Project site is approximately 64.15 inches per year (Psomas 2017c).

The Project has been designed to reduce potable outdoor demand by using water-efficient plants and efficient irrigation equipment to facilitate landscaping that meets the MAWA as required by the MWELo, specifically no more than 55 percent of the reference ET<sub>o</sub> for residential landscaping and no more than 45 percent of the reference ET<sub>o</sub> for commercial landscaping. This equals an average application rate of approximately 35 inches per year for residential landscaping and 29 inches per year for commercial landscaping based on the ET<sub>o</sub> rate of 64.15 inches per year. As shown in Section 3.4 of the *Centennial Specific Plan*, residential and other land use landscaping will utilize a plant palette and irrigation equipment to ensure that outdoor water use is consistent with these application rates. Landscaping will primarily consist of climate-adapted plants that require occasional water (with a plant factor as defined in the MWELo of 0.3 or less) installed on at least 75 percent of the planted area, excluding areas irrigated with recycled water. Efficient irrigation will be achieved through the use of automatic weather-based irrigation controllers required on all lots that use ET or soil moisture sensor data and have rain sensors. Pressure regulators will be installed on irrigation systems to ensure the dynamic pressure of the system is within the manufacturer's recommended pressure range. The irrigation objective will be flexibly achieved by matching plant types with a required level of irrigation efficiency within each lot. Lots that include turfed areas, for example, must utilize very low water use shrubs in other locations and install efficient turf and drip irrigation systems to meet the overall outdoor water application rate. Lots that are planted with very low water use shrubs could achieve the outdoor application rate with less efficient irrigation systems or a mix of low, moderate, and limited numbers of high-water use shrubs. Consistent with the California Water Plan and the Peer Review Report, a budget-based water rate structure based on the cost of water service for the Project will be utilized to ensure that outdoor demand remains within projected levels (DWR 2014 [Vol. 3, Ch. 3]; Kennedy/Jenks 2017).

As shown in Table 5.18-7, approximately 75 percent (285 afy of 377 afy) of the outdoor water use for medium density attached, high density, and very high density residential will be supplied by recycled water in common area landscaping. In addition, dual water piping will be installed to supply recycled water for irrigation of the Project's very low and low density lots. About 56 percent (1,351 afy of 2,412 afy) of the outdoor irrigation in very low density and low density lots will consist of recycled water supplied from the on-site wastewater reclamation facilities. Recycled water will be used on approximately 50 percent

of the landscape areas around the outer portions of each lot and supplemented with potable water for irrigation adjacent to residential structures. Areas irrigated with recycled water are designated in the MWELo as a Special Landscape Area allowing higher irrigation application rates up to 100 percent of the applicable ETo. The residential areas irrigated with recycled water will still implement water efficient palettes and irrigation techniques to facilitate landscaping that meets a MAWA of 70 percent of the reference ETo.

The Project's total residential water use will be approximately 113 gpcd at buildout, including the projected 65 gpcd of potable water for indoor residential use recommended in the Peer Review Report; 22.5 gpcd for outdoor potable residential water use; and 25.5 gpcd of recycled water for outdoor irrigation in very low and low density lots and residential common areas.

Commercial, business park, industrial, and civic/institutional (CII) indoor water use was estimated by using factors developed for similar land uses in the Irvine Ranch Water District 1999 Water Resources Master Plan (IRWD 2003) and in a 2011 American Water Works Association report (Morales et al. 2011). The factors estimate indoor water use on the basis of gallons per day (gpd) utilized per 1,000 square feet (ksf) of non-residential floor space. The IRWD water use factors were derived from an eight-year study of water use data in the IRWD service area. The 2011 American Water Works Association report developed CII water use factors from customer-level water billing data for 3,172 customers combined with a statewide (Florida) inventory. The CII indoor water use factors, developed from the 2 studies and used to estimate Project demand, are summarized in Table 5.18-7 and include 200 gpd/ksf for commercial land uses, 65 gpd/ksf for business park land uses, 50 gpd/ksf for civic and institutional land uses, and 125 gpd/room for hotels (Psomas 2017a). Indoor CII potable water use will be further reduced by installing dual plumbing systems in the business park for use in toilets and urinals as well as for building cooling purposes. As shown in Table 5.18-7, approximately 30 percent of total business park indoor demand (157 afy of 525 afy) will be met by using recycled water to meet these demands.

Non-residential outdoor irrigation, including school and park turf areas, CII, roadway landscaping, and other park and vegetated slope areas, will be reduced by requiring the installation of equipment with high irrigation efficiencies and low water-use plants on the site. "Irrigation efficiency" refers to the percentage of applied water that can be used by irrigated plants net of evaporation, conveyance, soil infiltration, and other losses. The Project will require the installation of equipment with a 0.80 outdoor irrigation efficiency for public and private parks and a 0.81 efficiency for recreation and entertainment land use, arterial roadway, and slope irrigation (Psomas 2017c).

Vegetation water requirements are defined in the MWELo as a "plant factor" ranging from 0 to 1 that, when multiplied against the applicable reference ETo, reflects the amount of water required to support a plant species. The plant factor range for low water use plants is 0.1 to 0.3; the plant factor range for moderate water use plants is 0.4 to 0.6; and the plant factor range for high water use plants is 0.7 to 1.0. As shown in Table 5.18-7, the Project will irrigate 750 acres of slopes for stability and to control erosion. To reduce slope irrigation demand, the plant factor for species used to vegetate slopes will be 0.2, the middle of the range for low water use plants. The irrigation efficiency and plant factor requirements will generate a

recycled water demand for slopes of approximately 1,008 afy (see Table 5.18-7). Consistent with the Peer Review Report, the Project water demand includes a plant establishment factor to account for water use required during the initial phases of landscape establishment.

Table 5.18-8 summarizes the Project's buildout water demand, including approximately 6,788 afy of potable and 4,577 afy of recycled water use. Total demand will be approximately 11,365 afy. At full buildout, the Project's total per capita water use will be approximately 177.5 gpcd.

**TABLE 5.18-8  
SUMMARY OF PROJECT BUILDOUT DEMAND  
AND PER CAPITA WATER USE**

Potable Demand (afy)	6,788
Recycled Demand (afy)	4,577
<b>Total Water Demand (afy)</b>	<b>11,365</b>
Buildout Population	57,150
Total Water Use (gpcd)	177.5
Source: Psomas 2017a	

As discussed above, the General Plan Update Draft EIR and the AVIRWMP estimate per capita urban water demand for the Antelope Valley and water districts serving the region (see Table 5.18-8). The General Plan Update Draft EIR estimates the average 2035 per capita daily water demand in the County, including Antelope Valley, at 142 gpcd to comply with the State's urban water use reduction mandates (DRP 2015c). The General Plan Update Final EIR incorporates the AVAP Final EIR analysis, which projected water demands based on the average AVIRWMP estimate for the Antelope Valley of 199 gpcd. The Project's buildout demand of approximately 177.5 gpcd is in the middle of and consistent with the range of these projections. As shown in Table 5.18-5, the AVIRWMP estimates that in 2010 overall regional water use averaged 199 gpcd. The AVIRWMP also notes that the 2010 levels may decline to meet the State's water reduction requirements, including the 20 percent urban water use reduction by 2020 enacted by the State in 2009. As shown in Table 5.18-5, if the regional water districts analyzed in the AVIRWMP reduced estimated 2010 urban demand by 10 percent from 2010 levels regional water use would average about 179 afy. The Project's water demand is also consistent with these projections.

The Project will achieve higher levels of water use efficiency than in most existing Antelope Valley developed areas because new development must utilize significantly more efficient plumbing, technology, fixtures, appliances, and other water system equipment to comply with applicable federal, State, and local regulations. The State's provisional residential indoor and other standards that would be implemented under Executive Order B-37-16 also require that new development water consumption be more efficient than in existing communities. Outside the cities of Lancaster and Palmdale, the region is largely rural with large lots or farm areas and isolated subdivisions that do not possess the centralized services, conservation features, and planned landscaping or water recycling features included in the Project. The region's more urban areas generally were not constructed and

have not been upgraded to include the water efficient technologies and management measures required for the Project, including the extensive use of recycled water and native and drought-tolerant landscaping. As a result, existing regional water utilization rates are anticipated to remain generally higher than the Project's water consumption rates. Project development will result in an increment of regional growth that incorporates more efficient potable and recycling water systems and requirements.

As discussed above, the analysis of Project demand includes the factors recommended in the Peer Review Report submitted to the County, including a 65 gpcd indoor water consumption rate (Kennedy/Jenks 2017). The existing State residential indoor water use standard is 55 gpcd. Published studies indicate that lower rates of consumption have been achieved in California (DWR 2014; Aquacraft 2011a, 2011b). The 2016 framework plan for implementing Executive Order B-37-16 cites a 2016 Water Research Foundation study that found that the national residential indoor water use average is about 59 gpcd and that toilet replacement and continued enforcement of federal clothes washing machine water use efficiency standards would lower residential indoor water use by 6 gpcd by 2030 and by 9 gpcd by 2040 (DWR et al. 2016b). The Project will comply with all applicable laws and regulations, including State and local water use standards that may be lower than the conservative rates used in the Project demand analysis. Consequently, actual project demand may be lower than projected, as both existing and potential new water use standards and requirements are implemented in California.

### ***Construction Demand***

As shown in Table 5.18-9, construction will require grading of approximately 127 million cubic yards (mcy) from Year 1 to Year 18 of the Project. About 76.72 acre-feet of water will be required to obtain the optimum moisture content for compaction and for dust suppression and other construction purposes per mcy of grading. Approximately 9,744 acre-feet of water for construction will be required from Year 1 to Year 18 of the Project.

**TABLE 5.18-9  
CONSTRUCTION WATER DEMAND BY PHASE AND YEAR**

<b>Year</b>	<b>Grading (mcy)</b>	<b>Water Demand (af)</b>
Year 1	2.0	153
Year 2	11.0	844
Year 3	10.0	767
Year 4	8.0	614

<b>Total</b>	<b>127.0</b>	<b>9,744</b>
mcy: million cubic yards; af: acre-feet		
Totals may not add due to rounding.		
Source: Psomas 2017a		

Construction water use is a one-time demand that does not recur after construction is complete. The additional construction water demand during Project years 1 through 18 has been incorporated into the projections of average, single-dry and multiple-dry year water supplies shown in Tables 5.18-10, 5.18-11, and 5.18-12.

### ***Project Water Supplies***

Project water supplies consist of imported surface water, recycled water, groundwater, return flows, and banked surface water that are managed in an interrelated, conjunctive manner to meet demand. The following discussion first summarizes the Project's primary water facilities. Next, the amount and reliability of the Project's water supplies and the projected supplies and demand during average, single-dry, and multiple-dry years are discussed in detail.

## Water Facilities

As shown in Exhibit 5.18-7, Preliminary Water Storage and Distribution System, the Project's water supply facilities include existing off-site and proposed on-site water banking facilities that allow for the percolation, storage, and extraction of water for Project use; on-site potable water treatment facilities to treat potable water to applicable water quality standards, including the federal and California Safe Drinking Water Acts and related regulations; on-site wastewater treatment facilities that will treat the Project's indoor wastewater flows to Title 22 unrestricted reuse standards; and water distribution facilities including pipelines, pump stations, storage reservoirs, and pressure regulating valves that will convey recycled water for outdoor irrigation and indoor business park use. The Project's water facilities will be owned and operated by a Project Water Purveyor that will be regulated by the California Public Utilities Commission or formed as a Community Services District, a statutory water district, or other entity with the appropriate capacity to own, operate, and maintain the Project's water system. The Project Water Purveyor will be funded through a rate-payer system and fees. Until the Project Water Purveyor is established, the Project Applicant/Developer will be responsible for all Project-related water services. All of the Project's water supplies and the design, permitting, financing, and construction of all treatment, collection, and distribution infrastructure will be provided by the Project Applicant/Developer. The following sections describe the water supply facilities that will serve the Project.

**Existing Tejon Ranch Company Water Bank.** The Tejon Ranch Company (TRC) and its affiliates currently own and operate a water bank on 160 acres located northeast of the Project site in Kern County (TRC Water Bank).<sup>1</sup> The water bank was constructed in 2006 and currently stores water for TRC and AVEK. As of December 2015, approximately 17,287 acre-feet is stored for Project use. The TRC Water Bank would provide water storage and extraction facilities to the Project under a contract with the Project Water Purveyor. The conveyance facilities between the TRC Water Bank and the Project would be designed, permitted, financed, and constructed by the Project Applicant/Developer. TRC would also provide appropriate easements for access to the TRC Water Bank. The TRC Water Bank is included as a preexisting banking facility that will continue operations in the Antelope Valley in accordance with the adjudication Judgment and Physical Solution (see Appendix 5.18-D).

The water bank consists of several recharge basins or infiltration ponds separated by a series of small overflow weirs. Water is introduced to the facility by pumping water from a turnout on the East Branch of the California Aqueduct (East Branch) to the banking facility and then infiltrated into the local aquifer for storage. All water banked for Project use is subject to a leave-behind requirement of ten percent of the infiltrated water amount to account for banking losses; to support the regional aquifer; and to conform with the requirements of the Judgment and Physical Solution. AVEK also pumped water from a turnout on the East Branch to the TRC Water Bank during 2011 to store excess supplies available under its SWP water supply contract. The turnout serving the TRC Water Bank is owned by AVEK and is located at

---

<sup>1</sup> Kern County is a responsible agency for purposes of the Centennial EIR.

approximately the intersection of 305<sup>th</sup> Street West and the Aqueduct. The turnout has been upgraded and will be managed for Project use in accordance with turnout operating and maintenance agreements among TRC, AVEK, and the DWR. A pipeline has been installed between the turnout and the TRC Water Bank and can deliver water to separate ponds in the recharge facility. The TRC Water Bank has the capacity to recharge approximately 11,500 afy. There is at least 161,000 acre-feet of unused aquifer storage within 0.5 mile of the existing TRC banking facility and the proposed on-site water banking facility (described below)(GEI 2005, 2010). The location of the TRC Water Bank relative to the Project is depicted in Exhibit 4-13, Centennial Project – Conceptual Domestic Water Supply System, in Section 4.0, Project Description.

**On-Site Water Banking Facility.** A second, approximate 100-acre water banking facility will be designed, permitted, financed, and constructed by the Project along the northern edge of the site to provide additional water recharge capacity. The on-site bank will also facilitate the periodic rotation of infiltration or extraction between the TRC Water Bank and the on-site bank to avoid potential impacts to the local aquifer. A transmission pipeline will extend from an existing East Branch turnout located at approximately the intersection of 320<sup>th</sup> Street West and the California Aqueduct, and will be routed along the southern edge of the bank to allow for delivery to recharge ponds in the facility. The turnout will be upgraded and managed in accordance with the turnout operating and maintenance agreements between AVEK and the DWR. The on-site water bank will also be able to obtain water from a turnout located on the West Branch of the California Aqueduct. A series of contoured infiltration basins separated by a network of berms and overflow weirs will be constructed to receive and infiltrate the water. The on-site water bank's soil and storage characteristics are similar to those of the existing TRC banking facility and will have the capacity to infiltrate and store approximately 7,200 afy. As indicated above, there is at least 161,000 acre-feet of unused aquifer storage within 0.5 mile of the proposed on-site and the existing TRC Water Bank facilities (GEI 2010, 2005). The on-site water banking facilities are depicted in Exhibit 4-13. New water banking facilities in the Antelope Valley Basin, including the proposed on-site bank, are subject a storage agreement with the watermaster in accordance with the adjudication Judgment and Physical Solution (see Appendix 5.18-D).

**Monitoring and Extraction Wells.** A series of existing and new on-site and off-site wells will be used to monitor groundwater levels; to extract banked water; to recover return flows; and to extract groundwater for Project use in accordance with the Judgment and Physical Solution. Off-site wells will be located on land owned by TRC to the north and east of the site. The well system will be connected to the on-site water treatment and distribution facilities by a network of pipelines that will be designed, permitted, financed, and constructed by the Project Applicant/Developer. Exhibit 4-13 shows the Project's conceptual monitoring and extraction well field and water transmission system.

**Potable Water Treatment Facility.** The Project Applicant/Developer will design, permit, finance, and construct an on-site water treatment plant adjacent to the West Branch of the Aqueduct to provide potable water for the Project. The treatment plant

will include required chlorination and other disinfection facilities; it will also include ion exchange or other available, feasible technologies that will ensure that potential constituent levels, including arsenic, are reduced below applicable MCL and other water quality requirements. The DWR has constructed a new turnout from the West Branch to replace a turnout previously demolished in conjunction with the enlargement of the Tehachapi Afterbay located to the north of the Project site. The turnout is owned and managed by AVEK. The West Branch turnout can be used to supply the on-site water bank during periods when the East Branch may lack capacity to convey water to the facility. The locations of the Project water treatment plant, the West Branch turnout, and the primary connecting pipelines between these facilities are identified in Exhibit 4-13.

**Wastewater Treatment Facilities.** All wastewater flows generated by the Project will be collected and treated to Title 22 standards for unrestricted reuse in on-site wastewater treatment facilities. Approximately 90 percent of the indoor wastewater flows will be available for external irrigation and for wastewater and cooling use within the business park. At buildout, the recycled water supply will meet approximately 40 percent of the Project's water demand. The Project Applicant/Developer will design, permit, finance, and construct the on-site wastewater collection, treatment, and recycled water distribution facilities. Wastewater reclamation facilities are also discussed in Sections 5.2 (Hydrology and Flood) and 5.19 (Wastewater) of this EIR. The locations of the planned wastewater reclamation facilities are shown in Exhibit 4-14, Centennial Project – Conceptual Wastewater System, in Section 4.0, Project Description.

### ***Water Supplies***

The Project's water supplies include the following: (1) water currently banked at the existing TRC Water Bank to the north of the Project site; (2) purchased and in-lieu program rights to water deliveries from AVEK and the return of certain water supplies loaned to AVEK in 2008 and 2009 for later return and delivery (collectively, "AVEK call water"); (3) groundwater subject to the allocations in the Judgment and Physical Solution; (4) Table A Amounts transferred from the Tulare Lake Basin Water Storage District and the Dudley Ridge Water District that will be imported for Project use under an existing agreement with AVEK; (5) service area deliveries of SWP water by AVEK that are incorporated in the Agency's current UWMP; (6) recycled water treated to Title 22 unrestricted reuse levels generated by the Project's on-site wastewater treatment facilities; and (7) in-basin return flows from Project imported water use in accordance with the Judgment and Physical Solution. The existing TRC Water Bank and the proposed on-site water bank will be used to bank, store, and retrieve water for use in later dry periods to enhance the Project's overall water supply reliability. As shown in Tables 5.18-10, 5.18-11, and 5.18-12, the Project's water supplies meet projected demand at buildout and, on a sustainable basis thereafter, allow for the maintenance of an average annual reserve banked supply of more than 79,000 acre-feet. The amount of the average annual reserve that will be maintained in the water banks equates to more than 11 years of the Project's full buildout potable demand and provides the Project with a significant emergency supply.

Documentation concerning the water supply sources summarized below is included as Appendices H through P of the WSA (Appendix 5.18-A).

**Existing Banked Water.** TRC purchased and has stored approximately 17,287 acre-feet of water in the TRC Water Bank for Project use. The stored water was conveyed from the California Aqueduct to the TRC Water Bank, released into the bank's percolation ponds, and infiltrated into the ground. TRC is storing the banked water for the benefit of the Project in accordance with an agreement between TRC and the Project Applicant (Appendix I of Appendix 5.18-A). Consistent with the Judgment and Physical Solution, 10 percent of the stored amount of water must be retained in the aquifer to supplement groundwater supplies and to account for infiltration and extraction losses.

**Antelope Valley – East Kern Water Agency Call Water.** AVEK is the primary SWP contractor for the Antelope Valley and sells SWP water to other districts and users

throughout its service area. During 2008 and 2009, SWP supplies were severely constrained by drought conditions and regulatory limits affecting the operation of the SWP Delta pumps. To help alleviate the critical water shortage that was emerging in the Antelope Valley, TRC agreed to loan certain water supplies to AVEK for return in later years pursuant to two agreements. The remaining balance of water that AVEK is required to return to TRC under the agreements is 13,595 acre-feet. TRC has also participated in an in-lieu program administered by AVEK under which AVEK provides surface supplies in future wetter years in exchange for TRC using groundwater and foregoing SWP deliveries in prior dry years. The amount of water that AVEK is required to supply to TRC under the in lieu program is 13,032 acre-feet. In 2007 and 2008, TRC purchased 2,362 acre-feet of water from AVEK for future delivery. For ease of reference, these water supplies are collectively referred to as “AVEK Call Water” in this EIR. The total amount of AVEK Call Water available for Project use is 28,989 acre-feet. As shown in Table 5.18-10, the AVEK Call Water is used as part of the Project’s reserve supply, and delivery is assumed to occur on a pro-rata basis over 20 average water years. The actual delivery timing can be flexibly arranged with AVEK to reflect the agency’s available supplies from year to year. The water supply and demand projections assume that no AVEK Call Water would be supplied in either a single-dry year or during multiple-dry year droughts (see Table 5.18-11 and Table 5.18-12). Documentation concerning the AVEK Call Water is included in Appendices J, O, and P of Appendix 5.18-A.

**Table A Water Transfers from the Tulare Lake Basin Water Storage District and the Dudley Ridge Water District.** In 2008, TRC acquired the rights to approximately 1,451 afy of SWP Table A Amounts held by the Tulare Lake Basin Water Storage District (Tulare Lake) and subcontracted by Tulare Lake to GWF Energy, LLC and the Lurene Mattson Trust to meet general water needs on TRC property. In 2010, TRC also acquired the rights to approximately 1,993 afy of SWP Table A Amounts held by the Dudley Ridge Water District (Dudley Ridge) and subcontracted by Dudley Ridge to the 3-R Land and Development Company, LLC, the Friend Family Trust, the Don Jackson Family LLC, and the Donald Lee Jackson Revocable Trust. The transfer agreements are included in Appendices L and K of Appendix 5.18-A. In 2012, TRC and AVEK executed an assignment and import agreement under which the Tulare Lake and Dudley Ridge Table A Amounts were transferred to AVEK in accordance with SWP system rules and regulations, and AVEK agreed to import the supplies for Project use subject to cost reimbursement and the provision of five percent of the imported amounts for agency use (see Appendix 5.18-E).

As discussed in Section 5.18.4, SWP Table A water is subject to delivery variability due to weather, regulatory constraints, seasonal demand, and other factors. The availability of the Tulare Lake and Dudley Ridge transfer water for Project use is evaluated in this EIR by using the ELT scenario in DCR Appendix C developed for AVEK by the DWR (CNRA 2015) and the lower, more conservative single-dry year reliability rate of five percent to reflect 2014 conditions used in the AVEK 2015 UWMP. The 2015 UWMP projects that deliveries in an average or normal year will be 59 percent of Table A amounts; 5 percent of Table A amounts in a single-dry year; and 12 percent, 16 percent, and 24 percent of Table A amounts, respectively, in the

three consecutive dry years in a multiple-dry year period. Under this scenario and accounting for AVEK's 5 percent supply retention in the TRC-AVEK import agreement, the Project would receive approximately 1,930 afy from the Tulare Lake and Dudley Ridge Table A Amounts in an average year (see Table 5.18-10), 164 afy in single-dry years (see Table 5.18-11) and from 392 to 785 afy in multiple-dry year droughts (see Table 5.18-12).

Table A water is subject to the terms of the SWP contracts between the DWR and the SWP contractors. Article 2 of the contract provides for a minimum term of at least 75 years, which generally extends through 2035 unless construction financing bonds or Project repayment terms require a longer period. Article 4 of the contract provides for renewal at the election of the contractor at the same amount, cost, conveyance, and quality as the prior contract. Article 4 also provides for similar renewal rights at the end of each succeeding term. The intent of these provisions is to provide SWP system participants with a stable, reasonably priced, reliable long-term source of water. According to the AVEK 2015 UWMP, the term of the SWP contracts is expected to be extended to December 31, 2085 (AVEK 2016). The consolidated and amended AVEK SWP contract, including Articles 2 and 4, is included in Appendix 518-E.

**Antelope Valley – East Kern Water Agency Service Area Deliveries.** The entire Project site and approximately 38,611 acres of TRC land are located within the AVEK jurisdictional boundaries and have been subject to AVEK annual water service assessments since the mid-1970s (Exhibit 5.18-6, Project Site and Tejon Ranch Company Land Ownership within the AVEK Service Area).

Section 61.1 of the AVEK Agency Law (California Uncodified Acts 9095, Sections 49–96) states that AVEK shall

... whenever practicable, distribute and apportion the water purchased from the State of California or water obtained from any other source as equitably as possible on the basis of total payment by a district or geographical area within the agency regardless of its present status, of taxes, in relation that such payment bears to the total taxes and assessments collected from all other areas. It is the intent of this section to assure each area or district its fair share of water based on the amounts paid into the agency as they bear relation to the total amount collected by the agency.

TRC and AVEK executed a water services agreement in 1976 that provides for deliveries from AVEK to TRC in accordance with the agency's rules and regulations. The water services agreement is attached as Appendix 5.18-E. Since 1976, TRC has received approximately 79,000 acre-feet of water from AVEK (Appendix 5.18-E), including approximately 6,700 acre-feet received by TRC in 2006 and 2007. TRC has the right to request water deliveries from AVEK in the future in accordance with principles set forth in Section 61.1 of the AVEK Agency Law and under the water services agreement.

AVEK provides wholesale water to TRC, LACWWD40, and other Antelope Valley water districts and end users in its service area. Table 4-2 of the AVEK 2015 UWMP itemizes the Agency's projected future demands for wholesale water from 2020 to 2035 and includes TRC demand of 4,000 afy. All of this amount will be used by TRC to meet Project demand. The AVEK UWMP includes the recovery of up to 36,000 afy of water banked by AVEK in wetter years that will partially offset SWP delivery reductions during single-dry and multiple-dry years. Consequently, during drier periods, the UWMP indicates that more water would be available to AVEK to meet demand than from SWP supplies alone. To provide a conservative assessment and because the Project will be served by an on-site and TRC's existing off-site water banking facilities, the delivery reliability of the 4,000 afy of TRC demand identified in the UWMP is analyzed by assuming that only SWP water will be used to meet this demand. If AVEK uses non-SWP sources of supply in single-dry and multiple-dry years to meet TRC demand, delivery reliability in these drier years would be higher than projected.

As discussed above, the ELT scenario used in the 2015 UWMP includes an average or normal year delivery of 59 percent of Table A amounts; a single-dry year delivery of 5 percent of Table A amounts; and multiple-dry year period deliveries of 12 percent, 16 percent and 24 percent of Table A amounts. Assuming that all of the 4,000 afy of TRC demand in the UWMP was supplied from SWP water, the Project would receive approximately 2,360 afy in an average year (see Table 5.18-10), 200 afy in a single-dry year (see Table 5.18-11) and from 480 to 960 afy in multiple-dry years (see Table 5.18-12). As discussed above, Table A water is subject to the terms of the SWP contracts between the DWR and the SWP contractors, and the SWP contracts are expected to be extended to December 31, 2085 (AVEK 2016).

**Imported Water Return Flows.** The adjudication Judgment and Physical Solution provides that imported water used to meet urban demand in the Antelope Valley Basin may be recovered by the importing party in an amount equal to 39 percent of the average imported water use over the prior five years. As shown in Table 5.18-10, the amount of in-basin return flows attributable to the Project's imported water use will increase as the Project is developed and will mature five years after buildout. At full buildout in Year 20, in-basin return flows will be approximately 862 afy and will increase to a maximum of 1,034 afy by Year 25.

The Judgment and Physical Solution also allows for the production of return flows generated by imported water use in the Antelope Valley Watershed surrounding the basin in an amount to be determined to the satisfaction of the watermaster. Portions of the Project site are located in the basin watershed, and imported water use in these areas would be expected to generate return flows that could be used to meet Project demand. The amount of any such return flows has not yet been quantified and no application has been made to the watermaster concerning the use of these potential supplies. Consistent with the recommendations of the Peer Review Report, the analysis of Project water supply and demand does not include return flows that may be generated by imported water use in the Antelope Valley Watershed surrounding the basin (Kennedy/Jenks 2017). In the event the watermaster approves the

production water return flows generated by imported water use in the basin watershed, the Project's water supplies will be higher than projected.

**Groundwater.** As discussed above, TRC is a party to the Judgment and Physical Solution entered by the Superior Court in the Antelope Valley groundwater adjudication. Exhibit 4 to the Judgment and Physical Solution allocates overlying production rights to groundwater in amounts consistent with the basin's total sustainable yield. The adjudication Judgment and Physical Solution, including Exhibit 4, is included in Appendix 5.18-D. Following a seven-year rampdown period applicable to all basin groundwater users, TRC has been allocated an overlying production right of 1,634 afy. All of TRC's overlying right allocation will be provided to and utilized by the Project. As discussed above, groundwater production in accordance with the Judgment and Physical Solution is considered to be highly reliable from year to year and unaffected by single-dry or multiple-dry year conditions (RWMG 2013).

Water quality samples indicate that groundwater in the Project area is suitable for potable use. Total dissolved solids (TDS) concentrations in several shallow and deep wells analyzed by Geosyntec in 2007 were approximately 318 milligrams per liter (mg/L) and hydrogen potential (pH) levels were neutral at 7.5. Iron and manganese were not detected in the samples. Nitrate concentrations were measured at 12.6 mg/L (as nitrate), which is below the applicable maximum contaminant level (MCL) drinking water standard of 45 mg/L. The boron concentration was 0.26 mg/L compared with the California Department of Public Health Action Level of 1 mg/L (Geosyntec 2007). Arsenic was detected in a deep local aquifer at approximately 11.9 micrograms per liter ( $\mu\text{g/L}$ ), which is above the State and federal MCL of 10  $\mu\text{g/L}$ . No other metals, including total chromium, were detected above applicable MCL standards. Chromium-6 was detected at a very low level (0.5  $\mu\text{g/L}$ ) in one well sample taken in 2005 (GEI 2010, 2005). None of the deep aquifer groundwater samples contained detectable concentrations of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), asbestos, total and fecal coliform bacteria, e. coli bacteria, 1,2,3-trichloropropane, or 1,2-dibromoethane (Geosyntec 2007).

Water quality tests performed by GEI in 2010 focused on the deep aquifer that would serve the Project and were consistent with the 2007 sampling results. TDS levels ranged from 310 to 320 mg/L, well below applicable standards. The results also indicate the presence of coliform bacteria and odor at the applicable MCL of 3.0 threshold odor number (TON). These results are typical for wells that are used for agriculture and well water that is not disinfected or treated for potable use. Standard chlorine disinfection, ultra-violet (UV) light disinfection or, if needed, physical cleaning by either scrubbing or brushing, followed by disinfection would meet applicable potable water standards for these characteristics (GEI 2010). Arsenic was observed in one well at 13  $\mu\text{g/L}$  (higher than the applicable MCL of 10  $\mu\text{g/L}$ ) and at 8.9  $\mu\text{g/L}$  in a second location. Further aquifer sampling will be conducted prior to Project residential, commercial, or employment-related groundwater use to verify these results. The analysis data will be reviewed by the California Department of Public Health (CDPH) Drinking Water Program to confirm that constituent levels

comply with federal and State drinking water standards. If elevated arsenic levels are confirmed in subsequent water quality analyses, the Project will implement an integrated treatment approach to ensure that arsenic concentrations in potable water are maintained at applicable levels for potable water, including the following potential measures:

- *Well Screening to Exclude Arsenic-Containing Sediments.* Public water suppliers in the Antelope Valley, including LACWWD40, have demonstrated that arsenic concentrations in well water can be significantly reduced by installing screens that isolate soils or well zones where arsenic occurs. An isolation strategy will be evaluated and deployed to reduce potential arsenic concentrations in well water serving the Project to the extent feasible (Psomas 2011; DWR 2009).
- *Blending.* Potable water will be conveyed to and treated in a central water treatment facility, including well extractions and SWP supplies (see Exhibit 4-13, Centennial Project – Conceptual Domestic Water System). Depending on the annual and seasonal availability of SWP supplies (which typically contain arsenic concentrations that range from 1–4 ppb), well and SWP water can be blended in the facility to meet the arsenic MCL requirements (Psomas 2011; DWR 2009).
- *Ion Exchange Process.* Ion exchange is a USEPA-approved technology for the removal of arsenic from potable water supplies. An application of the technology developed by Envirogen, a commercial treatment system supplier, has been documented to be effective in reducing arsenic to non-detect levels in a plant operated by the Victorville Water District (VWD) under conditions similar to Antelope Valley and the Project area. The ion exchange process uses an adsorptive media such as iron oxide that bonds arsenic to the surface of the media in a staggered bed design. Water is passed through the media, where the arsenic is bonded and captured, and the purified water is then conveyed for further use. In 2002, VWD treated approximately 127 million gallons of well water using a mobile, 1,000 gallon per minute (gpm) Envirogen facility to non-detect levels. Approximately 99.94 percent of the treated water was recovered for potable use. Based on these results, VWD contracted with Envirogen to install a full-scale, centralized 6,000-gpm arsenic removal facility that will treat groundwater extracted from 5 wells. Envirogen has also operated 4 similar permitted units during the last 5 to 6 years with treatment capacities ranging from 1,200 to 8,000 gpm and recovery rates for treated product water averaging 99.90 to 99.94 percent. These units are located in Victorville, California (one unit treating water from the La Mesa Well); Mecca, California (two units treating water from Well 6806 and Well 7802); and one unit in Gilbert, Arizona. The Victorville, Mecca, and Gilbert installations show that ion exchange technology does not generate a significant wastewater stream and effectively removes arsenic from potable water supplies. The primary disposal requirements associated with the technology include the filtration media and solids suspended in the media. Assuming arsenic occurs in Project-serving groundwater at the highest tested level of approximately 13 µg/L, treatment to meet buildout demand could generate approximately 90 pounds of arsenic in a normal year and approximately 200 pounds of arsenic in a single-dry year. Disposal options include (1) disposal

at dedicated regeneration locations; (2) cleaning in a dedicated on-site facility that would remove the arsenic and other solids from the adsorptive media and transporting the solids for disposal at USEPA-approved regional facilities, such as the Harbors Environmental Services in Wilmington, California; or (3) transporting the adsorptive media and solids for cleaning and disposal at the Wilmington or a similar, USEPA-approved facility (Psomas 2011; DWR 2009).

Additional treatment technologies currently exist (e.g., reverse osmosis) that can supplement the treatment approach if required to meet the arsenic concentration objectives. Future techniques may be also be developed that could treat arsenic in a more cost-effective manner and reduce treatment wastes. The treatment facilities will be managed to allow for the systematic consideration and evaluation of available arsenic filtration technologies over time to ensure that applicable arsenic concentration levels are maintained and to reduce treatment wastes to the maximum extent feasible.

**Recycled Water.** Wastewater will be collected and treated to unrestricted reuse standards in accordance with Title 22 of the *California Code of Regulations*. The on-site distribution system will provide recycled water for outdoor irrigation and for 30 percent of indoor business park demand. Dual plumbing will also be installed to meet irrigation needs along the outer portions of very low density and low density residential lots with an area of at least 7,000 square feet.

The Project's proposed recycled water use is consistent with the Recycled Water Policy adopted in 2009 by the State Water Resources Control Board (Resolution No. 2009-0011). The Recycled Water Policy goals include (1) increasing statewide use of recycled water over 2002 levels by at least one million afy by 2020 and by at least two million afy in 2030 and (2) substituting as much recycled water for potable water as possible by 2030. To facilitate these goals, the Recycled Water Policy provides direction to each RWQCB regarding the appropriate criteria for issuing recycled water use permits to streamline the recycled project permitting process. At buildout, approximately 4,577 afy of recycled water will be used to meet 40 percent of total Project water demand.

### ***Project Buildout Water Supply and Demand Projections***

This section discusses buildout supply and demand during average (normal), single-dry, and multiple-dry years over a 20-year projection in conformance with Section 10910(c)(3) of the *California Water Code*. The projections incorporate the ELT scenario 82-year hydrologic projections used by AVEK in the 2015 UWMP (AVEK 2016).

Tables 5.18-10 through 5.18-12 provide buildout supply and demand projections during average, single-dry and multiple-dry years. The average year projections use the ELT long-term average reliability factor of 59 percent in the AVEK UWMP for SWP supplies. Single-dry year projections are presented in five-year increments and assume SWP deliveries will be five percent of Table A Amounts, the level used in AVEK's UWMP. Multiple-dry year projections are presented in five-year increments with the first two years shown as normal

years and the last three years as a dry period or drought. Consistent with the ELT scenario and the AVEK UWMP, three-year drought period annual delivery rates used in the analysis are 12 percent, 16 percent, and 24 percent of the applicable SWP Table A amounts.

The projections show that Project supplies are sufficient to meet buildout demand for the 20-year analysis period and on a sustainable basis after buildout. The average year analysis in Table 5.18-10 is extended to Year 25 to provide projections up to the time when in-basin return flows fully mature. Project reserve supplies reach a maximum annual average volume of more than 79,000 acre-feet by Year 25 and would increase over time as return flows mature, and available supplies would, on average, exceed supplies in future years. Tables 5.18-11 and 5.18-12 show that stored water will be sufficient to meet demand when imported water supplies are limited both in single-dry years and multiple-dry years during and after Project buildout.

### ***Water Use Monitoring and Reporting Requirements***

The Specific Plan Green Development Program requires that the Project Water Purveyor meter all Project water use and provide the County with two water use reports. The first report must be submitted to the County at the end of the 5<sup>th</sup> year following first occupancy or occupancy of the 4,000<sup>th</sup> dwelling unit, whichever occurs latest. The second report must be provided to the County at the end of the 10<sup>th</sup> year following first occupancy or occupancy of the 10,000<sup>th</sup> dwelling unit, whichever occurs latest.

The purpose of the reports is to verify that the projected rates of potable and recycled water use for residential, CII, irrigation, and other purposes are being achieved and that available water supplies are sufficient to meet future demand after approximately 25 percent and 50 percent of the Project is completed. If the water use documented in a water use report exceeds projected levels, the Project Water Purveyor must implement response measures to reduce water consumption, such as modifying the water budget based rates in accordance with applicable laws, surcharges, additional enforcement, or water system repairs or upgrades. If required, the response measures could also include securing supplemental water, including the following potential water sources:

- **Imported Water Return Flows from Basin Watershed Use.** As discussed above, subject to the submission of an engineering report and approval by the watermaster, the Judgment and Physical Solution allows for the production of return flows generated by imported water use in the Antelope Valley Basin Watershed in addition to return flows from imported water use in the basin (see Appendix 5.18-D). Imported water will be used within the portions of the Project site that are outside the basin but within the basin watershed. If the return flows generated by this imported water use can be sufficiently quantified and approved by the watermaster, Project supplies would be augmented by this additional water source.
- **In-Basin Transfers.** The Judgment and Physical Solution for the Antelope Valley Basin allows for the transfer of overlying production rights from one party to another subject to watermaster approval (see Appendix 5.18-D). If required, supplemental supplies could be acquired from other parties pursuant to the Judgment and Physical

Solution and with watermaster approval in a manner that would avoid significant impacts to regional groundwater and groundwater users.

- **Antelope Valley – East Kern Water Agency Fee Program.** As summarized in the LACWWD40's 2015 UMWP, AVEK has implemented a fee program to facilitate obtaining additional imported water supplies to meet new demands in the region. The program requires payment to AVEK for each acre-foot of additional supply, and AVEK will use the funding to purchase water supplies that can be imported to the region using the SWP conveyance system. The fee program will likely focus on Table A transfers from other SWP contractors in accordance with the existing SWP contracts and DWR rules and regulations. AVEK acquisition of Table A transfers for fee program use would not generate additional impacts or require mitigation beyond the measures identified in the applicable SWP system environmental review process.
- **Additional Table A Transfers.** As discussed above, TRC acquired rights to 3,444 afy of Table A Amounts from Tulare Lake and Dudley Ridge for Project purposes. Additional Table A transfer opportunities may become available in the future. If available, Table A water secured for the Project would be transferred to AVEK's SWP account in accordance with applicable SWP contracts and rules and would be imported subject to an agreement with AVEK. Transfers of Table A Amounts would require the approval of the transferring SWP contractor, AVEK, and the DWR after appropriate environmental review. Project acquisition of additional Table A transfers would not generate additional impacts or require mitigation beyond the measures identified in the SWP system environmental review process.
- **Investment in Efficient Water Use Retrofit Programs or Additional Recycled Water Capacity for Existing Antelope Valley Users.** One or more water purveyors in the Antelope Valley may adopt a program under which additional water rights could be acquired by investing in water fixture retrofitting, new recycled water capacity, or other actions that reduce existing consumption in the region. It is likely that significant water savings could be achieved in existing residences, commercial and industrial buildings, or agricultural operations by replacing older fixtures and distribution equipment with modern, water-efficient facilities. Potable water demand could also be reduced by increasing the supply and delivery capacity of high-quality recycled water for irrigation in lieu of potable supplies. A regional water user could pay for applicable retrofits or capacity enhancements; establish the extent of reduced water consumption that results from the new facilities; and be credited with a supply equal to the net savings minus an applicable safety margin. Any such retrofit or recycled water program would be conducted in conjunction with regional water management programs designed to increase supply reliability and would be documented to ensure that net water savings were generated for the Antelope Valley. Other potential environmental impacts and mitigation measures that could be associated with a retrofit program would be evaluated by the applicable water purveyor or other implementing agency. No additional environmental review or mitigation would likely be required to participate in a retrofit or recycled water supply credit program approved by a local or regional water district or agency.
- **Storm Water Reuse.** The Urban Water Management Planning Act requires a consideration of storm water reuse as a potential future water supply. The

LACWWD40's 2015 UWMP indicates that certain districts in the Antelope Valley have considered or are implementing storm water reuse projects, including the Amargosa Creek Storm Water Runoff Recharge and Retention Basin project. It is possible that the Project could participate in the funding of these or similar regional storm water retention and reuse programs in exchange for rights to use a portion of the resulting additional supply. Regional programs would be subject to environmental evaluation and permitting by the applicable lead agency. Project participation in such efforts would not generate additional impacts or require mitigation beyond the measures identified by the Project's lead agency.

- **Desalination.** The Urban Water Management Planning Act requires a consideration of desalination as a potential future water supply. The Antelope Valley has no access to seawater and the 2015 AVEK UWMP states that desalination of brackish groundwater would add costs without increasing the Agency's supplies. The LACWWD40's 2015 UWMP indicates that, although there are no opportunities for the development of desalinated water in the district's service area, it may be possible for AVEK to partner with another SWP contractor, contribute financially to the construction of an ocean desalination facility, and obtain SWP water rights in exchange. Desalination facilities can involve potentially significant environmental impacts associated with brine disposal; with building and obtaining rights-of-way for water conveyance facilities; and with energy use. Due to cost and potential mitigation requirements, operating a desalination facility for Project use is not a feasible option. The Project could participate in the funding of a desalination project and SWP exchange program and acquire rights to use a portion of the resulting new supply. A desalination project coupled with an SWP water exchange would be subject to environmental evaluation and permitting by the applicable lead agencies. Project participation in a desalination program would not generate additional impacts or require mitigation beyond the measures identified by the lead agencies.
- **Other Potential Private or Public Water Sales.** Public or private entities may acquire rights to non-SWP water that can be transferred to the Project site by means of the California Aqueduct. The acquisition of sale and delivery rights from a seller, as well as the sale and transfer to the Project, would require appropriate agency approvals and environmental review. Water delivered to the Project site would also be required to meet applicable California Aqueduct water quality standards. Approvals from AVEK, the DWR, and other potential conveyance facility rights holders would be necessary to deliver third-party water through the California Aqueduct to the turnouts that serve the Project. In general, the conveyance of non-SWP water would occur on a lower priority than the conveyance of SWP supplies in the Aqueduct system, and transfers that rely on variable conveyance rights are more difficult to complete. A transfer relying on variable conveyance in the California Aqueduct would generally occur when there is surplus capacity and water would be stored until needed within the on-site and TRC water banks. Certain of the potential impacts associated with the purchase and conveyance of non-SWP supplies to and through the SWP system would be analyzed and mitigated in review processes undertaken by the participating water agencies. Additional impacts and mitigation measures could be associated with the transfer of water from the originating location, including the possibility of impacts to agriculture or other uses. The extent of these

impacts and mitigation would depend on the locations from which the water was obtained and the pre-transfer uses of the transferred supplies and would be reviewed by the participating water agencies.

### ***On-Site Water Supply Impacts***

Based on the supply and demand projections discussed above and summarized in Tables 5.18-10 through 5.18-12, the Project's water supplies will be able to sustainably meet demand up to and following buildout with an average annual banked reserve of more than 79,000 acre-feet, or more than 11 years of full buildout potable demand. The Project's indoor and outdoor potable water use will be minimized by meeting and exceeding applicable State CALGreen Code and County Green Building Standards Code residential and non-residential equipment and water flow requirements. All Project landscaping and irrigation must conform to the plant palette and irrigation efficiency requirements in Section 3.4 of the Specific Plan. Outdoor water use will be consistent with the MWEL0 as amended in 2015. The projected annual residential per capita indoor and outdoor water demand of approximately 113 gpcd and total per capita water urban use of approximately 177.5 gpcd is consistent with the 2035 per capita water use rates projected by the County in the General Plan Update draft and final EIRs (142–199 gpcd) and the AVIRWRMP 2010 average water demand estimate of 199 gpcd and a conservative 10 percent reduction from the 2010 average level to meet the state's 20 percent urban water use reduction mandate (179 gpcd) (see Table 5.18-5).

As discussed above, the Project water supplies and demand analysis uses the recommended factors in the Peer Review Report submitted to the County (Kennedy/Jenks 2017). Certain of these factors, such as an assumed indoor residential use of 65 gpcd, are relatively conservative compared with recent studies, reported use by other water districts, and the State's current indoor residential standard of 55 gpcd. The analysis of Project supplies also does not include imported water return flows from basin watershed use that may be permitted by the watermaster in accordance with the Judgment and Physical Solution. Finally, the supply analysis does not assume that AVEK will use banked or groundwater supplies to meet the 4,000 afy of TRC demand incorporated into the AVEK UWMP during a single-dry or multiple-dry year. Consequently, the analysis of Project water supplies and demand includes conservative water use and supply assumptions.

The Project's use of groundwater and return flows from imported water in the Antelope Valley Basin and watershed areas will conform to the requirements of the adjudication Judgment and Physical Solution and will avoid significant impacts to groundwater supplies. High quality recycled water will be produced and distributed on site to meet 40 percent of buildout demand, including outdoor irrigation and for indoor wastewater and cooling in the business park. The use of recycled water is consistent with California and County policies that encourage increased municipal and industrial recycled water supplies.

Available SWP supplies include imported water secured and transferred to AVEK for importation and Project use and service area deliveries to TRC incorporated in Table 4-2 of the Agency's 2015 UWMP. The existing TRC and proposed on-site water banks allow for the wet-year storage and dry-year use of AVEK and other deliveries, which significantly

increases the overall reliability of both regional and Project water supplies. The TRC Water Bank is a preexisting facility that will continue operations under the adjudication Judgment and Physical Solution. The proposed water bank will be operated in conformance with a storage agreement with the adjudication watermaster.

Potentially significant water supply impacts could occur if on-site water use exceeds projected levels or if SWP delivery reliability is lower than projected. If water use is less efficient than projected, demand could exceed supply in the latter of the Project's buildout years (see Table 5.18-12). If the annual average SWP delivery reliability is lower than estimated, less imported water would be available to meet Project demand from the secured Table A sources under the TRC-AVEK agreement and from the service area deliveries to TRC incorporated into the 2015 UWMP.

Mitigation Measure (MM) 18-1 and MM 18-2 will reduce these potential impacts to less than significant levels. MM 18-1 requires implementation of the water efficiency measures included in Part 2B of the Specific Plan's Green Development Program and the water conservation measures included in PDFs 18-1, 18-2, and 18-3. These measures will result in the installation of residential and non-residential water fixtures, irrigation, and other equipment that will exceed applicable State CALGreen Code and County Green Building Standards Code standards; will ensure that landscaping demand conforms to the more stringent of the MWELo or County standards; and will ensure that approximately 40 percent of total Project demand will be met by using recycled water. MM 18-1 also requires that the Project's on-site water use be monitored at all times. Finally, MM 18-1 requires that the Project Water Purveyor implement water budget based rates that reflect all applicable legal requirements to provide pricing incentives for meeting and exceeding projected levels of demand. The rates will be based on the projected indoor and outdoor water use factors summarized Table 5.18-7 except for indoor residential water use, which will incorporate the more stringent of the 55 gpcd standard in the recent multi-agency framework report (DWR et al. 2016b) or subsequent standards that may be implemented by the State or County. As shown in Table 5.18-7, residential indoor water use accounts for approximately 61 percent (4,161 afy of 6,788 afy) of the Project's full buildout potable water demand. The incorporation of a lower indoor residential use standard than assumed in the analysis in the water budget based rates will provide additional assurance that the Project demands will meet or exceed projected levels.

MM 18-2 requires implementation of water use monitoring and reporting, as described in Part 2B of the Specific Plan's Green Development Program and PDF 18-4, including the submission of water use reports to the County at the end of the 5<sup>th</sup> and 10<sup>th</sup> years or the occupancy of the 4,000<sup>th</sup> and 10,000<sup>th</sup> units, whichever occurs latest. The reports will utilize metering data to determine whether the water use efficiencies summarized in Table 5.18-7 are being achieved as the Project is built and that available water supplies are sufficient to meet future demand. If a report determines that water use is exceeding projected levels, the Project Water Purveyor must identify specific response measures to ensure that water supplies will meet future demand. These measures may include modified water-budget based rates to encourage lower water use in conformance with applicable legal requirements; enforcement; system repairs or upgrades to reduce losses and increase efficiency; or securing new water sources.

MM 18-1 and MM 18-2 ensure that Project's water efficiency will be achieved and that water supplies will be confirmed in reports that utilize on-site metering data after approximately 25 percent and 50 percent of the proposed Project has been built. If required, the Project Water Purveyor must identify and implement response measures that will ensure that available supplies will meet future demand. No subsequent development may occur until the County is satisfied that water supplies are sufficient to meet future demand. Potential impacts related to water use efficiency and water supply reliability will be reduced to less than significant levels with the incorporation of MM 18-1 and MM 18-2.

## Off-Site Impacts

As shown on Exhibit 4-13, Centennial Project – Conceptual Domestic Water System, in Section 4.0, Project Description, certain components of the Project's water infrastructure would be located outside the Project site. These infrastructure components include extraction wells; water conveyance pipelines; and related piping, control structures, and electrical power systems. The operation of the off-site groundwater extraction wells and related water conveyance pipelines and systems do not impact Project water supplies because these systems are necessary to implement the proposed domestic water system.

The impacts of constructing off-site water infrastructure are described in the respective technical sections of this EIR (e.g., biological resources, land use). The operational impacts from using these off-site infrastructure systems are also described in the respective technical sections (e.g., air quality, utility systems) of this EIR. The construction of off-site systems will not result in significant impacts to water supplies.

**Impact Summary:** On-site water supply impacts will be less than significant with the incorporation of mitigation measures MM 18-1 and MM 18-2. The construction of off-site systems will not result in significant impacts to water supplies and no mitigation is required.

**Threshold 18-2** **Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted)?**

## On-Site and Off-Site Impacts

The Project's use of groundwater and return flows from in-basin imported water use is regulated by the terms and conditions of the adjudication Judgment and Physical Solution. The Judgment and Physical Solution incorporates and implements a judicial determination of the total sustainable yield of the Antelope Valley aquifer and limits the use of native supplies and imported water return flows to levels that will allow for the sustainable use of groundwater, including the avoidance of overdraft conditions. Groundwater use in accordance with the Judgment and Physical Solution would not result in a lowering of local groundwater to levels that would impact the production rate of pre-existing nearby wells

and would not cause groundwater to drop to levels that would not support existing or planned land uses. Consequently, Project groundwater and return flow use would not significantly impact groundwater levels and no mitigation is required.

The Project's potential impacts to groundwater recharge are discussed in more detail in Section 5.2, Hydrology and Flood, and Section 5.4, Water Quality. Project development would not interfere substantially with groundwater recharge to the extent of causing a net deficit in aquifer volume or a lowering of the local groundwater table. Under existing conditions, the Project is located in a watershed of approximately 39,600 acres, of which approximately 36,660 acres, including most of the Project site and the surrounding watershed, drains to the Antelope Valley Groundwater Basin. No surface water flows will be redirected to other watersheds under post-development conditions. Under existing conditions, approximately 3,308 acre-feet of runoff to the basin is generated from the Project site during a 50-year storm event, excluding flows from the site west toward Gorman Creek. At buildout, approximately 4,362 acre-feet of runoff to the basin would be generated from Project areas during a 50-year storm event. The increase in runoff volume is related to the reduction of permeable areas due to development (Psomas 2017b).

To ensure that no loss of groundwater recharge potential in the basin would occur, the Project will construct and maintain 26 storm water infiltration basins with a total storage capacity of approximately 2,229 acre-feet in alluvial, low-lying locations of the site. The basins are typically located adjacent to or within natural drainages and in development areas in the flatter eastern areas of the Project site. Natural soil conditions are better suited for infiltration in these locations and promote effective infiltration. Each basin has been sized to impound water at depths of approximately six to eight feet and to discharge within a maximum of four days. The short draw-down time minimizes evaporation losses and maximizes groundwater recharge. The depth of stored water promotes infiltration by reducing the surface area of ponded water and lowering evaporation losses below the level that occur under existing site conditions. The basin system will also intercept low flow discharges during the summer months, which will incrementally add to overall groundwater recharge volumes. Basin performance will be monitored and maintenance will be performed as required to maintain the planned infiltration rates (Psomas 2017b). The Project's runoff management and basin system is discussed in more detail in Section 5.2, Hydrology and Flood.

Project runoff volume would increase from impervious surfaces introduced by development. On-site basins will capture and infiltrate this runoff to maintain existing peak flow rates and volumes during storm events at off-site discharge locations (see Section 5.2, Hydrology and Flood). Most of the basins are located in the eastern portions of the site that contribute surface flows and groundwater recharge to the Antelope Valley Basin. As a result, Antelope Valley Basin recharge rates would either be unaffected by or could potentially increase as a result of Project development.

***Impact Summary:*** There would be a less than significant impact to groundwater supplies, groundwater recharge rates, groundwater levels, and to existing and potential future well uses; no additional mitigation is required.

## 5.18.7 MITIGATION MEASURES

**MM 18-1** In addition to complying with the water efficiency and conservation set forth in Divisions 4.3 and 5.3 of the California Green Building Standards (CALGreen) Code or the County Green Building Standards Code, whichever are more stringent, the Project Applicant/Developer shall implement the measures listed below.

**Meter Water Use.** Install, maintain, and monitor all non-construction potable and non-potable water use using appropriate metering equipment throughout the site.

**Reduce Potable Water Use with On-Site Recycled Water.** Install, maintain, and operate on-site wastewater treatment and conveyance facilities that provide recycled water treated to California Title 22 unrestricted reuse standards from on-site wastewater. Recycled water shall be used to meet (i) 100 percent of commercial, business park, institutional, school, hotel, park, and slope irrigation demand and (ii) outdoor irrigation demand in 50 percent of the total very low and low density residential lot landscaped area.

**Water Efficient Appliances.** Require installation of water-efficient major appliances (washers, dryers, dishwashers) in compliance with the California Appliance Efficiency Regulations, Energy Star®, or other applicable standards.

**Water Efficient Irrigation.** Require the installation of irrigation equipment with a minimum 0.80 irrigation efficiency for all public and private park, recreation and entertainment land use, arterial roadway, and slope irrigation uses. Water Smart/Evapotranspiration-based controllers shall be used. Low water use plants and shrubs shall be used in all irrigated slope areas with an average plant factor of 0.2, as defined in the State Model Water Efficient Landscape Ordinance.

**Water Budget Based Water Rates.** Require that the Project Water Purveyor implement water budget based rates in compliance with all applicable legal requirements and in a manner consistent with the use of such rates by other water districts in California (e.g., Irvine Ranch Water District). The water budget based rates shall incorporate and be designed to ensure that Project potable water use meets or exceeds the following standards and adjusted as may be required to meet more stringent standards that may be adopted by the State or Los Angeles County:

*1. Indoor Water Use Standards*

- (a) Residential indoor water use – 55 gallons per capita per day
- (b) Commercial indoor water use – 200 gallons per day per thousand square feet
- (c) Business Park indoor water use – 65 gallons per day per thousand square feet, including recycled water for commercial wastewater and cooling use except where prohibited by applicable law for particular types of areas or uses (e.g., employee cafeterias)

- (d) Institutional indoor water use – 50 gallons per day per thousand square feet
- (e) Hotel indoor water use – 125 gallons per day per room.

## 2. Outdoor Water Use Standards

- (a) Residential outdoor water use – 55 percent of the reference evapotranspiration rate for the Project site
- (b) Commercial, industrial, and institutional outdoor use – 45 percent of the reference evapotranspiration rate for the Project site

**MM 18-2** The Project Applicant/Developer shall submit to the County Water Use Reports prepared by a qualified specialist to the satisfaction of the County to verify that the projected water use efficiencies are being achieved (1) at the end of the 5<sup>th</sup> year following first occupancy or occupancy of the 4,000<sup>th</sup> dwelling unit, whichever occurs later and (2) at the end of the 10<sup>th</sup> year following first occupancy or occupancy of the 10,000<sup>th</sup> dwelling unit, whichever occurs later. In the event that a Water Use Report indicates that consumption exceeds the projected levels, response measures must be implemented to ensure that available supplies will be sufficient to meet future demand. No further development will be approved until additional measures are implemented to achieve the required efficiencies and/or provide additional water supplies, as confirmed by the Project Water Purveyor. No subsequent Tentative Maps shall be approved until the Project Water Purveyor has demonstrated to the satisfaction of the County that the implementation of specific water demand and supply response measures will ensure that available supplies will meet future Project demand.

### 5.18.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Impacts to water supply will be less than significant after mitigation. Potential groundwater impacts will be less than significant and no mitigation is required. The Project will contribute to a significant and unavoidable cumulative impact to regional water supplies.

## 5.19 WASTEWATER COLLECTION

### 5.19.1 INTRODUCTION

#### Purpose

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that wastewater collection issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts related to wastewater are described in Sections 6.0 and 7.0, respectively. Potential odor and other air quality impacts from operation of the wastewater treatment system are addressed in Section 5.11, Air Resources.

#### Summary

As discussed further in Section 4.0, Project Description, the Project will include wastewater treatment and recycled water distribution facilities to minimize potable water demand. Two wastewater reclamation facilities (WRFs) would be constructed to provide solids handling, biogas reuse, and recycled water treated to unrestricted reuse standards under Title 22 of the *California Code of Regulations*. One WRF would be located west of the West Branch of the California Aqueduct (WRF West) and one would be located east of the Aqueduct (WRF East). As discussed in Section 5.18, Water Resources, recycled water will be used for outdoor irrigation and indoor wastewater and cooling in the proposed business park. At full buildout, recycled water will meet approximately 40 percent of total Project's water demand.

The WRFs are proposed in locations that allow for wastewater to generally flow by gravity for treatment. Pump stations would be required to serve areas that cannot flow by gravity. Seasonal storage ponds would be provided at the WRF East site to temporarily store recycled water during periods of lower demand (e.g., during winter) for use during high demand periods (e.g., during summer). Feasible and applicable wastewater treatment facility mosquito and health vector best management practices recommended by the California Department of Public Health will be implemented for the ponds (CDPH 2012). As discussed in Section 5.18, the Project's water facilities will be owned and operated by a Project Water Purveyor that will be regulated by the California Public Utilities Commission (CPUC) or formed as a Community Services District, a statutory water district, or other entity with the appropriate capacity to own, operate, and maintain the Project's water system. The Project Water Purveyor or an alternate qualified public utility district would provide wastewater services, including the operation and maintenance of the WRFs and recycled water system. The WRFs will be required to obtain Waste Discharge Requirements and other approvals issued by the Lahontan Regional Water Quality Control Board (RWQCB) and comply with the State Water Resources Control Board's (SWRCB's) Recycled Water Use Policy.

Section 3.5 of the *Centennial Specific Plan* includes a Wastewater Management Plan (see also Project Design Features [PDFs] 19-1 through 19-3). The Wastewater Management Plan

requirements and PDFs 19-1 through 19-3 have been incorporated in mitigation measures (MMs) 19-3, 19-4 and 19-5. MM 19-1 ensures payment of all applicable fees associated with establishing the Project Water Purveyor, or an alternate qualified public utility district, as the operator of the WRFs. MM 19-2 requires that the Project either be annexed into an existing qualified public utility district (e.g. Golden Valley Municipal Water District) or that a new public utility district (e.g. Project Water Purveyor) has been created to serve the Project. The Project Water Purveyor or alternate qualified public utility district shall be responsible for the design, construction, and operation of the wastewater facilities, and shall ensure compliance with all applicable standards and regulations. MM 19-3 requires the Project Applicant/Developer to prepare a Facilities Report, a Pump Station Feasibility Report, and a Sewer Area Study consistent with County policies and requirements. These measures ensure that potential impacts related to wastewater treatment requirements and wastewater capacity will be less than significant.

## **Section Format**

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation. This information is presented in the following format (Please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

### 5.19.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

#### Federal

##### *Capacity Assurance, Management, Operation, and Maintenance Program*

In January 2001, the U.S. Environmental Protection Agency (USEPA) published a proposed rule intended to clarify and expand permit requirements under the Clean Water Act to further protect public health and the environment from impacts associated with sanitary sewer overflows. The proposed rule is generally referred to as the Capacity Assurance, Management, Operation, and Maintenance Program (CMOM) regulation. The proposed CMOM regulation requires development and implementation of programs intended to meet the performance standard of eliminating sanitary sewer overflows; to provide overflow emergency response plans, system evaluations, and capacity assurance plans; to conduct program audits; and to implement public communication efforts.

#### State

##### *California Porter-Cologne Act*

The Porter-Cologne Water Quality Control Act of 1970 (Porter-Cologne Act)(*California Water Code*, Sections 13000 et. seq.) is California’s primary statute governing water quality and water pollution issues, including discharges from wastewater treatment facilities. The Porter-Cologne Act provides the SWRCB and nine RWQCBs authority to protect water quality and is the primary vehicle for implementing California’s responsibilities under the federal Clean Water Act (CWA). Each RWQCB must formulate and adopt a water quality control plan (commonly referred to as a “basin plan”) for the region within its jurisdiction. The basin plan must conform to the policies set forth in the Porter-Cologne Act and the State water policy established by the SWRCB. Each basin plan establishes beneficial uses for surface and ground water in the region and includes narrative and numeric water quality standards to protect those beneficial uses. Each RWQCB is also authorized to include water discharge prohibitions applicable to particular conditions, areas, or types of waste within its jurisdiction. The Act requires that, unless otherwise authorized by a general or other permit,

reports of waste discharges to regulated “waters of the State” must be provided to each RWQCB. The RWQCB may issue discharge permits under State law in response to a report of waste discharge. These permits are commonly referred to as “waste discharge requirements” (WDRs) and are issued by the RWQCBs for activities within each regional board’s jurisdiction. As discussed in Section 5.2, Hydrology and Flood, all of the proposed Project development areas are within the jurisdiction of the Lahontan RWQCB. No on-site development is proposed for the far western portions of the site that are regulated by the Los Angeles RWQCB.

### ***Wastewater Reclamation Facilities Regulation***

Planning, design, construction and operation of wastewater reclamation facilities are regulated under the provisions of Title 22 of the *California Code of Regulations*. The California RWQCBs use the Title 22 criteria and, with input from the California Department of Health Services (DHS), issue WDRs for all wastewater reclamation facilities to ensure that applicable water quality objectives and standards are not exceeded. The Lahontan RWQCB would issue WDRs to both of the WRFs proposed to serve the Project prior to commencing operations.

### ***Recycled Water Policy and Regulations***

The State of California has implemented laws that provide for and encourage the use of recycled water. Section 461 of the *California Water Code* states, “It is hereby declared that the primary interest of the people of the state in the conservation of all available water resources requires the maximum reuse of recycled water in the satisfaction of requirements for beneficial uses of water”. The State also encourages Californians to develop water recycling projects to help meet potable water demands and to augment surface and groundwater supplies through the provisions of Sections 13500–13556 of the *California Water Code*.

The regulation of recycled water is vested by State law in the SWRCB’s Division of Drinking Water (DDW). The DDW assumed responsibility for State drinking and recycled water regulation in 2014 when the State legislature transferred these functions from the California Department of Public Health (DPH). Sections 13500–13557 of the *California Water Code* regulate the protection of the potable water supply through the control of cross-connections with potential contaminants, including recycled water. Water quality standards and treatment reliability criteria for recycled water are codified in Title 22 of the *California Code of Regulations* (CCR Title 22). Title 22 establishes quality and/or treatment processes required to use recycled water for non-potable applications. Title 22 also addresses sampling and analysis requirements at a treatment plant; preparation of an engineering report prior to production or use of recycled water; and general treatment design requirements, reliability requirements, and alternative methods of treatment. Permits are issued to each water recycling project by one of the nine RWQCBs. These permits include water quality and public health protections, as detailed in Title 22.

On February 3, 2009, in Resolution No. 2009-0011, the SWRCB adopted a Recycled Water Policy (Policy) (SWRCB 2009). The Policy states, “In the face of an unprecedented water crisis due to the collapse of the Bay-Delta ecosystem, climate change, continuing population

growth combined with a severe drought on the Colorado River and failing levees in the Delta, the SWRCB has adopted a Recycled Water Policy in an effort to move aggressively towards a sustainable water future". The SWRCB Policy also states "we declare our independence from relying on the vagaries of annual precipitation and move towards sustainable management of surface waters and groundwater, together with enhanced water conservation, water reuse and the use of stormwater". The following goals were included in the Policy:

- Increase use of recycled water over 2002 levels by at least one million acre-feet per year (afy) by 2020 and at least two million afy by 2030.
- Increase the use of storm water over use in 2007 by at least 500,000 afy by 2020 and at least one million afy by 2030.
- Increase the amount of water conserved in urban and industrial areas by comparison to 2007 by at least 20 percent by 2020.
- Substitute as much recycled water for potable water as possible by 2030.

The SWRCB Policy provides direction to the RWQCBs regarding appropriate criteria to be used in issuing permits for recycled water projects and is intended to streamline recycled water project permitting while providing the RWQCBs with sufficient authority and flexibility to address site-specific conditions. The Policy encourages other public agencies to consider the benefits of using recycled water in evaluating the impacts of recycled water projects on the environment as required by CEQA. The Policy also acknowledges that the SWRCB shares jurisdiction over the use of recycled water with the RWQCBs and the DPH and recognizes that the DWR and CPUC have important roles in encouraging the use of recycled water. The Policy provides guidance concerning these roles. The Policy also includes incentives for using recycled water.

The Policy notes that (1) some groundwater basins contain salts and nutrients that exceed or threaten to exceed water quality objectives established in the Basin Plans; (2) all salts and nutrients should be managed on a basinwide or watershedwide basis through development of regional or subregional management plans; (3) every groundwater basin/sub-basin in California is to have a consistent, locally driven salt/nutrient management plan developed by water and wastewater entities, together with contributing stakeholders in collaborative processes, including compliance with CEQA and participation by RWQCB staff. The Policy describes the components of these salt and nutrient management plans. Finally, the Policy addresses the control of incidental runoff from landscape irrigation projects, recycled water, groundwater recharge projects, anti-degradation factors, control of emerging constituents, and chemicals of emerging concern.

In 2009, the SWRCB adopted a General Permit for landscape irrigation uses of recycled water to facilitate the California Legislature's intent to promote the use of recycled water (SWRCB Order No. 2009-0006-DWQ). The General Permit streamlines the regulatory process for the irrigation use of disinfected tertiary recycled water produced by a public entity at a municipal wastewater treatment facility. Such uses include parks, greenbelts, and playgrounds; school yards; athletic fields; golf courses; cemeteries; residential landscaping, common areas; commercial and industrial landscaping, (except eating areas); and freeway, highway, and street landscaping.

This Policy was amended on April 25, 2013, to require monitoring for constituents of emerging concern and for reducing the monitoring of priority pollutants in recycled water used for landscape irrigation.

### ***Model Water Efficient Landscape Ordinance***

The Water Conservation in Landscaping Act of 2006 (Assembly Bill [AB] 1881) required local agencies, no later January 1, 2010, to adopt the state model water efficient landscape ordinance (MWELo) or an equivalent local ordinance. State MWELo regulations were significantly strengthened in response to a drought executive order issued by the California Governor in 2015 (Executive Order B-29-15). The emergency regulations became effective on June 1, 2015, and require new development projects (including residential, commercial, industrial and institutional projects that require a permit, plan check, or design review) with landscape areas of 500 square feet (sf) or more to do the following:

- Dedicate landscape water meters or submeters for residential landscapes over 5,000 square feet (sf) and non-residential landscapes over 1,000 sf.
- Have pressure regulators and master shut-off valves for irrigation systems.
- Meet the national standard stated in the Ordinance to ensure that only high efficiency sprinklers are installed on all irrigation emission devices.
- Have flow sensors that detect and report high flow conditions due to broken pipes and/or popped sprinkler heads for landscape areas greater than 5,000 sf.
- Increase the minimum width of areas that can be overhead irrigated from 8 feet to 10 feet; areas less than 10 feet wide must be irrigated with subsurface drip or other technology that produces no over spray or runoff.

The maximum amount of water that can be applied to a landscaped area was reduced from 70 percent of the reference evapotranspiration (ET<sub>o</sub>) rate to 55 percent for residential landscape projects, and 45 percent of ET<sub>o</sub> for non-residential projects. The emergency regulations further restrict the amount of high water use plants and turf that may be used for residential and nonresidential development. The Project's compliance with the MWELo, as amended in 2015, is discussed in Section 5.18, Water Resources.

## **County**

### ***Los Angeles County General Plan and Antelope Valley Area Plan***

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan* (AVAP), part of the County General Plan, were updated in 2015 and include goals and policies that address wastewater in the unincorporated County. The AVAP goal and policy applicable to the analysis of wastewater for the Project are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies, and regulations.

**Goal COS 3:** A clean water supply untainted by natural and man-made pollutants and contaminants.

**Policy COS 3.2:** Restrict the use of septic systems in areas adjacent to aqueducts and waterways to prevent wastewater intrusion into the water supply.

### ***Wastewater Treatment Plant Operations***

As discussed in Section 5.18, Water Resources, the Project's water facilities will be owned and operated by a Project Water Purveyor that will be regulated by the CPUC or formed as a Community Services District, a statutory water district, or other entity with the appropriate capacity to own, operate, and maintain the Project's water system. The Project Water Purveyor or an alternate qualified public utility district would also provide wastewater services, including the operation and maintenance of the WRFs and recycled water system and be funded through a rate-payer system and fees. Until the Project Water Purveyor or an alternate qualified public utility district is established, the Project Applicant/Developer will be responsible for all Project-related wastewater and recycled water services. The design, permitting, financing, and construction of all wastewater treatment, collection, and distribution infrastructure will be provided by the Project Applicant/Developer.

### **5.19.3 ENVIRONMENTAL SETTING**

Due to the rural nature of existing land uses on and immediately surrounding the Project site, wastewater treatment for existing development is provided by septic tanks. There are currently no connections to an existing municipal wastewater system within the Project site or in adjacent areas. No wastewater treatment providers that could provide service for the proposed development are located or planned in the vicinity of the Project site. The nearest municipal wastewater management agency is the Sanitation Districts of Los Angeles County (LACSD), which serves approximately 5.6 million people in 78 cities and unincorporated areas within the County. The LACSD operates 11 wastewater reclamation plants (WRPs), which treat approximately 510 million gallons per day (mgd) of wastewater. The following 4 WRPs are located within 50 miles of the Project site (LACSD 2017):

- The Valencia WRP, located approximately 32 miles south of the Project site, which provides primary, secondary, and tertiary wastewater treatment and has a capacity of 21.6 mgd.
- The Saugus WRP, located approximately 35 miles south of the Project site, which provides primary, secondary, and tertiary wastewater treatment and has a capacity of 6.5 mgd.
- The Lancaster WRP, located approximately 41 miles east of the Project site, which provides tertiary wastewater treatment and has a capacity of 18 mgd.
- The Palmdale WRP, located approximately 43 miles east of the Project site, which provides primary, secondary, and tertiary wastewater treatment and has a capacity of 12 mgd.

## 5.19.4 PROJECT DESIGN FEATURES

- PDF 19-1** The Project will implement the Wastewater Management Plan, as discussed in Section 3.5 of the *Centennial Specific Plan*, and will include two wastewater reclamation facilities (WRFs) to provide on-site treatment of all Project-generated wastewater. Both WRFs will include solids disposal and primary, secondary, and tertiary treatment. The WRFs would be sited in locations that allow for wastewater to generally flow by gravity for treatment to reduce energy demands. Pump stations would be implemented to serve areas that cannot flow by gravity. As described in the Wastewater Management Plan, the WRFs will provide tertiary treatment (California Code of Regulations, Title 22 unrestricted reuse) and will produce recycled water for various outdoor uses, (e.g. landscaping, decorative water features including ponds, waterfalls, artificial streams) and for indoor wastewater and cooling in the business park, subject to all applicable laws and regulations. Biosolids will be hauled to a suitable landfill or used for conversion into fertilizer products. The effluent stream would be disinfected and discharged into the recycled water distribution system or into seasonal storage ponds. The two WRFs will be connected through a recycled water distribution system to balance storage and flow. The WRFs will include equipment to capture and reuse biogas for energy production to be used at the facility. The facilities would be operated and maintained by the Project Water Purveyor or an alternate qualified public utility district.
- PDF 19-2** WRF West will serve the Project area located west of the West Branch of the California Aqueduct and would be located on an approximate 3-acre site and will treat an average flow of approximately 0.34 million gallon per day (mgd). WRF West would be constructed in one phase.
- PDF 19-3** WRF East will serve the Project area located east of the West Branch of the California Aqueduct. The facility would be located in the northeasterly portion of the Project site and will treat an average flow of 4.28 million gallons per day. Lined seasonal recycled water storage ponds will be included in the WRF East design to temporarily store recycled water during times of low demand. Feasible and applicable wastewater treatment facility mosquito and health vector best management practices recommended by the California Department of Public Health will be implemented for the ponds. Waste solids would be hauled to a suitable off-site landfill or converted into fertilizer products. WRF East will also include equipment to capture and reuse biogas for energy production on the Project site. WRF East will be constructed in multiple phases to maximize operational and economic feasibility.

### 5.19.5 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact related to wastewater collection if it would:

- Threshold 19-1** Exceed wastewater treatment requirements of either the Los Angeles or Lahontan Regional Water Quality Control Boards.
- Threshold 19-2** Create water or wastewater system capacity problems, or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

### 5.19.6 ENVIRONMENTAL IMPACTS

- Threshold 19-1** **Would the project exceed wastewater treatment requirements of either the Los Angeles or Lahontan Regional Water Quality Control Boards?**

#### On-Site Impacts

As shown in Table 5.18-7 of Section 5.18 Water Resources, and in the Potable Water, Wastewater and Recycled Water Demands and System Plan Report (Appendix 5.19 A), total Project indoor water use at buildout will be approximately 4.48 mgd (5,019 afy), including 3.71 mgd (4,161 afy) for residential indoor demand, 0.74 mgd (829 afy) for schools, commercial, industrial and institutional indoor uses, and 0.03 mgd (29 afy) for other uses, including recreation. In addition to the indoor potable water flows contributing to wastewater flows, buildings in the Business Park land use will implement dual plumbing which will add 0.14 mgd (157 afy) to the wastewater flows for a total of 4.62 mgd (5,176 afy).

To account for losses in the wastewater treatment, recycled water distribution system and evaporation, the recycled water demand estimates include a conservative 10 percent loss between indoor water demand (wastewater flow volumes) and the available recycled water supply. This 10 percent loss is made up of the following components: approximately 2 percent losses through the wastewater treatment process, approximately 3 percent through evaporation losses in the recycled water storage ponds and approximately 5 percent loss through the distribution system. The evaporation losses were calculated on a monthly basis as part of the recycled water balance analysis and considered the recycled water seasonal storage pond area each month as the surface area and depth of storage fluctuated. Consequently, the supply of tertiary treated recycled water at buildout will be approximately 4.16 mgd or 4,658 afy.

Treatment of all wastewater generated on the Project site would occur at two permanent on-site WRFs and would consist of primary, secondary, and tertiary treatment processes using biological oxidation and solids handling techniques. Approximately 10 percent of Project

development will occur west of the West Branch of the California Aqueduct, and 90 percent will occur to the east of the Aqueduct. The WRF West facilities would be located west of the Aqueduct and would collect and treat wastewater from and produce recycled water for the western portion of the proposed development. The WRF East facilities would be significantly larger in size and would provide wastewater and recycled water service for nearly 90 percent of the proposed development. The locations of the on-site WRFs and related facilities, including the primary wastewater collection pipelines, treatment plant locations, and recycled water storage ponds, are shown on Exhibit 5.19-1, Preliminary Wastewater Collection System.

The maximum daily demand for potable water has been conservatively estimated to be 2.0 times the average daily demand. Consistent with this design approach, the WRFs will also have a nominal peak treatment capacity of 2.0 times the average daily flow, or 9.24mgd. The capacity of each treatment unit or element can be more accurately addressed in consultation with the Lahontan Regional Water Quality Control Board during the design process, based on its actual operating parameters which will account for a greater fluctuation in peak dry weather flow that may occur at the smaller WRF West, and general flow peaking resulting from wet weather flows that will occur at each WRF.

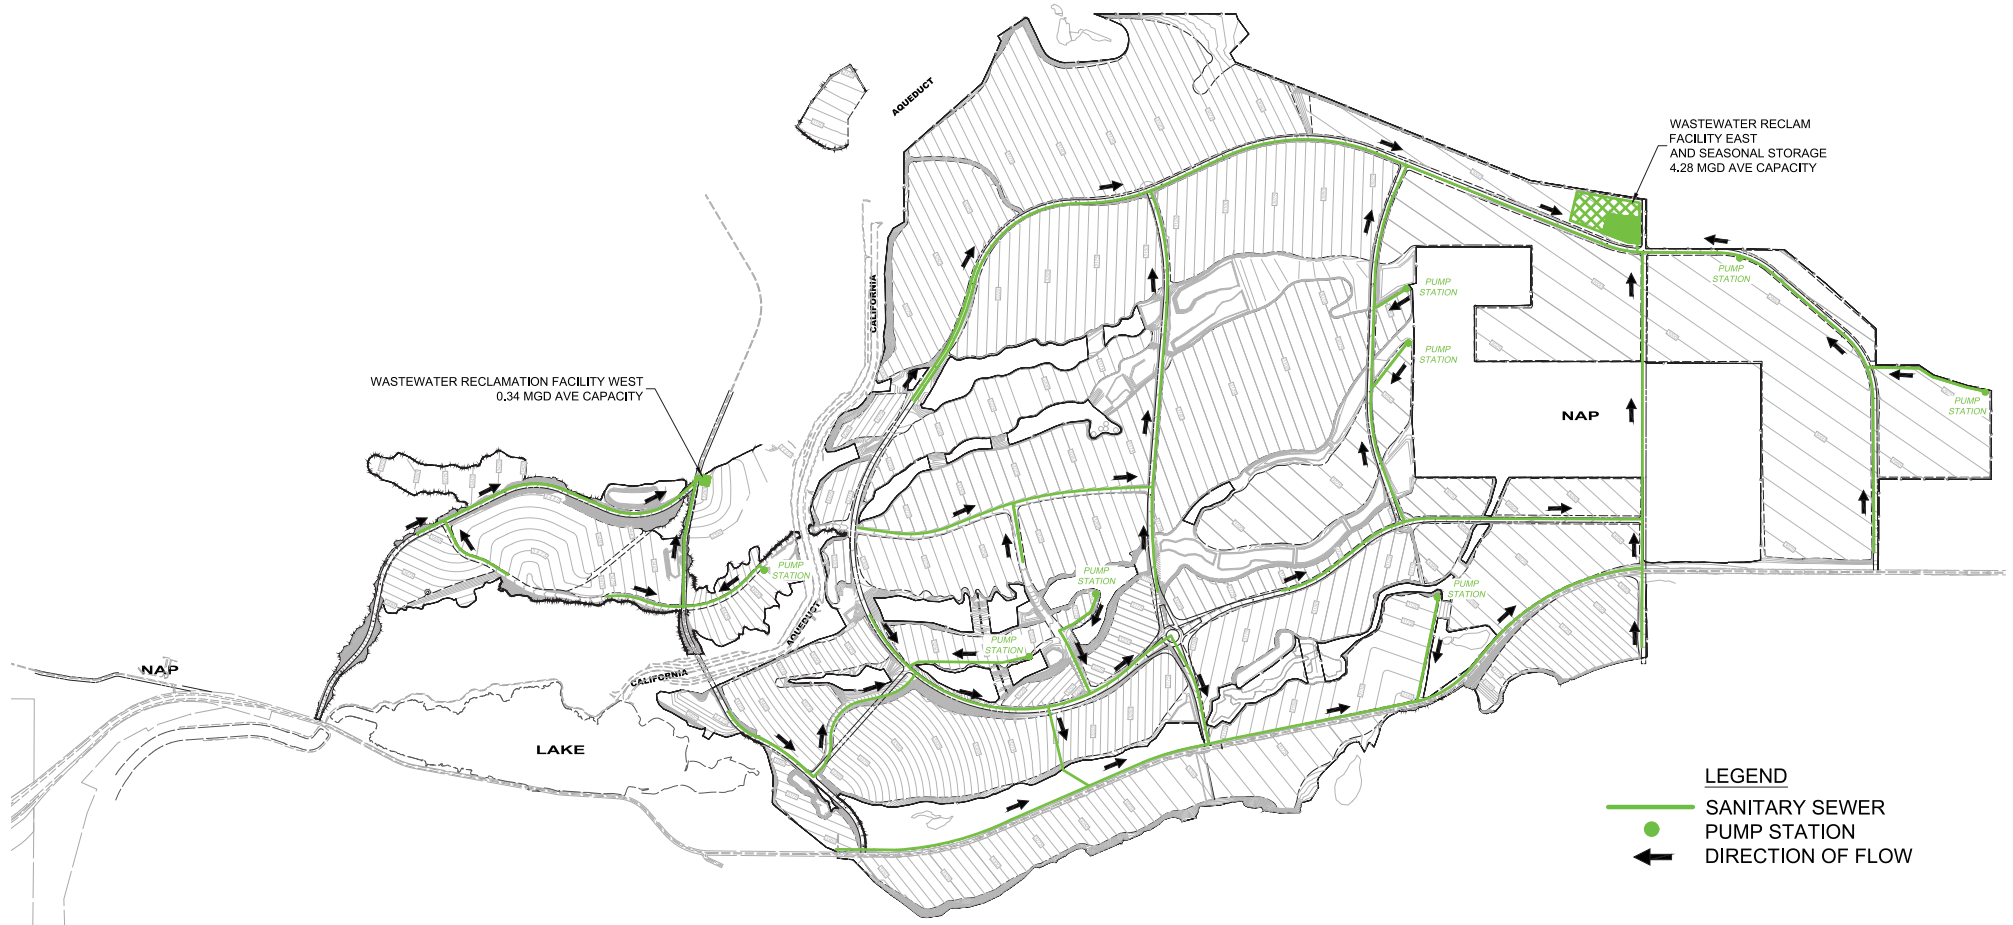

Both WRFs are proposed in locations that would allow for wastewater to generally flow by gravity for treatment and are sited in areas that are not adjacent to sensitive land uses. The wastewater collection system also includes locations where small sewer lift stations and force mains will be required. The proposed sewer lift stations will typically consist of a duplex, submersible pump system equipped with aboveground electrical facilities as well as generators to provide stand-by power. Telemetry systems will be included at each lift station and at each WRF to continuously monitor pump station operations and overall WRF flow processes. During the early stages of development, flows to the lift stations will be smaller than the ultimate design flow. The detailed design process for the lift stations and force mains will consider the potential for odor generation during initial low flow conditions and if required, provide odor control systems as part of the final design. Exhibit 5.19-1 depicts the proposed sewer pipeline routes and sewer pump station locations for the Project.

The treatment facilities will consist of primary treatment using grinder pumps and screening in channels, which can be constructed in phases, followed by secondary and tertiary treatment. The wastewater will be treated to meet CCR Title 22 unrestricted reuse standards, which requires biological oxidation clarification and filtration of the treated wastewater. Membrane bioreactor (MBR) wastewater treatment technology will be utilized to meet the recycled water quality objectives. MBR treatment systems have been permitted by the Lahontan RWQCB, including for use in an MBR tertiary treatment plant operated by the LACSD located between Lancaster and Rosamond near the intersection of State Route (SR) 138 and SR-14 (Order No. R6V-2006-0035).

The MBR process combines a biological treatment system followed by membrane filtration. This MBR technology will provide an effluent that exceeds secondary and tertiary Title 22 requirements and meet the discharge requirements set by the Lahontan Regional Water Quality Control Board. Solids handling will be provided by anaerobic digesters to treat the sludge followed by centrifuges or belt filter presses to further reduce the liquid content prior

Centennial Project

to being hauled to a suitable landfill or for conversion into fertilizer products. Exhibit 5.19-2, Treatment Methods at Project Wastewater Reclamation Facilities (WRF), provides an overview of treatment processes and methods that would be used at each WRF.

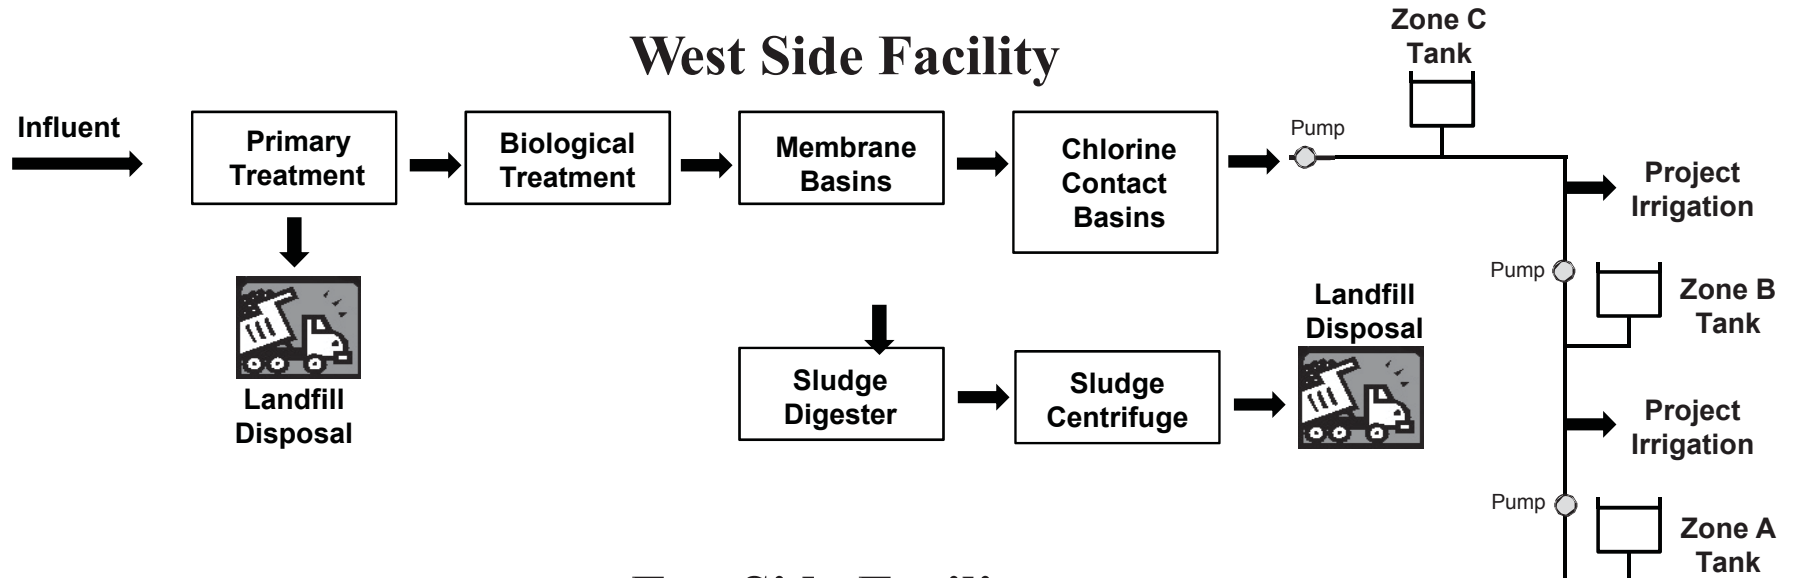

Exhibit 5.19-3, Preliminary Recycled Water, Storage, and Distribution System, depicts the proposed recycled water storage, and distribution system for the Project. All recycled water supplies would be generated by treating on-site wastewater flows at WRF East and WRF West. No supplemental recycled system supplies would be required or utilized by the Project. During most of the year, when there is sufficient demand for irrigation and other recycled water uses, recycled water will be disinfected and pumped from a booster pumping station at the WRF East into the Zone A recycled water distribution system (see Exhibit 5.19-3). In winter months when recycled water irrigation demand is reduced, excess supplies will be discharged to lined, seasonal storage ponds located adjacent to WRF East (see Exhibit 5.19-1). When demand increases in other parts of the year, the stored recycled supplies will be withdrawn from the ponds; polished by filtration and disinfection; and the pumped into the Zone A distribution system.

Recycled water operational storage tanks will be located on the same pads as the domestic water storage tanks, and the pressure zones of each system will have the same hydraulic gradient. This design approach will reduce the number of reservoir sites throughout the Project and will improve facility operation and maintenance. A recycled water booster pump station will be installed at each recycled reservoir site to pump water as required to higher zones and reservoirs. Pressure-reducing valves will be located at key locations within the recycled water system and will move supplies to lower zones; will maintain operating pressures; and will provide greater system reliability (Psomas 2017a).

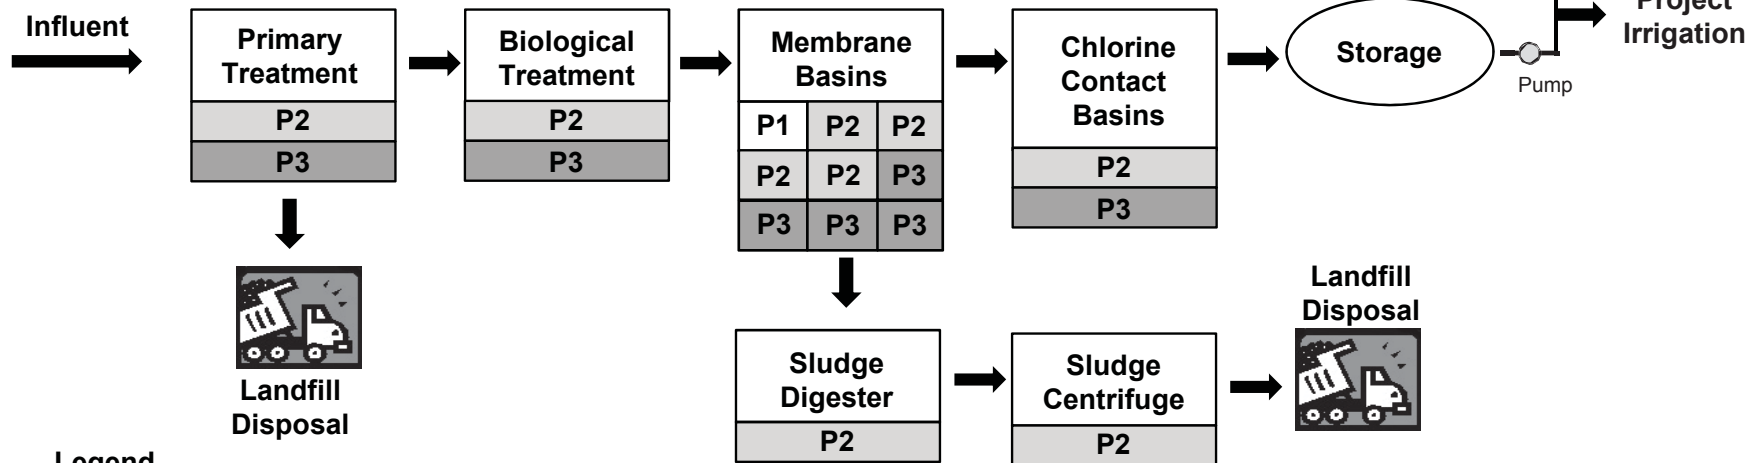

The use of recycled water on the Project site is described in detail in Section 5.18, Water Resources. At full buildout, recycled water will be used for (i) 100 percent of the commercial, business park, institutional, school, hotel, park, and slope outdoor irrigation demand; (ii) 56 percent of the total very low and low density residential lot outdoor irrigation demand (50 percent of the very low and low density landscape lot area); and (iii) wastewater and cooling use within the proposed business park except where prohibited by applicable law for particular types of areas or uses (e.g., employee cafeterias).

As discussed in Section 5.19.2, Title 22 of the *California Code of Regulations* establishes criteria for recycled water, treatment, conveyance, and water quality testing and is administered by the SWRCB Division of Drinking Water. State surface and groundwater quality, including discharge from the WRFs, is further regulated by the Lahontan RWQCB under the Porter Cologne Act. Each of the proposed WRFs will be required to obtain WDRs from the Lahontan RWQCB that include enforceable operational, treatment, conveyance, discharge, water quality and monitoring requirements before wastewater treatment and recycled water operations may commence. The WDRs issued by the Board will be consistent with the RWQCB's wastewater treatment requirements (Psomas 2017b). The proposed WRFs, wastewater treatment system, and recycled water system will not be located on or discharged to portions of the site within the boundaries of the Los Angeles RWQCB. The proposed wastewater system is also consistent with AVAP Goal COS 3 and Policy COS 3.2

because no septic systems will be used by the Project and no wastewater intrusion will occur into the Project and adjacent water supplies.

MMs 19-1 through 19-5 require that the Project either be annexed into an existing qualified public utility district (e.g. Golden Valley Municipal Water District) or that a new public utility district (e.g. Project Water Purveyor) is created. The Project Water Purveyor or alternate qualified public utility district would be responsible for the design, construction, and operation of the on-site WRFs, wastewater conveyance and treatment facilities, and recycled water facilities, and would ensure compliance with all applicable standards and regulations. No wastewater facilities may be operated until WDRs have been issued by the Lahontan RWQCB. With mitigation, potential Project impacts from exceeding the wastewater treatment requirements of the Lahontan RWQCB will be less than significant.

### **Off-Site Impacts**

Both of the proposed WRFs and related conveyance pipelines, pump stations, and seasonal storage ponds that will serve the proposed development areas would be located entirely within the Project site. No wastewater discharges, including recycled water use, will occur off site. Accordingly, implementation of the WRFs would not involve any off-site impacts and would not exceed the wastewater treatment requirements of the Lahontan RWQCB. There would be no impact and no mitigation is required.

The proposed off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, would not generate wastewater. Therefore, the wastewater treatment requirements of the Lahontan RWQCB would not be exceeded. There would be no impact and no mitigation is required.

***Impact Summary:*** MMs 19-1 through 19-5 require that the proposed Project's wastewater and recycled water systems comply with all the wastewater treatment and recycling WDRs issued by the Lahontan RWQCB prior to WRF operation. With mitigation, Project implementation would not exceed the wastewater treatment requirements of the Lahontan RWQCB and potential impacts would be less than significant.

**Threshold 19-2** **Would the project create water or wastewater system capacity problems, or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?**

## On-Site Impacts

As discussed, the Project would involve the construction of new wastewater collection, conveyance, and treatment facilities. Potential environmental impacts of a facility's construction on resource categories other than wastewater (e.g., air quality/odors, biological resources, land use) are assessed throughout this Draft EIR in the appropriate topical sections.

As discussed above and in Section 5.18, Water Resources, the Project will reuse all wastewater generated on the site, subject to a loss of 10 percent of the volume of wastewater generated within the site and the amount of recycled water produced for reuse. Approximately 4.62 mgd of wastewater will be produced at Project buildout, which will result in a recycled supply of approximately 4.16 mgd (4,659 afy). As discussed in Section 5.18, Project outdoor irrigation and indoor wastewater and cooling in the proposed business park will utilize the available recycled water supplies, after accounting for system losses. If there is any excess recycled water that accrues on an annual basis, irrigation schedules can be modified slightly to use the excess supply. If recycled water generation does not reach the projected volumes to meet the forecast irrigation demands, then irrigation schedules will be adjusted to reduce demand to meet available supply, as was done in California during the recent drought conditions. The majority of recycled water demand will come from large HOAs, which the Golden Valley Municipal Water District (GVMWD) or other Public Utility District (PUD) can coordinate with to manage supply/demand balance. Additionally, demand and supply will be monitored as Project phasing progresses and appropriate adjustments to landscaping and irrigation systems can be made throughout Project development to maintain acceptable balance. The proposed wastewater treatment and recycled water systems will not create water or wastewater system capacity problems or require the construction of additional water or wastewater treatment facilities.

## Off-Site Impacts

All wastewater generated on the site would be conveyed for treatment to the two on-site WRFs using a dedicated, on-site system of gravity-flow sewer lines, pump stations, and trunk sewers. These facilities will be implemented entirely within the Project site. The Project will not connect with or receive service from any off-site wastewater treatment facilities, including the existing LACSD facilities that are closest to the site. The proposed off-site Project facilities, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, would not generate wastewater. No potential impacts related to off-site water or wastewater system capacity problems, or the construction of new off-site water or wastewater treatment facilities will occur and no mitigation is required.

**Impact Summary:** Mitigation Measures (MMs) 19-1 through 19-5 require that the proposed Project's wastewater and recycled water systems be implemented as dedicated on-site facilities with sufficient capacity to convey and treat all on-site wastewater and produce recycled water treated to Tile 22 unrestricted reuse standards. The on-site demand for recycled water will approximate supply at full buildout. The Project will not connect with or receive any wastewater or recycled water supplies

from any off-site provider or source. With mitigation, Project implementation would not create water or wastewater system capacity problems, nor would it result in the construction of new water or wastewater treatment facilities or expansion of existing facilities; potential impacts would be less than significant.

### 5.19.7 MITIGATION MEASURES

The following mitigation measures are required to ensure that the proposed Project's wastewater treatment and recycled water facility implementation will be consistent with the wastewater treatment requirements of the Lahontan RWQCB; will not create water or wastewater system capacity problems.

- MM 19-1** The Project Applicant/Developer shall provide documentation to the County that it has completed all required procedures and has paid all applicable fees associated with establishing the Project Water Purveyor, or an alternate qualified public utility district, as the operator of the WRFs.
- MM 19-2** The Project Applicant/Developer shall demonstrate that the Project has either been annexed into an existing qualified public utility district (e.g. Golden Valley Municipal Water District) or that a new public utility district (e.g. Project Water Purveyor) has been created to serve the Project. The Project Water Purveyor or alternate qualified public utility district shall be responsible for the design, construction, and operation of the wastewater facilities, and shall ensure compliance with all applicable standards and regulations, including all Lahontan RWQCB and Title 22 requirements of the California Code of Regulations.
- MM 19-3** The Project shall incorporate the Wastewater Management Plan (*Centennial Specific Plan*, Section 3.5), and the Project Applicant/Developer shall prepare a Facilities Report, a Pump Station Feasibility Report, and a Sewer Area Study consistent with County Policies and Requirements.
- MM 19-4** The Project Applicant/Developer shall provide the County with plans and specifications that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utility district requirements and standards that demonstrate that the WRF West shall serve the Project site west of the West Branch of the California Aqueduct. The facility shall be located on an approximate 3-acre site and shall treat an average flow of approximately 0.34 million gallon per day. Biosolids shall be hauled to a suitable landfill or used for conversion into fertilizer products.
- MM 19-5** The Project Applicant/Developer shall provide the County with plans and specifications that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utility district requirements and standards that demonstrate that the WRF East shall serve the Project site east of the West Branch of the California Aqueduct. WRF East will be located near

the northeasterly corner of the Project and shall treat an average flow of 4.28 million gallons per day. Biosolids shall be hauled to a suitable landfill or used for conversion into fertilizer products. Lined seasonal recycled water storage ponds shall be implemented as required to temporarily store recycled water during times of low demand. The ponds shall implement feasible and applicable wastewater treatment facility best management practices for mosquito and health vector recommended in the California Department of Public Health's 2012 *Best Management Practices for Mosquito Control in California: Recommendations of the California Department of Public Health and the Mosquito and Vector Control Association of California*.

### 5.19.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Implementation of MMs 19-1 through 19-5 would reduce potentially significant impacts related to wastewater to levels that are less than significant.

## 5.20 DRY UTILITIES

This section of the Draft Environmental Impact Report (EIR) describes the potential impacts to dry utilities from implementation of the Project.

### 5.20.1 INTRODUCTION

#### **Purpose**

Appendix G of the California Environmental Quality Act (CEQA) Guidelines requires that impacts to dry utilities be evaluated as part of the environmental documentation process. Appendix F of the CEQA Guidelines suggests analysis of energy use and conservation, including natural gas and petroleum. The impacts of the proposed development Project site are analyzed at a project level of detail. The direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features.

This section addresses potential direct and indirect impacts to electricity (Southern California Edison), natural gas (Southern California Gas Company), petroleum (related to motor vehicle operation), telephone (AT&T), and cable (yet to be determined, possibly CalNeva Broadband) utility services that will result from implementation of the Project.

#### **Summary**

The Project will result in the development of a maximum of 19,333 residential units. The new residential units will result in an increase in demand for dry utility services and facilities, including electricity (Southern California Edison), fossil fuels (natural gas and petroleum), telephone (AT&T), and cable television (CATV)(CalNeva Broadband or other provider yet to be determined).

Direct and indirect impacts to dry utility services and facilities will be less than significant. Each affected utility has been consulted to determine whether there will be adequate energy supplies, communication services, and the infrastructure to serve the Project. In the case of cable television, since there is currently no provider, one local Cable Television company is willing and able to provide services to the Project site. With implementation of the planned energy efficiency features and with upgrades to utility infrastructure near and within the Project site (as determined by each provider), there will be adequate energy and communication services for the Project in addition to the existing demand for these services.

There will be less than significant impacts associated with off-site features related to installation of infrastructure for electricity, natural gas, petroleum, telephone, cable television, and internet services. Any necessary off-site utility upgrades will occur within lands (easements) already owned by these respective utilities. The connection of off-site utilities has been included in the Project description and analyzed throughout this Draft EIR in conjunction with Project-level impacts. Regarding cable television services, the provider of this service has not been identified and, therefore, the location and extent of any off-site utility upgrades is unknown. At the time of preparation of this EIR (i.e., 2016), while CalNeva Broadband has the nearest existing CATV facilities and has indicated that they have the

capability to serve the Project with implementation of necessary infrastructure, no CATV Provider has been confirmed for the Project site at this time. Due to the magnitude of the Project's CATV demand, any company wishing to provide service to the Project site would need to provide sufficient evidence regarding its ability to serve the Project before that service provider would be selected. Regardless, the upgrade and/or retrofitting of the off-site fiber optic connections and necessary extensions are typically the responsibility of the Service Provider and would occur within easements owned by the Service Provider. The only other cable television company in the vicinity is Time Warner Cable, whose facilities stop near Castaic; and "currently does not have any plans to expand facilities any further north" (BJ Palmer 2015).

The analysis in this section focuses on the projected demand for dry utility services and the facilities necessary to meet this demand. The physical environmental impacts related to the implementation of necessary utility infrastructure are addressed as part of the Project analysis provided throughout this EIR.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Electricity
  - Relevant Plans, Policies, and Regulations
  - Environmental Setting
  - Project Design Features
  - Threshold Criteria
  - Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:

## 5.20.2 ELECTRICITY

### Relevant Plans, Policies, and Regulations

#### *Federal*

##### Energy Independence and Security Act of 2007

On December 19, 2007, the Energy Independence and Security Act of 2007 (EISA) was signed into law. In addition to setting increased Corporate Average Fuel Economy (CAFE) standards for motor vehicles, the EISA includes other provisions related to energy efficiency:

- Renewable Fuel Standard (RFS) (Section 202)
- Appliance and Lighting Efficiency Standards (Sections 301–325)
- Building Energy Efficiency (Sections 411–441)

Additional provisions of the EISA address energy savings in government and public institutions, promoting research for alternative energy, additional research in carbon capture, international energy programs, and the creation of “green jobs”.

#### *State*

##### Title 24 Energy Efficiency Standards

California’s Energy Efficiency Standards for Residential and Non-Residential Buildings were established in 1978 in response to a mandate to reduce the State’s energy consumption. These standards are promulgated under the *California Code of Regulations* (CCR) Title 24, Part 6, and are commonly referred to as “Title 24”. The Title 24 standards are periodically updated to reflect new or improved energy efficiency technologies and methods. The 2016 Title 24 standards have been adopted and was effective January 1, 2017. A new development project is required to incorporate the most recent Title 24 standards in effect at the time the building permit application is submitted.

##### Title 24 Green Building Standards

The 2016 California Green Building Standards Code (24 CCR, Part 11), also known as the CALGreen code, contains mandatory requirements for new residential and nonresidential buildings (including buildings for retail, office, public schools and hospitals) throughout California (CBSC 2017b). The development of the CALGreen Code is intended to (1) cause a reduction in greenhouse gas (GHG) emissions from buildings; (2) promote environmentally responsible, cost effective, healthier places to live and work; (3) reduce energy and water consumption; and (4) respond to the directives by the Governor. In short, the code is established to reduce construction waste; make buildings more efficient in the use of materials and energy; and reduce environmental impact during and after construction.

The CALGreen Code contains requirements for construction site selection, storm water control during construction, construction waste reduction, indoor water use reduction, material selection, natural resource conservation, site irrigation conservation, and more. The

code provides for design options allowing the designer to determine how best to achieve compliance for a given site or building condition. The code also requires building commissioning, which is a process for the verification that all building systems, such as heating and cooling equipment and lighting systems, are functioning at their maximum efficiency.

The CALGreen Code provides standards for bicycle parking, carpool/vanpool/electric vehicle spaces, light and glare reduction, grading and paving, energy efficient appliances, renewable energy, graywater systems, water efficient plumbing fixtures, recycling and recycled materials, pollutant controls (including moisture control and indoor air quality), acoustical controls, storm water management, building design, insulation, flooring, and framing, among others.

Beyond the mandatory standards, voluntary Tier 1 status can be achieved by complying with additional measures for energy and water efficiency, material conservation, and other design features. Examples of Tier 1 requirements are 15 percent less energy use in residential construction than required by existing regulations and 12 percent less indoor water use in non-residential construction. Tier 2 status can be achieved by complying with additional voluntary measures; example requirements are 30 percent less energy use in residential construction and 20 percent less indoor water use in non-residential construction. The Project would commit to achieving Tier 1 status pursuant to the CALGreen Code.

#### Senate Bill 1368 (Greenhouse Gas [GHG] Emissions Standard for Baseload Generation)

Senate Bill (SB) 1368 imposes a GHG emission standard on baseload generation. The new standard prohibits any more long-term investments in power plants unless their air emissions are as low as, or lower than, emissions from clean and efficient natural gas power plants. The law will be implemented and enforced by the California Public Utilities Commission (CPUC) and the California Energy Commission (CEC) in conjunction with the California Air Resources Board (CARB).

#### ***County***

#### Countywide Energy and Environmental Policy (January 2007)

In January 2007, the Los Angeles County Board of Supervisors adopted the Countywide Energy and Environmental Policy, which provides guidelines for sustainability and green building design within County departments. The Policy states that the County will join the California Climate Action Registry (CCAR) to establish goals for reducing GHG emissions. In addition, the policy incorporates a sustainable building program into County capital improvement projects and seeks to integrate energy-efficient and sustainable designs into future County building plans.

#### Los Angeles County General Plan and Antelope Valley Area Plan

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, part of the County General Plan, include goals and policies that address electricity issues in the unincorporated County.

The AVAP goals and policies applicable to the analysis of electricity with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal ED 1:** A healthy and balanced economic base in the Antelope Valley that attracts a wide range of industries and businesses and provides high-paying jobs for local residents.

**Policy ED 1.14:** Promote appropriate types of residential development in the vicinity of existing communities and town centers that are in reach of existing infrastructure and utilities.

**Goal COS 14:** Energy infrastructure that is sensitive to the scenic qualities of the Antelope Valley and minimizes potential environmental impacts.

**Policy COS 14.1:** Require that new transmission lines be placed underground whenever physically feasible.

**Policy COS 14.2:** If new transmission lines cannot feasibly be placed underground due to physical constraints, require that they be co-located with existing transmission lines, or along existing transmission corridors, whenever physically feasible.

**Policy COS 14.3:** If new transmission lines cannot feasibly be placed underground or feasibly collocated with existing transmission lines or along existing transmission corridors due to physical constraints, direct new transmission lines to locations where environmental and visual impacts will be minimized.

**Policy COS 14.4:** Discourage the placement of new transmission lines on undisturbed lands containing sensitive biotic communities.

**Policy COS 14.5:** Discourage the placement of new transmission lines through existing communities or through properties with existing residential uses.

**Policy COS 14.7:** Require that electrical power lines in new residential developments be placed underground.

## Environmental Setting

According to the U.S. Department of Energy, in 2012, California's total energy consumption—including for electricity generation—was 7,620.1 trillion British thermal units (Btu), representing approximately 7.7 percent of the United States' energy consumption. The major sources of consumed energy in California were petroleum (43.0 percent) and natural gas (32.0 percent). Other sources include coal, nuclear electric power, and renewable. Approximately 18 percent of this energy was consumed by residential users, 19 percent by commercial users, 24 percent by industrial users, and 39 percent by the transportation sector (USD OE 2016a). In 2014, California's major sources of electricity were natural gas (52.0 percent), nuclear (10.7 percent), hydroelectric (9.5 percent), coal (0.4 percent), and renewable sources (20.1 percent) (USD OE 2016b). In 2015, approximately 66.4 percent of

California's electricity was generated in state; approximately 12.2 percent came from the Pacific Northwest; and approximately 25.1 percent came from the Southwest (CEC 2016).

Electrical service to the Project site is provided by Southern California Edison (SCE). SCE uses different types of energy to produce electricity including coal, natural gas, hydroelectric plants, nuclear energy, and renewable resources. SCE is a regulated public utility that provides electricity to a business and residential population of approximately 15 million people within a 50,000-square-mile service area that covers Central, Coastal, and Southern California (SCE 2016). SCE is regulated by the CPUC, which is intended to protect consumers from overcharge and to promote energy efficiency, system reliability, and utility financial integrity. SCE is also required to provide service to existing and proposed future development in its service area.

SCE has both transmission and distribution facilities located both within and near the Project site. Transmission facilities consist of 66-kilovolt (kV), 220-kV, and 500-kV transmission lines; distribution facilities consist of 12-kV and 6.9 kV distribution lines. Overhead 66-kV transmission lines and 12-kV distribution lines are parallel to the northern side of State Route (SR) 138. The Bailey Substation, located on an SCE-owned parcel in the southwestern corner of the Project site, currently serves as a transmission-only substation and is not equipped for distribution. The off-site Gorman Substation serves as the primary distribution facility in the area. Located approximately 3.6 miles northwest of the Project site along Gorman Post Road, the Gorman Substation does not have space to expand its capacity (Peterson 2007). Existing electrical lines are shown in Exhibit 5.20-1, Known Major Utilities in the Project Area, and Exhibit 5.20-2, Dry Utilities Improvements.

There are distribution lines that extend northeast from the existing Bailey Substation area to the Oso Pumping Plant and north from SR-138 along Cement Plant Road to the National Cement Plant. The existing lines to the Oso Pumping Plant run through the Open Space north of Oso Canyon (please refer to Exhibit 5.20-1).

In addition, in September 2016, the Los Angeles Department of Water and Power (LADWP) completed construction of the Barren Ridge Renewable Transmission Project (Barren Ridge Project) to tap into renewable energy sources in the Tehachapi Mountain and Mojave Desert areas of Southern California in the greater Project area (. The Barren Ridge Project utilizes existing and future renewable energy sources in this area. Barren Ridge will provide transmission access to approximately 1,000 megawatts (MW) of wind and solar power, which include 250 MW from Beacon, 60 MW from RE Cinco, 250 MW from Springbok 1 and 2, 143 MW from Pine Tree, as well as hundreds of megawatts from several of LADWP's hydroelectric plants from the north. The Barren Ridge Project spans a distance of 62 miles from the Barren Ridge Switching Station to the Haskell Canyon Switching Station (LADWP 2016). The entire route lies designated utility corridors and parallels existing transmission lines (LADWP 2015).

Existing land uses on the Project site are primarily ranching-related with other limited agricultural activities. The current demand for electricity is minimal and is accommodated by the existing facilities described above. These facilities not only serve the minimal on-site uses, but also nearby uses as the National Cement Plant and the Alamo Pumping Plant located

to the north of the Project site. Currently, approximately 300 dwelling units could be served by the existing overhead facilities associated with the Gorman Substation before a utility upgrade would be required (BJ Palmer 2015).

## Project Design Features

See the *Centennial Specific Plan's* Appendix 1-B, Green Development Program, and summary of corresponding Project Design Features in Section 5.21, Climate Change.

## Threshold Criteria

The following criterion from the County of Los Angeles Environmental Checklist is used to establish the threshold in order to determine the potential for significance. The Project would result in a significant impact to electrical facilities and services if it would:

**Threshold 20-1** Create energy utility (electricity, natural gas, propane) system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

## Environmental Impacts

**Threshold 20-1** **Would the project create electrical system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?**

### *On-Site Impacts*

The Project would place new demands on electrical service provided by SCE. Specifically, the Project would result in an increase in the amount of electricity consumed on the site for lighting and other uses, and it will create a need for new delivery infrastructure. The physical environmental impacts related to the implementation of necessary utility infrastructure are addressed as part of the Project analyzed throughout this EIR.

### Electrical Demand

Project construction would involve limited electricity demands for equipment such as temporary lighting fixtures and tools.

During operations, SCE estimates that buildout of all proposed land uses in the Project over a 20-year horizon would generate a peak increase in electricity demand of approximately 165 MW<sup>1</sup> at buildout (as shown in Table 5.20-1, Southern California Edison Estimate of the Centennial Peak Electrical Demand). The peak demand, rather than the total annual demand, is based on the type and quantity of land uses on the Project site which SCE determined would collectively generate the highest demand (i.e., peak) for electricity at one time (rather than the average demand of all types and quantities of the proposed land uses). The purpose

<sup>1</sup> A megawatt (MW) is one million watts

of the peak demand calculation is to provide a more conservative estimate as the basis of supply and infrastructure planning.

**TABLE 5.20-1  
SCE ESTIMATE OF  
CENTENNIAL PEAK ELECTRICAL DEMAND**

<b>Land Use Type<sup>a</sup></b>	<b>Quantity and Units<sup>a</sup></b>	<b>Demand Factor (watts per unit)</b>	<b>Peak Electrical Demand (MW)</b>
Single Family Residential	14,119 du	6,955	98
Condos/Townhomes	4,914 du	3,870	19
Multi-Family (Apartments)	300 du	5,000	2
Commercial	2.6 million sf	15	39
Schools	10 schools	700,000	7
<b>Total</b>			<b>165</b>
SCE: Southern California Edison; MW: megawatts; du: dwelling units; sf: square feet			
<sup>a</sup> Land use types and proportions were provided by SCE to reflect peak demand (i.e., collectively produce the maximum electrical demand at one time). The peak demand does not include all land uses as it represents the combination of land uses that would generate the highest demand at one time.			
Demand factors derived from usage letter submitted by SCE in 2007 based on project design at that time (SCE 2007b).			

It should be noted that this estimate of peak electrical demand is based on SCE's general-use demand factors and does not take into account the current code requirements and additional measures that would be implemented to increase energy efficiency (see Green Development Program). The Project would comply with all State Energy Efficiency Standards for Residential and Non-residential Buildings (Title 24; 24 CCR 6) and California Green Building Standards Code (CALGreen Code; 24 CCR Part 11) requirements in effect at the time building permit applications are submitted. These standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. Title 24 covers the use of energy-saving appliances, conditioning systems, water heating, and lighting, among other issues. The CALGreen Code covers the use of water and energy, among other issues, and requires building commissioning to verify building systems are functioning and maximum efficiency.

SCE would serve the Project's demand for electrical service through the existing distribution facilities on the Project site and the utility improvements that are proposed as part of the Project, which are described below. SCE has indicated that, with implementation of required infrastructure improvements, there would be adequate electrical supplies to serve the Project (SCE 2007b). However, the realistic peak electric demand with planned energy efficiency features would be lower than the more conservative estimate of peak demand (i.e., 141 MW).

### Electrical Line Relocation

According to the Dry Utility Report (Appendix 5.20-A), Project implementation would necessitate the relocation and/or removal of existing SCE facilities along portions of SR-138 and Gorman Post Road, as well as within the Project site (BJ Palmer 2015). Exhibit 5.20-2, Centennial Project – Dry Utilities Improvements, shows the location of both existing and proposed newly upgraded and relocated electrical lines and illustrates the extent of anticipated line relocations. The existing 66-kV lines that extend from the Bailey Substation and run northwest through the Project site may be relocated or may be placed underground. Where relocated electricity lines would remain aboveground, all poles would be placed within the proposed SCE easement, and the specific type and spacing of any new poles would be determined by SCE. Continued coordination between the Project Applicant/Developer and SCE during site development, as required by Mitigation Measure (MM) 20.2-1 below, would prevent prolonged service disruptions that could be experienced by the surrounding electricity users, facilities along SR-138, and the Gorman Substation.

### SCE Easements

SCE has an existing right-of-way easement for their facilities within and surrounding the Project development area. Existing SCE electrical easements along SR-138 and Gorman Post Road will be affected by Project development. Some of these easements contain active facilities, while others do not. Upon development of the Project site and after coordination with and approval by SCE, those easements through the Project development area that do not contain active facilities would be quit-claimed to the Project Applicant/Developer. The location of new easements would be determined in coordination with SCE, as required by MM 20.2-1. The development of the Project area would dictate that existing facilities be removed or relocated as the Project progresses. New easements would be developed for those facilities relocated to a new location, consistent with Project improvements. As above, those improvements to be constructed along SR-138 and Gorman Post Road would not create any physical impacts beyond those addressed elsewhere in this document as part of Project development.

### SCE Infrastructure

SCE has also determined that full Project buildout would require a new substation, currently named the “Centennial Substation”. The Centennial Substation would be located in the vicinity of 300<sup>th</sup> to 310<sup>th</sup> Street West either north or south of SR-138. This necessary infrastructure would also be ensured via MM 20.2-2. Approximately 4.5 acres would be required for this substation site. The substation would convert the 66 kV voltage to 12 kV/9.5 kV for distribution to the various uses within this portion of the Project site. A detailed description of the proposed substation can be found in Section 4.5.10, Dry Utilities, of the Project Description (Section 4.0).

SCE has indicated that buildout of the western portion of the Project site would require additional capacity beyond the initial approximate 300-dwelling-unit existing capacity of the Gorman Substation. The Gorman Substation, located approximately 3.6 miles northwest of the site, is currently configured for distribution voltage. However, this substation would require the addition of one or more additional transformers within the footprint of the SCE-

owned parcel and reconstruction of the existing overhead power lines along Gorman Post Road within the SCE-owned easement from the substation to the Project site. Potential infrastructure improvements necessary to serve the western portion of the Project site are required by MM 20.2-2. In any event, the improvements implemented to serve the western portion of the Project site would occur entirely on lands owned by SCE, and therefore would not be on the Project site.

In addition to the expansion or upgrade of existing facilities and construction of a future substation for Project buildout, an electrical distribution system would be developed on the Project site to supplement and, in some cases, sell power back to the regional electrical grid. This distribution system would be included within the main utility corridors for dry utilities as shown on Exhibit 5.20-2, Centennial Project – Dry Utilities Improvements. The timing for construction of these facilities, as well as the specific facilities' locations and sizing, would be coordinated with SCE. The necessary facilities would be constructed in advance of the land uses that require the facilities in order to ensure that the Project's electrical needs are met as the site develops. The main utility corridors for dry utilities would be located underground within Parkways or Secondary Highways, as discussed in the Project's Mobility Plan (Section 3.2 of EIR Appendix 4.0-A).

All new and upgraded on-site facilities and infrastructure would be ensured via MM 20.2-2 and would be implemented as part of the Project within the public road system right-of-way. Those improvements to be constructed within the development area would not create any additional physical impacts beyond those addressed elsewhere in this EIR as part of the Project because implementation of electrical facilities would be concurrent with Project development.

As stated above, connection to these existing facilities and development of a new on-site electrical distribution system will occur as part of the Project. The only other existing off-site facilities that would require upgrades or retrofitting to provide adequate electrical service to the Project would be those discussed herein (i.e., the Gorman Substation and associated overhead lines and/or the Bailey Substation and other off-site electrical lines).

Continuing coordination between the Project Applicant/Developer and SCE, as required by MM 20.2-1, would ensure that the new system would accommodate the Project's requirements, including construction timing of these facilities and the specific facilities' locations and sizing.

#### Energy Conservation in the Project

The Project would be subject to Title 24 and CALGreen Code energy efficiency standards. However, as discussed in Section 5.21, Climate Change, the Project has committed to compliance with CALGreen voluntary measure A4.203.1.2.1 for low-rise residential buildings, resulting in buildings that would exceed 2013 Title 24 requirements by 15 percent (see PDF 11-3 in Section 5.11, Air Resources), and with CALGreen voluntary measure A5.203.1.2.1 for non-residential buildings and residential buildings taller than four stories, resulting in buildings that would exceed 2013 Title 24 requirements by 10 percent (PDF 11-2). Renewable energy produced on the Project site will be primarily rooftop solar, and at minimum 50 percent of the Project's anticipated electricity demand will be satisfied

from on-site renewable energy generation (PDF 21-3). The GHG emissions associated with energy use (electricity and natural gas) were estimated based on these assumptions. For the reasons discussed above, implementation of the Project would result in a less than significant impact to electrical services or facilities during construction or operation.

Through coordination with SCE, two options were developed for bringing the additional electrical capacity: (1) upgrading the existing Bailey Substation located on an SCE-owned parcel within the southwestern corner of the Project site (Exhibit 5.20-2, Centennial Project – Dry Utility Improvements) and/or (2) upgrading the Gorman Substation and retrofitting the associated existing overhead transmission lines between the Gorman Substation and the Project site to handle the higher load. Upgrade of the Bailey Substation is considered the more likely solution; however, both options would continue to remain open until later stages of the site development process. The timing of the upgrade to the Gorman Substation and associated overhead lines or the Bailey Substation would be determined through ongoing coordination between SCE and the Project Applicant/Developer. In either event, these improvements would occur entirely on lands and/or easements owned by SCE, and therefore would not be on the Project site. The option to upgrade the Bailey Substation (option 1) or Gorman Substation and overhead lines (option 2) to provide additional electrical capacity to the initial development of the entire Project is described in further detail below.

The Bailey Substation is a transmission relay substation, and is currently not configured for the distribution of voltage facilities that would be required to serve the Project. The site of the Bailey Substation is large enough (1.5 acres) to accommodate the required upgrade and it could be configured to serve the Project. The Bailey Substation upgrade would include the installation of a distribution transformer to carry sufficient load to the Project. Distribution voltage would then be extended to the Project on the existing overhead pole line along SR-138 or routed northerly overhead or underground around Quail Lake within the Project limits for the initial phases of development, then placed underground throughout the Project. This location, if upgraded as described, would provide sufficient electrical capacity to serve initial Project site development. The update of the Bailey Substation would not require retrofitting of any overhead lines. The upgrade of the Gorman Substation would require retrofitting of overhead lines as described further below.

The Gorman Substation, located approximately 3.6 miles northwest of the site, is currently configured for distribution voltage. However, this substation would require the addition of one or more additional transformers and the reconstruction of existing overhead power lines along Gorman Post Road from the substation to the Project. At a point just west of the Project boundary, the overhead facilities would take either direction along SR-138 or the northerly route around Quail Lake. It should be noted that, if the Bailey Substation upgrade were implemented, no upgrades to the Gorman Substation and its associated overhead lines or other off-site substation and overhead facilities would be necessary to serve any portion of the Project.

### ***Off-Site Impacts***

To provide adequate electricity for the Project, two options were developed for bringing the additional capacity to serve the western portion of the Project site: (1) upgrading the existing

Bailey Substation located on an SCE-owned parcel within the southwestern corner of, but not part of, the Project site or (2) upgrading the Gorman Substation and retrofitting existing overhead transmission lines to handle the higher load. At this time, upgrading the Bailey Substation is considered the more likely solution; however, both options will continue to remain viable until later stages of the site development process subsequent to the CEQA process. If the Bailey Substation is upgraded, no upgrades to the Gorman Substation or other off-site facilities will be necessary to serve the first phase of Project implementation.

Improvements to SCE facilities (including upgrading the existing Gorman Substation and associated overhead lines or upgrading the Bailey Substation) would occur entirely on SCE-owned lands and within existing development footprints. The inclusion of these electricity upgrades were included in the Project description and were included throughout the Project analysis. There would be a less than significant impact related to SCE (i.e., off-site) facilities and services.

Each of the proposed off-site well locations would be served by electricity to power the well pump and to control and monitor equipment. Electricity would be delivered to each well location through an underground or aboveground tie-in to the nearest electrical line from each well location. These lines would be near the proposed well locations, as CEW-3, CEW-4, and CEW-5 are located proximate to the existing Tejon Water Bank, all of which are, or will be, served by electricity. Collectively, the off-site wells would demand a minimal amount of electricity, particularly compared with the anticipated peak demand for buildout of the Project, which can adequately be served by SCE. Therefore, based on SCE's review and commitment to serve the Project, they would be able to serve the proposed off-site wells with electrical service without adversely affecting existing or planned service. There would be a less than significant impact and no mitigation is required.

***Impact Summary:*** The Project would result in less than significant impacts to electrical service and facilities with implementation of the Green Development Program as well as MM 20.2-1 and MM 20.2-2.

## **Mitigation Measures**

**MM 20.2-1** The Project Applicant/Developer shall coordinate with Southern California Edison (SCE) to ensure that there are no prolonged disruptions to the existing transmission lines that extend through the Project study area and to coordinate in the design and implementation of future electrical service and facilities (e.g., transmission lines, access road) in the Project study area. This will ensure that (1) no prolonged service disruptions during the extension and upgrading of these services would arise; (2) the nature, design, and timing of electrical system improvements are in accordance with all SCE requirements; and (3) the improvements are adequate to serve the proposed land uses and are available for the first occupied land uses.

**MM 20.2-2** The Project Applicant/Developer shall provide the County with plans and specifications that demonstrate a future substation shall be constructed in the eastern half of the Project site to serve Project development in the easterly

portion of the Project site. To provide adequate capacity for electrical services for the Project, SCE would select one of the following two options to implement: (1) reconfigure the Bailey Substation or (2) upgrade the Gorman Substation and retrofit the existing overhead power lines. An electrical generation and distribution system shall be constructed as part of the main utility corridors for dry utilities. The timing of construction, as well as specific facility location and sizing, shall be coordinated with SCE.

## **Level of Significance After Mitigation**

Impacts related to electrical services and facilities would be less than significant with implementation of the Green Development Program, MM 20.2-1 and MM 20.2-2.

### **5.20.3 FOSSIL FUELS (NATURAL GAS AND PETROLEUM)**

#### **Relevant Plans, Policies, and Regulations**

##### ***Federal***

##### Energy Independence and Security Act of 2007

See summary under Section 5.20.2, Electricity.

##### Corporate Average Fuel Efficiency Standards

In response to the U.S. Supreme Court ruling, the Bush Administration issued an Executive Order on May 14, 2007, directing the U.S. Environmental Protection Agency (USEPA), the Department of Transportation (DOT), and the Department of Energy (DOE) to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. On December 19, 2007, the Energy Independence and Security Act of 2007 (EISA) was signed into law, which requires an increased Corporate Average Fuel Economy (CAFE) standard of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020. The EISA requires establishment of interim standards (from 2011 to 2020) that will be the “maximum feasible average fuel economy” for each fleet. On October 10, 2008, the National Highway Traffic Safety Administration (NHTSA) released a final environmental impact statement analyzing proposed interim standards for passenger cars and light trucks in model years 2011 through 2015. The NHTSA issued a final rule for model year 2011 on March 23, 2009.

On May 19, 2009, President Obama announced a national policy for fuel efficiency and emissions standards in the U.S. auto industry. In September 2009, the DOT and the USEPA issued a proposed rule setting federal standards that apply to passenger cars, light-duty trucks, and medium-duty passenger vehicles built in model years 2012 through 2016. On April 1, 2010, the DOT and the USEPA jointly established these new rules, which establish more stringent CAFE standards and impose GHG emission standards.

On June 30, 2009, the USEPA granted the waiver for California, discussed in more detail below, for its greenhouse gas emission standards for motor vehicles.

---

**State****Title 24 Energy Efficiency Standards**

See summary under Section 5.20.2, Electricity.

**Title 24 Green Building Standards**

See summary under Section 5.20.2, Electricity.

**Senate Bill 1368 (GHG Emissions Standard for Baseload Generation)**

See summary under Section 5.20.2, Electricity.

**Assembly Bill 1493 (Mobile Source Reductions)**

Assembly Bill (AB) 1493 required CARB to adopt regulations by January 1, 2005, to reduce GHG emissions from noncommercial passenger vehicles and light-duty trucks with a model year of 2009 and later. The bill required the CCAR to develop and adopt protocols for the reporting and certification of GHG emissions reductions from mobile sources for use by CARB in granting emission reduction credits. The bill also authorized CARB to grant emission reduction credits for reductions of GHG emissions prior to the date of the enforcement of regulations, using model year 2000 as the baseline for reduction.

In 2004, CARB applied to the USEPA for a waiver under the Federal Clean Air Act to authorize implementation of these regulations. The waiver request was formally denied by the USEPA in December 2007. In January 2008, the State Attorney General filed a lawsuit against the USEPA challenging the denial of California's request for a waiver to regulate and limit GHG emissions from these vehicles. In January 2009, President Barack Obama issued a directive to the USEPA to reconsider California's request for a waiver, which the USEPA granted on June 30, 2009. As part of this waiver, the USEPA specified that CARB may not hold a manufacturer liable or responsible for any noncompliance caused by emission debits generated by the manufacturer for the 2009 model year.

**County****Countywide Energy and Environmental Policy (January 2007)**

See summary under Section 5.20.2, Electricity.

**Los Angeles County General Plan and Antelope Valley Area Plan**

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, part of the County General Plan, include goals and policies that address fossil fuel issues in the unincorporated County.

The AVAP goal and policy applicable to the analysis of fossil fuels with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal ED 1:** A healthy and balanced economic base in the Antelope Valley that attracts a wide range of industries and businesses and provides high-paying jobs for local residents.

**Policy ED 1.14:** Promote appropriate types of residential development in the vicinity of existing communities and town centers that are in reach of existing infrastructure and utilities.

## Environmental Setting

As noted above, natural gas represents the largest source of electricity in California, and is the second-largest type of consumed fuel. Petroleum is the most-consumed source of energy in the state; the transportation sector consumes approximately 39 percent of the state's energy (USDOE 2016a). The state's natural gas comes from a variety of places, and approximately 90 percent of the natural gas supply is imported (CEC 2017). The crude oil consumed in California comes from both in-state and out-of-state sources. In 2014, approximately 37.8 percent came from California, 10.6 percent from Alaska, and 51.6 percent from foreign countries (CEC 2015b).

While residential natural gas consumption has increased, the average annual natural gas consumption per household has decreased, largely as a result of energy efficiency improvements. For example, although absolute consumption of natural gas has increased between 1970 and 2007, natural gas consumption per household dropped 36 percent. (CEC 2009). Similarly, the CEC projects that demand for gasoline may drop as a result of new energy efficiency requirements; regulations at the state and local levels; rising fuel prices; and increased popularity of fuel-efficient vehicles such as hybrid and light-duty diesel vehicles (CEC 2010).

The Southern California Gas Company (SoCalGas), also known as The Gas Company, provides natural gas service to much of the Southern California region, including the Project site. According to the SoCalGas website, the company has a service area of approximately 20,000 square miles and provides service to 21.4 million customers throughout Central and Southern California, from Visalia to the Mexican border (SoCalGas 2015). SoCalGas is regulated by the CPUC, and is required to provide service to existing and proposed future development in its service area.

There are existing SoCalGas gas lines within and near the Project site. There is one high-pressure gas main in the vicinity, and it is a 33-inch diameter, north-south-running gas transmission line (Line 225) within an SoCalGas-owned easement that originates at SR-138 just east of the Golden State Freeway (Interstate [I] 5). A six-inch high-pressure distribution line branches from Line 225 and travels east to serve the National Cement Plant north of the Project boundary. There is a medium-pressure gas distribution main in SR-138, which branches from Line 225 and travels east to the Quail Lake area (SoCalGas 2006). These facilities are shown on Exhibit 5.20-2, Centennial Project – Dry Utilities Improvements. Additional, various-sized, medium-pressure gas-distribution mains are located in and around SR-138 in the Project vicinity.

---

## Project Design Features

See the *Centennial Specific Plan's* Appendix 1-B, Green Development Program, and summary of corresponding Project Design Features in Section 5.21, Climate Change.

## Threshold Criteria

The following criterion from the County of Los Angeles Environmental Checklist is used to establish a threshold to determine the potential for significance. The Project would result in a significant impact to natural gas facilities and services if it would:

**Threshold 20-2** Create energy utility (electricity, natural gas, propane) system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

## Environmental Impacts

**Threshold 20-2** **Would the project create natural gas system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?**

### *On-Site Impacts*

The Project will increase demand for the SoCalGas-provided natural gas services and facilities.

The Project will also result in consumption of petroleum, primarily for transportation energy (i.e., gasoline and diesel). Natural gas and petroleum will be consumed throughout construction and operations of the Project. Energy will be required during construction for the transportation of building materials and construction of buildings and infrastructure. Natural gas consumption during construction will be minimal; gasoline and diesel use account for the vast majority of construction-period energy needs.

During operations, energy will be consumed for various purposes including, but not limited to, building heating and cooling, use of consumer products, lighting, stationary source operation, and motor vehicle use. Although motor vehicle use accounts for the majority of petroleum consumption associated with the Project, other Project activities that could result in petroleum consumption include propane used for barbeques, asphalt paving and industrial uses. The physical environmental impacts related to the implementation of necessary utility infrastructure are addressed as part of the entire Project analyzed throughout this EIR.

---

## Natural Gas

### *Natural Gas Demand*

To determine the estimated natural gas demand from operation of the Project site, the SoCalGas Engineering Department was consulted to determine the appropriate “rule of thumb” load estimates for the various land uses on the Project site. Using these factors, it is estimated that Centennial would demand approximately 30 million cubic feet (cf) per month of natural gas, as shown in Table 5.20-2, SoCalGas Estimate of Centennial’s Monthly Natural Gas Demand. This represents the total estimated demand per month from all types and quantities of proposed land uses that would utilize natural gas, rather than peak demand, which is used by SoCalGas as the basis of gas supply and infrastructure planning.

It should be noted that this estimate of natural gas demand is based on SoCalGas’ general-use demand factors and does not take into account the current code requirements and additional measures that would be implemented to increase energy efficiency (Green Development Program).

As part of their planning process, SoCalGas forecasts future demand inclusive of the Project and continues to provide the necessary energy resources for existing demands. Therefore, SoCalGas has indicated that current supplies of monthly natural gas are sufficient to supply the Project based on SoCalGas’ estimate of natural gas demand (SoCalGas 2006). However, the realistic natural gas demand with planned energy efficiency features would be lower than the appropriately conservative estimate prepared by SoCalGas as the basis of supply and infrastructure planning. The extension of the additional main from the 33-inch transmission main would parallel the existing medium-pressure main that exists within the right-of-way of Gorman Post Road and SR-138. This tap would require an additional pressure regulation station on an easement space (75 feet by 30 feet).

**TABLE 5.20-2  
SOCALGAS ESTIMATE OF CENTENNIAL'S MONTHLY NATURAL GAS DEMAND**

<b>Land Use Type</b>	<b>Land use Size</b>	<b>Demand Factor</b>	<b>Usage (cf/month)</b>
Single Family	14,600 du	6,665.0 cf/du/month	97,309,000
Multi-Family	4,800 du	4,011.5 cf/du/month	19,255,200
Commercial	4,138,200 sf	2.9 cf/sf/month	12,000,780
Employment	30,753,360 sf	2.0 cf/sf/month	61,506,720
School <sup>b</sup>	6,446,880 sf	2.0 cf/sf/month	12,893,760
Park <sup>a,b</sup>	7,100,280 sf	0.0 cf/sf/month	0
Commercial Recreation <sup>b</sup>	3,267,000 sf	2.0 cf/sf/month	6,534,000
Open Space <sup>a,b</sup>	257,308,920 sf	0.0 cf/sf/month	0
Utility <sup>b</sup>	8,319,960 sf	2.0 cf/sf/month	16,639,920
<b>Total</b>			<b>226,139,380</b>
<b>Total (in millions)</b>			<b>226</b>
SoCalGas: Southern California Gas Company; cf: cubic foot/feet; du: dwelling unit; sf: square foot/feet			
<sup>a</sup> Assumes that "Park" and "Open Space" land use types would not use natural gas. While some parks may contain scattered, small-scale, built facilities that may use natural gas and electricity, the extent of these facilities is unknown at this time. Regardless, the level of natural gas demand from such facilities would be nominal compared to the estimate of demand for the remainder of built land uses, which are based on conservative demand factors that do not account for the additional energy conservation features planned for the Project. Open space also includes greenways and landscape lots.			
<sup>b</sup> To utilize the SoCalGas-provided demand factors, the number of units was derived by converting the gross acres for each land use, except residential units, as presented in Centennial Project Statistical Table (Table 4-2 in Section 4.0, Project Description), to square feet (1 acre = 43,560 sf). Therefore, these numbers are greater than the actual land area that would be covered with structures for each land use, such as school buildings.			
Source of demand factors: SoCalGas 2008.			

### *Natural Gas Distribution Line Relocation*

SoCalGas' high-pressure natural gas facilities along the westerly boundary of the Project site may be affected by Project-related roadway improvements. Portions of the utilities within these easements may require adjustment or relocation. As with the electrical lines, there are approximately 29,000 feet of natural gas facilities along the SR-138 and along Gorman Post Road.

To prevent problems with providing other utility services, ongoing coordination between the Project Applicant/Developer and SoCalGas, as required by MM 20.3-1, would ensure that the new facilities would accommodate the Project's requirements. Coordination is typical between a project applicant and a utility provider to avoid any prolonged service disruptions during extension, relocation, and upgrade of services and facilities. This routine coordination ensures that the nature, design, and timing of natural gas system improvements are adequate to serve the Project. The timing for construction, as well as location and sizing, of these facilities will be coordinated with SoCalGas.

### *SoCalGas Infrastructure*

SoCalGas anticipates that either additional feeds from the existing distribution system in the Project vicinity or a new system would be necessary to serve the Project's projected demand. This will be determined in the future as part of the Project planning and implementation process. Regardless, MM 20.3-2 requires that the Project Applicant/Developer install, bond for, or otherwise provide on-site natural gas facilities in coordination with SoCalGas. To provide natural gas service to the Project, a series of transmission and distribution gas mains would be installed in the proposed roadways. An underground extension of gas facilities will need to be constructed east along Gorman Post Road from the proposed regulator station to the Project's westerly entrance, where it would follow the route along with electricity and telephone lines through the Project site around the north side of Quail Lake. The main could also be extended along the SR-138 roadway, just outside the road right-of-way, easterly to the initial construction phases of the Project. Due to gas line installation requirements, transmission main extensions would be in separate trenches within proposed roadways. Distribution main extensions would be installed in utility corridors (shown on Exhibit 5.20-2, Centennial Project – Dry Utility Improvements). Some of these transmission and distribution mains may parallel each other in the same roadway. It may be necessary to extend a high pressure line to and within the Project site for the placement of a series of future regulator stations. The initial distribution gas source is proposed to come from connecting, or “tapping” into an existing high pressure main west of the southwest corner of the site near Gorman Post Road, placing a regulator station (potential easement space needed of approximately 75 feet by 30 feet), and running distribution medium pressure and/or transmission high pressure to and through the Project site. Gas distribution efficiency and operating integrity require that the gas mains are looped. As the Project develops, the mains may be tied to each other for pressure stabilization. MM 20.3-3 requires that an additional regulator station be constructed in the future to loop the distribution system for increased reliability.

As discussed above, SoCalGas has stated that, with appropriate expansion of infrastructure, there are adequate natural gas supplies to serve the Project (SoCalGas 2006). All new and upgraded on-site facilities and infrastructure, including regulators and distribution facilities, would be implemented as part of site development and would be constructed within public rights-of-way. Therefore, these improvements would not create additional physical impacts beyond those addressed elsewhere in this EIR because natural gas facilities would be implemented within the footprint of the overall development Project.

### *Energy Conservation in the Project*

The Project would be subject to Title 24 and mandatory CALGreen Code energy efficiency standards. However, as discussed in the Green Development Program, the Project has committed to achieving CALGreen's voluntary Tier 1 status, including exceeding Title 24 requirements by 15 percent for low-rise buildings and by 10 percent for nonresidential, hotel, and high-rise residential buildings (PDFs 11-5 and 11-6, from Section 5.11, Air Resources). Also, a minimum of 50 percent of the Project's anticipated electrical energy demand would be satisfied from on-site renewable energy generation (PDF 21-3 from Section 5.21, Climate Change). The GHG emissions associated with energy use (electricity and natural gas) were estimated based on these assumptions. A description of the ways the

Project will satisfy CALGreen Tier 1 energy efficiency measures is provided in the Green Development Program, and summarized in PDF 21-3 in Section 5.21, Climate Change.

For the reasons discussed above, implementation of the Project would result in a less than significant impact to natural gas services or facilities during construction or operation.

### Petroleum

#### *Petroleum Demand*

Project construction and operations would result in consumption of petroleum. The majority of fuel consumption resulting from the Project would involve the use of motor vehicles. Petroleum fuel consumption associated with the Project is a function of the vehicle miles traveled (VMT) as a result of Project construction and operations. As discussed in Sections 5.10 (Traffic, Access, and Circulation), 5.11 (Air Resources) and 5.21 (Climate Change), the Project would result in an increase in VMT which, in turn, could result in additional fuel consumption and energy use associated with transportation.

It should, however, be noted that, as discussed above, as a result of anticipated fuel efficiency improvements, additional VMT will not necessarily result in a proportional increase in fuel consumption. Moreover, as discussed below, the Project incorporates a variety of features intended to reduce VMT associated with the Project.

#### *Transportation Facilities*

The Green Development Program summarized in Section 5.21, Climate Change, describes the Project features that would reduce petroleum consumption both through energy-efficient site planning and building design as well as transportation improvements and vehicle trip reductions. As discussed further in Section 5.10, Traffic, Access and Circulation, the Project will construct and/or provide funding for necessary traffic and transit improvements to ensure there are less than significant traffic impacts. Without these improvements, the Project-generated trips would otherwise result in increased gasoline usage and less efficient gasoline consumption due to traffic congestion. The Project also includes a Mobility Plan that addresses vehicle circulation and alternative transportation infrastructure, including local transit and pedestrian and bicycle routes. Finally, the Project proposes compact and efficient siting of residential and mixed-use neighborhoods as well as office and commercial space to maximize the use of existing infrastructure while providing for the Project's internal circulation needs.

#### *Vehicle Trip Reductions in the Centennial Project*

As discussed previously, the Project incorporates a number of ways to reduce energy use from motor vehicle use. These include the multi-modal circulation systems, efficient site planning and building design, transportation improvements, and other vehicle trip reducing design features such as the provision of internet infrastructure, which supports telecommuting as well as online shopping and research. For the reasons discussed above, transportation energy impacts from implementation of the Project would be less than significant.

## ***Off-Site Impacts***

### Natural Gas

To provide adequate natural gas for the Project, improvements to SoCalGas facilities would occur outside the Project site on lands owned by SoCalGas. Potential off-site impacts resulting from connections to the existing high-pressure main near the southwestern corner of the Project site and the construction of a gas regulator station at this location would be confined to existing SoCalGas easements and within the existing development footprint. The inclusion of these natural gas line upgrades was included in the Project description and throughout the Project analysis. There would be a less than significant impact related to SoCalGas facilities and services.

The proposed off-site wells would not include natural gas service. Therefore, there would be no impact to SoCalGas supplies or services, and no mitigation is required.

### Petroleum

VMT associated with off-site Project features is addressed in Section 5.10, Traffic, Access, and Circulation. Construction of off-site Project features would generate only minimal trips. As discussed in Section 5.10, long-term operation of the proposed off-site Project features would not result in substantive new vehicle trips, longer driving distances, or traffic congestion such that petroleum consumption could be significantly increased. The proposed utility improvements would not generate trips, and there would be no impact related to transportation energy.

As discussed in Section 5.10, Traffic, Access, and Circulation, the proposed off-site wells would cause essentially no increase in traffic. It is anticipated that one daily visit to each well location would be necessary for maintenance and monitoring purposes; however, this level of traffic would be nominal, particularly in comparison to the anticipated daily trips associated with the Centennial Project. Therefore, transportation energy impacts from implementation of the proposed off-site wells would be less than significant.

***Impact Summary:*** The Project would result in less than significant impacts to natural gas service and facilities and petroleum consumption with implementation of the Green Development Program, and MMs 20.3-1 through 20.3-3.

## **Mitigation Measures**

**MM 20.3-1** The Project Applicant/Developer shall coordinate with the Southern California Gas Company (SoCalGas) in the design and implementation of future natural gas service and facilities in the Project study area to ensure that (1) no prolonged service disruptions during the extension and upgrade of these services would arise; (2) the nature, design, and timing of natural gas system improvements are in accordance with SoCalGas requirements; and (3) the improvements are adequate to serve the Project, to be in place for the first occupied land uses.

- MM 20.3-2** The Project Applicant/Developer shall install, bond for, or otherwise provide on-site natural gas facilities in coordination with SoCalGas.
- MM 20.3-3** An additional regulator station shall be constructed by SoCalGas to loop the distribution system for increased reliability. The timing for development of this station shall be determined by SoCalGas through an assessment of the system's operational needs. The timing for construction of this facility, as well as the specific location and sizing, shall be coordinated with SoCalGas.

### **Level of Significance After Mitigation**

Impacts related to natural gas services and facilities and petroleum consumption would be less than significant with implementation of the Green Development Program, and MMs 20.3-1 through 20.3-3.

### **5.20.4 TELEPHONE SERVICE**

#### **Relevant Plans, Policies, and Regulations**

No pertinent federal, State, or local plans, policies, or regulations related to telephone service have been identified.

#### **Environmental Setting**

AT&T (formerly known as SBC)<sup>2</sup> is a national provider of voice and data telecommunications services, serving millions of customers. AT&T is regulated by the CPUC, whose focus is to develop and implement policies and procedures to facilitate competition in all telecommunications markets; to ensure reasonably priced essential services; and to provide consumer protection against abusive practices (AT&T 2015). Several other communications companies (such as MCI World Com, Rapid Cable, and Quest Communications) operate existing underground fiber optic systems adjacent to I-5 for regional services.

The AT&T Central Office responsible for providing service to the Project area is located north of the Project site in Lebec. Underground and overhead fiber optic (fiber) and twisted pair (copper) distribution facilities are located within the Project site. A Litespan 2000 unit is located on Gorman Post Road. This structure's usage is based on digital and Y2K compliance needs of the National Cement Plant and was installed in anticipation of future growth in the area (BJ Palmer 2015).

#### **Project Design Features**

- PDF 20.4-1** The telephone line extension that would be implemented for the Project would retrofit and/or replace the current overhead system.

---

<sup>2</sup> As of November 18, 2005, SBC was renamed AT&T.

---

## Threshold Criteria

The following criterion from the County of Los Angeles Environmental Checklist is used to establish a threshold to determine the potential for significance. The Project would result in a significant impact to telephone facilities and services if it would:

**Threshold 20-3** Create energy utility (electricity, natural gas, propane) system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

## Environmental Impacts

**Threshold 20-3** **Would the project create telephone service system capacity problems, or result in the construction of new facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?**

### *On-Site Impacts*

#### Telephone Service Demand

The Project would result in an increased demand for the number of telephone lines and would create the need for new telephone service infrastructure provided by AT&T. The physical environmental impacts related to the implementation of necessary utility infrastructure are addressed as part of the Project analyzed in this EIR.

AT&T currently designates two lines per customer for a typical single-family home. Using this assumption, the Project will require 38,666 telephone lines for residential uses. Telephone line sizes for commercial areas are planned for and sized based on the Project Applicant/Developer's proposed demand. AT&T has stated that the Project's demand for telephone service would be adequately served on a demand basis (Matthews 2006). This means that, as demand increases, service to the Project site and associated facilities would be improved or expanded to accommodate the demand. No impacts related to AT&T's ability to provide telephone service would occur; however, AT&T has stated that upgrading the Central Office in Lebec would be necessary and would involve internal upgrades to distribution facilities, which would expand the Central Office's service capacity and meet the overall Project demand. The upgrade would be performed in stages, based on the level of demand, as the Project progresses.

To extend telephone service to the Project, telephone fiber or cabling would be provided in the proposed utility corridors. The initial extension (overhead and/or underground) of telephone facilities will be constructed along Gorman Post Road in the current franchise area entering the Project site at the most westerly entrance, or continuing overhead along the pole line along SR-138 (PDF 20.4-1).

The Project would be developed as a "full fiber" project, with the extension of fiber lines (as opposed to cable lines) to all homes on the site. AT&T would plan for a substructure system

that would allow for this service. To support the development of the Project as “full fiber”, additional fiber from existing AT&T facilities would either be placed overhead on the existing pole line along SR-138 or on a temporary overhead/underground location within the Project limits line along the north side of Quail Lake, along with electrical facilities, to service the initial phases of development. Several telephone fiber pedestals would be placed throughout the Project site, allowing for a complete fiber system to be constructed to allow fiber to the home, including high speed service capabilities. These new fiber facilities would be in addition to existing copper/fiber facilities currently in place (BJ Palmer 2015). The determination of whether these additional facilities are needed, as well as the locations of the telephone fiber pedestals or other AT&T facilities, would be determined in the future as part of Project planning and implementation. However, these facilities, both aboveground and underground, would be within the Project boundaries and, therefore, any potential physical impacts from these facilities are addressed as part of the analysis provided throughout this EIR.

The cost associated with new facilities and the existing system retrofit would be the responsibility of AT&T. Extension of these facilities would be conducted by AT&T as well. New business telephone extensions within 200 feet of the Project boundary and within the Project site are also AT&T’s responsibility. Each year, AT&T budgets for capital improvements such as these for the upcoming year. AT&T manages the allocation of their funds based on a project’s estimated needs. Construction and activation of the improvements are then based on application and demand. Timeframes would be consistent with the Project’s progress. Once AT&T installs telephone lines, line extension fees would apply to individual homeowners. With additional cabinets, the existing AT&T Litespan 2000 unit would have sufficient capacity to serve the Project site (BJ Palmer 2015).

In addition, future Centennial residents would be expected to use cell phones with coverage provided by a variety of different providers. Construction of cell phone towers is managed by each individual provider as deemed necessary to support demand, and such a project would require preparation of its own CEQA documentation. As the location(s) of future cell phone towers, if deemed necessary, is unknown, consideration of the environmental impacts of these facilities would be speculative. Therefore, the environmental impacts of potential future cell phone towers are not addressed as part of the Project analysis within this EIR but, as stated above, would be addressed through the separate CEQA documentation to be required for each project by the individual cell phone service providers. However, the Project would also accommodate wireless communication facilities, including antennas (mounted on buildings or stand-alone structures) and equipment shelters. These facilities would be designed to blend with the surrounding environment. Using “stealth design” techniques, antennas can be mounted on buildings; placed within tall architectural features (such as a clock tower, steeple, or entry signage); or strategically placed among a cluster of trees of similar height to render them invisible to the casual observer. Standards for wireless equipment are outlined in Section 2.2.8(Q) of the *Centennial Specific Plan*, which is Appendix 4.0-A of this EIR. The environmental impacts of these facilities located within the Project’s development area are addressed as part of the Project analysis provided throughout this EIR.

### Disruption of Other Utility Services

Existing AT&T facilities within the Project site may be affected through Project development (Exhibit 5.20-2, Centennial Project – Dry Utility Improvements). Approximately 48,000 linear feet of phone lines run throughout the Project site, and access roads to these lines within the Project site would be within future development areas. As a result, these facilities could require relocation or removal. Project development may also necessitate the relocation and/or removal of existing off-site AT&T facilities. Approximately 29,000 linear feet of existing telephone trunk and distribution lines along SR-138 and Gorman Post Road could require relocation or removal. Relocation or conversion of these facilities would be the Project Applicant/Developer's responsibility. As part of coordination between the Project Applicant/Developer and AT&T, and as required by MM 20.4-1 described below, the alternative locations for these relocated/removed telephone lines would be planned to avoid service disruptions and to avoid Project-related impacts to these facilities.

As discussed above, development of the Project could also impact off-site fiber connections to the Litespan 2000 cabinet and require an upgrade of the existing Central Office facility in Lebec. AT&T's implementation of necessary expansion and upgrades that would support the Project would not create significant physical impacts since all such improvements would occur within existing facility structures.

Additionally, it may be necessary to construct temporary overhead and/or underground facilities to provide sources; change the direction of "feed" to accommodate improvement requirements; or remove other facilities (BJ Palmer 2015). The temporary facilities are constructed solely to facilitate installation of the permanent facilities and would be removed with installation of permanent facilities. The location and extent of these facilities is unknown at this time, and would be determined during installation of necessary AT&T infrastructure. However, such temporary AT&T facilities improvements would be constructed entirely within the development area and would therefore not create any physical impacts beyond those addressed elsewhere in this EIR as part of the Project.

AT&T has current easements, franchise rights, and/or prescriptive claims that cover all their existing facilities. AT&T would extend the facilities/lines within existing or proposed road right-of-way areas whenever possible. When not possible, easements would be obtained for facilities placed on private property within the Project site. Any permits or authorizations required for the extension of telephone service to the Project site would be the responsibility of AT&T.

With implementation of MM 20.4-1, there would be less than significant impacts to telephone services and facilities during construction or operation.

### ***Off-Site Impacts***

To provide adequate telephone service for the Project, improvements to AT&T's facilities would occur outside the Project site on lands owned by AT&T (PDF 20.4-1). Potential off-site impacts resulting from upgrades of the Central Office in Lebec would be confined to existing AT&T property within the existing development footprint. The inclusion of these telephone line upgrades were included in the Project description and were included throughout the

Project analysis. As discussed above, ongoing coordination between AT&T and the Project Applicant/Developer, via MM 20.4-1, would help ensure there are no prolonged service disruptions for existing telephone and data users and that relocation or improvement of AT&T facilities is performed in compliance with all AT&T requirements. Therefore, there would be a less than significant impact related to AT&T facilities and services.

The proposed off-site wells may utilize telephone lines. However, the Supervisory Control and Data Acquisition (SCADA) system may also be operated via radio or dedicated telemetry lines. Regardless, this negligible level of additional demand on AT&T services would not affect the ability to serve existing or future telephone demand. Therefore, there would be a less than significant impact to AT&T services, and no mitigation is required.

***Impact Summary:*** The Project would result in less than significant impacts to telephone service and facilities with implementation of PDF 20.4-1 and MM 20.4-1.

## **Mitigation Measures**

**MM 20.4-1** The Project Applicant/Developer shall coordinate with AT&T in the design and implementation of future telecommunications service and facilities within the Project study area to ensure that: (1) no prolonged service disruptions during the extension and upgrading of these services would arise; (2) the nature, design, and timing of telecommunications system improvements are in accordance with AT&T requirements; and (3) the improvements are adequate to serve the proposed land uses.

## **Level of Significance After Mitigation**

Impacts related to telephone service and facilities would be less than significant with implementation of PDF 20.4-1 and MM 20.4-1.

## **5.20.5 CABLE TELEVISION**

### **Relevant Plans, Policies, and Regulations**

No pertinent federal, State, or local plans or policies related to cable television (CATV) service have been identified.

### **Environmental Setting**

CATV service is a free-enterprise system and is open to competition. Local service providers in the vicinity of the Project site include CalNeva Broadband (formerly Rapid Cable) and Time Warner Cable. CalNeva Broadband is a national CATV provider that serves customers in California and throughout the country. CalNeva Broadband currently provides cable television to the Gorman area northwest of the Project site and has indicated a willingness to expand services onto the Project site (BJ Palmer 2015). Time Warner Cable's closest facility is in Castaic, and the company does not currently plan on extending service further

to the north. At this time, the cable provider may be CalNeva Broadband or some other provider.

There are no existing CalNeva Broadband or other CATV facilities located on the Project site. The closest existing trunk and/or distribution facilities are CalNeva Broadband facilities and are located in Gorman, approximately four miles northwest of the Project site. CalNeva Broadband's plant is located north of the Project site in Frazier Park, located approximately eight miles west-northwest of the western boundary of the Project site. CalNeva Broadband has stated they have the capability and capacity to serve the entire Project area and future proposed surrounding developments with video and high speed internet access. However, a Cable Provider has not yet been confirmed.

## Project Design Features

**PDF 20.5-1** According to the Project, cabling for Cable Television (CATV) services would be provided as part of the on-site main utility corridors for dry utilities. The extension of CATV lines would proceed from the nearest location of service from whichever provider is chosen.

## Threshold Criteria

The following criterion from the County of Los Angeles Environmental Checklist is used to establish a threshold to determine the potential for significance. The Project would result in a significant impact to CATV facilities and services if it would:

**Threshold 20-4** Create energy utility (electricity, natural gas, propane) system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

## Environmental Impacts

**Threshold 20-4** **Would the project create cable services system capacity problems, or result in the construction of new facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?**

### *On-Site Impacts*

CATV service is not available in the immediate vicinity of the Project site. As such, the Project would place new demands on CATV service and require extension of facilities. Specifically, implementation of the Project would result in an increased demand for both the number of CATV lines and the need for new CATV service infrastructure. As described in PDF 20.5-1, cabling for CATV services would be provided as part of the on-site main utility corridors for dry utilities. The extension of CATV lines would proceed from the nearest location of service from whichever provider is chosen. As part of Project development, CATV service connections would be stubbed to each property line (MM 20.5-1). The physical

environmental impacts related to the implementation of necessary utility infrastructure are addressed as part of the entire Project analyzed in this EIR.

As discussed above, while CalNeva Broadband has the nearest CATV facilities to the Project site, no CATV Provider has been confirmed at this time. CalNeva Broadband has indicated that they have the capability to serve the Project with implementation of necessary infrastructure, including a fiber trunk system along Gorman Post Road in the current road right-of-way to the Project site (BJ Palmer 2015). Extension to the site would follow the route along with the electrical and telephone lines within the Project limits around the north side of Quail Lake. The facilities could also be extended along the SR-138 roadway overhead on the existing pole line, easterly to the initial construction phases of the Project. However, all options are being explored regarding potential CATV providers. Due to the magnitude of the Project's CATV demand, any company wishing to provide service to the Project site would need to provide sufficient evidence regarding their ability to serve the Project before that service provider would be selected. The CATV provider would need to extend fiber facilities providing phone, video, data, and high speed internet access. As a result, the Provider chosen will inherently be able to provide sufficient service and would be a less than significant impact to CATV service.

Coordination is typical between a Project Applicant/Developer and a Utility Provider (MM 20.5-1) in order to avoid any prolonged service disruptions during extension, relocation, and upgrade of services and facilities. This coordination also ensures that the nature, design, and timing of CATV system improvements are adequate to serve the Project's requirements. The construction timing, location, and sizing of these facilities would be coordinated with the CATV Provider, when selected.

There are no existing right-of-way conflicts because there are no CATV lines within the Project site. CATV lines would be extended within existing or proposed road right-of-way areas as part of the on-site main utility corridors for dry utilities, whenever possible, or within franchise areas. Any permits or authorizations required for the extension to the Project site would be applied for and obtained by the CATV Provider. Therefore, there would be less than significant impacts related to the provision of CATV services and facilities.

### ***Off-Site Impacts***

Development of the Project could impact off-site CATV lines near the Service Provider's plant or distribution facilities and may require an upgrade of existing facilities. The cost associated with any upgrade and/or retrofitting of the off-site fiber optic connections is typically the responsibility of the Service Provider, and extension of these facilities to the Project site would also be conducted by the Service Provider. Coordination between the Project Applicant/Developer and the Service Provider, in accordance with MM 20.5-1, and adherence to PDF 20.5-1 described above, would ensure that any impacts related to off-site Project features for CATV services and facilities would be less than significant.

The proposed off-site wells would not include CATV service. Therefore, there would be no impact to CATV services, and no mitigation is required.

**Impact Summary:** The Project would result in less than significant impacts to CATV service and facilities with implementation of PDF 20.5-1 and MM 20.5-1.

## Mitigation Measures

**MM 20.5-1** The Project Applicant/Developer shall coordinate with the Cable Television Service Provider in the design and implementation of future communication service and facilities within the Project study area to ensure that (1) no prolonged service disruptions during the extension and upgrading of these services would arise; (2) the nature, design, and timing of cable system improvements are in accordance with the Cable Service Provider's requirements; and (3) the improvements are adequate to serve the proposed land uses. The cable service connections shall be available at the property lines.

## Level of Significance After Mitigation

Impacts related to cable television service and facilities would be less than significant with implementation of PDF 20.5-1 and MM 20.5-1.

## 5.21 CLIMATE CHANGE

### 5.21.1 INTRODUCTION

#### Purpose

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that greenhouse gas (GHG) emissions issues be evaluated as part of the environmental documentation process. Because the effects of GHG emissions are considered in a global context, that is, global warming and climate change, GHG emissions are generally addressed as a cumulative issue. However, plan-level direct and indirect impacts are also addressed. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0 of this Environmental Impact Report (EIR), respectively. Because the topic of climate change is most appropriately considered on a cumulative level, the impact analysis in this EIR section is fundamentally a cumulative analysis. Therefore, the discussion in Section 7.0, Cumulative Impacts, presents a summary of the conclusions of this section.

#### Summary

The County acknowledges the consensus among leading scientists that without action to reduce GHG emissions, climate change due to global warming will pose a considerable threat to the environment and to human health and society (DRP 2015a). The *Final Unincorporated Los Angeles County Community Climate Action Plan 2020* (CCAP) is part of the County General Plan and was adopted along with the General Plan on October 6, 2015.

In accordance with CEQA Guidelines 15183.5(b), the CCAP provides that projects that “demonstrate consistency with applicable CCAP actions can be determined to have a less than significant cumulative impact on GHG emissions and climate change”. The Project’s design concepts are consistent with the CCAP, as summarized in Table 5.21-11, Centennial Project Compliance With Los Angeles County Community Climate Action Plan. The Project’s Green Development Program includes elements specifically created to reduce GHG emissions. These elements are delineated in the analysis below as project design features (PDFs). The analysis of Project consistency with each of the CCAP goals and policies shows that the Project is consistent with the CCAP.

Additional analysis under Threshold 21-1, and in Section 5.8, Land Use, Entitlements, and Planning, and in Table 5.8-1, shows that the Project would not conflict with applicable goals and policies of the Antelope Valley Area Plan (AVAP). Moreover, the analysis under Threshold 21-2 below shows that the Project would not conflict with the Southern California Association of Governments (SCAG) 2012–2035 Regional Transportation Plan Sustainable Communities Strategy (RTP/SCS) and 2016–2040 RTP/SCS.

The quantification of greenhouse gas emissions as calculated through the California Emissions Estimator Model (CalEEMod) Version 2016.3.1 estimates that the Project at buildout in 2035 would have GHG emissions of approximately 244,379 metric tons of carbon dioxide equivalent (MTCO<sub>2e</sub>) per year as shown in Table 5.21-1. Project GHG emissions as

shown in column 2 (Emissions MTCO<sub>2e</sub>) of Table 5.21-1 include quantified reductions from project design features and mitigation measures (e.g., mixed use development community design, solar electricity generation, etc.), as further discussed in Section 5.21.6, Environmental Impacts. This total includes amortized emissions from the construction period, the loss of carbon-sequestering vegetation, and the planting of carbon-sequestering trees.

**TABLE 5.21-1  
OPERATIONAL AND TOTAL GHG EMISSIONS**

<b>GHG Sources</b>	<b>Emissions MTCO<sub>2e</sub></b>	<b>Percent of Operational Emissions</b>
<i>Operational</i>	239,215	
Area	11,297	5%
Energy	49,414	21%
Mobile	160,904	67%
Solid waste	10,214	4%
Water	7,387	3%
<i>Construction</i>	4,490	
Vegetation loss	922	
New trees	-249	
<b>Total</b>	<b>244,379</b>	
<b>AVAQMD Project-Level CEQA Significance Threshold</b>	<b>100,000</b>	
Exceeds threshold?	Yes	
Service population (SP)	80,825	
<b>GHG Efficiency</b>	<b>3.02</b>	
<b>SCAQMD Plan-Level Staff-Proposed GHG Efficiency Threshold (MTCO<sub>2e</sub>/SP/Year)</b>	<b>4.1</b>	
Exceeds threshold?	No	
<b>SCAQMD Project-Level Staff-Proposed GHG Efficiency Threshold (MTCO<sub>2e</sub>/SP/Year)</b>	<b>3.0</b>	
Exceeds threshold?	Yes	
GHG: greenhouse gas; MTCO <sub>2e</sub> /yr: Metric tons of carbon dioxide equivalent per year; AVAQMD: Antelope Valley Air Quality Management District; CEQA: California Environmental Quality Act; SCAQMD: South Coast Air Quality Management District.		
Emissions calculations can be found in Appendix 5.11-A.		

As discussed further in Section 5.21.2, in 2016 the California Supreme Court reviewed a quantitative GHG significance threshold (29% below “Business as Usual”) in a CEQA lawsuit challenging the Newhall master planned community project, and determined that the state agency respondent’s reliance on this quantitative GHG threshold was not appropriate because it was a statewide GHG reduction threshold, and the record lacked substantial evidence in support of the use of this threshold for the particular land use project at issue in that lawsuit. The AVAQMD GHG threshold was adopted, and the SCAQMD GHG threshold

was proposed by staff but never adopted, prior to this Supreme Court decision; neither of these agencies included substantial evidence in the public record justifying the use of their respective quantitative thresholds for particular types of projects. However, for informational purposes, Table 5.21-1 also shows that Project GHG emissions would exceed the AVAQMD 100,000 MTCO<sub>2e</sub> per year project-level threshold. The Project's service population is estimated at 57,150 residents and 23,675 employees for a total of 80,825 at Project buildout. Also, for informational purposes, Table 5.21-1 shows that the Project's GHG efficiency would be 3.02, which would not exceed the SCAQMD-staff-proposed "plan-level" 4.1 GHG efficiency threshold, but would exceed the SCAQMD-staff-proposed "project-level" 3.0 GHG efficiency threshold.

The Project would be consistent with the CCAP, the SCAG 2012–2035 and 2016–2040 RTP/SCS, and regulatory measures designed to reduce GHG emissions. Additionally, the Project is consistent with the SCAQMD's staff's proposed draft efficiency threshold for the AVAP.

As discussed in detail in Section 5.21.6, based on the Project's consistency with the CCAP, the SCAG 2012–2035 and 2016–2040 RTP/SCS, and based on its compliance with applicable GHG-reducing regulatory measures, the Project could be found to have a less than significant impact on GHG. However, climate change is a global phenomenon and the significance of GHG emissions is most appropriately considered on a cumulative level. The Project would emit GHGs at an estimated rate of 244,379 metric tons per year and would contribute to the global inventory of GHGs.

To date, the vast majority of other States and nations have not followed California's lead in mandating GHG emission reductions across a broad spectrum of economic sectors and have not enacted regulations similar to those adopted in California, which already has nearly the lowest level of GHG per capita of any state. The County of Los Angeles has no jurisdictional control or responsibility for GHG reductions in other parts of California, and certainly not in the context of global action. Moreover, due to the County's limited jurisdiction over many GHG reduction measures required in both the CCAP and the RTP/SCS, and with respect to the many GHG-reducing regulatory programs implemented at the State level, the County lacks the requisite level of jurisdiction and control to ensure that all such measures and programs will be fully implemented as planned by third party agencies and private parties. Therefore, because of the global context of GHG emissions which are outside the County's jurisdiction and control, and because of the Project's forecasted GHG emission rate, the project's incremental contribution to the cumulative environmental impact related to GHG emissions is conservatively determined to be cumulatively considerable and this significant cumulative impact would be significant and unavoidable.

All reasonable and feasible measures to maximize project GHG emissions reduction to the greatest extent feasible are described in Section 5.21.7.

## **Section Format**

This section of environmental analysis includes a description of the state of the science of climate change; a discussion of the regulatory setting; a description of the related PDFs

incorporated into the Project to minimize Project impacts; identification of thresholds of significance (or lack thereof); the GHG inventory; and analysis of the Project's potential individual and cumulative effects and identification of significant impacts:

## **Global Climate Change**

Global climate change is a broad term used to describe any worldwide, long-term change in the Earth's climate. Global climate change refers to an increase in temperatures across the Earth due to human and industrial activity. Climate change, in addition to rising temperatures, can cause other climatic changes, such as a shift in the frequency and intensity of weather events such as rainfall or hurricanes, but it does not necessarily imply that all locations will be warmer. In fact, with global climate change, some locations will have climate patterns that may change in a way that makes the locations colder than average temperatures.

Climate change is a recorded change in the Earth's average weather measured by variables such as wind patterns, storms, precipitation, and temperature. Historical records show that global temperature changes have occurred naturally in the past, such as during previous ice ages. The year 2014 ranks as Earth's warmest year since 1880, and the 10 warmest years in the instrumental record, with the exception of 1998, have now occurred since 2000. The average global temperature has risen about 1.4 degrees Fahrenheit (°F) (0.8 degrees Celsius [°C]) since 1880 (NASA 2015).

The global atmospheric concentration of carbon dioxide (CO<sub>2</sub>), the most abundant GHG, has increased from a pre-industrial (roughly 1750) value of about 280 parts per million (ppm) to a seasonally-adjusted 405.75 ppm in February 2017, primarily due to fossil fuel use, with land use change providing a significant but smaller contribution. The annual CO<sub>2</sub> concentration growth rate during the ten-year period between 1995 and 2005 was larger

than the growth rate from the beginning of continuous direct measurements in 1960 to 2005 (ESRL 2017).

### ***Greenhouse Gases***

GHGs, as defined by the United States Environmental Protection Agency (USEPA) and California Air Resources Board (CARB), include CO<sub>2</sub>, methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF<sub>6</sub>). GHGs are global pollutants and are therefore unlike criteria air pollutants such as ozone (O<sub>3</sub>), particulate matter (respirable particulate matter with a diameter of 10 microns or less [PM<sub>10</sub>] and fine particulate matter with a diameter of 2.5 microns or less [PM<sub>2.5</sub>]), and toxic air contaminants (TACs), which are pollutants of regional and local concern (see Section 5.11, Air Resources, of this EIR). While pollutants with localized air quality effects have relatively short atmospheric lifetimes (generally on the order of a few days), GHGs have relatively long atmospheric lifetimes, ranging from one year to several thousand years. Long atmospheric lifetimes allow for GHGs to disperse around the globe. Therefore, GHG effects are global, as opposed to the local and/or regional air quality effects of criteria air pollutant and TAC emissions.

Global warming potential (GWP) is a term used to indicate, on a pound for pound basis, how much a gas will contribute to global warming relative to how much warming would be caused by the same mass of CO<sub>2</sub>. As the baseline for measuring GWP, CO<sub>2</sub> is considered to have a GWP equal to one. CH<sub>4</sub> and N<sub>2</sub>O are substantially more potent than CO<sub>2</sub> with GWPs of 25 and 298, respectively. (Prior values of 21 and 310 were from the Intergovernmental Panel on Climate Change [IPCC] second assessment report; CARB has adopted the current values from the IPCC's fourth assessment report.) Carbon dioxide equivalent (CO<sub>2</sub>e) is a quantity that enables all GHG emissions to be considered as a group despite their varying GWP. The GWP of each GHG is multiplied by the quantity of that gas to produce CO<sub>2</sub>e.

### ***The Greenhouse Effect***

In a greenhouse, sunlight enters through the glass panels, and the heat from the sunlight is then trapped inside the structure. The Earth's atmosphere acts like a greenhouse by allowing sunlight in, but traps some of the heat that reaches the Earth's surface. When solar radiation from the sun reaches the Earth, much of it penetrates the atmosphere and ultimately reaches the Earth's surface. This solar radiation is absorbed by the Earth's surface and is then re-emitted as heat in the form of infrared radiation. Whereas the GHGs in the atmosphere let solar radiation through, GHGs trap infrared radiation, resulting in the overall warming of the Earth's surface.<sup>1</sup> This phenomenon is referred to as the "greenhouse effect".

Concentrations of major greenhouse gases, such as CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, and water vapor (H<sub>2</sub>O) have been naturally present for millennia at relatively stable levels in the atmosphere, and act to keep temperatures on Earth hospitable. Without these GHGs, the earth's temperature would be too cold for life to exist. With increased human industrial activity, concentrations of certain GHGs have grown dramatically. In the absence of major industrial human activity,

---

<sup>1</sup> Infrared radiation has longer wavelengths than does solar radiation. GHGs reflect radiation with longer wavelengths. As a result, instead of escaping back into space, GHGs reflect much infrared radiation (i.e., heat) back to Earth.

natural processes maintain atmospheric GHG concentrations at relatively stable levels, which have allowed global temperatures to remain at constant levels over the last several centuries. As the concentrations of GHGs have increased as a result of human industrial activity, the amount of infrared radiation that is trapped has increased, thereby increasing the Earth's average temperature.

### **5.21.2 RELEVANT PLANS, POLICIES, AND REGULATIONS**

Many legal requirements applicable to greenhouse gas and climate change continue to be expanded and modified. This subsection presents a summary of applicable international laws (national treaties followed by sub-national agreements), federal laws, regulations and other actions, state laws, regulations, and other actions, and then local (regional and County) laws, regulations and other actions. Many of these legal requirements emerged over time through a combination of executive or agency actions, court decisions, regulations, enacted statutes, and approved plans. This regulatory background discussion includes a broader range of legal authorities than is included in other topical sections; is focused on the most significant of these measures; and based on the continuing evolution of these requirements within each category, is generally organized chronologically from earliest to most recent.

#### **International**

##### ***International Treaties and Other Developments***

The Kyoto Protocol is an international agreement linked to the United Nations Framework Convention on Climate Change. It was adopted in Kyoto, Japan, on December 11, 1997, and entered into force on February 16, 2005. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing GHG emissions. The targets amount to an average of five percent reduction against 1990 levels over the 2008–2012 five-year period. The major distinction between the Protocol and the Convention is that, while the Convention encouraged industrialized countries to stabilize GHG emissions, the Protocol commits them to do so. Recognizing that developed countries are principally responsible for the current high levels of GHG emissions in the atmosphere as a result of more than 150 years of industrial activity, the Protocol places a heavier burden on developed nations under the principle of “common but differentiated responsibilities” (UN 1997). The United States has not ratified the Kyoto Protocol. A  $\frac{2}{3}$  majority vote in the Senate is required for approval. As long as the United States has not ratified the treaty, it is not subject to its terms and obligations.

Negotiations after Kyoto have continued in an attempt to address the period after the first “commitment period” of the Kyoto Protocol, concluded at the end of 2012. In Durban, South Africa, in 2011, parties to the protocol agreed in principle to negotiate a new comprehensive and legally binding climate agreement by 2015 and to enter it into force for all parties starting from 2020. However, significant divisions remain in determining the parameters of any such new protocol, including its enforcement mechanisms and the degree to which developing economies will begin to be subject to binding emissions targets.

The 21<sup>st</sup> session of the Conference of Parties (COP21) took place from November 30, 2015 to December 11, 2015, in Paris, France. The session included representatives from 196 parties

to the United Nations Framework Convention on Climate Change. Outcomes from COP21 include, but are not limited to, limiting global temperature increase well below 2°C; establishing binding commitments by all parties to make Nationally Determined Contributions (NDC) and to pursue domestic policies aimed at achieving NDCs; and regular reporting by all countries on their emissions and progress made in implementing and achieving their NDCs (UN 2016). The continued commitment of the United States to the Paris Treaty was among the issues addressed in the 2016 Presidential election, with President Trump stating in some contexts his position that the United States should withdraw from the Paris treaty. No such withdrawal proposal has been made by the Trump administration, and a withdrawal request would trigger a multi-year process before taking effect. The timing, terms, and consequences of a full or partial withdrawal request remain speculative at this time.

## **Federal**

### ***Federal Action on Greenhouse Gas Emissions***

In 2002, President George W. Bush set a national policy goal of reducing the GHG emission intensity (tons of GHG emissions per million dollars of gross domestic product) of the U.S. economy by 18 percent by 2012 (NOAA 2002). The goal did not establish any binding reductions. Rather, the USEPA administers a variety of voluntary programs and partnerships with GHG emitters in which the USEPA partners with industries that produce and utilize synthetic gases to reduce emissions of particularly potent GHGs.

### ***April 2007 Supreme Court Ruling***

In *Massachusetts et al. vs. Environmental Protection Agency et al.* (April 2, 2007), the U.S. Supreme Court ruled that the USEPA was authorized by the Clean Air Act to regulate CO<sub>2</sub> emissions from new motor vehicles. The Court did not mandate that the USEPA enact regulations to reduce GHG emissions, but found that the only instances in which the USEPA could avoid taking action were if it found that GHGs do not contribute to climate change or if it offered a “reasonable explanation” for not determining that GHGs contribute to climate change. On December 7, 2009, the USEPA issued an “endangerment finding” under the Clean Air Act, concluding that GHGs threaten the public health and welfare of current and future generations and that motor vehicles contribute to GHG pollution (USEPA 2009a). These findings provide the basis for adopting new national regulations to mandate GHG emission reductions under the Federal Clean Air Act.

### ***Light-Duty Vehicle Greenhouse Gas Emissions Standards and Corporate Average Fuel Economy Standards***

The USEPA and the Department of Transportation’s National Highway Traffic Safety Administration (NHTSA) have been working together on developing a National Program of regulations to reduce GHG emissions and to improve the fuel economy of light-duty vehicles. On April 1, 2010, the USEPA and NHTSA announced a joint Final Rulemaking establishing standards for 2012 through 2016 model year vehicles. On October 15, 2012, the agencies issued a Final Rulemaking with standards for model years 2017 through 2025. The rules require these vehicles to meet an estimated combined average emissions level of 295 grams

of CO<sub>2</sub> per mile by 2012, decreasing to 250 grams per mile by 2016, and finally to an average industry fleet-wide level of 163 grams per mile in model year 2025. The 2016 standard is equivalent to 35.5 miles per gallon (mpg) and the 2025 standard is equivalent to 54.5 mpg if the levels were achieved solely through improvements in fuel efficiency. The agencies expect, however, that a portion of these improvements will occur due to air conditioning technology improvements (i.e., they will leak less) and due to the use of alternative refrigerants, which would not contribute to fuel economy. These standards would cut GHG emissions by an estimated 2 billion metric tons and 4 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2017–2025). The combined USEPA GHG standards and NHTSA Corporate Average Fuel Economy (CAFE) standards resolve previously conflicting requirements under both federal programs and the standards of the State of California and other States that have adopted the California standards (USEPA 2010b; USEPA and NHTSA 2012).

### ***Heavy-Duty Engines and Vehicles Fuel Efficiency Standards***

In addition to the regulations applicable to cars and light-duty trucks, on August 9, 2011, the USEPA and the NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks, which applies to vehicles from model year 2014 to 2018 (USEPA 2011). USEPA and NHTSA have adopted standards for CO<sub>2</sub> emissions and fuel consumption, respectively, tailored to each of three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the USEPA, this program will reduce GHG emissions and fuel consumption for affected vehicles between 9 percent to 23 percent.

### ***Additional Federal GHG Rules and Policies***

In addition to the rules and regulations developed with respect to stationary and mobile sources discussed above, various other federal developments have occurred that aim to reduce GHGs from other sources, including land use activities.

### **Energy Independence and Security Act**

On December 19, 2007, the Energy Independence and Security Act of 2007 was signed into law (EISA). Among other key measures, the EISA would do the following, which would aid in the reduction of national mobile and non-mobile GHG emissions:

1. Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard (RFS) requiring fuel producers to use at least 36 billion gallons of biofuel in 2022;
2. Prescribe or revise standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances; and
3. Set miles per gallon targets for cars and light trucks and directed the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks. (These were superseded by the NHTSA and USEPA actions discussed above.)

Additional provisions of the EISA address energy savings in government and public institutions, promoting research for alternative energy, additional research in carbon capture, international energy programs, and the creation of “green jobs”.

#### American Recovery and Reinvestment Act

On February 17, 2009, President Obama signed the American Recovery and Reinvestment Act of 2009 (ARRA). ARRA was passed in response to the economic crisis of the late 2000s, with the primary purpose to maintain existing jobs and create new jobs. Among the secondary objectives of ARRA was investment in “green” energy programs, including funding the following through grants, loans, or other funding; private companies developing renewable energy technologies; local and State governments implementing energy efficiency and clean energy programs; research in renewable energy, biofuels, and carbon capture; and development of high efficiency or electric vehicles.

#### ***Council on Environmental Quality National Environmental Policy Act Guidelines on Greenhouse Gases***

On February 18, 2010, the White House Council on Environmental Quality (CEQ) published draft guidance on the consideration of greenhouse gases and climate change for National Environmental Policy Act (NEPA) analyses (CEQ 2010). On December 18, 2014 CEQ released the *Revised Draft Guidance on the Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in NEPA Reviews* (CEQ 2014). Both documents recommend that proposed federal actions that are reasonably expected to directly emit 25,000 million metric tons of carbon dioxide equivalent per year (MMTCO<sub>2e</sub>/year) should prepare a quantitative and qualitative NEPA analysis of direct and indirect greenhouse gas emissions.

The draft guidance provides reporting tools and instructions on how to assess the effects of climate change. The draft guidance does not propose to regulate greenhouse gases. Although CEQ has not yet issued final guidance, various NEPA documents are beginning to incorporate the approach recommended in the draft guidance.

#### ***Voluntary Programs***

The USEPA administers a variety of voluntary programs and partnerships with GHG emitters in which the USEPA partners with industries that produce and utilize synthetic gases to reduce emissions of particularly potent GHGs. For example, the USEPA's National Clean Diesel Campaign (NCDC) promotes diesel emission reduction strategies. The NCDC works to reduce the pollution emitted from diesel engines across the country through the implementation of varied control strategies by working with manufacturers, fleet operators, air quality professionals, environmental and community organizations, and State and local officials to reduce diesel emissions. NCDC activities include: developing new emissions standards for locomotive and marine diesel engines; and promoting the reduction of emissions for existing diesel engines, including use of cleaner fuels, retrofitting and repairing existing fleets, idling reduction among others. The USEPA also administers the State and Local Climate and Energy Program that provides technical assistance, analytical tools, and outreach support to State, local, and tribal governments (USEPA 2017).

**Greenhouse Gas and Climate Policies of the Trump Administration.** President Trump and his senior advisors and appointees, including US Environmental Protection Agency Secretary Scott Pruitt, have stated their intent to halt various regulatory activities to reduce greenhouse gas emissions, including for example, the Climate Action Plan, the Clean Power Plan, and a waiver program allowing California to mandate more stringent emission standards for passenger cars and light duty trucks. Representatives from various states, including California's Governor and Legislative leaders, along with national environmental advocacy groups such as the Natural Resources Defense Council, have stated their intent to sue to block federal agency actions that would postpone or eliminate GHG reduction measures approved by former President Obama, and to consider expansions of state-level GHG reduction measures that are not dependent on federal action. The timing, emission consequences, litigation outcome, and implementation consequences of these types of federal GHG decisions, and the potential for and consequences of enhanced GHG reduction regulatory programs by other entities such as the state of California, remain speculative at this time.

## **Multi-State/Regional Area**

### ***Western Regional Climate Action Initiative***

The Western Regional Climate Action Initiative (WCI) is a partnership among seven States, including California, and four Canadian provinces to implement a regional, economy-wide cap-and-trade system to reduce global warming pollution. The WCI will cap GHG emissions from the region's electricity, industrial, and transportation sectors with the goal to reduce the heat trapping emissions that cause global warming to 15 percent below 2005 levels by 2020. When the WCI adopted this goal in 2007, it estimated that this would require 2007 levels to be reduced worldwide between 50 and 85 percent by 2050. California is working closely with the other States and provinces to design a regional GHG reduction program that includes a cap-and-trade approach. CARB's planned cap and-trade program, discussed below, is also intended to link California and the other member States and provinces. As of January 1, 2014, California's Cap-and-Trade program is linked to Quebec's pursuant to the Agreement Between the California Air Resources Board and the Gouvernement du Québec Concerning the Harmonization and Integration of Cap-and-Trade Programs Reducing Greenhouse Gas Emissions, in accordance with the direction in CARB Board Resolution 13-7 (CARB 2013).

### ***Pacific Coast Action Plan on Climate and Energy***

On October 28, 2013, the Governors of California, Oregon, and Washington and the Premier of British Columbia signed a clean energy pact, known as the Pacific Coast Action Plan on Climate and Energy (Pacific Coast Action Plan). Although the Action Plan does not impose legally enforceable obligations and lacks a specific schedule for implementation, the pact sets out a number of goals and aspirational measures. The Action Plan calls upon each of the parties to undertake a number of measures to address the use of carbon-based fuels in the transportation sector, including the adoption or maintenance of low-carbon fuel standards; the development of targets and action plans in order to encourage public and private investment in low-carbon commercial fleets that use alternative fields; and the expansion of

the sale of zero-emissions vehicles to a goal of ten percent of new vehicle purchases by 2016 (Pacific Coast Collaborative 2013).

## State

California has enacted a variety of legislation relating to climate change, much of which sets aggressive goals for GHG emissions reductions within the state. However, none of this legislation provides definitive direction regarding the treatment of climate change in environmental review documents prepared under CEQA. In particular, the amendments to the State CEQA Guidelines do not require or suggest specific methodologies for performing an assessment or thresholds of significance, and do not specify greenhouse gas reduction mitigation measures. Instead, the CEQA amendments continue to rely on lead agencies to choose methodologies and make significance determinations based on substantial evidence, as discussed in further detail below (CNRA 2009b). Consequently, no State agency has promulgated binding regulations for analyzing GHG emissions, determining their significance, or mitigating any significant effects in CEQA documents. The discussion below provides a brief overview of the Governor's, CARB and California Office of Planning and Research (OPR) policies, of court decisions, and of the legislation that relates to climate change that may affect the emissions associated with the proposed Project.

### ***California Supreme Court Ruling in Center for Biological Diversity v. Department of Fish and Wildlife***

In its recent decision, *Center for Biological Diversity v. Department of Fish and Wildlife*, S217763 (*Newhall*), the Court evaluated the California Department of Fish and Wildlife's (CDFW) analysis of potential impacts caused by GHG emissions contained in the EIR for the proposed land development called Newhall Ranch (California 2015a). In the EIR, the CDFW analyzed GHG emissions under Assembly Bill (AB) 32, using the business-as-usual (BAU) comparison as its sole criterion of significance.

In *Newhall*, the California Supreme Court concluded that a finding of consistency with meeting statewide emission reduction goals is a legally permissible criterion of significance when analyzing potential impacts of GHG emissions under CEQA. However, the Court found that the EIR's conclusion that the project's emissions would be less than significant under that criterion was not supported by substantial evidence, and remanded back to the appellate court the narrow issue of whether substantial evidence supported the application of AB 32 statewide GHG reduction goal of 29 percent to new land use projects.

The Court then identified "potential options" for lead agencies evaluating cumulative significance of a proposed land use development's GHG emissions in future CEQA documents, but the Court was careful to note that there was no "guarantee" that any of these would be sufficient:

We do not, of course, guarantee that any of these approaches will be found to satisfy CEQA's demands as to any particular project; what follows is merely a description of potential pathways to compliance, depending on the circumstances of a given project.

The “potential pathways to compliance” suggested by the Court are as follows:

1. **Business As Usual (BAU) Model:** While the Court cautioned that the Scoping Plan may not be appropriate at the project-level, the BAU model might be used to determine what level of reduction from business as usual a new land use development at the proposed location must contribute in order to comply with statewide goals pursuant to AB 32. The Court specifically directed that reliance on this type of quantitative threshold must be supported by substantial evidence in the record that links the statewide GHG reduction standard to the appropriate GHG reduction standard for the specific type of project under consideration.
2. **Compliance With Regulatory Programs Designed To Reduce Greenhouse Gas Emissions:** The Court suggests that a lead agency could rely on a showing of compliance with regulatory programs designed to reduce greenhouse gas emissions in order to demonstrate consistency with AB 32’s goals. The Court clarifies that a significance analysis based on compliance with such statewide regulations only goes to impacts within the area governed by the regulations.
3. **Local Climate Action Plan Or Other “Geographically Specific Greenhouse Gas Emission Reduction Plans”:** The Court points out that these plans may provide a basis for the tiering or streamlining of project-level CEQA analysis, so long as the plan is “sufficiently detailed and adequately supported.”
4. **Regional Sustainable Community Strategy (SCS):** The Court also articulates that a lead agency need not additionally analyze greenhouse gas emissions from cars and light trucks in CEQA documents for certain residential, mixed use and transit priority projects that are consistent with an applicable SCS adopted pursuant to SB [Senate Bill] 375.
5. **Numerical GHG Significance Thresholds:** Although noting that use of such thresholds are not required, the Court favorably cited to the BAAQMD GHG significance thresholds, based on compliance with AB 32, which use a “service population” GHG ratio threshold for land use projects and a 10,000 ton annual GHG emission threshold for industrial projects. The Court remanded for further consideration the application of the 29 percent overall Scoping Plan metric, which is used by several Air Districts and, like the favorably-cited BAAQMD [Bay Area Air Quality Management District] metric, is based on AB 32.
6. **Executive Order Nos. S-3-05 and B-30-15:** Citing to Executive Order Nos. S-3-05 and B-30-15, the Court cautioned that those EIRs taking a goal-consistency approach to CEQA significance may “in the near future” need to consider the project’s effects on meeting emissions reduction targets beyond 2020.

Following the Supreme Court’s decision in *Newhall*, the EIR at issue in that case was set aside on remand by the lower court. On November 2016, the CDFW released a draft Additional

Environmental Analysis (AEA) intended to address the agency's CEQA compliance obligations (CDFW 2016). The AEA does not respond to the Supreme Court's direction to provide substantial evidence supporting the 29% BAU statutory GHG reduction threshold relied upon by the *Newhall* EIR. The AEA also does not include an assessment of the *Newhall* project's consistency with any of the Court's suggested GHG CEQA compliance pathways, although referenced documentation in the *Newhall* administrative record do include and confirm compliance with each pathway. Instead, as described in the AEA, the *Newhall* project applicant (Five Point LLC) voluntarily modified its project and proposed to achieve "net zero" GHG emissions for the project with the implementation of the project applicant's "zero net emission" proposal, which was made enforceable by the addition of 13 mitigation measures that correspond to the applicant's proposal, as further described in the AEA. The AEA states that the adoption and implementation of the 13 mitigation measures would reduce mobile source, electricity, natural gas, vegetation removal, and construction-related emissions by the amount of emissions estimated for the project and result in no net contributions of GHG emissions from the project, or "zero net emissions." The AEA further concludes that because the project would result in no net increase of GHG emissions after implementation of the mitigation measures, there would be no contribution of GHG emissions to cumulative GHG emissions influencing global climate change and the *Newhall* project would not conflict with any plan, policy, or regulation adopted for the purpose of reducing the emission of GHGs. Consequently, the AEA concludes that project GHG and climate change impacts would be less than significant. (CDFW 2016, pp. 1-18).

### ***Executive Order S-3-05 (Statewide GHG Targets)***

On June 1, 2005, Governor Arnold Schwarzenegger signed Executive Order S-3-05, which proclaims that California is vulnerable to the impacts of climate change. It declares that increased temperatures could reduce snowpack in the Sierra Nevada Mountains; could further exacerbate California's air quality problems; and could potentially cause a rise in sea levels. In an effort to avoid or reduce the impacts of climate change, Executive Order S-3-05 calls for a reduction in GHG emissions to the year 2000 level by 2010, to year 1990 levels by 2020, and to 80 percent below 1990 levels by 2050.

Executive orders do not have the same status as a law because in California's constitutional system, it is the Legislature, not the Governor, who is entrusted with the role of making statewide laws (California 1997 [p. 836], 1990). The Legislature declined to include the Executive Order's 2050 goal in AB 32 (discussed below), and again declined to use the EO's 2050 goal in adopting Senate Bill (SB) 375 (discussed below), nor has it incorporated it in any implementing legislation or applicable plans. Additionally, although CARB has the requisite authority to adopt whatever regulations are necessary beyond the AB 32 horizon year 2020 to meet the target set forth in S-3-05, the agency has not done so. Since the Legislature has never enacted EO S-3-05's 2050 target, and no expert agency has interpreted CEQA to require it, the 2050 target has only the force and effect of an executive order issued by a former Governor. There is no authority that suggests that the constitutional authority to establish CEQA significance thresholds resides in the Governor. CEQA is a statute, and the authority to amend and revise its requirements falls first to the Legislature. The Legislature alone has the authority to enact, amend, or revise legislation, absent some express delegation of authority to the Governor or an executive branch agency through statutory enactments

(California 2010 [p. 1015]). If the Legislature has delegated any of its authority to define CEQA's requirements, it delegated that authority to OPR and not to the Governor's office.

Moreover, CARB's Scoping Plan to implement AB 32 looked beyond 2020 to assess whether implementing the Scoping Plan would achieve the State's long-term climate goals and determined that it would do the following (CARB 2008a [p. 117]):

Climate scientists tell us that the 2050 target represents the level of greenhouse gas emissions that advanced economies must reach if the climate is to be stabilized in the latter half of the 21st century. Full implementation of the Scoping Plan will put California on a path toward these required long-term reductions. Just as importantly, it will put into place many of the measures needed to keep us on that path.

The 2014 Scoping Plan Update confirms that "California is on track to meet the near-term 2020 greenhouse gas limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" and it recognizes the potential for California to "reduce emissions by 2030 to levels squarely in line with those needed in the developed world and to stay on track to reduce emissions to 80 percent below 1990 levels by 2050" (CARB 2014b, p. 2).

However, the 2014 Scoping Plan Update also concludes that additional actions will be needed to continue reducing emissions and meet the 2050 goals in the face of anticipated population and economic growth (CARB 2014b). In fact, significant technological innovation, well beyond the scope of an individual development project, are absolutely necessary components of any plausible path to achieving the EO S-3-05's 2050 target. For example, CARB has concluded that "California must transition to zero and near-zero emission transportation and freight movement technologies" which require expedited completing of "promising new heavy-duty vehicle technologies," and to "encourage additional needed technology innovation" CARB proposes to amend some of its regulatory requirements. [<https://www.arb.ca.gov/msprog/itr/itr.htm>] Similarly, in one of several reports CARB's Advanced Technology to Meet California's Climate Goals: Opportunities, Barriers & Policy Solutions (CARB, 2009) concludes that "(m)eeting California's long-term GHG goals will require the development and deployment of low and zero GHG advanced technologies in addition to the accelerated diffusion of currently available technologies."

These new technology innovations to change transportation engine and fuel technology, and energy generation and storage technology are generally outside the jurisdiction and control of the local government agency such as the County. Achieving these goals will require wholesale shifts in fuel and energy technology, neither of which are currently available, rendering any further analysis of a given development project's impacts relative to the 2050 target too speculative for purposes of determining CEQA significance.

The Court in the *Newhall* decision noted that an analysis of goals beyond 2020 may be necessary for new development; however, Court noted that the target set by EO S-3-05 and the interim goal set in EO B-30-15 (discussed below) were not required significance criteria in analyzing impacts related to GHG emissions and climate change under CEQA for the abovementioned reasons.

### ***Executive Order B-30-15 (Statewide Interim GHG Targets)***

California EO B-30-15 (April 29, 2015) set an “interim” statewide emission target to reduce GHG emissions to 40 percent below 1990 levels by 2030, and directed State agencies with jurisdiction over greenhouse gas emissions to implement measures pursuant to statutory authority to achieve this 2030 target and the 2050 target of 80 percent below 1990 levels. Specifically, the Executive Order directed CARB to update the Scoping Plan to express this 2030 target in metric tons. This new Executive Order is subject to all the same limitations as discussed above for EO S-03-05. However, EO B-30-15 is more specific in its direction to State agencies so it remains to be seen how it will be implemented, and like EO S-3-05, neither CARB nor the legislature have incorporated the target set forth in B-30-15 in any implementing legislation or applicable plans. However, SB 350 was signed into law and (discussed below) it requires the state to double energy efficiency savings in electricity and natural gas by retail customers by 2030 and raises the Renewable Portfolio Standard (RPS) so that half of the state’s electricity must be procured from renewable sources by 2030.

### ***Assembly Bill 32 (Statewide GHG Reductions)***

The California Global Warming Solutions Act of 2006 (AB 32) was signed into law in September 2006 after considerable study and expert testimony before the Legislature (California 2006a). The law instructs CARB to develop and enforce regulations for the reporting and verifying of statewide GHG emissions. The Act directed CARB to set a GHG emission limit based on 1990 levels, to be achieved by 2020. The bill set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

The heart of the bill is the requirement that statewide GHG emissions be reduced to 1990 levels by 2020. Based on CARB’s calculation of 1990 baseline emissions levels, California must reduce GHG emissions by approximately 28.5 percent below “business-as-usual” predictions of year 2020 GHG emissions to achieve this goal. The bill requires CARB to adopt rules and regulations in an open public process to achieve the maximum technologically feasible and cost-effective GHG reductions. Key AB 32 milestones for CARB’s actions include the following:

- **June 30, 2007.** Identification of discrete early action GHG emissions reduction measures. On June 21, 2007, CARB satisfied this requirement by approving three early action measures (CARB 2007a). These were later supplemented by adding six other discrete early action measures (CARB 2007b).
- **January 1, 2008.** Identification of the 1990 baseline GHG emissions level; approval of a statewide limit equivalent to that level; and adoption of reporting and verification requirements concerning GHG emissions. On December 6, 2007, CARB approved a statewide limit on GHG emissions levels for the year 2020 consistent with the determined 1990 baseline (CARB 2007c).
- **January 1, 2009.** Adoption of the Scoping Plan for achieving GHG emission reductions. On December 11, 2008, CARB adopted *Climate Change Scoping Plan: A Framework for Change* (Scoping Plan), discussed in more detail below (CARB 2008a).

- **January 1, 2010.** Adoption and enforcement of regulations to implement the “discrete” actions. Several early action measures have been adopted and became effective on January 1, 2010 (CARB 2007a, 2007b).
- **January 1, 2011.** Adoption of GHG emissions limits and reduction measures by regulation. On October 28, 2010, CARB released its proposed cap-and-trade regulations, which would cover sources of approximately 85 percent of California’s GHG emissions. On October 20, 2011, the Board adopted the final cap-and-trade regulation. The final rulemaking package was approved by the Office of Administrative Law (OAL) on December 14, 2011, with an effective date of January 1, 2012 (CARB 2011a).
- **January 1, 2015.** Cap-and-trade compliance obligations were phased in for suppliers of natural gas, reformulated gasoline blendstock for oxygenate blending (RBOB), distillate fuel oils, and liquefied petroleum gas, with emissions that meet or exceed specified emissions thresholds. Emission offsets are allowed for up to eight percent of a facility’s compliance obligation. According to the 2016 California Climate Investments Annual Report, \$2.6 billion from the Greenhouse Gas Reduction Fund has been appropriated to State agencies, and \$1.7 billion has been awarded to projects (CARB 2016a). CARB has confirmed that the Cap-and-Trade program will continue to be administered after 2020.

As noted above, on December 11, 2008, CARB adopted the Scoping Plan to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that will be adopted to reduce California’s GHG emissions. CARB determined that achieving the 1990 emission level would require a reduction of GHG emissions of approximately 28.5 percent below what would otherwise occur in 2020 in the absence of new laws and regulations (referred to as “business as usual”). The Scoping Plan evaluates opportunities for sector-specific reductions; integrates all CARB and Climate Action Team early actions and additional GHG reduction measures by both entities; identifies additional measures to be pursued as regulations; and outlines the role of a cap-and-trade program. The key elements of the Scoping Plan (CARB 2008a) include:

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
- Achieving a statewide renewables energy mix of 33 percent;
- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85 percent of California’s GHG emissions;
- Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets;
- Adopting and implementing measures pursuant to existing State laws and policies, including California’s clean car standards, goods movement measures, and the Low Carbon Fuel Standard; and
- Creating targeted fees, including a public goods charge on water use, fees on high global warming potential gases, and a fee to fund the administrative costs of the State of California’s long-term commitment to AB 32 implementation.

In 2009, a coalition of environmental groups brought a challenge to the Scoping Plan alleging that it violated AB 32 and that the environmental review document (called a “Functional Equivalent Document” [FED]) violated CEQA by failing to appropriately analyze alternatives to the proposed cap-and-trade program. On May 20, 2011, the San Francisco Superior Court entered a final judgment in favor of the coalition and ordered that CARB take no further action with respect to cap-and-trade rulemaking until it complies with CEQA by properly analyzing alternatives in its FED to cap and trade (California 2011). CARB appealed the decision on May 23, 2011 (CARB 2011b). The Appellate Court stayed the Superior Court’s injunction on June 3, 2011. The portions of the Scoping Plan that do not relate to cap and trade remain valid under the Court’s judgment. On June 19, 2012, the California First District Court of Appeal upheld the Scoping Plan and affirmed CARB’s approval of the Scoping Plan as in compliance with AB 32.

In connection with preparation of the supplement to the Functional Equivalent Document, CARB released revised estimates of the expected 2020 emission reductions in consideration of the economic recession and the availability of updated information from development of measure-specific regulations. Consideration of the economic recession and the effectiveness of adopted regulation reduced the projected 2020 BAU emissions from 596 MMTCO<sub>2e</sub> to 545 MMTCO<sub>2e</sub> (CARB 2011c). With the revised 2020 BAU projection, achieving the 1990 emissions level would require a reduction of GHG emissions of 118 MMTCO<sub>2e</sub>, or 21.7 percent (down from 28.5 percent), to achieve in 2020 emissions levels in the BAU condition. CARB also updated its BAU evaluation to account for new laws and regulations mandating GHG reductions that had been implemented subsequent to the original Scoping Plan, such as the cleaner car mandates required by Pavley (vehicle model-years 2009–2016) and the renewable portfolio standard (12 percent–20 percent). Inclusion of these new GHG mandates further reduced the 2020 projected estimate of GHG emissions to 507 MMTCO<sub>2e</sub>. As a result, based on both the economic recession and new GHG reduction implementation mandates, CARB determined in 2011 that achieving the 1990 emission level (and 2020 emissions limit of 427 MMTCO<sub>2e</sub>) would require a reduction of GHG emissions of 80 MMTCO<sub>2e</sub>, or a reduction by approximately 15.8 percent (down from 28.5 percent, but not directly comparable because of the change in methodology) to achieve in 2020 emissions levels in the “business as usual” or NAT condition (CARB 2011d).

CARB approved the final “First Update to the Climate Change Scoping Plan” on May 22, 2014. The first update describes California’s progress towards AB 32 goals, stating that “California is on track to meet the near-term 2020 greenhouse gas limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32”. Specifically, “if California realizes the expected benefits of existing policy goals (such as 12,000 megawatts [MW] of renewable distributed generation by 2020, net zero energy homes after 2020, existing building retrofits under AB 758, and others) it could reduce emissions by 2030 to levels squarely in line with those needed in the developed world and to stay on track to reduce emissions to 80 percent below 1990 levels by 2050” (CARB 2014b). This first update retains from the October 2013 draft the recalculated 1990 GHG emissions level of 431 MMTCO<sub>2e</sub>, as well as the 509 MMTCO<sub>2e</sub> 2020 “business as usual” or NAT condition (CARB 2014b). Thus, under CARB’s most current document, reducing the “business as usual” or NAT condition of 509 MMTCO<sub>2e</sub> to the 1990 emissions level of 431 MMTCO<sub>2e</sub> will require a reduction of 78 MMTCO<sub>2e</sub>, or approximately a 15.3 percent reduction (compared to a

28.5 percent reduction as set forth in the original Scoping Plan but not directly comparable because of the change in methodology).

CARB is moving forward with a second update to the Scoping Plan to reflect the 2030 target established in Executive Order B-30-15 (CARB 2015a) and in Senate Bill 32 (discussed below).

On January 20, 2017, CARB completed a draft 2030 Target Scoping Plan Update for which an extended public comment process is scheduled for completion in April 2016 (CARB 2016b). CARB estimates that adoption of the final 2030 Target Scoping Plan Update will be considered for approval by the CARB board at a public hearing conducted in Summer 2017. The 2030 Target Scoping Plan Update includes the new statutory GHG reduction requirements that were not included in the current Scoping Plan, including for example Senate Bill 32 (discussed below) which sets a 40% GHG reduction target below 1990 GHG levels to be achieved by 2030, SB 350 (which sets a 50% reduction in GHG emissions from electricity generation and other energy uses in existing structures, and a 50% renewable energy portfolio requirement), and SB 650 (which establishes priority GHG reduction targets for designated types of greenhouse gases such as methane). The key elements of the draft Scoping Plan proposal call for further GHG reductions from the refinery sector specifically, further reductions from other stationary sources through either a renewed and expanded cap and trade or carbon tax program, further reductions from other sectors such as transportation technologies and services, water and solid waste conservation and management, and land uses in both open space and urban areas. The additional state statutory requirements addressed by the draft 2030 Target Scoping Plan Update are described below. Ongoing statutory proposals (e.g., to increase the renewable portfolio standard to 100% instead of 50%, and to adopt and expand cap and trade as a tax rather than fee program), and uncertainties regarding the greenhouse gas reductions requiring federal concurrence or support, may result in modifications to the 2030 Target Scoping Plan Update which are unknown at this time.

### ***Senate Bill 32***

SB 32, signed into law on September 8, 2016, requires CARB to ensure that statewide greenhouse gas emissions are reduced to at least 40 percent below the 1990 statewide greenhouse gas level no later than December 31, 2030. Per SB 32, CARB is to achieve this 2030 GHG reduction target by “adopting rules and regulations to achieve the maximum technologically feasible and cost-effective greenhouse gas emissions reductions[.]” See Health & Safety Code Section 38566. The new SB 32 GHG reduction mandate is the same as the GHG reduction included in Executive Order B-30-15 of 40 percent below 1990 levels by 2030. As discussed above, CARB is the process of preparing the 2030 Target Scoping Plan Update, which is intended to build upon and leverage the framework for achieving California’s GHG reduction mandate established in the initial Scoping Plan and its first update, and to define the state’s climate change priorities for the next 14 years and beyond.

### ***Assembly Bill 197***

AB 197 is a companion to, and was enacted on the same day as, SB 32 (i.e., September 8, 2016). AB 197 adds two non-voting members to the CARB board, establishes certain

qualifications for CARB board membership, and creates a six member Joint Legislative Committee on Climate Change Policies to determine facts and make recommendations to the Legislature regarding California climate change policy. Under AB 197, the CARB Chair is required to appear before this committee on an annual basis and present annual information regarding GHG emissions, toxic air contaminants, and criteria pollutants generated by all economic sectors covered by the Scoping Plan. AB 197 further authorizes the committee to establish an expert panel to independently analyze the State's climate change policies. In addition, AB 197 requires CARB to make available on its website, and updated annually, all GHG emissions, criteria pollutants, and toxic air contaminant information broken down to a local level for stationary sources and sub-county level for mobile sources. AB 197 also obligates CARB, when adopting rules and regulations that achieve emission reductions beyond statewide GHG emission limits to consider "social costs" and to prioritize (a) emissions reductions from large stationary sources of GHG emissions, and (b) direct emission reductions from mobile sources. For purposes of AB 197, "social costs" is defined to mean "an estimate of the economic damages, including, but not limited to, changes in net agricultural productivity; impacts to public health; climate adaptation impacts, such a property damages from increased flood risk; and changes in energy system costs, per metric ton of greenhouse gas emissions per year." Finally, AB 197 requires each Scoping Plan update to identify for each of its emission reduction measures (i) the range of air pollution reductions and GHG emissions reductions projected to result from each measure, and (ii) the cost-effectiveness, including avoided social costs, of each measure.

### ***Senate Bill 375 (Land Use Planning)***

SB 375 became law on (date) and it provides for a new planning process to coordinate land use planning, regional transportation plans, and funding priorities in order to help California meet the GHG reduction goals established in AB 32 (California 2008b). SB 375 requires Metropolitan Planning Organizations (MPOs) relevant to the project area (including SCAG) to incorporate a "sustainable communities strategy" (SCS) in their regional transportation plans (RTPs) that will achieve GHG emission reduction targets set by CARB. SB 375 also includes provisions for streamlined CEQA review for some infill projects such as transit-oriented development. SB 375 will be implemented over the next several years.

SB 375 is similar to the Regional Blueprint Planning Program, established by the California Department of Transportation, which provides discretionary grants to fund regional transportation and land use plans voluntarily developed by MPOs working in cooperation with Councils of Governments. On April 22, 2009, the Metropolitan Transportation Commission (MTC) adopted the 2009 Regional Transit Plan (RTP) with AB 32 goals in mind. The 2012 RTP was SCAG's first plan subject to SB 375. The Scoping Plan, adopted by CARB in December of 2008, relies on the requirements of SB 375 to implement the carbon emissions reductions anticipated from land use decisions.

SB 375 also required CARB to appoint a Regional Targets Advisory Committee (RTAC) to recommend factors for CARB to consider and methodologies for it to use in setting GHG emission reduction targets for each region. The RTAC must include representation from the League of California Cities, the California State Association of Counties, MPOs, developers, planning organizations, and other stakeholders. In January 2009, CARB appointed 21

members to the RTAC. On September 29, 2009, the RTAC released its recommendations to CARB, representing a key step in the establishment of regional targets for inclusion in sustainable community strategies (RTAC 2009). The RTAC recommendations focus largely on the manner in which CARB staff should interact with various stakeholders during the target-setting process, and how staff should use empirical studies and modeling in establishing regional GHG targets.

Following the release of RTAC's recommendations, CARB began the process of developing regional GHG reduction targets (Regional Targets) for the State's MPOs. On September 23, 2010, CARB adopted Regional Targets applying to the years 2020 and 2035 (CARB 2011e). For the area under SCAG's jurisdiction—including the Project area—CARB adopted Regional Targets of 8 percent for 2020 and 13 percent for 2035. On February 15, 2011, the CARB's Executive Officer approved the final targets (CARB 2011f). CARB filed a Notice of Decision two days later on February 17, 2011 (CARB 2011e). CARB is considering further changes to the SB 375 MPO GHG reduction targets, with workshops scheduled in March of 2017 and new targets to be set following CARB approval of the 2030 Scoping Plan Target Update. The new targets will take effect as of the next MPO approval cycle for the Regional Transportation Plan/Sustainable Communities Strategy, which for SCAG will occur in 2020.

### ***Senate Bill 605 and the Short-Lived Climate Pollutant Reduction Strategy***

On September 21, 2014, Governor Jerry Brown signed Senate Bill 605 (SB 605), which requires CARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants in the state no later than January 1, 2016. As defined in the statute, short-lived climate pollutant means "an agent that has a relatively short lifetime in the atmosphere, from a few days to a few decades, and a warming influence on the climate that is more potent than that of carbon dioxide." SB 605, however, does not prescribe specific compounds as short-lived climate pollutants or add to the list of GHGs regulated under AB 32. In developing the strategy, CARB must complete an inventory of sources and emissions of short-lived climate pollutants in the state based on available data, identify research needs to address any data gaps, identify existing and potential new control measures to reduce emissions, and prioritize the development of new measures for short-lived climate pollutants that offer co-benefits by improving water quality or reducing other air pollutants that impact community health and benefit disadvantaged communities. The draft strategy released by CARB in September 2015 focuses on methane, black carbon, and fluorinated gases, particularly hydrofluorocarbons, as important short-lived climate pollutants. The draft strategy recognizes emission reduction efforts implemented under AB 32 (e.g., refrigerant management programs) and other regulatory programs (e.g., in-use diesel engines, solid waste diversion) along with additional measures to be developed. On November 28, 2016, CARB released for 45-day public review and comment its Revised Proposed Short-Lived Climate Pollutant Reduction Strategy and the CARB board will consider its adoption at a public hearing scheduled for March 23 and 24, 2017 (CARB 2016d).

### ***Senate Bills 1078, 107, and SBX1-2 (Renewable Portfolio Standards)***

Established in 2002 under SB 1078 (California 2002b), and accelerated in 2006 under SB 107 (California 2006c) and again in 2011 under SBX1-2 (California 2011b), California's Renewable Portfolio Standard (RPS) requires retail sellers of electric services to increase

procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020. The 33 percent standard is consistent with the RPS goal established in the Scoping Plan (CARB 2008a). As interim measures, the Renewable Portfolio Standards require 20 percent of retail sales to be sourced from renewable energy by 2013 and 25 percent by 2016. Initially, the Renewable Portfolio Standard provisions applied to investor-owned utilities, community choice aggregators, and electric service providers. SBX1-2 added, for the first time, publicly owned utilities to the entities subject to RPS (California 2011b).

### ***Senate Bill 1***

Senate Bill 1 of 2006 (SB 1) established the statewide California Solar Initiative, also required the California Energy Commission (CEC) to implement regulations that require sellers of production homes to offer a solar energy system option to all prospective homebuyers. Besides offering solar as an option to prospective homebuyers, sellers of homes constructed on land for which an application for a tentative subdivision map has been deemed complete on or after January 1, 2011, must disclose to the prospective homebuyer the total installed cost of the solar option, the estimated cost savings associated with the solar energy system option, information about California solar energy system incentives, and information about the Go Solar California website. Sellers of production homes affected by this law may opt for the solar offset program rather than offer solar as an option to prospective homebuyers. The solar offset program requires sellers to install a solar system elsewhere which is equivalent to the aggregate capacity of solar that would have been installed in an affected subdivision if 20 percent of the buyers had opted for the solar option (California 2006d).

### ***Assembly Bill 1109***

Assembly Bill 1109 (AB 1109), the Lighting Efficiency and Toxic Reduction Act, requires the establishment of minimum energy efficiency standards for all general purpose lights. The standards are structured to reduce average statewide electrical energy consumption by not less than 50 percent from the 2007 levels for indoor residential lighting and not less than 25 percent from the 2007 levels for indoor commercial and outdoor lighting by 2018 (California 2007b).

### ***Senate Bill 350***

Senate Bill (SB) 350. Signed October 7, 2015, is the *Clean Energy and Pollution Reduction Act of 2015*. SB 350 is the implementation of some of the goals of EO B-30-15. The objectives of SB 350 are

- (1) To increase from 33 percent to 50 percent, the procurement of our electricity from renewable sources.
- (2) To double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation (California 2015b).

### ***Title 24 Energy Efficiency Standards***

The Energy Efficiency Standards for Residential and Nonresidential Buildings (Title 24, Part 6 of the *California Code of Regulations* [CCR]) were established in 1978 in response to a

legislative mandate to reduce California's energy consumption. The CEC adopted the 2008 changes to the Building Energy Efficiency Standards in order to (1) "Provide California with an adequate, reasonably-priced, and environmentally-sound supply of energy" and (2) "Respond to Assembly Bill 32, the Global Warming Solutions Act of 2006, which mandates that California must reduce its greenhouse gas emissions to 1990 levels by 2020". The current applicable standards are the 2013 Standards, effective July 1, 2014. The 2016 Code went into effect on January 1, 2017 (CBSC 2015). The 2016 code is at least 28 percent more efficient for than the 2013 Code (CEC 2015a). The requirements of the energy efficiency standards result in the reduction of natural gas and electricity consumption. Both natural gas use and electricity generation result in GHG emissions.

### ***Title 24 Green Building Standards***

The 2013 California Green Building Standards Code (24 CCR, Part 11), also known as the CALGreen code, contains mandatory requirements and voluntary measures for new residential and nonresidential buildings (including buildings for retail, office, public schools and hospitals) throughout California (CBSC 2014). The development of the CALGreen Code is intended to (1) cause a reduction in greenhouse gas (GHG) emissions from buildings; (2) promote environmentally responsible, cost effective, healthier places to live and work; (3) reduce energy and water consumption; and (4) respond to the directives by the Governor. In short, the code is established to reduce construction waste; make buildings more efficient in the use of materials and energy; and reduce environmental impact during and after construction.

The CALGreen Code contains requirements for construction site selection, storm water control during construction, construction waste reduction, indoor water use reduction, material selection, natural resource conservation, site irrigation conservation, and more. The code provides for design options allowing the designer to determine how best to achieve compliance for a given site or building condition. The code also requires building commissioning, which is a process for the verification that all building systems, such as heating and cooling equipment and lighting systems, are functioning at their maximum efficiency.

The CALGreen Code provides standards for bicycle parking, carpool/vanpool/electric vehicle spaces, light and glare reduction, grading and paving, energy efficient appliances, renewable energy, graywater systems, water efficient plumbing fixtures, recycling and recycled materials, pollutant controls (including moisture control and indoor air quality), acoustical controls, storm water management, building design, insulation, flooring, and framing, among others.

Beyond the mandatory standards, optional Tier 1 status can be achieved by complying with voluntary measures for energy and water efficiency, material conservation, and other design features. An example of a Tier 1 requirement is 12 percent less indoor water use in nonresidential construction. Tier 2 status can be achieved by complying with additional voluntary measures; an example requirement is 20 percent less indoor water use in nonresidential construction.

---

***Executive Order S-01-07 and the Low Carbon Fuel Standard***

Executive Order S-01-07 (January 18, 2007) requires a ten percent or greater reduction (from current transportation fuels) in the average fuel carbon intensity for CARB-regulated transportation fuels in California (California 2007a). CARB identifies the Low Carbon Fuel Standard (LCFS) as a Discrete Early Action item under AB 32.

In 2009, CARB approved for adoption the LCFS regulation, which became fully effective in April 2010 and is codified in the *California Code of Regulations* (CCR, specifically Title 17, Sections 95480–95490). The LCFS will reduce greenhouse gas emissions by reducing the carbon intensity of transportation fuels used in California by at least 10 percent by 2020. Carbon intensity is a measure of the GHG emissions associated with the various production, distribution, and use steps in the "lifecycle" of a transportation fuel. Following a federal lawsuit challenging the LCFS, on September 25, 2015, CARB re-adopted the LCFS regulation (CARB 2015b).

***Assembly Bill 1493 (Mobile Source Reductions)***

Assembly Bill (AB) 1493 required CARB to adopt regulations by January 1, 2005, to reduce GHG emissions from noncommercial passenger vehicles and light-duty trucks of model year 2009 and after (California 2002a). The bill required the California Climate Action Registry (CCAR) to develop and adopt protocols for the reporting and certification of GHG emissions reductions from mobile sources for use by CARB in granting emission reduction credits. The bill authorized CARB to grant emission reduction credits for reductions of GHG emissions prior to the date of the enforcement of regulations, using model year 2000 as the baseline for reduction.

In 2004, CARB applied to the USEPA for a waiver under the Federal Clean Air Act to authorize implementation of these regulations. The waiver request was formally denied by the USEPA in December 2007. In January 2008, the State Attorney General filed a lawsuit against the USEPA challenging the denial of California's request for a waiver to regulate and limit GHG emissions from these vehicles. In January 2009, President Barack Obama issued a directive to the USEPA to reconsider California's request for a waiver, which the USEPA granted on June 30, 2009, as discussed further below (USEPA 2009b). As part of this waiver, the USEPA specified that CARB may not hold a manufacturer liable or responsible for any noncompliance caused by emission debits generated by the manufacturer for the 2009 model year. The emission standards become increasingly more stringent through the 2016 model year. Regulations to make California emissions standards for model year 2017 and beyond consistent with federal standards were adopted in 2012 and are discussed further below.

***CARB's Advanced Clean Cars Program***

In January 2012, CARB approved the Advanced Clean Cars Program, a new emissions-control program for model year 2017 through 2025. The program combines the control of smog, soot and GHGs with requirements for greater numbers of zero-emission vehicles. By 2025, when the rules will be fully implemented, the new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions. The program also

requires car manufacturers to offer for sale an increasing number of zero-emission vehicles (ZEVs) each year, including battery electric, fuel cell, and plug-in hybrid electric vehicles.

In December 2012, CARB adopted regulations allowing car manufacturers to comply with California's GHG emissions requirements for model years 2017–2025 through compliance with the EPA GHG requirements for those same model years (CARB 2012).

### **Cap and Trade**

Pursuant to AB 32, CARB was allowed, but not required, to include among mechanisms intended to reduce GHG emissions a "system of market-based declining annual aggregate emission limits". As noted above, CARB developed a Scoping Plan that directed CARB staff to develop, among other programs, a cap-and-trade mechanism that would apply a declining aggregate cap on GHG emissions and provide a flexible compliance system using tradable instruments. On October 20, 2011, CARB adopted the final cap-and-trade regulation (17 CCR Subchapter 10, Article 5). The program imposes a "cap" on the total GHG emissions from covered entities in the state, and the quantity of emissions allowed under the cap will decrease each year, ultimately reaching the goal of returning statewide GHG emissions to 1990 levels by 2020. The quantity of allowed emissions actually increased between 2014 and 2015, but that is to account for the addition of the fuel importers and distributors and additional electricity importers to the program as discussed below. The net effect is to reduce overall GHG emissions.

The cap-and-trade program started on January 1, 2012, and will proceed in "compliance phases", the first of which began on January 1, 2013. In the first phase, the program applies to electric utilities, importers of electricity, and specified industries, including refineries. Approximately 350 electric utilities and approximately 600 industrial facilities were included in the initial phase of the program. On January 1, 2015, cap-and-trade compliance obligations were phased in for suppliers of natural gas, reformulated gasoline blendstock for oxygenate blending (RBOB), distillate fuel oils, and liquefied petroleum gas that meet or exceed specified emissions thresholds. The threshold that triggers a cap-and-trade compliance obligation for a fuel supplier is 25,000 metric tons or more of CO<sub>2e</sub> annually from the GHG emissions that would result from full combustion or oxidation of quantities of fuels (including natural gas, RBOB, distillate fuel oil, liquefied petroleum gas, and blended fuels that contain these fuels) imported and/or delivered to California. Phasing in of cap-and-trade compliance obligations for transportation fuel providers further reduces GHG emissions attributable to mobile sources, beyond the GHG emissions reductions achieved by the Pavley Standard, LCFS, and Advanced Clean Cars Program discussed above. This analysis does not incorporate GHG emissions reductions based on cap-and-trade compliance obligations applicable to transportation fuel suppliers.

### **California Integrated Waste Management Act of 1989**

The California Integrated Waste Management Act of 1989 (*California Public Resources Code*, Sections 40000 et seq.) requires each jurisdiction's source reduction and recycling element to include an implementation schedule that shows (1) diversion of 25 percent of all solid waste by January 1, 1995, through source reduction, recycling, and composting activities and (2) diversion of 50 percent of all solid waste on and after January 1, 2000, through source

reduction, recycling, and composting facilities. Additionally, jurisdictions are not prohibited from implementing source reduction, recycling, and composting activities designed to exceed these requirements.

### ***Assembly Bill 341***

Assembly Bill 341 amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is a policy goal of the State that not less than 75 percent of solid waste generated be source reduced, recycled, or composted by the year 2020, and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the State's policy goal. CalRecycle conducted several stakeholder workshops and published a discussion document in May 2012 titled *California's New Goal: 75 Percent Recycling*, which identifies concepts that CalRecycle believes would assist the State in reaching the 75 percent goal by 2020 (CalRecycle 2016a).

### ***Assembly Bill 1826***

In October 2014 Governor Brown signed AB 1826 Chesbro (Chapter 727, Statutes of 2014), requiring businesses to recycle their organic waste on and after April 1, 2016, depending on the amount of waste they generate per week. This law also requires that on and after January 1, 2016, local jurisdictions across the state implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units (however, multifamily dwellings are not required to have a food waste diversion program). Organic waste (also referred to as organics) means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste. This law phases in the mandatory recycling of commercial organics over time. In particular, the minimum threshold of organic waste generation by businesses decreases over time, which means an increasingly greater proportion of the commercial sector will be required to comply (CalRecycle 2016b).

### ***California Water Code***

Sections 10910 through 10915 of the *California Water Code* require preparation of a project-specific Water Supply Assessment for developments consisting of 500 or more dwelling units. Sections 10610.4, 10617, and 10620 of the *California Water Code* require urban water suppliers to develop water management plans to actively pursue the efficient use of available supplies.

### ***State Model Water Efficient Landscape Ordinance (MWELO) and Executive Order B-29-15***

The MWELO (23 CCR Division 2, Chapter 2.7) establishes an outdoor water budget for new landscaped areas that are 500 square feet or larger, and rehabilitated landscaped areas that are 2,500 square feet or larger (DWR 2015). Executive Order (EO) B-29-15 called for revisions to the MWELO in order to increase water efficiency standards for new and rehabilitated landscapes through more efficient irrigation systems, greywater usage, on-site storm water capture, and by limiting the portion of landscapes that can be covered in turf. It also established a goal of achieving a statewide reduction in potable urban water usage of

25 percent relative to water use in 2013 (California 2015b). The California Department of Water Resources (DWR) updated the MWEL0 in December 2015 to incorporate these elements and the emergency drought regulations set forth by EO B-29-15, which establish improved efficiency standards for water appliances.

### ***Senate Bill X7-7 (Water Conservation Act of 2009)***

The Water Conservation Act of 2009 sets an overall goal of reducing per-capita urban water use by 20 percent by December 31, 2020. The State is required to make incremental progress toward this goal by reducing per-capita water use by at least 10 percent by December 31, 2015. This is an implementation measure of the Water Sector of the AB 32 Scoping Plan. Reduction in water consumption directly reduces the energy necessary and the associated emissions to convey, treat, and distribute the water; it also reduces emissions from wastewater treatment.

The DWR adopted a regulation on February 16, 2011, that sets forth criteria and methods for exclusion of industrial process water from the calculation of gross water use for purposes of urban water management planning. The regulation would apply to all urban retail water suppliers required to submit an Urban Water Management Plan, as set forth in the *California Water Code* (specifically, Division 6, Part 2.6, Sections 10617 and 10620).

### ***CARB Airborne Toxic Control Measures and Emission Standards***

CARB adopted an airborne toxic control measure to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel particulate matter (PM) and other toxic air contaminants, and promulgated emission standards for off-road diesel construction equipment such as bulldozers, loaders, backhoes, and forklifts, as well as many other self-propelled off-road diesel vehicles.

### ***Senate Bill 97 (State CEQA Guidelines)***

SB 97 required OPR to prepare amended the State CEQA Guidelines for submission to the California Natural Resources Agency (CNRA) regarding GHG analysis and feasible mitigation of the effects of GHG emissions as required by CEQA. These amendments became effective as of March 18, 2010. The adoption of SB 97 and subsequent CEQA amendments are widely recognized as confirmation that lead agencies are required to include an analysis of climate change impacts in CEQA documents.

### ***CEQA Amendments***

Pursuant to SB 97, OPR developed proposed amendments to the State CEQA Guidelines (CEQA Amendments) for the feasible mitigation of GHG emissions and their effects, which it first submitted to the Secretary of the CNRA on April 13, 2009. After a public review and comment period, on December 30, 2009, the CNRA adopted the CEQA Amendments, which became effective on March 18, 2010.

The CEQA Amendments for Greenhouse Gas Emissions state in Section 15064.4(a) that lead agencies should “make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate” GHG emissions. The CEQA Amendments note that an

agency may identify emissions by either selecting a “model or methodology” to quantify the emissions or by relying on “qualitative analysis or other performance based standards” (CNRA 2009b). Section 15064.4(b) provides that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment (CNRA 2009b):

- The extent a project may increase or reduce GHG emissions as compared to the environmental setting.
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

In addition, Section 15064.7(c) of the CEQA Amendments specifies that “[w]hen adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence” (CNRA 2009b). Similarly, the revisions to Appendix G, Environmental Checklist Form, which is often used as a basis for lead agencies’ selection of significance thresholds, does not prescribe specific thresholds. Rather, Appendix G asks whether the project would conflict with a plan, policy or regulation adopted to reduce GHG emissions or would generate GHG emissions that would significantly affect the environment, indicating that the determination of what is a significant effect on the environment should be left to the lead agency.

Accordingly, the CEQA Amendments do not prescribe specific methodologies for performing an assessment; they do not establish specific thresholds of significance; and they do not mandate specific mitigation measures. Rather, the CEQA Amendments emphasize the lead agency’s discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009b).

The CEQA Amendments indicate that lead agencies should consider all feasible means, supported by substantial evidence and subject to monitoring and reporting, of mitigating the significant effects of GHG emissions. As pertinent to the Project, these potential mitigation measures, set forth in Section 15126.4(c), may include (1) measures in an existing plan or mitigation program for the reduction of GHG emissions that are required as part of the lead agency’s decision; (2) reductions in GHG emissions resulting from a project through implementation of project design features; (3) off-site measures, including offsets, to mitigate a project’s emissions; and (4) carbon sequestration measures (CNRA 2009b).

Among other things, the CNRA noted in its Public Notice for these changes that impacts of GHG emissions should focus on the cumulative impact on climate change. The Public Notice states (CNRA 2009c):

While the Proposed Amendments do not foreclose the possibility that a single project may result in greenhouse gas emissions with a direct impact on the environment, the evidence before [CNRA] indicates that in most cases, the impact will be cumulative. Therefore, the Proposed Amendments emphasize that the analysis of greenhouse gas emissions should center on whether a project's incremental contribution of greenhouse gas emissions is cumulatively considerable.

Thus the CEQA Amendments continue to make clear that the significance of greenhouse gas emissions is most appropriately considered on a cumulative level.

## **Other Potentially Applicable State Regulations or Policies**

### ***Executive Order S-13-08***

On November 14, 2008, Governor Schwarzenegger issued Executive Order S-13-08 instructing California agencies to assess and prepare for the impacts of rising sea level associated with climate change (California 2008c).

The resulting 2009 California Climate Adaptation Strategy (CAS) report was developed by the CNRA in coordination with the Climate Action Team (CAT). The report presents the best available science relevant to climate impacts in California and proposes a set of recommendations for California decision-makers to assess vulnerability and promote resiliency in order to reduce California's vulnerability to climate change. Guidance regarding adaptation strategies is general in nature and emphasizes incorporation of strategies into existing planning policies and processes.

In addition to requiring the CAT to create a Climate Adaptation Strategy, Executive Order S-13-08 ordered the creation of a comprehensive Sea Level Rise Assessment Report. The report, published in June 2012, indicates that the sea level along most of California's coast is expected to rise about one meter over the next century and is likely to increase the risk of damage in the form of flooding, coastal erosion, and wetland loss due to storm surges and high waves. The sea level increase is slightly higher than projected for global sea levels (National Research Council 2012).

Executive Order S-13-08 also called for the California Ocean Protection Council (OPC) to work with the other CAT State agencies to develop interim guidance for assessing the potential impacts of sea level rise due to climate change in California. In coordination with National Academy of Sciences (NAS) efforts, the OPC drafted interim guidance recommending that State agencies consider a range of sea level rise scenarios for the years 2050 and 2100 in order to assess project vulnerability, reduce expected risks, and increase resiliency to sea level rise. The draft resolution and interim guidance document is consistent with the Ocean Protection Act (*California Public Resource Code*, Division 26.5, Section 35615[a][1]), which specifically directs the OPC to coordinate activities of State agencies to improve the effectiveness of State efforts to protect ocean resources (CNRA 2014; Sea Level Rise Task Force 2010). An update to the 2009 CAS report, the final "Safeguarding California Plan", was published in July 2014.

***Assembly Bill 1613 (Waste Heat and Carbon Emissions Reduction Act)***

AB 1613 directed the CEC, the California Public Utilities Commission (CPUC), and CARB to implement the Waste Heat and Carbon Emissions Reduction Act, which is designed to encourage development of new combined heat and power (CHP) systems in California with a generating capacity of not more than 20 megawatts. In June 2010 and updated in 2015, the CEC published modified final guidelines establishing technical criteria for eligibility of CHP systems for programs to be developed by the CPUC and publicly owned utilities (CEC 2015b). Section 2840 of the Act provides that the CEC's guidelines require that CHP systems:

- Be designed to reduce waste energy;
- Have a minimum efficiency of 60 percent;
- Have nitrogen oxides (NO<sub>x</sub>) emissions of no more than 0.07 pound per megawatt-hour;
- Be sized to meet the eligible customer generation thermal load;
- Operate continuously in a manner that meets the expected thermal load and optimizes the efficient use of waste heat; and
- Be cost-effective, technologically feasible, and environmentally beneficial.

As directed by AB 1613, the CPUC also established (1) a standard tariff for the sale of electricity to electricity corporations for delivery to the electrical grid and (2) a "pay as you save" pilot program requiring electricity corporations to finance the installation of qualifying CHP systems by non-profit and government entities. A January 2011 decision by an administrative law judge determined that the pilot program will not be established due to lack of customer interest and difficulties in instituting a program that meets California Department of Corporations requirements (Decision 11-01-010 Before the Public Utilities Commission of the State of California 2011).

***Executive Order B-16-12***

On March 23, 2012, Governor Brown issued EO-B-16-12, which orders CARB, the CEC, the CPUC, and other relevant agencies to facilitate the rapid commercialization of zero-emission vehicles (ZEVs), and sets a target for the number of ZEVs in California at 1.5 million by 2025. The Executive Order also directs that the California's state vehicle fleet increase the number of its ZEVs through the normal course of fleet replacement so that at least 10 percent of fleet purchases of light-duty vehicles be zero-emission by 2015 and at least 25 percent by 2020. Further, the Executive Order also sets a target for a reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels by 2050.

***Senate Bill 391 and California Transportation Plan 2040***

On October 11, 2009, Governor Brown signed into law SB 391, which directs the California Department of Transportation (Caltrans) to update the California Transportation Plan to address how the state will achieve maximum feasible emissions reductions in order to attain

a statewide reduction of GHG emissions to 1990 levels by 2020 and 80 percent below 1990 levels by 2050. Per SB 391, the California Transportation Plan update must be adopted by December 31, 2015 and updated every five years thereafter. Pursuant to SB 391, in June 2016, Caltrans adopted California Transportation Plan 2040 (CTP 2040), which provides a long-range policy framework to meet future statewide mobility needs and reduce greenhouse gas emissions for the transportation sector. (Caltrans 2016a) The CTP 2040 outlines goals and recommendations to achieve a safe, sustainable, accessible, and competitive transportation system that provides reliable mobility while meeting the state's GHG reduction goals over a 20 year planning horizon. Per SB 391, the CTP 2040 is scheduled to be updated every five years, starting in 2021.

### ***Executive Order B-32-15 and the California Sustainable Freight Action Plan***

Executive Order B-32-15 (July 17, 2015) requires the California State Transportation Agency, the California Environmental Protection Agency, the California Natural Resources Agency, CARB, Caltrans, the California Energy Commission, and the Governor's Office of Business and Economic Development to develop an integrated action plan by July 2016 to establish clear targets to improve freight efficiency and transition to zero-emission technologies, and to identify state policies, programs, and investments to meet these targets. Pursuant to Executive Order B-32-15, in July 2016, the participating agencies published the California Sustainable Freight Action Plan (Freight Action Plan) (CARB 2016b). The Freight Action Plan recommends a high-level vision for a sustainable freight transportation system and 11 guiding principles for state agencies to utilize when developing specific policies, investments, and programs related to the California freight transportation system. The Freight Action Plan also establishes targets to (i) improve freight system efficiency 25 percent by increasing the value of goods and services produced from the freight sector relative to amount of carbon that it produces by 2030, and (ii) deploy over 100,000 freight vehicles and equipment capable of zero emission operation and to maximize near-zero emission freight vehicles and equipment powered by renewable energy by 2030. Per the Freight Action Plan, its targets are not mandates, but rather aspirational measures of progress toward sustainability for the State to meet and try to exceed; under the plan, state agencies will measure and report progress on the statewide Freight Action Plan targets, and evaluate the targets to determine necessary adjustments.

### ***California 2016 Mobile Source Strategy***

On May 16, 2016, CARB published the updated Mobile Source Strategy 2016, which establishes a comprehensive statewide strategy to reduce emissions from mobile sources to meet climate change and air quality goals over a fifteen year planning horizon. (CARB 2016c) The Mobile Source Strategy sets forth several measures CARB is proposing to achieve its mobile source emission reduction goals, including a heavy-duty low NOx engine standards and a "last-mile" delivery regulation that would require the use of low-NOx engines as a stepping stone to zero-emission trucks. The Mobile Source Strategy also provides a framework to inform updates to the State Implementation Plan strategy, the California Sustainable Freight Action Plan, and the Short-Lived Climate Pollution Reduction Strategy, and revises the Advance Clean Transit strategy to include low-NOx engines to transit busses. Additional mobile source emission reduction measures described in the Mobile Source

Strategy include: expanding the requirements for cleaner low carbon fuels; incentives for the turnover of equipment and fleets to the cleanest technologies; pilot studies to demonstrate new clean technologies; programs to ensure that emission control systems remain durable over vehicle lifetimes.

### ***California New Residential Zero Net Energy Action Plan***

In June 2015, the California Energy Commission and the California Public Utilities Commission jointly published the *California New Residential Zero Net Energy Action Plan 2015-2020* (ZNE Plan) (CEC 2015c). The ZNE Plan is designed to operationalize the State's goal to have 100% of new homes achieve zero net energy (ZNE) by establishing guiding principles for establishing a regulatory framework achieving that goal by 2020 (CEC 2015c). Starting in 2008, the Title 24 energy efficiency requirements for residential homes have been periodically ratcheted up with the objective of eventually achieving the ZNE goal, with updates adopted in 2013 (effective 2014) and 2016 (effective 2017). With each update, the Title 24 standards efficiency requirements have increased at a rate of 12-15% in each cycle. The 2016 standards that went into effect on January 1, 2017 get still closer to ZNE by requiring, for example, high efficiency lighting, high efficiency walls and attics with increased continuous insulation, and high efficiency water heating systems. According to the ZNE Plan, the 2019 update to Title 24 (effective 2020) will require full ZNE for all new residential construction.

## **Regional**

### ***Antelope Valley Air Quality Management District***

The AVAQMD has adopted GHG emissions requirements into the appropriate Rules and Regulations. The AVAQMD's *CEQA and Federal Conformity Guidelines* (2011) establishes a CEQA significance threshold of 100,000 tons (90,718 metric tons) of CO<sub>2e</sub> per year for GHG emissions, as discussed in Section 5.21.6, Environmental Impacts.

### ***South Coast Air Quality Management District***

On December 5, 2008, the SCAQMD Governing Board adopted its staff proposal for an interim CEQA GHG significance threshold for projects where the SCAQMD is the lead agency (SCAQMD 2008). Currently, the SCAQMD Governing Board has only adopted thresholds relevant to industrial (stationary source) projects. To achieve a policy objective of capturing 90 percent of GHG emissions from new residential/commercial development projects and implement a "fair share" approach to reducing emission increases from each sector, SCAQMD staff have proposed as a draft approach combining performance standards and screening thresholds. At this time, the SCAQMD has not adopted any significance thresholds for new residential, commercial, or mixed use development projects, but has proposed several draft thresholds over the last few years. The SCAQMD's latest iteration of proposed thresholds, as introduced in September 2010 (SCAQMD 2010), are discussed in Section 5.21.6, Environmental Impacts.

Since sharing the proposed approach to CEQA significance at its GHG CEQA Significance Threshold Stakeholder Working Group meeting in September 2010, the SCAQMD has

cancelled all subsequent meetings and no schedule has been issued for how or when thresholds will be established. The Working Group has not convened since the fall of 2010. As of the preparation of this Draft EIR, the proposal has not been considered or approved for use by the SCAQMD Board.

### ***Southern California Association of Governments***

As described above, SB 375 requires the MPOs to prepare a Sustainable Communities Strategy (SCS) in their regional transportation plan. SCAG's SCS is included in the SCAG 2012–2035 Regional Transportation Plan Sustainable Communities Strategy (RTP/SCS) (SCAG 2012a). The document was adopted by SCAG in April 2012. The goals and policies of the RTP/SCS that reduce vehicle miles traveled (VMT) focus on transportation and land use planning that include building infill projects, locating residents closer to where they work and play and designing communities so there is access to high quality transit service. The 2012–2035 RTP/SCS is expected to reduce per capita transportation emissions of 9 percent by 2020 and 16 percent by 2035. In June of 2012, CARB accepted SCAG's determination that the Final RTP/SCS would meet the region's GHG reduction target.

SCAG's SCS is now included in its 2016–2040 RTP/SCS. The document was adopted by SCAG on April 7, 2016. The 2016–2040 RTP/SCS is expected to reduce per capita transportation emissions by 8 percent by 2020 and by 18 percent by 2035 (SCAG 2016a).

### ***Metro Countywide Sustainability Planning Policy and Implementation Plan***

The *Metro Countywide Sustainability Planning Policy and Implementation Plan*, approved in December 2012, builds upon existing federal, State, regional, and local sustainability policies and plans. This policy serves as a guidance and implementation tool to increase coordination and collaboration across transportation modes, planning disciplines, and government agencies. The main goals of this policy are to improve air quality and increase transportation choices in Los Angeles County (Metro 2012).

### ***Metro Complete Streets Policy***

The *Metro Complete Streets Policy* was developed by the Los Angeles County Metropolitan Transportation Authority (Metro) in October 2014, and serves as a standard for comprehensive, multimodal transportation system design in Los Angeles County. This policy uses the existing policies established by the *Metro Countywide Sustainability Planning Policy and Implementation Plan* and builds upon them by clarifying and adding goals. These goals further encourage a multimodal transportation system by promoting active transportation, and add goals similar to those of the CTP 2040 by encouraging safety and healthy, equitable communities (Metro 2014).

## **Local – Los Angeles County**

### ***Countywide Energy and Environmental Policy***

The Countywide Energy and Environmental Policy (Policy) was adopted by the Los Angeles County Board of Supervisors on January 16, 2007, to provide guidelines for the development and enhancement of energy conservation and environmental programs within County

departments. The Policy was also the County's response for the need for energy conservation and reduction in GHG emissions. It directs the County to track its GHG emissions with the California Climate Action Registry, and to reduce its facilities' energy consumption by 20 percent by the year 2015. Under this policy, the Los Angeles County Energy Program (LACEP) provides financing for energy efficiency or solar improvements, and the County's Capital Project Program requires all new County buildings (i.e., greater than 10,000 square feet) to be Leadership in Energy and Environmental Design (LEED™) Certified at the Silver Level (CCAR 2009a).

Revisions to the Policy, adopted on June 30, 2015, enhance the County's existing and future policies programs, and reporting with regard to environmental sustainability. Further, the 2015 revisions established a County Sustainability Council with responsibilities that include, but are not limited to, developing consistent approaches and metrics to provide County services in an environmentally sustainable manner and leading efforts to acquire funding for countywide or regional sustainability programs (LACISD 2015).

Additionally, the County has pledged to be a "Cool County" by establishing a GHG emissions footprint; developing a GHG mitigation plan; working with local entities to reduce regional GHGs by 80 percent by 2050; and supporting federal legislation to raise CAFE standards. In addition, the County has implemented various internal programs on energy conservation; water conservation; waste reduction and recycling; green purchasing and contracting; and alternative fuel vehicle purchasing. On January 13, 2009, the County created an action plan for developing a Comprehensive Renewable Energy Program to develop renewable energy projects on existing County facilities and properties.

In 2009, the Los Angeles County Board of Supervisors directed the Chief Executive Officer (CEO) to take actions toward the use of renewable energy. The actions focused upon cost-benefit analyses. The CEO was directed to examine the practicality of Los Angeles County offsetting between 10 percent and 100 percent of current electrical needs through the use of renewable energy, including the purchase of renewable energy credits. The CEO was also instructed to compare costs and benefits of purchasing electricity from renewable energy sources to the costs and benefits of investing money in improving the energy efficiency of the County's operations.

The CEO provided a report to the County with a proposal to include (1) a cost analysis feasibility assessment; (2) recommendations regarding constituent-focused initiatives to be included in the Program; (3) an analysis of community choice aggregation, home energy audits, financing of residential renewable energy products, and other initiatives as deemed appropriate. The May 5, 2014 Energy & Environmental Policy Report #9 updated the accomplishments and activities of the County Office of Sustainability. The Report identified the creation of the Los Angeles County Energy Program, which is a comprehensive home energy retrofit program, and staff training sessions to promote sustainable construction and building operations (LACISD 2014).

### ***Los Angeles County General Plan***

The Los Angeles County 2035 General Plan and Programmatic EIR were adopted by the Los Angeles County Board of Supervisors on October 6, 2015. There are five Guiding Principles

that serve as the foundation of the General Plan and all future growth within the County. The Guiding Principles are to (1) employ smart growth; (2) ensure community services and infrastructure are sufficient to accommodate growth; (3) provide the foundation for a strong and diverse economy; (4) promote excellence in environmental resource management; and (5) provide healthy, livable, and equitable communities (DRP 2015b). In addition to the Guiding Principles, the General Plan provides the policy framework for how and where the unincorporated County will grow through the year 2035, while recognizing and celebrating the County's wide diversity of cultures, abundant natural resources, and status as an international economic center. The Los Angeles County 2035 General Plan accommodates new housing and jobs within the unincorporated areas in anticipation of population growth in the County and the region (DRP 2014). The Final EIR addresses the environmental effects associated with the implementation on the Los Angeles County 2035 General Plan. The FEIR finds that Greenhouse Gas Emissions Impacts would be significant and unavoidable without the implementation of Community Climate Action Plan (DRP 2014).

### ***Los Angeles County Community Climate Action Plan***

The *Final Unincorporated Los Angeles County Community Climate Action Plan 2020* (CCAP) is part of the County General Plan under the Air Quality Element and was adopted along with the General Plan on October 6, 2015. The County acknowledges the consensus among leading scientists that without action to reduce GHG emissions, climate change due to global warming will pose a considerable threat to the environment and to human health and society (DRP 2015a).

The CCAP is being implemented by the County to mitigate and avoid GHG emissions associated with community activities in unincorporated Los Angeles County. The CCAP addresses emissions from building energy, land use and transportation, water consumption, and waste generation. The measures and actions outlined in the CCAP tie together with the County's climate change initiatives and provides a blueprint for a more sustainable future. To reduce the impacts of climate change, the County has set a target to reduce GHG emissions from community activities in the unincorporated areas of Los Angeles County by at least 11 percent below 2010 levels by 2020, which is consistent with AB 32 targets. The CCAP describes the County's plan for achieving this goal, including specific strategy areas for each of the major emissions sectors, and provides details on the 2010 and projected 2020 emissions in the unincorporated areas.

The actions in the CCAP are priority actions and intended for near-term implementation such that the County can achieve its GHG reduction goal for 2020 for the unincorporated areas of Los Angeles County. The County has designated a CCAP Implementation Team (CIT) to lead and coordinate the County's efforts on CCAP implementation, monitoring, and plan updates. The following is a list of general implementation steps that the County will undertake to implement each CCAP local action.

- Develop implementation plans for each CCAP action
- Estimate project-specific costs
- Adopt or update ordinances and/or codes

- Establish partnerships
- Pursue funding sources
- Create monitoring/tracking processes and indicators
- Engage the community and stakeholders in CCAP action implementation

The environmental impacts associated with implementation of the CCAP were analyzed in the *Los Angeles County General Plan Update Environmental Impact Report* (SCH# 2011081042) certified by the County on October 6, 2015.

### ***Los Angeles County General Plan and Antelope Valley Area Plan***

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan* (AVAP) include goals and policies that address greenhouse gases in the unincorporated County. The AVAP goals and policies applicable to the analysis of greenhouse gas emissions with Project implementation are listed below.

**Goal LU 5:** A land use pattern that decreases greenhouse gas emissions.

**Policy LU 5.1:** Ensure that development is consistent with the Sustainable Communities Strategy adopted in 2012, an element of the Regional Transportation Plan developed by the Southern California Association of Governments.

**Policy LU 5.2:** Encourage the continued development of rural town centers that provide for the daily needs of surrounding residents, reducing the number of vehicle trips and providing local employment opportunities.

**Policy LU 5.3:** Preserve open space areas to provide large contiguous carbon sequestering basins.

**Policy LU 5.4:** Ensure that there is an appropriate balance of residential uses and employment opportunities within close proximity of each other.

**Goal COS 17:** Buildings are sustainable, conserving energy, water, and other resources, and limiting greenhouse gas emissions.

**Policy COS 17.1:** Promote green building techniques for the construction and operation of public and private buildings in the unincorporated Antelope Valley.

**Policy COS 17.2:** Require that new buildings be sited and designed in a manner that maximizes efficient use of natural resources, such as air and light, to reduce energy consumption, heat profiles, and greenhouse gas emissions.

**Policy COS 17.4:** Promote the use of individual renewable energy systems and require appropriate development standards for such systems to minimize potential impacts to surrounding properties. Simplify the permitting process for individual renewable energy systems that meet these development standards.

**Policy COS 17.5:** Protect active and passive solar design elements and systems from shading by neighboring structures and trees through appropriate development standards.

**Policy COS 17.6:** Require new landscaping to comply with applicable water efficiency requirements in the County Code.

**Policy COS 17.7:** Require low-flow plumbing fixtures in all new developments.

**Policy COS 17.9:** Require reduction, reuse, and recycling of construction and demolition debris.

### ***Los Angeles County Green Building Standards Code (Title 31)***

In November 2013, the Board of Supervisors adopted the Los Angeles County Green Building Standards Code (Title 31) in response to the mandates set forth in the CALGreen Code (2010 Green Building Standards Code) (CBSC 2014). Title 31 became effective on January 1, 2014. Title 22 (Planning and Zoning Code) Green Building and Drought Tolerant Landscaping requirements are now found in Title 31. The purpose of Title 31 is to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts that have a reduced negative impact or positive environmental impact and that encourage sustainable construction practices in planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental air quality (Title 31 of the Los Angeles County Code). Notably, Title 31 requires nonresidential buildings that are equal to or greater than 25,000 square feet (sf) to comply with the CALGreen Code (specifically, Section A5.601.2.4, Voluntary measures for CALGreen Tier 1). These measures include, but are not limited to, requirements for energy efficiency, parking for fuel-efficient vehicles, cool roofs, reduction of indoor potable water use, recycled content of construction materials, reduction in construction and demolition waste, and thermal insulation (Los Angeles County 2016).

The County's drought-tolerant landscaping requirements establish minimum standards for the design and installation of landscaping using drought-tolerant plants and native plants that require minimal use of water. These requirements include the following: (1) a minimum of 75 percent of total landscaped area must utilize non-invasive drought-tolerant plant and tree species appropriate for the climate zone region; (2) a maximum of 25 percent of landscaped areas may be turf grass; and (3) hydrozoning irrigation techniques shall be incorporated into the landscape design. Title 31 also establishes low-impact development (LID) standards for new construction that would conserve water, energy, and natural resources; divert waste from landfills; minimize impacts to existing infrastructure; and promote a healthier environment (County of Los Angeles 2016a).

### ***Los Angeles County Tree Planting Ordinance (Title 22)***

On March 29, 2016, the Board of Supervisors adopted the Tree Planting Ordinance that does the following (DRP 2016b):

- Amended Title 22 (Planning and Zoning) of the Los Angeles County Code ("County Code") to establish tree planting requirements for new projects and

- Amended Title 21 (Subdivisions) and Title 22 (Planning and Zoning) of the County Code to repeal drought tolerant landscaping and green building requirements that are now found in Title 31.

The Tree Planting Ordinance, effective April 28, 2016, includes the following requirements:

- a. For projects that are primarily residential with 3 or fewer units per lot, a minimum of 2 trees shall be planted on each lot.
- b. For projects that are primarily residential with 4 or more units per lot, a minimum of 1 tree shall be planted for every 5,000 square feet of building footprint per lot.
- c. For projects that are nonresidential or mixed-use, a minimum of 3 trees shall be planted for every 10,000 square feet of developed lot area.

Trees planted must (1) provide adequate shade; (2) be resistant to local pests and diseases; (3) be non-invasive species; and (4) be appropriate for the planting location (DRP 2016b) pursuant to Section 22.56.2100.

### ***Los Angeles County Roadmap for a Sustainable Waste Management Future.***

On April 22, 2014, the Board of Supervisors adopted a motion directing the development of a Roadmap to achieve a Sustainable Waste Management Future for the County unincorporated communities. Accordingly, the Sustainable Waste Management Future Working Group was formed to collectively develop the Roadmap. The intent of the Roadmap is to guide the County in implementing the four strategies identified by the Working Group, which are as follows: (1) Programs and Services, (2) Measuring Results, (3) Facilities and Infrastructure, and (4) Outreach and Education. By implementing these strategies the Roadmap sets to achieve 80 percent diversion from landfills by 2025; 90 percent diversion from landfills by 2035; and 95 percent (or higher) diversion from landfills by 2045. To accomplish these goals, the Working Group identified specific recommended initiatives, which will be expanded in detailed implementation plans. Although the Roadmap does not contain currently enforceable regulations, development under the *Centennial Specific Plan* will comply with any implementation plans once adopted.

### **5.21.3 ENVIRONMENTAL SETTING**

#### ***Global, National, State, and Regional Contributions to GHG Emissions***

Table 5.21-2 compares the magnitude of GHG emissions on the global, national, State, and regional (i.e., Los Angeles County) scales.

**TABLE 5.21-2  
COMPARISON OF WORLDWIDE GHG EMISSIONS**

Area and Data Year	Annual GHG Emissions (MMTCO <sub>2e</sub> )
World (2012)	46,049
United States (2014)	6,870
California (2013)	459
Los Angeles County, Unincorporated (2010)	8.0
MMTCO <sub>2e</sub> : million metric tons of carbon dioxide equivalent Source: WRI 2016; USEPA 2016; CARB 2015c; DRP 2015a.	

The U.S. contributes approximately 14.7 percent of worldwide GHG emissions per year; California contributes approximately 1.0 percent; and the unincorporated portion of the County contributes approximately 0.02 percent. CO<sub>2</sub> constitutes approximately 84 to 85 percent of all GHG emissions in the U.S. and California. The primary contributors to California GHG emissions are (1) transportation; (2) electric power production from both in-state and out-of-state sources; and (3) industrial uses. The primary contributors to unincorporated County GHG emissions are (1) building energy (49 percent) and (2) transportation (42 percent). The CCAP forecasts that unincorporated County GHG emissions will increase from 7.98 MMTCO<sub>2e</sub> per year in 2010 to 9.06 MMTCO<sub>2e</sub> per year in 2020 (DRP 2015a).

California GHG emissions have fallen from about 1.36% of the global total in 1990 to about 0.98% in 2011 (WRI 2016). The annual amount of global CO<sub>2e</sub> emissions increased by 12,936 MtCO<sub>2e</sub> from 1990 to 2011, or by more than 40% since 1990. For the same period, California's CO<sub>2e</sub> emissions increased by only 8.3 MTCO<sub>2e</sub> (2%), and declined by approximately 10.7% from 2007 to 2011. Overall, California accounted for only 0.065% of the net global CO<sub>2e</sub> emissions increase between 1990 and 2011. Moreover, California emits approximately 50% less CO<sub>2e</sub> per capita than the rest of the United States, and far less than locations such as Texas or Canada. In 2011, California emitted 11.4 metric tons CO<sub>2e</sub> per capita, whereas the US, Texas, and Canada emitted 22.3, 30.9, and 20.9 metric tons CO<sub>2e</sub> per capita, respectively. Indeed, California's 2011 per capita GHG emission rate was on par with Germany (10.8 MTCO<sub>2e</sub> per capita), a country widely regarded as a world leader in the development of zero-emission energy sources (WRI 2016).

### ***Project Site GHG Emissions***

The Project site is currently undeveloped and used primarily for livestock grazing. Of the 12,323 acres of land comprising the Project site, approximately 10,950 acres (89 percent) are currently used for cattle grazing. Existing GHG emissions from the Project site occur from enteric fermentation (cattle digestive processes), which primarily produces CH<sub>4</sub>, and from vehicles used on the property for grazing management. The extensive vegetation on the Project site sequesters CO<sub>2</sub>, thereby reducing GHG emissions attributed to the existing condition. A portion of State Route (SR) 138 extends through the Project site, and vehicles traveling that roadway do emit GHGs. However, for the purposes of this analysis, it is

assumed that the existing emissions are not quantified, as they are not associated with activities at the site.

### **Local Climate Change Effects**

The following descriptions of potential adverse effects are taken from the CCAP.

Large increases in global GHG concentrations could have substantial adverse effects on natural and human environments in the unincorporated areas. Current research efforts coordinated through the CARB and other State agencies examine the specific changes to California's climate that will occur as Earth's surface warms. California's *2012 Vulnerability and Adaptation Study*, the State's third major assessment on climate change, examines local and statewide vulnerabilities to climate change and includes new data and projections on climate changes in California. Dr. Alex Hall, from the University of California, Los Angeles (UCLA), in partnership with the Los Angeles Regional Collaborative for Climate Action and Sustainability (LARC), recently published several studies that develop climate change predictions that are specific to the greater Los Angeles area. These studies indicate that if GHG emissions continue to increase globally based on current trends, climate change could impact the natural environment in the following ways:

**Increases in Ambient Temperatures:** On average, the Los Angeles region is expected to warm 4 to 5°F over land by mid-century. The coasts and oceans will likely warm the slowest, whereas the mountains and deserts will experience more rapid warming. Warming across the region will be greatest in the summer and fall. For the unincorporated areas in particular, UCLA's high emissions modeling scenario predicts that mountain and inland areas may warm up to or greater than 4.5°F, and coastal and valley/urban areas warming up to 3.7 to 3.9°F.

**Increases in Extreme Heat Conditions:** Heat waves and very high temperatures could last longer and become more frequent. The number of extreme heat days is expected to triple in the coastal and central areas; the San Fernando Valley and San Gabriel Valley will witness almost a quadrupling of heat days. The number of extreme heat days in the desert and mountain areas will increase five to six times relative to the current amounts. For the unincorporated areas in particular, UCLA's high emissions modeling scenario predicts a nearly 12-fold increase in the number of heat days.

**Decreased Snowfall and Winter Snowpack:** The region's mountains could see a 42 percent reduction in annual snowfall by mid-century. The winter snowpack is also expected to melt 16 days earlier as a result of rising temperatures. As of March 2014, California is facing a severe drought and the snowpack in the Sierra Nevada is 12 percent of the annual average (DWR 2014). Changes in snowfall could exacerbate drought-like conditions, reducing water supplies and water security for all end users throughout the County.

**Increased Frequency, Intensity, and Duration of Extreme Storms:** Changes in storm events could create conditions that are conducive to air pollution formation, which further exacerbates air quality issues. Increased winter storm events could also affect peak stream flows and flooding as well as landslides.

**Changes in Growing Season and Species Distribution:** Changes in growing season conditions could cause variations in crop quality and yield. Plant and wildlife distributions may also be affected by changes in temperature, competition from colonizing species, regional hydrology, sea level, and other climate-related effects.

**Rising Sea Levels:** Sea levels are expected to steadily rise by mid-century, which could inundate portions of the coastline.

#### 5.21.4 PROJECT DESIGN FEATURES

##### Green Development Program

The Project would implement a Green Development Program, included as Appendix 1-B to the *Centennial Specific Plan*. The Green Development Program includes but is not limited to:

- Project features that comply with and implement the CCAP and
- Additional Project features that comply with and implement State and federal GHG reduction mandates and goals.

The Project first applies land use planning principles to create a balanced master-planned community that includes mixed-use neighborhoods where residential, commercial, and other employment-generating uses and institutional/public uses are proximate to each other and connected by a network of pathways to reduce reliance on automobile use and off-site commuting. The bicycle and pedestrian trail system connects community uses such as neighborhood parks, elementary schools, and neighborhood-scale retail to reduce single-occupancy automobile travel for these neighborhood-scale destinations.

The Project then applies infrastructure and building design standards to reduce GHG emissions through energy and water conservation measures. The Project's integrated water resources management approach would (1) minimize water use and maximize water reuse through development of two wastewater reclamation facilities (WRF) that will produce recycled water for landscape irrigation use throughout the Project site and (2) incorporate a variety of water supply sources including State Water Project (SWP) water, banked water, groundwater, and other non-SWP supplies to reduce the GHG emissions associated with water supply delivery.

The Project includes components (e.g., the Mobility Plan, Green Development Program) to conserve and enhance open space, promote transit, and reduce waste. Development within established Significant Ecological Areas would be entirely avoided, thereby minimizing disturbance of high-value biological resources and preserving open space areas that sequester CO<sub>2</sub>. As part of the Green Program the Project incorporates a comprehensive waste diversion and recycling program. In order to promote the use of alternative forms of transportation, the Project includes a Transportation Management Association (TMA) that develops strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or similar organizations in order to maximize transit efficiencies and services. The TMA's purpose is to coordinate and facilitate transit and rideshare usage to serve as many riders as possible thereby reducing GHG emissions from mobile sources.

Elements of the Green Development Program that would reduce GHG are stated in the project design features (PDF) listed below. The emissions reductions for some PDFs are quantifiable; others are not, but would reduce GHG emissions from the quantified levels and reduce associated GHG emissions impacts. PDFs that demonstrate quantifiable GHG emissions reductions are also stated as Mitigation Measures.

### ***Operational – Energy Efficiency***

- PDF 21-1** The Green Development Program requires compliance with CALGreen voluntary measure A4.203.1.2.1 for low-rise residential buildings. Therefore, the energy efficiency of these buildings would exceed 2016 Title 24 requirements by 15 percent. Low-rise residential buildings are three stories or less.
- PDF 21-2** The Green Development Program requires compliance with CALGreen voluntary measure A5.203.1.2.1 for nonresidential buildings. Therefore, the energy efficiency of nonresidential, hotel, and high-rise residential buildings would exceed 2016 Title 24 requirements by 10 percent. High-rise residential buildings are four stories or more.
- PDF 21-3** The Green Development Program requires a minimum of 50 percent of the Project's anticipated electrical energy demand at buildout (i.e. household, business, civic/institutional, recreational, and public facilities) shall be satisfied from on-site renewable energy generation. "Anticipated electrical energy demand" shall be determined on the basis of the anticipated loads for each building as shown in the reports submitted at the time of building permit application pursuant to the Building Energy Efficiency Standards of Title 24 or equivalent. "On-site renewable energy generation" includes, but is not limited to, solar, wind, geothermal, biofuel and hydroelectric systems. These systems shall be installed in connection with the development of one or more of the following: residential units, nonresidential buildings, public buildings, or Specific Plan utility facilities located either within the Specific Plan area or within its immediate vicinity.
- PDF 21-4** The Green Development Program requires that a minimum of 70 percent of public and community pools and spas would be equipped with active solar heating systems where heating is necessary or desired. The applicant for a pool permit shall provide the proposed plan for compliance with this provision prior to obtaining a permit for the pool.
- PDF 21-5** The Green Development Program requires that deeds, CC&Rs (Covenants, Conditions and Restrictions), or similar legal documents contain the following requirement: The owners of all single-family and multi-family residential units shall be required, upon resale, to present to the buyer a written energy audit checklist prepared by a qualified third party at the time the seller provides the buyer with the Real Estate Transfer Disclosure Statement required by Section 1102 et seq. of the *California Civil Code*. The energy audit checklist shall certify that all heating, ventilation, and air conditioning (HVAC) systems,

thermostats, appliances, windows and swimming pools (if applicable) are the same as those originally installed or, if changed, otherwise comply with Centennial's Green Development Program. The CC&Rs of the master homeowners association or other applicable association shall require compliance with the provisions of this measure and shall provide notice to individual owners of the resale energy audit checklist requirement. The master homeowners association or other applicable association shall monitor compliance and provide the County with an annual report of compliance with this measure.

- PDF 21-6** The Green Development Program requires that deeds, CC&Rs, or similar legal documents contain the following requirement: For nonresidential buildings, within 90 days after the end of the first full calendar year following the issuance of the certificate of occupancy and within 90 days after each 5-year period thereafter, the owner or tenant in possession thereof shall submit to the master commercial owners association or other applicable association a report prepared by the owner or a qualified, independent third party that evaluates whether all major building systems such as heat furnace, air conditioner, and other mechanical fixtures are working within the design standards established for each system. The master commercial owners association or other applicable association shall monitor compliance and provide the County with an annual report of compliance with this measure.
- PDF 21-7** The Green Development Program requires builders to install energy efficient major appliances and HVAC systems which meet the more stringent of applicable California Energy Commission (CEC) requirements or ENERGY STAR requirements. Major appliances subject to this requirement include dishwashers, clothes washers, refrigerators, and room air conditioners.
- PDF 21-8** The Green Development Program requires that the Project's wastewater reclamation facilities (WRF) will include equipment to capture and reuse biogas for energy production.

***Operational – Vehicle Trip and Vehicle Miles Traveled Reductions***

- PDF 21-9** The Green Development Program requires that the Project establish a Transportation Management Association (TMA) that develops strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize transit efficiencies and services. The TMA's purposes are to coordinate and facilitate transit and rideshare usage to serve as many riders as possible; to promote multi-modal transportation services and options; and to reduce resident and employee use of single-occupancy automobiles for off-site commuting, and for internal travel within the Specific Plan. PDF 21-9 is required for implementation through MM 10-1, detailed in Section 5.10, Traffic, Access, and Circulation.
- PDF 21-10** The Centennial Affordable Housing Implementation Plan (see Appendix 3-H of the Centennial Specific Plan, which is in Appendix 4.0-A of the EIR) will be

adopted in conjunction with the Specific Plan, which includes dedication of a minimum of ten percent of all homes in Centennial communities that permit housing, with the exception of the lowest density area (Community 8-2) will be affordable. The California Air Pollution Control Officers Association's (CAPCOA's) 2010 document entitled *Quantifying Greenhouse Gas Mitigation Measures* identifies affordable housing as a quantifiable measure for reducing GHG emissions as it allows lower income families to live closer to jobs centers.

**PDF 21-11** The Centennial Specific Plan's Green Development Program requires the installation of one 208/240 volts of alternating current (VAC) receptacle that may be used for charging electric vehicles in each detached and attached single-family residence. The installation shall comply with requirements of Section 4.106.4.1 of the 2016 CALGreen Code, or the most applicable code at the time of construction.

**PDF 21-12** The *Centennial Specific Plan's* Green Development Program requires each applicant for an applicable construction permit to install "alternative energy fueling stations" as listed below. An "alternative energy vehicle fueling station" is a 208/240 VAC electrical vehicle charging station (allowing simultaneous charging of two or more vehicles) or a station providing another new or improved technology (e.g. compressed natural gas [CNG] and hydrogen fuel cell) that provides refueling for vehicles that do not use fossil fuel.

- Business Park and Institutional land use designations shall provide a minimum of one alternative energy vehicle fueling station on site for the first 50,000 square feet of usable floor space and additional alternative energy vehicle fueling stations for each additional 50,000 square feet of usable floor space thereafter.
- Multi-family residential buildings of at least 20 residential units shall provide a minimum of one alternative energy vehicle fueling station for the first 20 residential units and an additional alternative energy vehicle fueling station for each additional 20 residential units thereafter.
- The Town Center and each Village Center shall provide a minimum of one alternative energy vehicle charging station.
- Designated Transit Hubs shall provide a minimum of one alternative energy vehicle charging station.

**PDF 21-13** The Green Development Program requires that, prior to the issuance of each nonresidential construction permit, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the building designs:

- Bicycle parking spaces at a rate of 5 percent of minimum required vehicle parking spaces for nonresidential land uses or as required by Section 22.52.1225B of the County Code, whichever is more stringent

- For new nonresidential buildings with over 10 tenant-occupants, provide secure bicycle parking spaces at a rate of 5 percent of tenant parking being added, with a minimum of 1 space. Acceptable parking facilities shall be conveniently reached from the street and may include, but not be limited to:
  - Covered, lockable enclosures with permanently anchored racks for bicycles.
  - Lockable bicycle rooms with permanently anchored racks.
  - Lockable, permanently anchored bicycle lockers.

**PDF 21-14** The Green Development Program requires that prior to the issuance of an applicable construction permit for each residential building permit, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the building designs or specifications.

- Visitor parking shall include preferentially located parking spaces for alternative-fueled vehicles.
- Bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code or as required by Section 22.52.1225B of the County Code, whichever is more stringent.

**PDF 21-15** The Green Development Program requires that prior to issuance of an applicable construction permit for each parking structure and parking lots with 20 or more parking spaces, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the parking facility:

- The parking facility shall include a minimum of five percent preferentially located parking spaces for alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles.
- The parking facility shall include at least one electric vehicle charging station. Electrical lines shall be designed and sized to add additional charging stations for up to three percent of the total parking spaces when a demand is demonstrated. The design and installation shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, of the CALGreen Code.

**PDF 21-16** The Green Development Program requires that the Project Applicant/Developer provide:

- Internet infrastructure and high-speed broadband access to facilitate telecommuting.

- A community intranet (or similar) with access for homeowners associations; interest groups; local event scheduling; schools, library, carpool and transit services; and other on-site entertainment and amenities reduce the need for people to use automobile travel to obtain the information that is provided.

Compliance shall be required prior to the issuance of building permit for the 1,000<sup>th</sup> residential unit.

***Operational – Water Conservation to Reduce Emissions Associated with Water Supply, Treatment, and Distribution***

**PDF 21-17** The Green Development Program requires each applicant for an applicable construction permit for a nonresidential or multi-family building to install recycled water infrastructure to serve common areas for these facilities, except where prohibited by law. To the extent recycled water is produced within the Project and available, recycled water shall be used for landscape irrigation within those common areas. Compliance with these measures shall be established prior to the issuance of a building permit for nonresidential and multi-family facilities and at the time of County approval of final landscaping plans submitted by the applicant after final map recordation for homeowners association common areas. Covenants, conditions and restrictions shall require the owners of such common areas to maintain, repair and replace irrigation systems and plantings in accordance with County approved plans.

**PDF 21-18** The Green Development Program requires each applicant for an applicable construction permit for a nonresidential building to install indoor plumbing fixtures and fixture fittings that would reduce the overall use of potable water within the building by 12 percent, consistent with 2016 CALGreen Tier 1 nonresidential voluntary measures as prescribed in Section A5.303.2.3.1 of the code.

**PDF 21-19** The Green Development Program requires each applicant for an applicable construction permit for a single or multi-family residential building to install kitchen faucets and appliances that comply with 2016 CALGreen code residential voluntary measures specified in Sections A4.303.1 and A4.303.3 of the code.

**PDF 21-20** Implement MM 18-1, which requires water rates to be based on the assigned water budget for each parcel, to assure that outdoor landscaped areas for single-family and multi-family homes do not exceed the assigned outdoor water budget for the parcel through excessive watering or excessive turf planting.

***Construction – Vehicle Emissions Reduction***

**PDF 21-21** The Green Development Program requires that, prior to the issuance of each construction permit, the Project Applicant/Developer shall require in contract

specifications that contractors set goals to limit unnecessary construction equipment idling to three minutes and provide a program to encourage equipment operators to achieve the three-minute goal. This requirement exceeds State regulations (*California Code of Regulations* [CCR], Title 13, 2449[d][2]) that limit idling to five minutes.

## 5.21.5 THRESHOLD CRITERIA

### CEQA Thresholds

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist and track the thresholds recommended in the State CEQA Guidelines as amended by the California Natural Resources Agency (CNRA) (CNRA 2009a). The Project would result in a significant impact if it would:

- Threshold 21-1**      Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
- Threshold 21-2**      Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Neither the County's Environmental Checklist nor the State CEQA Guidelines prescribe specific methodologies and significance criteria for determining the significance of GHG emissions impacts. The State CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate thresholds consistent with the manner in which other impact areas are handled in CEQA. CEQA cases have upheld local agencies discretion to determine the significance of GHG emissions.

As with all determinations made in preparing an EIR, pursuant to Section 15064.7(b) of the State CEQA Guidelines, even without the express discretion as is the case for GHG, the substantial evidence standard applies to an agency's determination of the significance of an impact. Under Section 15384, substantial evidence is defined as "facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts". Under the substantial evidence standard, even if there is other information that supports a contrary conclusion, or a disagreement among experts as to the methodology or significance criteria, so long as the agency decision is supported by substantial evidence, it will be upheld even if there is other substantial evidence or expert opinions to the contrary (California 1988, p. 407). As such, an agency determination of significance is upheld so long as it is based on substantial evidence.

Determining how to analyze the significance of a project's climate change impacts poses a difficulty for lead agencies. The science in this area is evolving constantly. At the same time, local agencies do not specialize in this area, and there are currently no local, regional, or statewide significance criteria for determining whether a mixed-use residential development in the County of Los Angeles has a "significant" impact on climate change. Although the CNRA has adopted the CEQA Amendments developed by OPR pursuant to SB 97, as discussed above, the CEQA Amendments pose two questions that agencies should

evaluate, they leave considerable discretion to lead agencies to develop appropriate methodologies and significance criteria in evaluating these questions. As such, the County's analysis of GHG significance is a good faith effort to consider all potential significance criteria under the current state of the guidance, policy, and regulation.

Under Threshold 21-1, this impact analysis evaluates consistency with regulatory programs designed to reduce GHG emissions and that contribute to the achievement of AB 32's goals as the primary significance criterion. In addition, for informational purposes, this impact analysis also evaluates the Project's estimated emissions as compared to the Antelope Valley Air Quality Management District (AVAQMD) significance thresholds for impacts related to GHG emissions, as well as certain significance thresholds for impacts related to GHG emissions proposed by staff of South Coast Air Quality Management District (SCAQMD), but not adopted by SCAQMD Board.

Under Threshold 21-2, this impact analysis evaluates consistency with the Los Angeles County Community Climate Action Plan (CCAP) and consistency with SCAG's RTP/SCS as primary significance criteria. For informational purposes, this impact analysis also evaluates consistency with the GHG emissions-related goals and policies of the *Antelope Valley Area Plan* (AVAP).

Therefore, this impact analysis utilizes the "potential compliance pathways" described by the Court in the *Newhall* decision, namely compliance with a local climate action plan and/or other geographically specific GHG emission reduction plans (i.e., the CCAP, the SCAG RTP/SCS, and, for informational purposes, the AVAP); compliance with regulatory programs designed to reduce GHG emissions and that contribute to the achievement of AB 32's goals; and, for informational purposes, consistency with numerical GHG significance thresholds (AVAQMD and staff-proposed SCAQMD significance thresholds).

As discussed in Section 5.21.5, following the Supreme Court's decision in *Newhall*, on November 2016, the CDFW released a draft Additional Environmental Analysis (AEA) intended to address that agency's CEQA compliance obligations at issue in that case. (CDFW 2016) As described in the AEA, the *Newhall* project applicant (Five Point LLC) voluntarily modified its project and proposed to achieve "net zero" GHG emissions for the project with the implementation of 13 mitigation measures described in the AEA. On that basis, the AEA concludes that, since the *Newhall* project will result in no net increase in GHG emissions, it would not contribute to cumulative GHG emissions influencing global climate change and thus would not conflict with any plan, policy, or regulation adopted for the purpose of reducing the emission of GHGs. Consequently, the AEA concludes that project GHG and climate change impacts would be less than significant (CDFW 2016, pp. 1-18).

It is important to note that the *Newhall* AEA does not establish a new significance criteria of any kind, much less a "net zero" GHG threshold under CEQA. In fact, agencies that have considered a zero threshold approach have rejected it. For example, despite having been urged to propose a zero-emissions CEQA threshold in its proposed amendments to the CEQA guidelines regarding the analysis of GHG emissions released in April 2009 (Proposed Guidelines), the state Office of Planning and Research (OPR) responded in its *Initial Statement of Reasons for Regulatory Action: Proposed Amendments to the State CEQA*

*Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB 97* that Section 15064.4(b)(1) of the Proposed Guidelines is not intended to suggest a zero emission threshold, as CEQA does not include a “one molecule” rule. (CRNA 2009a, p. 20; *see also*, SJVAPCD 2009b, p. 34 [explaining that OPR’s Proposed Guidelines confirm that a lead agency is not responsible for wholly eliminating all GHG emissions from a project]). In addition, in its report to the Ventura County Air Pollution Control Board on GHG significance thresholds, staff reported that “[n]ot a single California air pollution agency is considering either of the first two approaches for GHG significance thresholds [a “no threshold approach” or a “zero threshold approach”].

Moreover, with respect to the *Newhall* AEA, the applicant imposed a “net zero emissions” program for GHG; it was not imposed under CEQA by the State of California, which is acting as the lead agency, and unlike a local city or county has direct statutory and regulatory authority to reduce GHG emissions from all sectors of the California economy, including most notably the major sectors producing GHG emissions (electricity production, transportation fuels, and large-scale industrial facilities such as refineries and cement plants). In the *Newhall* AEA, for example, CARB and Cal/EPA were directly involved in – and contemporaneously produced a letter affirming the achievement of – the *Newhall* applicant’s “net zero” voluntary proposal. With respect to the project analyzed in this EIR, the County’s land use jurisdiction does not extend to having jurisdiction or control over the vast majority of GHG emissions within the state. With respect to consideration of land use project, particularly large-scale projects, this EIR considers – and the Project complies with – SB 375, which is the state’s statutory program for ensuring GHG reductions from land use and transportation projects, as discussed in Section 5.21.6.

## 5.21.6 ENVIRONMENTAL IMPACTS

### On-Site Impacts

**Threshold 21-1**      **Would the proposed project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?**

#### ***Compliance with Regulatory Programs Designed to Reduce GHG Emissions and Project GHG Emissions***

In addition to complying with the policies and regulations of the CCAP (discussed in Table 5.21-11 below), the Project will incorporate the project design features and comply with applicable regulations designed to reduce GHG emissions, thus contributing to the achievement of AB 32’s goals. Some regulatory measures were promulgated prior to or independently of AB 32, and others were identified in CARB’s 2008 Climate Change Scoping Plan and promulgated subsequent to approval of the Scoping Plan. A full list and description of these project design features and regulatory programs are presented in detail above in Sections 5.21.4 and 5.21.2, respectively. Following the *Newhall* Court’s direction, the following highlight key project design features and regulatory programs, organized by emission source category, in order to clarify which measures apply to each emission source, thus contributing to the reduction of GHG emissions associated with that source. After a brief

discussion of the methodology used to calculate the Project's GHG emissions, this analysis is organized by the following emissions source categories:

- Construction emissions
- Vegetation changes
- Annual operational emissions
  - Area sources (lawn mowers; natural gas fire places)
  - Energy use
  - Water supply, treatment, and distribution
  - Solid waste
  - Mobile source

### Calculation Methodology

GHG emissions were calculated by using the California Emissions Estimator Model (CalEEMod) Version 2016.3.1 as described in Section 5.11, Air Resources. In addition to the construction and operational inputs described in Section 5.11, Air Resources, the GHG emissions analysis includes the following input data or estimates:

- Electrical energy use
- Water use – indoor and outdoor, potable and recycled
- Solid waste generation
- Carbon sequestration loss from vegetation removal and gain from planting of trees
- Renewable generation of 50 percent of the Project's electrical energy use as specified in PDF 21-3, as implemented by MM 21-1.
- For the calculation of GHG emissions for the electrical energy used by the Project, including direct Project consumption of electricity and the electricity used to supply, distribute, and treat water used by the Project, it was assumed that Southern California Edison (SCE) would achieve the 50 percent renewable energy goal for 2030 established by EO B-30-15 and SB 350. It was not assumed that renewable energy would exceed 50 percent by 2035. (Note that under the modeling methodology, this 50 percent renewable energy assumption was made only for electricity consumption, and did not extend to transportation, etc.)
- Energy efficiency was assumed to exceed the 2016 code requirements as specified in PDF 21-1 and PDF 21-2, as implemented by MM 21-2 and 21-3, respectively. No credit was taken for additional energy efficiency that may be required by the 2019 and subsequent codes.

---

## One-Time Emissions

### *Construction Emissions*

The major construction phases included in this analysis are as follows:

- **Demolition** involves tearing down of buildings or structures and removal of asphalt and concrete parking areas and walkways.
- **Site Preparation** involves clearing vegetation (grubbing and tree/stump removal) and stones prior to grading.
- **Grading** involves cut and fill of land to ensure the proper base and slope for the construction foundation.
- **Building Construction** is the construction of structures and buildings.
- **Architectural Coating** is the application of coatings to both the interior and exterior of buildings or structures
- **Paving** is the laying of concrete or asphalt such as in parking lots or roads.

These phases would occur in connection with anticipated construction at the Project site and related off-site Project impact areas, as described in Section 4.0, Project Description. GHG emissions from these construction phases are largely attributable to fuel use from construction equipment and worker commuting. Additional indirect GHG emissions would result from the supply and delivery of water used during site grading.

Construction GHG emissions were calculated by using CalEEMod Version 2016.3.1 as described in Section 5.11, Air Resources. Specific inputs to CalEEMod include but are not limited to the start and finish dates of construction phases; inventories of construction equipment to be used during each phase; areas to be paved; and areas to be painted. Output emissions data are provided for off-road equipment and on-road vehicles.

Once construction begins (in Year 1), it will proceed continuously for approximately 20 years, with full buildout completed after 20 years. Construction emissions are calculated for the following construction activities: grading, building, paving, and architectural coating (painting).<sup>2</sup> The rate of construction would vary with a variety of factors including, but not limited to, market demand, weather, and as-found site conditions. The estimation of the quantities of grading, building, paving, and painting on a year-by-year basis for a 20-year project would be highly speculative. Therefore, the construction effort is initially evaluated assuming that each construction activity would be spread equally over the applicable years. Additionally, as further explained below, construction emissions are evaluated for a peak grading year.

Grading would occur from Year 1 through Year 18. Preliminary grading engineering design indicates that approximately 127 million cubic yards (mcy) of earth would be moved for the total Project. Based on the preliminary grading estimates, the average daily grading quantity

---

<sup>2</sup> Emissions modeling often includes demolition and site preparation (clearing and grubbing) activities. Demolition required for the proposed Project would be negligible. Clearing and grubbing would be predominantly grassland, and would occur concurrently with grading.

over the 18 years of grading would be approximately 26,500 to 36,500 cubic yards (cy), depending on the number of days of grading. For a conservative estimate, it is assumed that grading would be limited by weather and other factors to 200 days per year, and the average daily grading quantity would be 36,500 cy. Cut and fill would be balanced on the Project site and no off-site export or import is anticipated. Soil movement within the site would be by scraper. Equipment used for the average year grading analysis is shown in Table 5.21-3. Further below in Table 5.21-10, all summary of all Project-related GHG emissions are presented.

**TABLE 5.21-3  
GRADING, BUILDING, PAVING, AND ARCHITECTURAL COATING EQUIPMENT FOR  
AVERAGE YEAR EMISSIONS ESTIMATES**

Equipment Type	Number of Equipment
<b>Grading</b>	
Scrapers	10
Dozers	7
Compactors	2
Water trucks	2
Graders	1
<b>Building</b>	
Cranes	4
Forklifts	12
Tractor/Loader/Backhoes	12
Welders	4
Generator Sets	4
<b>Paving</b>	
Paving Machine	1
Roller	3
<b>Architectural Coating</b>	
Compressors	4

For the purposes of the GHG modeling assumptions, the Project construction is assumed to begin in 2016, with buildout complete in 2035, although the actual start of construction and buildout are likely to occur later than 2016 and 2035, respectively. The 2035 buildout date is consistent with the Project traffic impact analysis (see Section 5.10, Traffic, Access, and Circulation) and also with the CalEEMod model, which does not include on-road emissions factors beyond 2035. This is a conservative approach; if the actual start of construction occurs later than 2016 and buildout occurs later than 2035, both the construction equipment fleet and on-road vehicles are assumed to be “cleaner” than would be the case if construction starts in 2016 and buildout occurs in 2035, as described CARB’s 2016 Mobile Source Strategy. This is so because such later model vehicles will be subject to more stringent emission controls and fuel standards and thus generate less unit emissions with each future

year. As such, assuming development of the Project site occurs sooner than is likely to occur provides a more conservative assessment of construction GHG emissions.

It is estimated that construction grading would use 9,744 acre-feet (3,176 million gallons) of water for dust control during the estimated 20-year construction period. This estimation accounts for climatic conditions (i.e., dry and windy conditions) in the Project area. The water would come from previously imported water, banked, and stored north of the Project site. GHG emissions associated with this water use were calculated using energy data from CAPCOA's 2010 publication, *Quantifying Greenhouse Gas Mitigation Measures* and the SCE GHG intensity factor for 2025 (CAPCOA 2010).

The estimated Project construction GHG emissions for the Project's 20-year construction period are estimated at 134,692 MTCO<sub>2e</sub>. CalEEMod data for construction emissions are included in Appendix 5.11-A.

### **Regulatory Requirements**

**SCAQMD Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Thresholds.** Because construction activity impacts are relatively short in duration, they contribute a relatively small portion of the total lifetime GHG emissions of a project. In addition, GHG emissions-reduction measures for construction equipment are relatively limited. Therefore, in its *Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Thresholds*, the SCAQMD recommends that construction emissions be amortized over a 30-year project lifetime so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies (SCAQMD 2008). That method is used in this analysis. Emissions generated during the operational phase of the Project are considered in addition to the amortized construction phase emissions.

**USEPA and NHTSA CO<sub>2</sub> Standards.** The USEPA and NHTSA have adopted standards for CO<sub>2</sub> emissions and fuel consumption, respectively, tailored to each of three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to USEPA, this program will reduce GHG emissions and fuel consumption for affected vehicles by 6 percent to 23 percent.

**CARB Airborne Toxic Control Measures and Emission Standards.** CARB adopted an airborne toxic control measure to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other toxic air contaminants. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways. This measure also does not allow diesel-fueled commercial vehicles to idle for more than five minutes at any given time. In addition to limiting exhaust from idling trucks, CARB promulgated emission standards for off-road diesel construction equipment such as bulldozers, loaders, backhoes, and forklifts, as well as many other self-propelled off-road diesel vehicles. This regulation aims to reduce emissions through installation of diesel particulate filters and encouraging the replacement of older, dirtier engines with newer emission-controlled models. Implementation is staggered based on fleet size, with the largest operators beginning compliance in 2014.

**Title 24 Green Building Standards Code.** The 2013 California Green Building Standards Code (24 CCR Par 11), also known as the CALGreen Code, contains mandatory requirements aimed to reduce construction waste; make buildings more efficient in the use of materials and energy; and reduce environmental impact during and after construction. For example, projects must recycle and/or salvage for reuse a minimum of 50 percent of nonhazardous construction and demolition debris or meet local ordinance, whichever is more stringent (Section 5.408.3). In addition, 100 percent of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled (Section 5.408.4).

**Los Angeles Green Building Standards Code.** Title 31 of the Los Angeles County Code of Ordinances was adopting in 2013 in response to the mandates set forth in the CALGreen Code. The purpose of Title 31 is to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact, or positive environmental impact, and encouraging sustainable construction practices in planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental air quality.

**Antelope Valley Area Plan (AVAP).** Policy COS 17.1 promotes green building techniques for the construction and operation of public and private buildings in the unincorporated Antelope Valley. Policy COS 17.9 requires reduction, reuse, and recycling of construction and demolition debris.

### ***Project Design Features***

**PDF 17-2.** PDF 17-2 of Section 5.17, Other Services, states that the Project has committed to diverting from landfill disposal 100 percent of soil during grading activities, and at least 70 percent of nonhazardous construction and demolition waste, which exceeds the 65 percent diversion requirement with the Tier I voluntary measure in Section A5.408.3.1 of the California Green Building Standards Code. This goal also exceeds the 50 percent reduction required by Section 20.87.040 of the County Code and Sections 4.408.5/5.408.1.4 of the CALGreen Code. PDF 17-2 is required for implementation through MM 17-9.

**PDF 21-21.** The Green Development Program requires that, prior to the issuance of each construction permit, the Project Applicant/Developer shall require in contract specifications, that contractors set goals to limit unnecessary construction equipment idling to three minutes and include a program to encourage equipment operators to achieve the three-minute goal.

As the Project will incorporate these project design features and must comply with these applicable regulations imposed by law, the Project would contribute to the achievement for AB 32's goals related to construction emissions.

PDF 21-21 is required for implementation through MM 21-4.

### Vegetation Changes

Permanent vegetation changes that would occur as a result of Project development constitute a change in the carbon sequestration capacity of the Project site.

The loss of vegetation would occur concurrently with construction. Therefore, the increase in GHG emissions attributable to the loss of carbon sequestration is also amortized over 30 years. However, the reduction in GHG emissions resulting from the planting of new trees would occur more slowly and this reduction is conservatively amortized over 100 years in accordance with IPCC recommendations.

The removal of an estimated 6,416 acres of grassland and other vegetative covers on the Project site during construction would result in an estimated reduction in current levels of sequestration of 27,653 MTCO<sub>2</sub> as shown in Table 5.21-4. The planting of an estimated 35,123 new trees, as required by the adopted County Tree Planting Ordinance would result in an estimated long-term sequestration of 24,867 MTCO<sub>2</sub>e. Therefore, in total the Project would result in an overall reduction in the amount of carbon sequestration on the Project site, resulting in an overall increase in GHG emissions of 2,786 MTCO<sub>2</sub> (27,653–24,867 MTCO<sub>2</sub>). A summary of all Project-related greenhouse gas emissions is presented in Table 5.21-10 later in this section.

**TABLE 5.21-4  
VEGETATION CHANGE GREENHOUSE GAS EMISSIONS**

Type of Vegetation	Acres in Current Condition	Acres in Buildout Condition	Net Change	GHG Emissions MTCO <sub>2</sub>
Grassland	6,416 <sup>a</sup>	0	-6,416 acres	+ 27,653
<b>Annual Increase in CO<sub>2</sub> over 30 year Amortization</b>				<b>+922</b>
Type of Tree	Replacement Trees in Current Condition	Replacement Trees in Buildout Condition	Net Change	
Miscellaneous	0	35,123	+35,123 trees	-24,867
<b>Annual Decrease in CO<sub>2</sub> over 100 year Amortization</b>				<b>-249</b>
GHG: greenhouse gas; MTCO <sub>2</sub> e: metric tons of carbon dioxide				

### Regulatory Requirement

**Los Angeles County Tree Planning Ordinance.** On March 29, 2016, the Board of Supervisors adopted the Tree Planting Ordinance, effective April 28, 2016, includes the following requirements:

- a. For projects that are primarily residential with 3 or fewer units per lot, a minimum of 2 trees shall be planted on each lot.
- b. For projects that are primarily residential with 4 or more units per lot, a minimum of 1 tree shall be planted for every 5,000 square feet of building footprint per lot.

- c. For projects that are nonresidential or mixed-use, a minimum of 3 trees shall be planted for every 10,000 square feet of developed lot area.

Trees planted must (1) provide adequate shade; (2) be resistant to local pests and diseases; (3) be non-invasive species; and (4) be appropriate for the planting location (DRP 2016b).

#### Annual Operational Emissions

Emissions from mobile and area sources and indirect emissions from energy and water use, wastewater, and waste management, would occur every year after buildout. This section identifies operational GHG emissions.

The proposed Project incorporates elements that reduce Project-generated emissions during operation. In addition, the Project would be required to comply with applicable federal, State, and local rules and regulations to further reduce long-term operational emissions. A wide range of regulatory measures have been enacted through legislation or promulgation of regulations (see Section 5.21.2) that would assist with the reduction of GHG emissions associated with the proposed Project, both directly and indirectly. Some measures were promulgated prior to or independently of AB 32, and others were identified in CARB's 2008 Climate Change Scoping Plan and promulgated subsequent to approval of the Scoping Plan. These measures were evaluated and re-emphasized in the First Update to the Scoping Plan. Project elements have been incorporated to further reduce GHG emissions associated with operation. A discussion of the regulatory measures and Project elements to reduce Project-generated GHG emissions follows under each emissions source.

#### *Area Sources*

The area source GHG emissions included in this analysis result primarily from natural gas fireplaces with additional emissions from landscaping-related fuel combustion sources, such as lawn mowers. GHG emissions due to natural gas combustion in buildings other than from fireplaces are excluded from area sources since they are included in the emissions associated with building energy use. Emissions were calculated with CalEEMod. The input for fireplace emissions is specified in PDF 11-2 in Section 5.11, Air Resources, which limits fireplaces to a maximum of 13,954 natural gas fireplaces and no wood-burning fireplaces. Landscape maintenance emissions are based on Project land use data. The Project's area source GHG emissions are estimated at 11,297 MTCO<sub>2e</sub> per year, as shown in Table 5.21-5. Further below in Table 5.21-10, all summary of all Project-related greenhouse gas emissions are presented.

**TABLE 5.21-5  
AREA SOURCE GREENHOUSE GAS EMISSIONS**

Source	Emissions (MTCO <sub>2</sub> e/yr)
Fireplaces (Hearth)	11,056
Landscape maintenance	240
<b>Total</b>	<b>11,297</b>
MTCO <sub>2</sub> e/yr: Metric tons of carbon dioxide equivalent per year	
Total does not add due to rounding	
Emissions calculations can be found in Appendix 5.11-A.	

### ***Regulatory Requirements***

**SCAQMD Rule 445.** SCAQMD Rule 445 requires the use of natural gas to power all cooking stoves and fireplaces.

As the Project must comply with this applicable regulation imposed by law, the Project would contribute to the achievement for AB 32's goals related to area sources.

### ***Energy Use***

GHGs are emitted from buildings as a result of activities for which electricity and natural gas are typically used as energy sources. Combustion of any type of fuel emits CO<sub>2</sub> and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building. GHGs are also emitted during the generation of electricity from fossil fuels; these emissions are considered to be indirect emissions. The CalEEMod default natural gas use and emissions calculations are modified by application of the 2016 State Energy Efficiency Standards for Residential and Nonresidential Buildings, PDF 21-1 and PDF 21-2. PDF 21-1, and PDF 21-2 commit the Project to comply with CALGreen voluntary Tier 1 measures to exceed the 2016 code for residential and nonresidential buildings, respectively. The combined effect is a 32.4 percent reduction from the CalEEMod base data for Title 24 natural gas and electricity uses. The SCE GHG intensity factor for 2030 was used based on the SB 350 requirement for 50 percent renewable power by 2030. The carbon intensity factor was not extrapolated to 2035. Therefore, if SCE power content is greater than 50 percent in 2035, the Project's GHG emissions would be less than calculated. The Project's estimated 2035 GHG emissions from the direct burning of natural gas and the indirect generation of electricity are 49,412 MTCO<sub>2</sub>e per year as shown in Table 5.21-6. Further below, in Table 5.21-9, a summary of all Project-related greenhouse gas emissions is presented.

**TABLE 5.21-6  
ENERGY USE AND GREENHOUSE GAS EMISSIONS**

Land Use*	Energy Use		GHG Emissions (MTCO <sub>2e</sub> /yr)		
	Electricity (MWh/yr)	Natural Gas (MBTU/yr)	from Electricity Use	from Natural Gas Use	Total
Elementary School	1,834	4,958	312	266	578
General Light Industry	1,007	2,620	171	141	312
Government (Civic Center)	9,219	11,280	1,566	606	2,172
Health Club	689	1,792	117	96	213
High School	1,273	3,442	216	185	401
Office Park	46,430	49,430	7,888	2,654	10,542
Regional Shopping Center	6,465	1,318	1,098	71	1,169
Single-Family Housing	59,030	340,900	10,028	18,300	28,328
Apartments Mid Rise	11,060	71,130	1,879	3,818	5,697
<b>Total</b>	<b>137,007</b>	<b>486,870</b>	<b>23,275</b>	<b>26,137</b>	<b>49,412</b>

MTCO<sub>2e</sub>/yr: Metric tons of carbon dioxide equivalent per year; MWh/yr: megawatt hours per year; MBTU/yr: million British thermal units per year

\* Land use categories shown are CalEEMod standard names. "Health Club" is Project "Recreation/Entertainment"

Some totals do not add due to rounding.

Emissions calculations can be found in Appendix 5.11-A.

### **Regulatory Requirements**

**Title 24 Energy Efficiency Standards.** Title 24 (Part 11) serves to enhance and regulate California's building standards. Single-family homes built to the 2016 standards will use about 22 percent less energy for lighting, heating, cooling, ventilation and water heating compared to those built pursuant to the standards adopted in 2013. According to the ZNE Plan, the 2019 update to Title 24 (effective 2020) will require all new residential construction to be zero net energy (CEC 2015c).

**SB X1 2 and SB 350.** SB X1 2 established a use target of 33 percent for renewable energy sources for all electricity providers in California by 2020. SB 350 provides for further development of renewable energy with a target of a 50 percent generation rate by 2030. Conservatively, the estimates below do not include the higher renewable energy target established by SB 350. However, as disclosed previously, a Project design feature requires Project buildings to be 35 percent more energy efficient than 2008 standards, that 60 percent of the commercial building roofs have solar panels and that residences have energy friendly radiant roofs that are "Solar Ready". As the Project will comply with or exceed the applicable regulatory measures, the Project is consistent with the energy related regulatory programs designed to achieve AB 32's goals.

**Countywide Energy and Environmental Policy.** The Countywide Energy and Environmental Policy (Policy) was adopted by the Los Angeles County Board of Supervisors

on January 16, 2007, to provide guidelines for the development and enhancement of energy conservation and environmental programs within County departments. The Policy was also the County's response for the need for energy conservation and reduction in GHG emissions. It directs the County to track its GHG emissions with the California Climate Action Registry, and to reduce its facilities' energy consumption by 20 percent by the year 2015. Under this policy, the Los Angeles County Energy Program (LACEP) provides financing for energy efficiency or solar improvements. Revisions to the Policy, adopted on June 30, 2015, enhance the County's existing and future policies programs, and reporting with regard to environmental sustainability.

**Los Angeles Green Building Standards Code.** Title 31 of the Los Angeles County Code of Ordinances was adopted in 2013 in response to the mandates set forth in the CALGreen Code. The purpose of Title 31 is to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact, or positive environmental impact, and encouraging sustainable construction practices in planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental air quality. Title 31 includes such measures as requirements for energy efficiency, parking for fuel-efficient vehicles, cool roofs, reduction of indoor potable water use, recycled content of construction materials, reduction in construction and demolition waste, and thermal insulation. Title 31 was updated in April 2016 to relocate drought tolerant landscaping and green building requirements from Titles 21 and 22 to Title 31 (DRP 2016a).

**Antelope Valley Area Plan (AVAP).** AVAP Policy COS 17.2 requires that new buildings be sited and designed in a manner that maximizes efficient use of natural resources, such as air and light, to reduce energy consumption, heat profiles, and GHG emissions. Policy COS 17.4 promotes the use of individual renewable energy systems, by directing the County to require appropriate development standards for individual renewable energy systems to minimize potential impacts and to simplify the permitting process for such systems that meet these development standards. Policy 17.5 calls for the County to protect active and passive solar design elements and systems from shading by neighboring structures and trees through appropriate development standards.

### ***Project Design Features***

**PDF 21-1.** The Green Development Program requires compliance with CALGreen voluntary measure A4.203.1.2.1 for low-rise residential buildings. Therefore, the energy efficiency of these buildings would exceed 2016 Title 24 requirements by 15 percent. PDF 21-1 is required for implementation through MM 21-2.

**PDF 21-2.** The Green Development Program requires compliance with CALGreen voluntary measure A5.203.1.2.1 for nonresidential buildings. Therefore, the energy efficiency of nonresidential, hotel, and high-rise residential buildings would exceed 2016 Title 24 requirements by 10 percent. PDF 21-2 is required for implementation through MM 21-3.

**PDF 21-3.** The Green Development Program requires a minimum of 50 percent of the Project's anticipated electrical energy demand at buildout must be satisfied from on-site renewable energy generation. "Anticipated electrical energy demand" shall be determined

on the basis of the anticipated loads for each building as shown in the reports submitted at the time of building permit application pursuant to the Building Energy Efficiency Standards of Title 24. "On-site renewable energy generation" includes, but is not limited to, solar, wind, geothermal, biofuel and hydroelectric systems. PDF 21-3 is required for implementation through MM 21-1.

**PDF 21-4.** The Green Development Program requires that a minimum of 70 percent of public and community pools and spas would be equipped with active solar heating systems where heating is necessary or desired. The applicant for a pool permit shall provide the proposed plan for compliance with this provision prior to obtaining a permit for the pool. PDF 21-4 is required for implementation through MM 21-5.

**PDF 21-5.** The Green Development Program requires that deeds, CC&Rs, or similar legal documents contain the following requirement: The owners of all single-family and multi-family residential units shall be required, upon resale, to present to the buyer a written energy audit checklist prepared by a qualified third party at the time the seller provides the buyer with the Real Estate Transfer Disclosure Statement required by Section 1102 et seq. of the California Civil Code. The energy audit checklist shall certify that all HVAC systems, thermostats, appliances, windows and swimming pools (if applicable) are the same as those originally installed or, if changed, otherwise comply with Centennial's Green Development Program. All residential pool covers shall be removable, and shall not be automatic retractable covers.

The CC&Rs of the master homeowners association or other applicable association shall require compliance with the provisions of this measure and shall provide notice to individual owners of the resale energy audit checklist requirement. The master homeowners association or other applicable association shall monitor compliance and provide the County with an annual report of compliance with this measure. PDF 21-5 is required for implementation through MM 21-6.

**PDF 21-6.** The Green Development Program requires that deeds, CC&Rs, or similar legal documents contain the following requirement: For nonresidential buildings, within 90 days after the end of the first full calendar year following the issuance of the certificate of occupancy and within 90 days after each 5-year period thereafter, the owner or tenant in possession thereof shall submit to the master commercial owners association or other applicable association a report prepared by the owner or a qualified, independent third party that evaluates whether all major building systems such as heat furnace, air conditioner, and other mechanical fixtures are working within the design standards established for each system. The master commercial owners association or other applicable association shall monitor compliance and provide the County with an annual report of compliance with this measure. PDF 21-6 is required for implementation through MM 21-7.

**PDF 21-7.** The Green Development Program requires builders to install energy efficient major appliances and HVAC systems which meet the more stringent of applicable CEC requirements or ENERGY STAR requirements. Major appliances subject to this requirement include dishwashers, clothes washers, refrigerators, and room air conditioners. PDF 21-7 is required for implementation through MM 21-8.

**PDF 21-8.** The Green Development Program requires that the Project's wastewater reclamation facilities (WRF) will include equipment to capture and reuse biogas for energy production. PDF 21-8 is required for implementation through MM 21-9.

As the Project will incorporate these project design features and must comply with these applicable regulations imposed by law, the Project would contribute to the achievement for AB 32's goals related to energy use.

#### *Water Supply, Treatment, and Distribution*

Indirect GHG emissions result from the production of electricity used to convey, treat and distribute water and wastewater. The amount of electricity required to convey, treat and distribute water depends on the volume of water as well as the sources of the water. Additional emissions from wastewater treatment include CH<sub>4</sub> and N<sub>2</sub>O, which are emitted directly from the wastewater. Estimated indoor and outdoor water use quantities and source are shown in Table 5.21-7 and are summarized from the data provided in Section 5.18, Water Resources. GHG emissions were calculated in CalEEMod using energy data from the CAPCOA publication, *Quantifying Greenhouse Gas Mitigation Measures* (CAPCOA 2010). As shown in Table 5.21-7 GHG emissions from water use at buildout are estimated at 7,387 MTCO<sub>2e</sub> per year. A summary of all Project-related greenhouse gas emissions is presented in Table 5.21-10 later in this section.

**TABLE 5.21-7  
WATER USE AND GREENHOUSE GAS EMISSIONS**

Water Use/Source	Water Use (afy)		GHG Emissions (MTCO <sub>2e</sub> /yr)
	Indoor	Outdoor	
<b>Indoor/Imported</b>	5,436		6,329
<b>Outdoor/Imported</b>		1,518	434
<b>Outdoor/Water bank</b>		4,578	624
<b>Total</b>	<b>5,436</b>	<b>6,096</b>	<b>7,387</b>

afy: acre-feet per year; GHG: greenhouse gas; MTCO<sub>2e</sub>/yr: Metric tons of carbon dioxide equivalent per year.

#### **Regulatory Requirements**

**California Water Code.** Sections 10910 through 10915 of the *California Water Code* require preparation of a project-specific Water Supply Assessment for developments like the Project. Sections 10610.4, 10617, and 10620 of the *California Water Code* require urban water suppliers to develop water management plans to actively pursue the efficient use of available supplies.

**SB X7-7 (Water Conservation Act of 2009).** The Water Conservation Act of 2009 sets an overall goal of reducing per-capita urban water use by 20 percent by December 31, 2020. The State is required to make incremental progress toward this goal by reducing per-capita water use by at least 10 percent by December 31, 2015. This is an implementing measure of the Water Sector of the AB 32 Scoping Plan. Reduction in water consumption reduces the

energy necessary and the associated emissions to convey, treat, and distribute the water; it also reduces emissions from wastewater treatment.

**State Model Water Efficient Landscape Ordinance (MWELo) and Executive Order B-29-15.** The MWELo (CCR Title 23, Division 2, Chapter 2.7) establishes an outdoor water budget for new landscaped areas that are 500 square feet or larger, and rehabilitated landscaped areas that are 2,500 square feet or larger (DWR 2015). EO B-29-15 called for revisions to the MWELo in order to increase water efficiency standards for new and rehabilitated landscapes through more efficient irrigation systems, greywater usage, on-site storm water capture, and by limiting the portion of landscapes that can be covered in turf. It also established a goal of achieving a statewide reduction in potable urban water usage of 25 percent relative to water use in 2013 (California 2015b). The California Department of Water Resources updated the MWELo in December 2015 to incorporate these elements.

**Title 24 Green Building Standards Code As Adopted by the Building Standards Commission.** The Building Standards Commission, which regulates construction of public schools and community colleges in California, approved a modified version of the MWELo that applies to public schools and community colleges within the Project site.

**Title 24 Green Building Standards Code.** The California Green Building Code includes water efficiency requirements for new residential and nonresidential structures, including the requirement that indoor potable water use be reduced by 12 percent through the use of water saving fixtures and or flow restrictors.

**Los Angeles Green Building Standards Code.** Title 31 of the Los Angeles County Code of Ordinances was adopted in 2013 in response to the mandates set forth in the CALGreen Code. The purpose of Title 31 is to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact, or positive environmental impact, and encouraging sustainable construction practices in planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental air quality. Title 31 includes specific measures concerning drought-tolerant landscaping that require: (1) turf area shall be water-efficient and shall not exceed 25 percent of the total landscaped area; (2) non-invasive drought-tolerant plant and tree species appropriate for the climate zone region shall be utilized in at least 75 percent of the total landscaped area; and (3) hydrozoning irrigation techniques shall be incorporated into the landscape design.

**Antelope Valley Area Plan (AVAP).** AVAP Policy COS 2.1 requires new landscaping to comply with applicable water efficiency requirements in the County Code (including the measures discussed above). Policy COS 2.2 requires low flow plumbing fixtures in all new developments.

### ***Project Design Features***

**PDF 21-17.** The Green Development Program requires each applicant for an applicable construction permit for a nonresidential or multi-family building to install recycled water infrastructure to serve common areas for these facilities, except where prohibited by law. To the extent recycled water is produced within the Project and available, recycled water shall

be used for landscape irrigation within those common areas. Compliance with these measures shall be established prior to the issuance of a building permit for nonresidential and multi-family facilities and at the time of County approval of final landscaping plans submitted by the applicant after final map recordation for homeowners association common areas. Covenants, conditions, and restrictions shall require the owners of such common areas to maintain, repair and replace irrigation systems and plantings in accordance with County approved plans. PDF 21-17 is required for implementation through MM 21-10.

**PDF 21-18.** The Green Development Program requires each applicant for an applicable construction permit for a nonresidential building to install indoor plumbing fixtures and fixture fittings that would reduce the overall use of potable water within the building by 12 percent, consistent with 2016 CALGreen Tier 1 nonresidential voluntary measures as prescribed in Section A5.303.2.3.1 of the code. PDF 21-18 is required for implementation through MM 21-11.

**PDF 21-19.** The Green Development Program requires each applicant for an applicable construction permit for a single or multi-family residential building to install kitchen faucets and appliances that comply with 2016 CALGreen code residential voluntary measures specified in Sections A4.303.1 and A4.303.3 of the code. PDF 21-19 is required for implementation through MM 21-12.

**PDF 21-20.** The Green Development Program requires that landscaped areas of single-family detached residential front yards and multi-family residential common areas contain no more than 25 percent turf. PDF 21-20 is required for implementation through MM 21-13.

As the Project will incorporate these project design features and must comply with these applicable regulations imposed by law, the Project would contribute to the achievement for AB 32's goals related to water supply, treatment, and distribution.

#### *Solid Waste*

Solid waste may be disposed in landfills or diverted for recycling, composting, reuse, or other means to avoid landfilling. Any waste not diverted will be disposed of at a landfill. GHG emissions from landfills are associated with the anaerobic breakdown of material. Solid waste GHG emissions were calculated using Project land use data and CalEEMod default emission factors. As shown in Table 5.21-8, solid waste GHG emissions are estimated at 10,214 MTCO<sub>2e</sub> per year. Further below in Table 5.21-10, a summary of all Project-related greenhouse gas emissions is presented.

**TABLE 5.21-8  
SOLID WASTE GENERATION AND  
GREENHOUSE GAS EMISSIONS**

<b>Land Use</b>	<b>Solid Waste (tons/yr)</b>	<b>GHG Emissions (MTCO<sub>2</sub>e/yr)</b>
City Park	9	5
Elementary School	730	367
General Light Industry	118	60
Government (Civic Center)	4,469	2,248
Health Club	372	187
High School	319	161
Office Park	3,424	1,722
Regional Shopping Center	543	273
Single-Family Housing	9,087	4,570
Apartments Mid Rise	1,237	622
<b>Total</b>	<b>20,308</b>	<b>10,214</b>
MTCO <sub>2</sub> e/yr: Metric tons of carbon dioxide equivalent per year		
Totals may not add due to rounding.		
Emissions calculations can be found in Appendix 5.11-A.		

### ***Regulatory Requirements***

**AB 341.** AB 341 established a statewide diversion rate for solid waste of not less than 75 percent through measures such as source reduction, recycling, or composting by the year 2020, and annually thereafter. That legislation increased the solid waste diversion rate by 25 percent compared to the California Integrated Waste Management Act of 1989 that it replaced.

**Los Angeles County Roadmap for a Sustainable Waste Management Future.** As discussed above, the County's Roadmap for a Sustainable Waste Management Future sets to achieve 80 percent diversion from landfills by 2025; 90 percent diversion from landfills by 2035; and 95 percent (or higher) diversion from landfills by 2045. To accomplish these goals, the Working Group identified specific recommended initiatives, which will be expanded in detailed implementation plans. Although the Roadmap does not contain currently enforceable regulations, development under the Centennial Specific Plan will comply with any implementation plans once adopted.

### ***Project Design Features***

**PDF 17-3.** PDF 17-3 of Section 5.17, Other Services, states that the Project includes a Solid Waste Management Plan to achieve the goal of diverting 75% of operational solid waste from the Project requiring landfill disposal. Property Owners shall process on-site, contract with a waste management company and/or recyclers, and/or self-haul to waste and recycling facilities to properly recycle, divert, and dispose of solid wastes generated on-site, such as metals, paper, household plastics, glass, cardboard, food waste, and green waste. The waste

hauler shall be required by contract to maintain records showing the diversion from landfills of not less than 75 percent of the operational waste generated by the Project. PDF 17-3 is required for implementation through MM 17-10.

As the Project will incorporate this project design feature and must comply with this applicable regulation imposed by law, the Project would contribute to the achievement for AB 32's goals related to solid waste.

### *Mobile Sources*

The GHG emissions associated with on-road mobile sources are generated from residents, workers, customers, and delivery vehicles visiting the land use types in the Project. The emissions associated with on-road mobile sources includes running and starting exhaust emissions, evaporative emissions, brake and tire wear, and fugitive dust from paved and unpaved roads. Mobile source emissions were calculated in CalEEMod. Trip generation rates were adjusted to be consistent with the trip generation data provided in the Project traffic impact analysis (TIA) (Stantec 2016). Average trip distance inputs were adjusted based on VMT data in the Project TIA. VMT and GHG emissions results are shown in Table 5.21-9. GHG emissions based on 2035 on-road emissions factors are calculated to be 160,904 MTCO<sub>2e</sub> per year. Further below in Table 5.21-10, a summary of all Project-related greenhouse gas emissions is presented.

**TABLE 5.21-9  
MOBILE SOURCE VEHICLE MILES TRAVELED AND  
GREENHOUSE GAS EMISSIONS**

Land Use	Vehicle Miles Traveled (VMT/yr)	GHG Emissions (MTCO <sub>2e</sub> /yr)*
City Park	750,300	194
Elementary School	15,864,160	4,098
General Light Industry	4,087,962	1,056
Government (Civic Center)	45,359,777	11,718
Health Club	7,694,986	1,988
High School	8,950,942	2,312
Office Park	128,855,027	33,287
Regional Shopping Center	79,419,401	20,516
Single-Family Housing	249,898,307	64,556
Apartments Mid Rise	81,986,191	21,179
<b>Total</b>	<b>622,867,052</b>	<b>160,904</b>
VMT/yr: vehicle miles traveled per year; MTCO <sub>2e</sub> /yr: Metric tons of carbon dioxide equivalent per year		
* CalEEMod does not output mobile source GHG emissions by land use; emissions apportioned based on VMT.		
Total may not add due to rounding.		
Emissions calculations can be found in Appendix 5.11-A.		

## **Regulatory Requirements**

**Light-Duty Vehicle Greenhouse Gas Emissions Standards and Corporate Average Fuel Economy Standards.** The USEPA and the NHTSA have been working together on developing a National Program of regulations to reduce GHG emissions and to improve the fuel economy of light-duty vehicles. On April 1, 2010, the USEPA and NHTSA announced a joint Final Rulemaking establishing standards for 2012 through 2016 model year vehicles. This was followed up on October 15, 2012, when the agencies issued a Final Rulemaking with standards for model years 2017 through 2025. The rules require these vehicles to meet an estimated combined average emissions level of 295 grams of CO<sub>2</sub> per mile by 2012, decreasing to 250 grams per mile by 2016, and finally to an average industry fleet-wide level of 163 grams per mile in model year 2025. The 2016 standard is equivalent to 35.5 miles per gallon (mpg) and the 2025 standard is equivalent to 54.5 mpg if the levels were achieved solely through improvements in fuel efficiency. These standards would cut GHG emissions by an estimated 2 billion metric tons and 4 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2017–2025).

**AB 1493 (Pavley Standard).** The Pavley Standard requires CARB to adopt regulations by January 1, 2005, to reduce GHG emissions from non-commercial passenger vehicles and light-duty trucks of model year 2009 and thereafter. The CalEEMod model includes emission reductions for non-commercial passenger vehicles and light-duty trucks of model year 2017–2025.

**Executive Order S-01-07 and CARB's Low Carbon Fuel Standard (LCFS).** Executive Order S-01-07 (January 18, 2007) requires a ten percent or greater reduction in the average fuel carbon intensity for transportation fuels in California regulated by CARB. The LCFS regulation went into effect on April 15, 2010, and requires a reduction in the carbon intensity of transportation fuels used in California by at least ten percent by 2020. It imposes fuel requirements on fuel that will be sold in California that will decrease GHG emissions by reducing the full fuel-cycle and the carbon intensity of the transportation fuel pool in California.

**Advanced Clean Cars Program.** The Advanced Clean Cars program, introduced in 2012, combines the control of smog, soot causing pollutants and greenhouse gas emissions into a single coordinated package of requirements for model years 2017 through 2025.

**Cap-and-Trade Regulation.** Emissions associated with transportation (largely in the form of consumption of transportation fuels) are the largest portions of Project GHG emissions. Transportation fuels are subject to the cap-and-trade regulation discussed previously in this section. The regulation requires that emissions generated by the combustion of fuels be reduced over time. Although not accounted for under the CalEEMod estimates of the Project's GHG emissions, the cap-and-trade regulations relating to fuels will reduce the Project GHG emissions beyond the estimates included in this section.

**Antelope Valley Area Plan (AVAP).** Under AVAP Policy M 2.3, the County must require trip reduction measures to relieve congestion and reduce air pollution from vehicle emissions when evaluating new development proposals.

---

### **Project Design Features**

**PDF 21-9.** The Green Development Program requires that the Project establish a Transportation Management Association (TMA) that develops strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize transit efficiencies and services. The TMA's purpose is to coordinate and facilitate transit and rideshare usage to serve as many riders as possible; to promote multi-modal transportation services and options; and to reduce resident and employee use of single-occupancy automobiles for off-site commuting, and for internal travel within the Specific Plan. PDF 21-9 is required for implementation through MM 10-1, detailed in Section 5.10, Traffic, Access, and Circulation. Elements of MM 10-1 that would reduce fossil fuel VMT and thereby reduce GHG emissions include, but are not limited to:

- Providing residents and employees with multiple modes of accessibility for internal and external trips by future residents and visitors;
- Providing residents and employees on the Project site with multiple modes of transportation;
- Allowing for 60 percent of residential units to be located within one-half mile of a Village center that includes retail uses;
- Providing parks within a 5-minute walk of all residences;
- Locating 90 percent of residents within a 10-minute bike ride of retail;
- Locating 70 percent of residents within a 15-minute bike ride of employment center;
- Locating 85 percent of residents within walking or biking distance of a school;
- Requiring TMA implementation of combination of transit and transportation measures to reduce on-site single-occupancy automobile use by 30 percent in relation to standard ITE-generation rates for the overall Project;
- Requiring TMA implementation of a combination of measures to reduce off-site peak hour commutes to and from the Project site in single-occupancy automobiles by 20 percent; and
- Incorporating Transportation Demand Management (TDM) features to reduce dependence on the automobile, provide for a more efficient use of transportation resources among Project occupants, and thereby reduce pollutant emissions. The key TDM elements that are inherent in the overall Mobility Plan are
  - Sidewalks, greenway trails, and community trails that link residential, schools, shopping, and employment areas;
  - Creation and ongoing operation of a Transportation Management Association (TMA) to fund and manage the operation of ongoing transportation programs, including but not limited to transit and on-demand services.
  - Small- to medium-sized streets and blocks that allow for shorter walking distances to retail, parks, schools, and other destinations;
  - Pedestrian environments incorporated with public streets;
  - Parking behind buildings to encourage walking in retail areas along street

frontage; and

- Parks within 0.25 mile of all residences.

**PDF 21-10.** The Centennial Affordable Housing Implementation Plan (see Appendix 3-H of the Centennial Specific Plan, which is in Appendix 4.0-A of the EIR) will be adopted in conjunction with the Specific Plan and will include dedication of a minimum of ten percent of all homes in Centennial communities that permit housing, with the exception of the lowest density area (Community 8-2) to be affordable housing units. A range of employment opportunities will be created within the community; therefore, a range of housing needs will be provided to reduce the number of vehicle trips (particularly long trips outside the Project). CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* identifies affordable housing as a quantifiable measure for reducing GHG emissions as it allows lower income families to live closer to jobs centers (CAPCOA 2010). PDF 21-10 is required for implementation through MM 21-14.

**PDF 21-11.** The *Centennial Specific Plan's* Green Development Program requires the installation of one 208/240 VAC receptacle that may be used for charging electric vehicles in each detached and attached single-family residence. The installation shall comply with requirements of Section 4.106.4.1 of the 2016 CALGreen Code. PDF 21-11 is required for implementation through MM 21-15.

**PDF 21-12.** The *Centennial Specific Plan's* Green Development Program requires each applicant for an applicable construction permit for a Business Park or Institutional land use to install "alternative energy fueling stations" as listed below. An "alternative energy vehicle fueling station" is a 208/240 VAC electrical vehicle charging station or a station providing another new or improved technology (e.g. CNG) and hydrogen fuel cell) that provides refueling for vehicles that do not use fossil fuel.

- Business Park and Institutional land use designations shall provide a minimum of one alternative energy vehicle fueling station on site for the first 50,000 square feet of usable floor space and additional alternative energy vehicle fueling stations for each additional 50,000 square feet of usable floor space thereafter.
- Multi-family residential buildings of at least 20 residential units shall provide a minimum of one alternative energy vehicle fueling station for the first twenty (20) residential units and an additional alternative energy vehicle fueling station for each additional twenty (20) residential units thereafter.
- The Town Center and each Village Center shall provide a minimum of one alternative energy vehicle charging station.
- Designated Transit Hubs shall provide a minimum of one alternative energy vehicle charging station.

PDF 21-12 is required for implementation through MM 21-16.

**PDF 21-13.** The Green Development Program requires that prior to the issuance of each nonresidential construction permit, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the building designs for non-residential buildings:

- Bicycle parking spaces at a rate of 5 percent of minimum required vehicle parking spaces for non-residential land uses.
- Preferential parking for low-emitting, fuel-efficient, and carpool/van vehicles shall be provided as specified in Section A5.106.5.1, Nonresidential Voluntary Measures, of the CALGreen Code.

PDF 21-13 is required for implementation through MM 21-17.

**PDF 21-14.** The Green Development Program requires that prior to the issuance of an applicable construction permit for each multi-family residential building permit, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the building designs or specifications:

- Visitor parking shall include preferentially located parking spaces for alternative-fueled vehicles.
- Bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code or as required by Section 22.52.1225B of the County Code, whichever is more stringent.

PDF 21-14 is required for implementation through MM 21-18.

**PDF 21-15.** The Green Development Program requires that, prior to issuance of an applicable construction permit for parking structures and parking lots with 20 or more parking spaces, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the parking facility:

- The parking facility shall include a minimum of five percent preferentially located parking spaces for alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles.
- The parking facility shall include at least one electric vehicle charging station. Electrical lines shall be designed and sized to add additional charging stations for up to three percent of the total parking spaces when a demand is demonstrated. The design and installation shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, of the CALGreen Code.
- For residential parking facilities, bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen code or as required by Section 22.52.1225B of the County Code, whichever is more stringent.

PDF 21-15 is required for implementation through MM 21-19.

**PDF 21-16.** The Green Development Program requires that the Project Applicant/Developer provide:

- Internet infrastructure and high-speed broadband access to facilitate telecommuting, and
- A community intranet (or similar) with access for homeowners associations; interest groups; local event scheduling; schools, library, carpool and transit services; and other on-site entertainment and amenities reduce the need for people to use automobile travel to obtain the information that is provided.

Compliance shall be required prior to the issuance of building permit for the 1,000<sup>th</sup> residential unit. PDF 21-16 is required for implementation through MM 10-2 in Section 5.10, Traffic, Access, and Circulation.

As the Project will incorporate these project design features and must comply with these applicable regulations imposed by law, the Project would contribute to the achievement for AB 32's goals related to mobile source emissions.

Estimated Project operational GHG emissions are shown in Table 5.21-10. Table 5.21-10 also shows the combined operational, construction, and vegetation change GHG emissions.

As previously described in Section 5.21.5, under Threshold 21-1, this impact analysis evaluates consistency with applicable regulatory programs designed to reduce GHG emissions and that contribute to achievement of AB 32's goals as the primary significance criteria, a method of analysis that is consistent with pathways to compliance described in the *Newhall* decision. The quantitative emissions data in Tables 5.21-4 through 5.21-10 are provided for information purposes. Also for information purposes, Table 5.21-10 compares the emissions with the AVAQMD project-level CEQA significance threshold and the SCAQMD project-level recommended GHG efficiency threshold, both discussed in more detail below.

**TABLE 5.21-10  
OPERATIONAL AND TOTAL GHG EMISSIONS**

GHG Sources	Emissions MTCO <sub>2e</sub>	Percent of Operational Emissions
<i>Operational</i>	239,215	
Area	11,297	5%
Energy	49,414	21%
Mobile	160,904	67%
Solid waste	10,214	4%
Water	7,387	3%
<i>Construction</i>	4,490	
Vegetation loss	922	
New trees	-249	
<b>Total</b>	<b>244,379</b>	
<b>AVAQMD Project-Level CEQA significance threshold</b>	<b>100,000</b>	
Exceeds threshold?	Yes	
Service population (SP)	80,825	
<b>GHG Efficiency</b>	<b>3.02</b>	
<b>SCAQMD Plan-Level staff- proposed "plan-level" GHG efficiency threshold (MTCO<sub>2e</sub>/SP/Year)</b>	<b>4.1</b>	
Exceeds threshold?	No	
<b>SCAQMD Plan-Level staff- proposed "project-level" recommended GHG efficiency threshold (MTCO<sub>2e</sub>/SP/Year)</b>	<b>3.0</b>	
Exceeds threshold?	Yes	
GHG: greenhouse gas; MTCO <sub>2e</sub> : metric tons of carbon dioxide equivalent; AVAQMD: Antelope Valley Air Quality Management District; SCAQMD: South Coast Air Quality Management District.		
Emissions calculations can be found in Appendix 5.11-A.		

### **AVAQMD Thresholds**

The AVAQMD's *CEQA and Federal Conformity Guidelines* (2011) establishes significance thresholds to assess the regional impact of project-related air pollutant emissions in the AVAQMD. The AVAQMD threshold for GHG emissions is 100,000 MTCO<sub>2e</sub> per year. A project with emission rates below this threshold is considered to have a less than significant effect on regional air quality throughout the AVAQMD portion of the MDAB.

For informational purposes, the Project's estimated combined operational, construction, and vegetation change GHG emissions are 244,379 MTCO<sub>2e</sub>, thus exceeding AVAQMD's 100,000 MTCO<sub>2e</sub> threshold.

### **SCAQMD Thresholds**

In April 2008, SCAQMD convened a Working Group to develop GHG significance thresholds. On December 5, 2008, the SCAQMD Governing Board (Board) adopted its staff proposal for an interim CEQA GHG significance threshold for projects where the SCAQMD is the lead agency. As to all other projects, where the SCAQMD is not the lead agency, the Board has, to date, only adopted an interim threshold of 10,000 MTCO<sub>2e</sub> per year for industrial stationary source projects (SCAQMD 2008).

For all other projects, SCAQMD staff proposed a multiple tier analysis to determine the appropriate threshold to be used. The draft proposal suggests the following tiers: Tier 1 is any applicable CEQA exemptions; Tier 2 is consistency with a GHG reduction plan; Tier 3 is a screening value or bright line; Tier 4 is a performance based standard; and Tier 5 is GHG mitigation offsets (SCAQMD 2008). According to the presentation given at the September 28, 2010 Working Group meeting, SCAQMD staff proposed a Tier 3 draft threshold of 1,400 to 3,500 MTCO<sub>2e</sub>/year depending on if the project was commercial, mixed use, or residential (SCAQMD 2010). For the Tier 4 draft threshold SCAQMD staff presented a percent emission reduction target option but did not provide any specific recommendation for a percent emission reduction target; instead it referenced the San Joaquin Valley Air Pollution Control District (SJVAPCD) approach.

The percent reduction target is based on consistency with AB 32 as it was based on the same numeric reductions calculated in the Scoping Plan to reach 1990 levels by 2020. As discussed in Section 5.21.2, Relevant Plans, Policies, and Regulations, the First Update to the AB 32 Scoping Plan states the following (CARB 2014b):

California is on track to meet the near-term 2020 greenhouse gas limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32.” Specifically, “if California realizes the expected benefits of existing policy goals (such as 12,000 megawatts [MW] of renewable distributed generation by 2020, net zero energy homes after 2020, existing building retrofits under AB 758, and others) it could reduce emissions by 2030 to levels squarely in line with those needed in the developed world and to stay on track to reduce emissions to 80 percent below 1990 levels by 2050.

The second Tier 4 option is to utilize an efficiency target. The targets for 2020 are 4.8 MTCO<sub>2e</sub> per year per service population (SP) for project level thresholds where SP is project residents plus employees and 6.6 MTCO<sub>2e</sub> per year per SP for a plan level threshold (SCAQMD 2010). The targets for 2035 are 3.0 MTCO<sub>2e</sub> per year per SP for project level thresholds and 4.1 MTCO<sub>2e</sub> per year per SP for a plan level threshold.

The Working Group has not convened since the fall of 2010. As of the writing of this EIR, the proposal has not been considered or approved for use by the SCAQMD Board.

The Project’s estimated combined operational, construction, and vegetation change GHG emissions are 244,379 MTCO<sub>2e</sub> and its estimated service population is 57,150 residents and 23,675 employees for a total of 80,825, resulting in annual emissions of 3.02 MTCO<sub>2e</sub> per service population. Thus, for informational purposes, the Project’s estimated emissions would exceed the 2035 “project-level” efficiency threshold of 3.0 MTCO<sub>2e</sub> proposed by

SCAQMD staff, which threshold has not been adopted by the SCAQMD Board. However, Project's estimated emissions would not exceed the 2035 "plan-level" efficiency threshold of 4.1 MTCO<sub>2e</sub> proposed by SCAQMD staff.

**Threshold 21-2 Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?**

***Consistency with the Los Angeles County Community Climate Action Plan***

The Los Angeles County CCAP is designed to support the State's overall GHG reduction goals for 2020 under AB 32. The Project's consistency with the CCAP is shown in Table 5.21-11. If the Project is consistent with the CCAP, it would not have significant GHG emissions relative to the CCAP's 2020 planning horizon and the AB 32 reduction target. Since the Project has a phased implementation schedule with full buildout beyond the CCAP's 2020 planning horizon, consistency with the CCAP is only one *Newhall* compliance pathway used in this Section 5.21.6 to evaluate the significance of the Project's GHG emissions. However, the Project's consistency with the CCAP is important for determining the significance of GHG emissions for the current CCAP planning horizon.

As demonstrated in detail in Section 5.8, Land Use, Entitlements, and Planning, the Project would be consistent with the goals and policies of the AVAP, would implement the AVAP and would not conflict with it. Since the CCAP relies on the AVAP to inform its socioeconomic assumptions, and since the Project is consistent with the AVAP, it follows that the Project is also consistent with the socioeconomic assumptions contained in the County's CCAP.

The CCAP builds on existing County programs, and adds new actions, as shown in Table 5.21-11. Mandatory new actions are identified in ***bold and italic*** text, but this consistency analysis includes both mandatory and voluntary new actions. Centennial Implementation Actions, as shown in the Table 5.21-11 below, include a brief summary listing of Project Design Features (PDFs) and Mitigation Measures (MMs) presented in applicable topical sections 5.1 through 5.21 of this Draft EIR. The CCAP is a countywide program, and this analysis evaluates elements of the CCAP that are relevant to the Centennial Project.

**TABLE 5.21-11  
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY  
COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
<b>CATEGORY 1: GREEN BUILDING AND ENERGY</b>	
<b>Existing County Initiatives</b>	
<i>Energy Upgrades to Existing Structures</i> provides rebates and incentives for energy retrofit efficiency projects.	Because Centennial will be a new community, energy efficiency is required for buildings, infrastructure (e.g., outdoor irrigation), and appliances. The Project does not include any existing structures, and thus this CCAP action is not applicable.
<i>Los Angeles County Code (Title 31)</i> requires implementation of sustainable policies for new building design.	Title 31 applies to the Project, and is implemented through a variety of measures including, for example (1) landscape design restrictions related to minimizing turf grass and the use of non-invasive and drought tolerant plants and tree species; (2) recycling and/or salvaging a minimum of 75% of the non-hazardous construction and demolition debris; and (3) compliance with a water budget for landscape irrigation use conforms to the California Department of Water Resources Model Water Efficient Landscape Ordinance.
<i>Commercial Building Performance Partnership</i> provides financial mechanisms for energy conservation upgrades to existing buildings.	Energy conservation is required for new structures, and no retrofits of existing structures are included in the Project and thus this CCAP action is not applicable.
<i>Renewable Energy and Clean Fuels Program</i> implements projects to accelerate the use of compressed natural gas as an alternative fuel.	Renewable energy produced within the Project will be primarily rooftop solar, and at minimum 50% of the Project's anticipated electricity demand will be satisfied from on-site renewable energy generation. It is anticipated that the dominant alternative transportation fuel will be electricity (e.g., electric and hybrid-electric vehicles); however, compressed natural gas (CNG) will also be made available as a transportation fuel to the extent consistent with then-applicable recommendations and/or requirements from the California Air Resources Board (CARB) and County.
<b>New CCAP Actions</b>	
<i>BE-1: Green Building Development</i> encourages energy reductions in new development through voluntary reductions that exceed the minimum standards set forth in the State's CALGreen Building Code (Title 24).	The Project exceeds the CALGreen Building Code minimum requirements in several ways, including: <ol style="list-style-type: none"> <li>1. Compliance with CALGreen voluntary measure A4.203.1.2.1 for low-rise residential buildings, resulting in buildings that would exceed 2016 Title 24 requirements by 15% (PDF 21-1).</li> <li>2. Compliance with CALGreen voluntary measure A5.203.1.2.1 for nonresidential buildings and residential buildings taller than 4 stories,</li> </ol>

**TABLE 5.21-11  
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY  
COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	<p>resulting in buildings that would exceed 2016 Title 24 requirements by 10%.</p> <p>3. Owners of all single-family units and multi-family residential structures are required, upon resale, to present to the buyer a written energy audit checklist at the time the seller provides the buyer with the Real Estate Transfer Disclosure Statement required by Section 1102 et seq. of the <i>California Civil Code</i>. The energy audit checklist shall certify that all heating, ventilation, and air conditioning (HVAC) systems, thermostats, appliances, windows, and swimming pools are either the same as originally installed or otherwise comply with the Green Development Program.</p> <p>4. For nonresidential buildings, within 90 days after the end of the first full calendar year following the issuance of the certificate of occupancy, and within 90 days after each 5-year period thereafter, the owner or tenant in possession thereof shall submit to the master commercial owners association or other applicable association a report prepared by the owner or a qualified, independent third party that evaluates whether all major building systems such as a heat furnace, air conditioner, and other energy-consuming mechanical fixtures are working within the design standards established by the manufacturer of such equipment.</p> <p>5. Residential appliances offered by builders shall consist exclusively of low-energy and/or low-water consuming appliances that are Energy-Star compliant for each appliance that is rated by Energy Star (e.g., refrigerator, clothes washer, dishwasher, and room air conditioner).</p> <p>These project design features meet and exceed the requirements of Section 22.52.2130 of the County Code (Green Building).</p>
<p><b>BE-2: Energy Efficiency</b> retrofits will be further encouraged for existing buildings and structures.</p>	<p>The Project does not include any existing buildings, so this measure is not applicable.</p>
<p><b>BE-3: Solar Installations</b> are encouraged for new and existing buildings</p>	<p>Renewable energy produced within the Project would be generated at a minimum of 50% of the Project’s anticipated electricity demand would be satisfied from on-site renewable energy generation. Specific metrics to achieve this goal include:</p>

**TABLE 5.21-11**  
**CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY**  
**COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	<ol style="list-style-type: none"> <li>1. A minimum of 100% of all single-family detached residential units at buildout shall have solar energy collection equipment installed on roof areas or on top of other structures on the site (e.g., patio covers or pergolas).</li> <li>2. Single-family detached residential units with roof areas that are within 30 degrees of true south shall include plumbing appropriate for a solar water heating running from the installed water heater to the solar-ready roof areas, and those with roof areas that are not within 30 degrees of true south shall be plumbed to accommodate an on-demand tankless water heater.</li> <li>3. A minimum of 10% of all single-family detached residential units at buildout shall either include an installed solar water heater, tankless water heater, or other energy efficient water heater technology approved by the County.</li> <li>4. A minimum of 30% of all multi-family residential units at buildout shall have solar energy collection equipment, which shall be installed on roof areas facing within 30 degrees of true south.</li> <li>5. All swimming pools constructed within the Project shall be heated by a solar water heating system or renewable power system that provides electricity for water heating.</li> <li>6. A minimum of 60% of buildings located within Business Park land use designations at buildout shall have solar panel systems installed on roof areas. Such systems shall be installed on roof areas facing within 30 degrees of true south.</li> </ol>
<p><b>BE-4: Alternative Renewable Energy Programs</b> are designed to encourage the use of non-solar renewable energy technology such as wind, hydropower, and geothermal resources, as feasible.</p>	<p>The Project site does not have hydropower or geothermal resources. Utility-scale wind plants present a potential hazard to sensitive biological resources such as the California Condor, and utility-scale solar plants are not an authorized use on the Project site or vicinity under the Antelope Valley Area Plan.</p>
<p><b>BE-5: Wastewater Treatment Plant Biogas</b> recovery and reuse</p>	<p>The Project's wastewater reclamation facilities (WRF) will include equipment to capture and reuse biogas for energy production.</p>
<p><b>BE-6: Energy Efficiency Retrofits of Wastewater Equipment</b> promotes efficient treatment equipment</p>	<p>There is no existing wastewater treatment facility at the Project site, so this measure is not applicable.</p>
<p><b>BE-7 Landfill Biogas</b> encourages renewable biogas projects at regional landfills.</p>	<p>There is no existing or proposed landfill at the Project site, so this measure is not applicable.</p>

**TABLE 5.21-11  
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY  
COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
<b>CATEGORY 2: LAND USE AND TRANSPORTATION</b>	
<b>Existing County Initiatives</b>	
<p><b>Healthy Design Ordinance</b> (Ordinance 2013-001, amending Title 21 (Subdivisions) and Title 22 (Planning and Zoning)) is designed to require projects to have better walking environments (e.g., with wider sidewalks and more shade trees), encourage more bicycling (e.g., by requiring bike parking), improve access to healthy foods (e.g., with weekly farmer’s markets and permissible community gardens), and enhance project review requirements to provide an opportunity to review healthy design features such as landscaping, lighting, street furniture and bike parking spots.</p>	<p>The Project design complies with all of the substantive standards of the Healthy Design Ordinance, including but not limited to requirements for right-of-way widths; pedestrian crossings; tree plantings in lot frontages; and bicycle parking facilities. The Project allows community gardens as legally permitted uses in residential and mixed use areas of the Project. The Project Transportation Demand Management (TDM) Program includes bicycle program metrics, discussed below.</p>
<p><b>Bicycle Master Plan</b> promotes bicycle ridership and bike-friendly designs throughout the County.</p>	<p>The Project includes a safe and aesthetically pleasing dedicated bicycle network and pedestrian system into all development designs, and distribute community uses such as neighborhood parks, elementary schools, and neighborhood-scale retail in key locations throughout the Project to reduce single-occupancy automobile travel for these neighborhood-scale destinations. The Project TDM Program includes bicycle program metrics, discussed below.</p>
<p><b>Sustainable Transportation Programs</b> to increase the efficiency of the transportation network.</p>	<p>The Project includes the following measures to reduce single-occupancy commuter travel to and from the Project site:</p> <ol style="list-style-type: none"> <li>1. Land use planning principles that create a balanced master-planned community that includes:               <ol style="list-style-type: none"> <li>A. Mixed-use neighborhoods where residential, commercial, and other employment-generating uses and institutional/public uses are proximate to each other and connected by a network of trails to reduce reliance on automobile use within the Project site.</li> <li>B. A diverse range of residential product types, including dedication of a minimum of 10% of residential units as affordable housing, to compliment the diverse range of employment opportunities within the Project and help minimize the off-site employment commuter trips.</li> </ol> </li> <li>2. Establishment of a Transportation Management Association (TMA) that develops strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize</li> </ol>

**TABLE 5.21-11**  
**CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY**  
**COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	transit efficiencies and services. The TMA's purpose is also to coordinate and facilitate transit and rideshare usage to serve as many riders as possible, and to reduce the volume of automobile trips within and from the Project site, as described in more detail in the Project TDM Program below.
<b>New CCAP Actions</b>	
<b>LUT-1: Bicycle Programs and Supporting Facility improvements</b> to expand the County's existing bicycle network.	As a new community, the Project includes a network of multi-purpose trails and community trails, in addition to the greenways and paseos. The Project trail system will connect to the Pacific Crest Trail (PCT), which is designated as a National Scenic Trail that traverses approximately 2,650 miles through 3 states (California, Oregon, and Washington) will be relocated to the west side of 300 <sup>th</sup> Street West, which travels through the Project site. This realignment is not a part of the Project, but is assumed to be the future alignment for evaluation purposes in this EIR. Project requires bicycle parking facilities that meet or exceed the requirements of County Section 22.52.1225B, to encourage and support bicycle use.
<b>LUT-2: Pedestrian Network improvements</b> to expand the County's existing pedestrian network.	As a new community, the Project implements a Complete Streets design approach that includes sidewalks and dedicated bicycle network and pedestrian system incorporated into all development designs and throughout the community to reduce single-occupancy automobile travel for neighborhood-scale destinations.
<b>LUT-3: Transit Expansion</b> to create priority bus lanes and improve the existing efficiency of the transportation network.	As a new community, the Project implements a TDM Program that includes strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize transit efficiencies and services. The TMA's purpose is to coordinate and facilitate transit and rideshare usage to serve as many riders as possible.
<b>LUT-4: Travel Demand Management</b> to encourage ride-sharing and employer-sponsored vanpools to reduce peak-period vehicle trips.	The Project TDM Program encourages ride-sharing and employer-sponsored vanpools, as well as other measures to reduce automobile trips within and from the Project site. The TDM will be managed by the TMA.
<b>LUT-5: Car-Sharing Program</b> promotes the shared use of private and employer-owned vehicles.	The Project TDM Program includes formation of strategic partnerships with car sharing services (e.g., Uber or Lyft) and other innovation/technology approaches to increase transportation efficiency, as described in more detail below.

**TABLE 5.21-11**  
**CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY**  
**COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
<p><b>LUT-6: Land Use Design and Density</b> targets land use patterns to support mobility, and improve the diversity of urban and suburban developments</p>	<p>The Project includes a balanced mix of housing, employment, and community uses including schools, retail, and public services, to minimize off-site trips. The Project design also encourages pedestrian and bicycle use, and includes a diverse range of housing types.</p>
<p><b>LUT-7: Transportation Signal Synchronization Program</b> Improve the network of traffic signals on the major streets throughout Los Angeles (LA) County.</p>	<p>The Project does not include any existing traffic signals, but will use synchronized traffic signals to ensure the efficient use of future Project roadways.</p>
<p><b>LUT-8: Electric Vehicle Infrastructure.</b> Install EV charging facilities at County-owned public venues and ensure that at least one-third of these charging stations will be available for visitor use.</p>	<p>The Project requires electric vehicle infrastructure, specifically:</p> <ol style="list-style-type: none"> <li>1. Builders will be required to install one 240 volt of alternating current (VAC) outlet available for use to charge electric vehicles in the garage or other suitable location for each single-family home.</li> <li>2. For business park and institutional land uses, a minimum of 1 electric vehicle charging station (consisting of a 208/240 VAC or alternative electric charging technology approved by the County, serving 2 adjacent parking spaces) will be installed for the first 50,000 square feet (sf) of building space, and an additional fueling station will be installed for each subsequent 50,000 sf of building space.</li> <li>3. For multi-family residential projects that include at least 20 units, a minimum of 1 electric vehicle charging station be installed for the first 20 units and an additional charging station will be installed for each subsequent 20 units.</li> <li>4. Preferential parking for low-emitting, fuel-efficient, and carpool/van vehicles shall be provided for nonresidential structures larger than 20,000 sf and made available for employees and visitors.</li> <li>5. For parking facilities and parking lots with more than 20 spaces, the parking facility or lot must include: <ol style="list-style-type: none"> <li>A. A minimum of 5% preferentially located parking spaces for alternative-fueled vehicles.</li> <li>B. Electrical lines designed and sized to provide electric vehicle charging stations for</li> </ol> </li> </ol>

**TABLE 5.21-11**  
**CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY**  
**COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	up to 3% of parking space when demand is demonstrated.
<b>LUT-9: Idling Reduction Goal.</b> Encourage idling limits of 3 minutes for heavy-duty construction equipment as feasible within manufacturer's specifications.	The Project includes as a mandatory contract specification for all construction contractors a restriction to limit unnecessary construction equipment idling to 3 minutes, and include methods to encourage equipment operators to achieve the 3-minute goal.
<b>LUT-10: Efficient Goods Movement</b> is designed to improve cargo transport on existing roadways and transportation infrastructure.	The Project includes contributions to California Department of Transportation (Caltrans) to avoid any adverse Project-related impact to goods movement on Interstate (I) 5 and State Route (SR) 138. Contributions are described in mitigation measures in Section 5.10, Traffic, Access and Circulation.
<b>LUT-11: Sustainable Pavements Program</b> is designed to improve the resiliency of, and reduce the GHG emissions associated with, existing paved roadways.	The Project will use durable roadway paving materials that will be determined upon consideration of aggregates, asphalt materials, cementitious materials, recycled materials, and other roadway materials that are commonly used in pavement construction in order to assess from a life-cycle perspective the role they play in contributing to the sustainability of the Project's pavement system. "Cool" pavements will be used to reduce heat island effects.
<b>LUT-12: Electrify Construction and Landscaping Equipment.</b> Utilize electric equipment wherever feasible for construction projects. Reduce the use of gas-powered landscaping equipment.	All landscape maintenance equipment at Centennial will be electric. The Project will incorporate an outreach and education program for the Centennial property owners, in collaboration of SCAQMD, to reduce the use of gasoline-or diesel-powered landscaping equipment.
<b>CATEGORY 3: WATER CONSERVATION AND WASTEWATER</b>	
<b>Existing County Initiatives</b>	
<b>Conservation rebates, smart gardening workshops and stormwater controls</b> provide water and wastewater improvements in existing communities	This measure does not apply to new communities. The Project includes compliance with drought-response State measures including the Model Water Efficient Landscape Ordinance (MWELO), which are more stringent than required by CALGreen (DWR 2015). The Project includes 2 WRFs that will provide a reliable supply of recycled water for landscaping, to reduce reliance on potable water supplies.
<b>New CCAP Actions</b>	
<b>WAW-1: Per Capita Water Use Reduction Goal.</b> Meet the State established per capita water use reduction goal as identified by Senate Bill (SB) X7-7 for 2020. The State goal is a 20 percent reduction in per capita water use compared to baseline levels.	The final EIR for the Antelope Valley Area Plan (AVAP) update utilized the Antelope Valley Integrated Regional Water Management Plan (AVIRWMP) average Antelope Valley estimate of per capita water use (199 gallons per capita per day

**TABLE 5.21-11**  
**CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY**  
**COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	<p>[gpcd]) to evaluate the water demand growth that could occur from the implementation of the AVAP. At full buildout, the Project's total per capita water use would be approximately 177.5 gpcd.</p> <p>The Project would reduce water demand by approximately 10% below the per capita average consumption in the Antelope Valley. The analysis compared the Project to the baseline per capita consumption in the Project vicinity since the Project site is undeveloped there is not an established baseline of water consumption on the Project site.</p>
<p><b><i>WAW-2: Recycled Water, Water Supply Improvement Programs, and Stormwater Runoff.</i></b>  Promote the use of wastewater and gray water to be used for agricultural, industrial, and irrigation purposes. Manage stormwater, reduce potential treatment, and protect local groundwater supplies.</p>	<p>The Project includes a comprehensive water resources management program, including:</p> <ol style="list-style-type: none"> <li>1. <i>Recycled Water.</i> The Project includes water recycling facility to recycle, and reuse, wastewater piped to the Project WRF. All nonresidential and multi-family development must install recycled water infrastructure to irrigate common areas for these facilities (except where prohibited by law), and all available recycled water shall be used for such irrigation uses.</li> <li>2. <i>Potable Water Conservation.</i> The Project includes numerous potable water conservation measures, including: <ol style="list-style-type: none"> <li>A. Establishing maximum available water allocations for each residential and commercial parcel, and monitoring and enforcing such allocations through a metering system and rate structure and/or penalty structure for those exceeding their water allocations.</li> <li>B. Restricting outdoor landscaping planting in private yards to a designated low-water plant pallets to minimize use of potable water for private landscaping, prohibiting turf in commercial projects, and restricting turf to 25% of landscaped areas on private residential projects.</li> <li>C. Requiring the exclusive use of Energy Star or equivalent major appliances, as described above, that use less water (as well as less energy).</li> <li>D. Requiring the exclusive use of kitchen and bathroom faucets that comply with 2013</li> </ol> </li> </ol>

**TABLE 5.21-11  
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY  
COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	<p>CALGreen code residential voluntary measures specified in Sections A4.303.1 and A4.303.3 of the code.</p> <p>3. <i>Storm Water Management.</i> The Project's integrated water resources management approach will comply with County requirements related to hydrology and flood control considerations through compliance with Low Impact Development (LID) standards and best management practices (BMPs) for sediment management through hydromodification techniques. The Project includes 2 WRFs that will provide a reliable supply of recycled water for landscaping, to reduce reliance on potable water supplies. The Project provides a reliable water supply through use of an integrated water resources management approach that incorporates water conservation measures; uses recycled water for non-potable uses; uses multiple sources of water supply to ensure that the Project's water needs are met without the need to solely rely on the annual delivery of a fixed amount of imported water; provides a high degree of water supply reliability for each stage of Project buildout; and minimizes the impacts of additional water demand on the state's water supply.</p>
<b>CATEGORY 4: WASTE REDUCTION, REUSE AND RECYCLING</b>	
<b>Existing Initiatives</b>	
<p><b><i>Community waste diversion programs to redirect 50 percent of solid wastes to recycling or re-use instead of landfills</i></b></p>	<p>The Project will exceed this existing measure by implementing a 100 percent diversion of soil during grading activities, and at least 70 percent of non-hazardous construction and demolition waste. The Project will also divert 75 percent of operational solid waste.</p>
<b>New CCAP Action</b>	
<p><b><i>SW-1: Waste Diversion Goal.</i></b> For the County's unincorporated areas, adopt a waste diversion goal to comply with all State mandates to divert at least 75 percent of waste from landfill disposal by 2020.</p>	<p>The Project includes both a construction and operational waste reduction measures.</p> <p>1. The Project must implement a plan and monitoring program to ensure recycle or reuse of a minimum of 75% by weight of construction and demolition debris, exclusive of soil, rock, and gravel. This quantity exceeds the 50% requirement of Section 20.87.040 of the County Code and the 75% target proposed in the CCAP.</p>

**TABLE 5.21-11**  
**CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY**  
**COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	<p>2. The Developer must provide the County with a contract establishing an on-site waste recycling and composting program, including the collection of metals, paper, household plastics, glass, cardboard, green waste and food waste. The waste hauler should be required by contract to maintain records showing the diversion of not less than 75% of the operational waste generated by the Project. The Project will include a minimum of five acres for a Materials Recovery Facility/Transfer Station (MRF/TS), which may include mulching and composting operations and a Household Hazardous Waste Permanent Collection Center. An MRF/TS could be privately or publicly operated. The MRF/TS would allow for all materials that are recyclable to be sorted and compacted for shipment to an off-site recycling processing facility. The Developer shall encourage a waste management company to build these facilities within the Project site by grading, improving, and providing utility hookups by the end of the first phase of construction. The CC&amp;R for the MRF/TS will require that the lot provided within the site remain as a Non-Disposal Solid Waste Processing Facility.</p>

**TABLE 5.21-11  
CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY  
COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
<b>CATEGORY 5: LAND CONSERVATION AND TREE PLANTING</b>	
<b>Existing Initiatives</b>	
<i>Implementation of the urban forestry plan and oak woodlands conservation management plan.</i>	The Project’s Natural Resources/Open Space Management Plan includes both on-site and off-site preserve areas. Approximately 5,116 acres of open space are available for use as on-site mitigation and off-site mitigation areas total 23,547 acres, for a combined total of 28,663 acres of preserved open space resulting from Project implementation. The Project avoids development within established Significant Ecological Areas, minimizes disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat. Open spaces will be provided within the Business Park that allow for wildlife movement between the southern portion of the Project site through to the drainage located on the northern side of SR 138.
<b>New CCAP Actions</b>	
<i>LC-1: Develop Urban Forests.</i> Support and expand urban forest programs within the unincorporated areas.	The Project’s Natural Resources/Open Space Management Plan includes both on-site and off-site preserve areas. Approximately 5,116 acres of open space are available for use as on-site mitigation and off-site mitigation areas total 23,547 acres, for a combined total of 28,663 acres of preserved open space resulting from Project implementation. The Project avoids development within established Significant Ecological Areas, minimize disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat.  The planting of an estimated 35,123 new trees, as required by the County Tree Planting Ordinance would result in an estimated long-term sequestration of 24,867 metric tons of carbon dioxide equivalent (MTCO <sub>2e</sub> ). This is a conservative analysis, as it is likely that many more trees would be planted than the minimum required by the County ordinance.
<i>LC-2: Create New Vegetated Open Space.</i> Restore and revegetate previously disturbed land and/or unused urban and suburban areas.	This action is not directly applicable to new development projects. However, the Project’s Natural Resources/Open Space Management Plan includes both on-site and off-site preserve areas. Approximately 5,116 acres of open space are available for use as on-site mitigation and off-site mitigation areas total 23,547 acres, for a combined

**TABLE 5.21-11**  
**CENTENNIAL PROJECT COMPLIANCE WITH THE LOS ANGELES COUNTY**  
**COMMUNITY CLIMATE ACTION PLAN**

Existing Initiatives and New CCAP Actions	Centennial Implementation Actions
	total of 28,663 acres of preserved open space resulting from Project implementation. The Project avoids development within established Significant Ecological Areas, minimize disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat. Additionally, the Project would plant an estimated 35,123 new trees, as required by the County Tree Planting Ordinance. This would result in an estimated long-term sequestration of 24,867 MTCO <sub>2e</sub> . This is a conservative analysis, as it is likely that many more trees would be planted than the minimum required by the County ordinance
<b>LC-3: Promote the Sale of Locally Grown Foods and/or Products.</b> Establish local farmers markets and support locally grown food.	The Project will include a weekly Farmer's Market sponsored by the homeowners association (HOA) or other entity selected by the Master Applicant/Developer, and will allow for community gardens as a permitted use in commercial and residential areas.
<b>LC-4: Protect Conservation Areas.</b> Encourage the protection of existing land conservation areas.	The Project's Natural Resources/Open Space Management Plan includes both on-site and off-site preserve areas. Approximately 5,116 acres of open space are available for use as on-site mitigation and off-site mitigation areas total 23,547 acres, for a combined total of 28,663 acres of preserved open space resulting from Project implementation. The Project avoids development within established Significant Ecological Areas, minimize disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat.

As shown in Table 5.21-11, the Project would be consistent with, and would not conflict with, all applicable actions of the CCAP and its greenhouse gas reduction strategy.

The CCAP also recognizes the importance of ongoing implementation of statewide GHG reduction statutory mandates, including the following:

- **STATE-1:** Renewable Portfolio Standard, which requires California utilities to generate 50 percent of the state's electricity from renewable sources by 2030.
- **STATE-2:** CALGreen Building Code Standards (Title 24), which reduces GHG emissions through energy and water efficiency standards to be implemented in Commercial and Residential Buildings.

- **STATE-3:** Pavley/Advanced Clean Cars fuel efficiency standards, and Low Carbon Fuel Standards for on-road transportation, to reduce GHG emissions from fossil fuel use in transportation.
- **STATE 4:** Low Carbon Fuel Standard for Off-road Equipment and Vehicles, to reduce GHG emissions from fossil fuel use in construction equipment and other off-road equipment and vehicles.
- **STATE 5:** California Cap-and-Trade Program, to reduce GHG from stationary sources like factories and power plants, and from fossil fuel use.

These statewide mandates apply to Centennial-related buildings and activities, and will further reduce Project-related GHG emissions.

### ***Consistency with the SCAG 2016–2040 RTP/SCS***

The 2016-2040 RTP/SCS is the regional sustainable community strategy prepared pursuant to SB 375. The 2016–2040 RTP/SCS, prepared pursuant to SB 375 includes the same land use designations and density assumptions for Centennial Project site as the approved 2012–2035 RTP/SCS. As demonstrated in Section 5.9, Population, Housing, and Employment, the regional projections formally adopted by SCAG in its 2012–2035 RTP/SCS are used to determine Project conformity with these projections.

Demographic projections included as part of the adopted SCAG 2016–2040 RTP/SCS include development of the Project and are the most recently updated demographic projections available for the Project site and regional vicinity. The County and regional projections were formally adopted by SCAG and the Project has been analyzed to determine conformity with these projections in Section 5.9, Population, Housing, and Employment, of this EIR. Thus, the Project is consistent with, and would not conflict with, the regional blueprint prepared in accordance with SB 375 to reduce the regional share of GHG emissions attributable to the land use sector.

### **Off-Site Impacts**

Construction of the off-site Project features (i.e., roadway improvements, water infrastructure, and utilities connections), as described in Section 4.7 of the EIR, would generate short-term GHG emissions. These construction activities and their associated emissions would be a small part of the estimated on-site emissions, quantified above in Table 5.21-10. Upon completion of construction, the Project off-site roadway, water infrastructure, and utility improvements would not generate GHG emissions.

### **Impact Summary**

Under AB 32, CARB, which is the agency in charge of regulating sources of emissions of GHGs in California, has been tasked with adopting regulations for reduction of GHG emission. The effects of the Project are evaluated based on whether the Project implements reduction strategies identified in applicable statutes such as AB/SB 32 and its implementing plans and regulations and other legal requirements and plans to reduce GHG to meet statutory requirements. As discussed above in Section 5.21.5, this impact analysis evaluates the

Project's compliance with applicable regulatory programs designed to reduce GHG emissions and that contribute to achievement of the State's GHG reduction goals in order to determine whether the Project would generate direct or indirect GHG emissions that may have a significant impact on the environment, a "pathway to compliance" recognized by the Supreme Court in the *Newhall* decision. As discussed under Threshold 21-1, the Project would comply with, and would be consistent with, applicable regulatory programs designed to reduce GHG emissions and would thus contribute to the achievement of AB 32's greenhouse gas reduction goals. Since the Project would comply with applicable regulatory programs designed to reduce GHG emissions, the Project-level impact related to GHG emissions could be considered less than significant under Threshold 21-1.

Furthermore, as discussed above under Threshold 21-2, this impact analysis evaluates whether the project would conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases by examining its consistency with the CCAP and SCAG's RTP/SCS, another "pathway to compliance" recognized by *Newhall*. As discussed above, the Project would be consistent with, and would not conflict with, the Los Angeles County CCAP, which meets the requirements for a programmatic climate action plan specified in Section 15183.5 of the State CEQA Guidelines, as well as the RTP/SCS, the regional sustainable communities strategy prepared pursuant to SB 375. Since the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, and would be consistent with, and not conflict with, an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions, the Project-level impact related to GHG emissions could be considered less than significant under Threshold 21-2.

However, climate change is a global phenomenon and the significance of greenhouse gas emissions is inherently cumulative in nature. Accordingly, the Project's impact related to GHG emissions is most appropriately considered on a cumulative level, not on a project level. As described above, the Project would emit GHGs at an estimated rate of 278,577 metric tons per year that would contribute to the global inventory of GHGs.

To date, California remains a global leader in mandating GHG emission reductions across a broad spectrum of economic sectors, and most other nations and states have not enacted regulations similar to those adopted in California. California also already has nearly the lowest level of GHG per capita of any state. The County of Los Angeles has no jurisdictional control or responsibility for GHG reductions in other parts of California (and certainly not in the context of global action), which all contribute to climate change. In addition, the County does not have jurisdiction to enforce statewide implementation of all of the applicable GHG-reducing regulatory programs with which the Project (and other statewide projects) must comply. Although many other agencies with the necessary jurisdiction are currently taking action to reduce GHG emissions, the County cannot assure that these measures would ultimately be implemented or sufficient to address climate change. In light of these considerations, as well as the global nature climate change related to GHG emissions and the Project's total estimated GHG emissions, the Project's incremental contribution to the global GHG emissions inventory would be considered cumulatively considerable and this cumulative impact is significant and unavoidable, even though the Project satisfies several "pathways to compliance" identified by the *Newhall* court.

### **5.21.7 MITIGATION MEASURES**

The mitigation measures included below were informed by a review of potentially feasible GHG reduction measures identified by staff from the Attorney General of California, included on lists of potentially feasible measures from other agencies (e.g., Air Districts, planning associations), and measures suggested by the applicant.

Because the Office of Planning and Research (OPR) and other expert agencies and scientists agree that GHG emissions are inherently a cumulative impact issue relative to global climate change, the CEQA requirements for mitigating the project's contribution to a significant cumulative impact apply. The Supreme Court in the Newhall case identified several compliance pathways for assessing the significance of GHG emissions from projects, as described above. The project complies with each applicable pathway, and thus has a less than significant impact at a project level.

At a cumulative level, the project contributes GHG emissions to the global inventory of GHG emissions which are collectively causing climate change; however, on this global scale the GHG emissions of a single development project are insufficient to cause a significant adverse global climate change impact since all of California's anthropomorphic activities taken together account for only about 1% of global anthropomorphic GHG emissions based on US EPA data (2015). This conclusion that the project alone does not cause or substantially contribute to a significant adverse cumulative GHG impact is further supported by the fact that this project is designed to accommodate forecast population and economic growth based on growth allocations made by the state Department of Community Development, and assigned by regions and local jurisdictions as part of the Regional Housing Needs Assessment and Sustainable Communities Strategies programs described further in Section 5.9, and the project does not itself cause this population or economic growth. In fact, if this forecast growth does not occur on the Project site, it is likely to occur in other locations where per capita GHG emissions are equal to or higher than average per capita emissions in California. Per capita GHG emissions can vary by local jurisdiction, but locations with the lowest per capita emissions (San Francisco and New York City) also have housing costs that are among the highest in the nation as well as the state. Due to the widespread shortage and very high cost of California housing, numerous studies have confirmed that over 600,000 people have moved from California to other states over the past several years, and since most of those states (e.g., Texas, Arizona, Nevada) have much higher per capita GHG emissions than California the net effect of continuing to provide insufficient housing opportunities for California is to cause a net increase in global GHG for people who relocate to states with more housing opportunities.

Finally, courts have consistently held that single projects cannot be required to bear a greater than proportional share of mitigating a cumulative significant impact. Because GHG emissions from transportation, water and waste management and use, heating and cooling of buildings, and a myriad of other activities are common to all new and modified development projects, and are common attributes of simply residing, working or producing goods or services in California, the feasibility of the mitigation measures required for this project must be commensurate with a fair share allocation and not with a hypothetical “net zero” or “net reduction” threshold. Within this cumulative impact mitigation measure framework, all feasible mitigation measures to reduce the Project’s GHG emissions impacts have been required and are described below:

- MM 21-1** The Project Applicant/Developer shall provide the County with plans and specifications that demonstrate 50 percent of the Project’s anticipated electrical energy demand at buildout shall be satisfied from on-site renewable energy generation. “Anticipated electrical energy demand” shall be determined on the basis of the anticipated loads for each building as shown in the reports submitted at the time of building permit application pursuant to the Building Energy Efficiency Standards of Title 24. “On-site renewable energy generation” includes, but is not limited to, solar, wind, geothermal, biofuel and hydroelectric systems. These systems shall be installed in connection with the development of one or more of the following: residential units, nonresidential buildings, public buildings, or Specific Plan utility facilities located either within the Specific Plan area or within its immediate vicinity.
- MM 21-2** The Project’s plans and specifications shall demonstrate compliance with California Green Building Standards (CALGreen) Code voluntary measure A4.203.1.2.1 Tier 1 for newly-constructed low-rise residential buildings. Therefore, the energy efficiency of these buildings would exceed 2016 Title 24 requirements by 15 percent. Low rise buildings are three stories or less. The Project shall incorporate the Green Development Program (Centennial Specific Plan, Appendix 2A), and the Project Applicant/Developer shall be responsible for the implementation of this requirement, which may include energy reduction measures such as use of high performance glazing, radiant heat roof barriers, insulation of all pipes, programmable thermostats, fluorescent and LED bulbs, solar access, sealed ducts, strategic placement of trees and other shading devices. All single-family homebuyers shall have the option to include a photovoltaic array system.
- MM 21-3** The Project’s plans and specifications shall demonstrate compliance with CALGreen voluntary measure A5.203.1.2.1 Tier 1 for nonresidential buildings (e.g. hotel, high-rise residential), thereby exceeding the 2016 Title 24 energy efficiency requirements for these buildings by 10 percent. The Project shall incorporate the Green Development Program (*Centennial Specific Plan*, Appendix 2A), and the Project Applicant/Developer shall be responsible for the implementation of this requirement, which may include energy reduction measures such as high performance glazing, radiant heat roof barriers, high-

efficient HVAC with hot-gas reheat, insulation of all pipes, programmable thermostats, fluorescent and LED bulbs, solar access, sealed ducts, zero use of CFC refrigerants in commercial buildings, strategic placement of trees, and other shading devices. Commercial structures shall include passive solar design techniques, such as a north-south panel orientation on buildings, and shall install operable windows designed to maximize natural ventilation by opening into prevailing west winds at inlets and away outlets, thereby reducing use of interior climate controls.

**MM 21-4** The Project Applicant/Developer shall require, in contract specifications, that contractors limit construction equipment idling to 3 minutes and include a program to ensure that equipment operators comply with the 3-minute limit.

**MM 21-5** The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that a minimum of 70 percent of public and community pools and spas shall be equipped with active solar heating systems where heating is necessary or desired. The Project Applicant/Developer shall provide the proposed plan for compliance with this provision prior to obtaining a permit for the pool.

**MM 21-6** Deeds, CC&Rs or similar legal documents shall contain the following requirement: The owners of all single-family and multi-family residential units shall be required, upon resale, to present to the buyer a written energy audit checklist prepared by a qualified third party at the time the seller provides the buyer with the Real Estate Transfer Disclosure Statement required by California Civil Code, Section 1102 et seq. The energy audit checklist shall certify that all HVAC systems, thermostats, appliances, windows and swimming pools (if applicable) are the same as those originally installed or, if changed, otherwise comply with Centennial's Green Development Program. All residential pool covers shall be removable, and shall not be automatic retractable covers.

The CC&Rs of the master homeowners association or other applicable association shall require compliance with the provisions of this measure and shall provide notice to individual owners of the resale energy audit checklist requirement. The master homeowners association or other applicable association shall monitor compliance and provide the County with an annual report of compliance with this measure.

**MM 21-7** Deeds, CC&Rs, or similar legal documents shall contain the following requirement: For nonresidential buildings, within ninety (90) days after the end of the first full calendar year following the issuance of the certificate of occupancy and within ninety (90) days after each five year period thereafter, the owner or tenant in possession thereof shall submit to the master commercial owners association or other applicable association a report prepared by the owner or a qualified, independent third party that evaluates whether all major building systems such as heat furnace, air conditioner, and

other mechanical fixtures are working within the design standards established for each system. The master commercial owners association or other applicable association shall monitor compliance and provide the County with an annual report of compliance with this measure.

- MM 21-8** Energy efficient major appliances and HVAC systems that meet the more stringent of applicable California Energy Commission (CEC) requirements or ENERGY STAR requirements, or equivalent, shall be exclusively offered by residential builders. Major appliances subject to this requirement include dishwashers, clothes washers, refrigerators, and room air conditioners.
- MM 21-9** The Project Applicant/Developer shall provide plans and specifications to the County that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utility district requirements and standards, demonstrating that the Project's wastewater reclamation facilities (WRFs) shall include equipment to capture and reuse biogas for energy production.
- MM 21-10** The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that nonresidential or multi-family buildings shall be constructed with recycled water infrastructure to serve common areas for these facilities, except where prohibited by law. To the extent recycled water is produced within the Project and available, recycled water shall be used for landscape irrigation within those common areas. Compliance with these measures shall be established prior to the issuance of a construction permit for nonresidential and multi-family facilities and at the time of County approval of final landscaping plans submitted by the Project Applicant/Developer after final map recordation for homeowners association common areas. Covenants, conditions and restrictions (CC&Rs) shall require the owners of such common areas to maintain, repair and replace irrigation systems and plantings in accordance with County approved plans.
- MM 21-11** The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that non-residential building shall be constructed with indoor plumbing fixtures and fixture fittings that would reduce the overall use of potable water within the building by 12 percent, consistent with 2016 CALGreen Tier 1 non-residential voluntary measures as prescribed in Section A5.303.2.3.1 of the code.
- MM 21-12** The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that single or multi-family residential building shall be constructed with kitchen faucets and appliances that comply with 2016 CALGreen code residential voluntary measures specified in Sections A4.303.1 and A4.303.3 of the code.
- MM 21-13** The outdoor residential (single-family and multi-family) water budget for water-budget-based ratemaking shall be based on having no more than 25

percent turf grass allowed in landscaped areas of single-family detached residential front yards and multi-family residential common areas.

- MM 21-14** Ten percent of all homes in Centennial communities that permit housing, with the exception of the lowest density area (Community 8-2) will be affordable, in conformance with the Affordable Housing Implementation Plan (see Appendix 3-H of the *Centennial Specific Plan*).
- MM 21-15** The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that one 208/240 VAC receptacle that may be used for charging electric vehicles, shall be installed in each detached and attached single-family residence. The installation shall comply with requirements of the 2016 CALGreen Code Section 4.106.4.1, or the most applicable code at the time of construction.
- MM 21-16** The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that “alternative energy fueling stations” shall be installed as follows. An “alternative energy vehicle fueling station” is a 208/240 VAC electrical vehicle charging station or a station providing another new or improved technology (e.g. compressed natural gas (CNG) and hydrogen fuel cell) that provides refueling for vehicles that do not use fossil fuel. An electric charging station shall allow for simultaneous charging of two electric vehicles.
- Business Park and Institutional land use designations shall provide a minimum of one alternative energy vehicle fueling station on site for the first 50,000 square feet of usable floor space and additional alternative energy vehicle fueling stations for each additional 50,000 square feet of usable floor space thereafter.
  - Multi-family residential buildings of at least 20 residential units shall provide a minimum of one alternative energy vehicle fueling station for the first twenty (20) residential units and an additional alternative energy vehicle fueling station for each additional twenty (20) residential units thereafter.
  - The Town Center and each Village Center shall provide a minimum of one alternative energy vehicle charging station.
  - Designated Transit Hubs shall provide a minimum of one alternative energy vehicle charging station.
- MM 21-17** The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the building designs for non-residential buildings:
- Bicycle parking spaces at a rate of 5 percent of minimum required vehicle parking spaces for non-residential land uses.

- Preferential parking for low-emitting, fuel-efficient, and carpool/van vehicles shall be provided as specified in Section A5.106.5.1, Nonresidential Voluntary Measures, of the CALGreen Code.

**MM 21-18** The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the building designs or specifications for multi-family residential buildings:

- Visitor parking shall include preferentially located parking spaces for alternative-fueled vehicles.
- Bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code or as required by County Code Section 22.52.1225B, whichever is more stringent.

**MM 21-19** For parking structures and parking lots with 20 or more parking spaces, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the parking facility:

- The parking facility shall include a minimum of five percent preferentially located parking spaces for alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles.
- The parking facility shall include at least one electric vehicle charging station. Electrical lines shall be designed and sized to add additional charging stations for up to three percent of the total parking spaces when a demand is demonstrated. The design and installation shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, of the CALGreen Code.
- For residential parking facilities, bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen code or as required by County Code Section 22.52.1225B, whichever is more stringent.

**MM 21-20** The Project Applicant/Developer shall ensure that the implementation of the Green Development Program takes into account compliance with the following regulations:

1. Regulations that are quantified inputs into the CalEEMod analysis, resulting in GHG Reductions:
  - a. Pavley Motor Vehicle Standards (AB 1493)
  - b. Low Carbon Fuel Standard (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 7, Section 95480 et seq.)

- c. Title 24 (part 6 [Energy Code] and part 11 [CALGreen Code]) of the California Code of Regulations
  - d. Renewable Portfolio Standard (SB X1 2 and SB 350)
  - e. Solid Waste Diversion (AB 341)
  - f. Statewide reduction in potable urban water usage of 25 percent relative to water use in 2013 (Executive Order B-29-15)
  - g. Model Water Efficient Landscape Ordinance (MWELO) (California Code of Regulations, Title 23, Division 2, Chapter 2.7)
  - h. Los Angeles Tree Planting Ordinance (Los Angeles County Code, Title 22, Division 1, Chapter 22, Part 20, Sections 22.52.2100 et seq.)
  - i. Los Angeles County Green Building Standards Code (Los Angeles County Code, Title 31, Chapter 1, Sections 100 et seq.)
  - j. California Water Code (California Code of Regulations, Division 6, Part 2.10, Sections 10910–10915)
  - k. Los Angeles County Community Climate Action Plan
2. Regulations that are not quantified inputs into the CalEEMod analysis, but should be considered for incorporation as appropriate:
- a. EPA and NHTSA GHG and CAFE standards for passenger cars, light-duty trucks, and medium-duty passenger vehicles (75 FR 25324–25728 and 77 FR 62624–63200) and for medium- and heavy-duty vehicles (76 FR 57106–57513)
  - b. Cap-and-Trade Program for Electricity, Stationary Sources, and Fuels (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 5, Section 95801 et seq.)
  - c. Advanced Clean Cars Program (California Code of Regulations, Title 13, Division 3, Chapter 1, Articles 1, 2, 6 (parts); Chapter 2, Articles 1, 2.1, 2.3, 2.4 (parts); Chapter 4.4 (parts); Chapter 8 (parts).
  - d. Under Inflated Vehicle Tires (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 8, Section 95550 et seq.)
  - e. Heavy-Duty Vehicle Greenhouse Gas Emission Reduction Regulation (California Code of Regulations, Title 17, Division 3,

Chapter 1, Subchapter 10, Article 4, Subarticle 1, Section 95300 et seq.)

- f. Management of High Global Warming Potential Refrigerants for Stationary Sources (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 5.1, Section 95380 et seq.)
- g. Small Containers of Automotive Refrigerant (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 5, Section 95360 et seq.)
- h. High-Global Warming Potential Greenhouse Gases in Consumer Products (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 8.5, Article 2)
- i. CALGreen Code as Adopted by the Building Standards Commission (California Code of Regulations, Title 24, Part 11 Emergency Building Standard DSA-SS EF-02/15)
- j. Natural Gas Cooking Stoves and Fireplaces (SCAQMD Rule 445)

### 5.21.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Although the Project would comply with various “pathways to compliance” for CEQA GHG analysis identified by the *Newhall* court, as discussed in Sections 5.21.6, even with implementation of all reasonable and feasible mitigation measures, as described in Section 5.21.7, the Project’s climate change impacts would remain significant and unavoidable.

## 6.0 GROWTH-INDUCING IMPACTS

### 6.1 INTRODUCTION

Section 15126(d) of the California Environmental Quality Act (CEQA) Guidelines (14 *California Code of Regulations* [CCR] 15126.2[d]) requires evaluation of a project's growth-inducing impacts. This section discusses the manner in which the Centennial Project could encourage substantial economic or population growth or the construction of additional housing in the surrounding area, either directly or indirectly.

#### 6.1.1 DEFINITION OF GROWTH INDUCEMENT

Section 15126.2(d) of the State CEQA Guidelines defines "growth inducement" as the ways in which a project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. A project can induce unplanned growth by removing infrastructure constraints; providing new transportation access; building infrastructure sized to serve the region; or otherwise attracting growth to the project area that is not assumed in a General Plan or the regional growth projections. Projects are considered to induce growth if they remove obstacles to population growth that would allow for more construction in the area; increase the population or require the construction of new regional-serving facilities that could cause significant environmental effects; and/or facilitate other activities that could significantly affect the environment, either individually or cumulatively.

CEQA does not assume that growth is necessarily beneficial, detrimental, or of little significance to the environment. It also does not require that a project mitigate the effects of induced growth, nor does it require an attempt to stop additional growth. Accordingly, CEQA does not require that an environmental impact report (EIR) provide a detailed analysis of a project's effects on growth, and states that a general analysis is sufficient.<sup>1</sup>

#### 6.1.2 SUMMARY

The Project is proposed in response to anticipated growth in the Northern Los Angeles County/Antelope Valley area, and Project development is consistent with the growth projections that have been adopted by the Southern California Association of Governments (SCAG) for the Project area, the Antelope Valley, the North Los Angeles County Subregion, the County, and the region.

The Project is also consistent with the *Antelope Valley Area Plan* (AVAP) and proposes development in the West Economic Opportunity Area (EOA), where the AVAP anticipates future development. The EIR (SCH No. 2014061043) for the AVAP fully evaluated the growth-inducing impacts of buildout of the unincorporated areas of the Antelope Valley, as allowed by the AVAP (LACDRP 2015b). No changes to the AVAP are proposed by the Project that would affect population generation or otherwise lead to additional indirect growth, and no changes to the circumstances under which development would occur have occurred since

---

<sup>1</sup> See *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 369.

the EIR for the AVAP was certified in June 2015. The portion of the Project site that is located east of 300<sup>th</sup> Street West is designated as RL2 (1 DU/ 2 ac) in the AVAP; the Specific Plan designates this land as LDR (0-7 du / ac). The AVAP allows for flexibility in land use adjustments, as stated in Chapter 8 (Plan Implementation), Section II.C.3 (West EOA):

In order to allow for more flexibility in the future, detailed site design of specific neighborhoods in this area, a Specific Plan for a Project in the West EOA may be allowed to convert the areas designated as Residential 5 (H5) to General Commercial (CG) or Public and Semi-public (P) designations without amending this Area Plan, so long as the resulting residential densities do not exceed those provided for by this Area Plan and no change in unmitigated significant impacts occur. The Specific Plan may also include provisions for the conversion of residential to commercial areas, provided the amount of planned commercial building square footage does not result in any new unmitigated significant impacts. The Specific Plan shall also stipulate that these provisions (i.e., converting residential to commercial or other designations) are subject to a traffic study that confirms that no new unmitigated significant traffic impacts will occur. Land use adjustments within designations are permitted as part of a Specific Plan provided that the adjustments: 1) do not increase the total number of developable acres, dwelling units, or square footage; 2) increase the total amount of open space and do not decrease the total amount of natural open space; and 3) do not result in unmitigated significant impacts.

Because the Project is consistent with the allowable land uses and development densities/intensities in the AVAP and because the EIR for the AVAP adequately analyzed the growth-inducing impacts of the AVAP, the proposed Project would not have any growth-inducing impacts that were not previously analyzed in that certified EIR. As such, the Project would not be considered growth-inducing related to planned growth in the region. However, because the Project site is currently largely vacant and the Project would substantially increase population and housing relative to the existing site conditions, it is reasonably foreseeable that future unplanned development may occur along the eastern fringes of the Project site, where physical constraints to development are less than to the north and south.

### **6.1.3 SECTION FORMAT**

Due to its nature, this section is organized differently than other sections in this document. It is organized as follows:

- Introduction
  - Definition of Growth Inducement
  - Summary
  - Section Format
  - References
- Existing Regional Trends
- Growth Constraints Near the Project Site
- Growth Inducement Potential

- Potential Growth-Inducing Impacts
  - Removal of Obstacles to Growth
  - Expansion of Public Services
  - Economic and Population Expansion or Growth
  - Establishment of Precedent-Setting Action
- Project Impacts
- References

#### 6.1.4 REFERENCES

The main references used in this section include the AVAP (which designates areas for development in the unincorporated areas of the Antelope Valley) and the EIR for the AVAP (which provides buildout projections for population, housing and employment and discusses the growth-inducing impacts of the AVAP). The analyses in this document also uses SCAG's 2016 Adopted Growth Forecasts and the *2016–2040 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS). All references cited for preparation of this analysis are listed in Section 6.7.

## 6.2 EXISTING REGIONAL TRENDS

The Project site is located in the North Los Angeles County Subregion, as identified by the SCAG. This SCAG subregion includes the Cities of Lancaster, Palmdale, and Santa Clarita, as well as the unincorporated Santa Clarita and Antelope Valley areas. SCAG projects that Los Angeles County and the North Los Angeles County Subregion will experience substantial growth between 2012 and 2040 (SCAG 2016c). The Project site is located in traffic analysis zones (TAZs)<sup>2</sup> where future growth is expected (SCAG 2012e, 2016b). Future growth in the County is expected to occur as infill development in urban centers, as well as new development on vacant lands.

Section 5.9, Population, Housing, and Employment, discusses population, housing, and employment projections for the region, Los Angeles County, North Los Angeles County, Antelope Valley, and TAZs 20280000 and 20281000, which include the Project site. Concurrent with the projected increases in housing and population in these TAZs (SCAG 2012c), the economic base in these TAZs is expected to grow, as the largely vacant Project site is developed to include future commercial, light manufacturing, public service, and residential uses. The proposed Project is consistent with the household and employment projections for the area that includes the Project site in the SCAG's 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (SCAG 2012e) and 2016 RTP/SCS (SCAG 2016a). The resident population of the Project at buildout is 82.46 percent of the projected resident population of TAZ 20280000 and TAZ 20281000 by 2035, but exceeds the SCAG projections for 2040. The 2016 RTP/SCS states that TAZ level data or any data at a geography smaller than the jurisdictional level is included in the draft growth forecasts for regional modeling purpose only, and is advisory and non-binding. As such, the

---

<sup>2</sup> SCAG divides the entire region into traffic analysis zones (TAZs) as a basic geographic unit for its growth projections.

exceedance of population growth projections at the Project site on a TAZ level is not considered a significant adverse impact.

The AVAP regulates development within the unincorporated areas of the Antelope Valley, including the site. At buildout, the EIR for the AVAP estimates a resident population of 405,410 people; a housing stock of 106,180 units; and an employment base of 134,351 jobs (LACDRP 2015b). The AVAP focuses future development in Economic Opportunity Areas (EOAs) as a means to accommodate growth and development in the Antelope Valley while preserving the rural character and ecological resources of the surrounding areas. The Project site is located within the West EOA. The Project is also consistent with the allowable development for this area, based on the Land Use Policy Map in the AVAP.

### 6.3 GROWTH CONSTRAINTS NEAR THE PROJECT

On June 17, 2008, the Tejon Ranch Company entered into a Conservation and Land Use Agreement (Conservation Agreement) with Audubon California, the Endangered Habitats League, the Natural Resources Defense Council, the Planning and Conservation League, and the Sierra Club (Resource Groups). The Conservation Agreement covers the site and allows Tejon Ranch Company and its development partners to pursue approvals for developing portions of the Ranch, including the Project site, while providing for the designation of permanent open spaces and the dedication or sale of conservation easements over approximately 240,000 acres of the Ranch (approximately 90 percent of the Ranch). In exchange for the preservation of open space areas, the Natural Resources Defense Council, the Sierra Club, Audubon California, the Planning and Conservation League, and the Endangered Habitats League will not oppose the development of the Tejon Industrial Complex, Tejon Mountain Village, Grapevine, and the Centennial Project. This agreement would preclude future development in other areas of Tejon Ranch to the north and southeast of the site. In preventing development throughout much of the Ranch property, the Conservation Agreement creates a barrier to development and other improvements within the approximately 240,000 acres of open space set aside in the Agreement, thus limiting future development within the vicinity of the Project site. The boundaries of Tejon Ranch-owned lands are depicted in Exhibit 3-2, Project Vicinity Map, in Section 3.0, Environmental Setting.

The San Gabriel Mountains and the Angeles National Forest are located south of the Project site. This area is subject to physical and government ownership constraints. The Los Padres National Forest and the Hungry Valley State Vehicular Recreation Area to the west of the site—which, together with the Angeles National Forest, total approximately 2.6 million acres—are expected to remain undeveloped. The 93,000-acre Wind Wolves Preserve (west of Interstate [I] 5 in the Tehachapi Mountains) is also expected to remain as permanent open space (The Wildlands Conservancy 2016). Some lands in the area are also owned by the Bureau of Land Management and the State Department of Parks and Recreation and are unlikely to be developed.

Thus, vacant land near the site that may be developed in the future would be limited to privately-owned parcels and areas that are not designated for preservation as open space. Exhibit 3-4, Local Area Constraints, included in Section 3.0, Environmental Setting, depicts

the locations of many of these constraints in relation to the Project site boundary. In addition to the open space constraints, other development constraints in the Project area include the steep slopes and rugged terrain in the Tehachapi Mountains to the northwest and the San Gabriel Mountains to the south, and the San Andreas Fault that runs through these mountains (CDOC 1974a, 1974b). This is discussed further in Section 5.1, Geotechnical. Wildfire hazards that may constrain development are discussed in Section 5.3, Hazards and Hazardous Materials. This area also contains environmentally sensitive areas, such as the San Andreas Significant Ecological Area (SEA), as discussed in Section 5.7, Biological Resources.

An additional constraint to development is water supply in the Antelope Valley. The Antelope Valley Groundwater Basin, which was determined to be in overdraft, is regulated in accordance with a Court-approved adjudication Judgment and Physical Solution entered in December 2015. The purpose of the Antelope Valley Adjudication Judgment and Physical Solution is to allow for groundwater use in a manner that avoids overdraft and fosters sustainable beneficial uses by limiting production to the basin's total sustainable yield of approximately 110,000 acre-feet per year (afy). Tejon Ranch is a party to the Judgment and Physical Solution entered by the Superior Court and has been allocated an overlying production right of 1,634 afy. All of Tejon Ranch's overlying right allocation will be provided to and utilized by the Project. Although water supply is not a constraint for the proposed Project, as described in Section 5.18, Water Resources, other future development projects in the area would be constrained if their development was not anticipated in the AVAP and/or the Court-approved adjudication Judgment and Physical Solution (California Superior Court 2015; see Appendix 5.18-E).

Another constraint is the Antelope Valley Area Plan and related provisions of the County General Plan, which focus new urban development in designated locations, including the Project site which is in the West EOA. Development located outside this and other areas designated for future development could occur only if the Board of Supervisors made a policy choice to amend the Antelope Valley Area Plan to allow development at greater densities than currently allowed according to the AVAP's land use designations.

## 6.4 GROWTH INDUCEMENT POTENTIAL

When considering the growth constraints to development in the vicinity of the Project site, as discussed in Section 6.3 above, the Project may prompt further growth in three general areas:

- Areas west of the Project site from Quail Lake, along State Route (SR) 138 to the I-5, and northward along the eastern side of I-5 to Gorman would potentially be influenced by development of the proposed Project. Also, development of the adjacent Gorman Post Ranch has been proposed in this area.
- Areas east of the Project site along the SR-138 corridor, which are also included in the West EOA designated in the Antelope Valley Area Plan.
- Areas east of the Project site (e.g., the area near Neenach and toward the cities of Lancaster and Palmdale) that are outside the West EOA.

As shown on Exhibit 3-1, Regional Location, in Section 3.0, Environmental Setting, growth to the north and south of the Project site will be precluded due to the Tejon Ranch Conservation Agreement and its provision for up to 240,000 acres of open space slated for permanent preservation. Specifically, this Conservation Agreement involves only Tejon Ranch property, and includes land both south and north of the proposed Project site. The Conservation Agreement serves to prevent development within much of the Ranch property, not including the Tejon Mountain Village and Tejon Industrial Complex projects, and creates a barrier to development and other improvements within the approximately 240,000 acres of open space set aside in the Agreement, thus limiting future development in the vicinity of the Project site. As previously discussed, the Angeles National Forest and Los Padres National Forest lands provide a substantial barrier to development to the south of the Project site.

## 6.5 POTENTIAL GROWTH-INDUCING IMPACTS

Pursuant to Section 15126.2(d) of the State CEQA Guidelines, an EIR must discuss the ways in which the proposed Project could foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment. An EIR should not assume that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment. For the growth-inducing analysis, impacts would be considered significant only if the reasonably foreseeable growth could result in significant effects on the environment. This discussion of the potential growth-inducing effects of the Project uses four growth-inducing criteria:

1. Would this project remove obstacles to growth, e.g., through the construction or extension of major infrastructure facilities that do not presently exist in the project area, or through changes in existing regulations pertaining to land development?
2. Would this project result in the need to expand one or more public services to maintain desired levels of service?
3. Would this project encourage or facilitate economic effects that could result in other activities that could significantly affect the environment?
4. Would approval of this project involve some precedent-setting action that could encourage and facilitate other activities that could significantly affect the environment?

Each growth-inducing criterion is discussed below.

1. **Removal of Obstacles to Growth.** While the Project does include the construction of new infrastructure facilities and provisions for new access to the area north of SR-138, the infrastructure facilities are not sized to accommodate growth beyond that which is proposed for the Centennial Project.

No new electrical production plants or natural gas facilities are part of the proposed Project and no new electrical/gas production facilities are required to support the development of the proposed Project, although 50% of the Project's total electric energy demand (i.e. household, business, civic/institutional, recreational, and public facilities) must be met by onsite renewable energy. This renewable energy generation

would be used by the Project; therefore, the Project would not provide any additional power/gas supplies or eliminate a power-related obstacle to growth.

Water supplies are limited in the proposed Project area. The Project will utilize several water supplies and on- and off-site water banking facilities to meet potable demand. Available supplies include groundwater and imported water return flows in accordance with the approved Antelope Valley adjudication Judgment and Physical Solution and State Water Project (SWP) supplies secured for Project use and imported to the site under an agreement with the Antelope Valley – East Kern Water Agency (AVEK). The Project is designed to have a balance between demand and supply, and will not generate “extra” potable water that could be used to support additional growth in the area. Also, the Antelope Valley adjudication Judgment and Physical Solution limits the amount of growth in the area due to limited water supplies.

While the Project does propose two wastewater reclamation facilities (WRFs), they are designed to accommodate the proposed Project only and would not treat wastewater from the surrounding area. Due to limited wastewater treatment facilities in the Project’s surrounding area and due to the restricted size of wastewater reclamation plants proposed as part of the Project, growth is not anticipated to be induced as a result of the wastewater reclamation plants associated with the Project.

SR-138 provides the main access from the Lancaster/Palmdale area to I-5. The SR-138 is planned for expansion by Caltrans, as discussed in Section 5.10, Traffic, Access and Circulation, and is not related to the proposed Project. While new roads are a part of the infrastructure supporting the proposed Project, these roads are internal to the Project site. The roads would provide new access in an area (the proposed Project); however, they are limited to the boundaries of the Project site and are not sized to support regional traffic flows. Except for providing access to the SR-138, the Project roads would not provide access to other areas outside the Project boundaries. At the Project site, the construction of roads, water treatment and delivery systems, sewers, two wastewater reclamation facilities, and utilities would not be sized to accommodate growth beyond that which is proposed for the Centennial Project.

However, future nearby landowners could propose to connect to or build upon the Project’s infrastructure to serve future development in the surrounding area. Such proposals would be subject to environmental analysis pursuant to CEQA, and any approvals of future development would be at the discretion of the lead agency.

- 2. Expansion of Public Services.** Housing being built as part of the Project will only support the anticipated needs of this new community. New housing will bring in a new population base. This population will require support services such as fire and police protection, libraries, schools and employment opportunities. The Project will be adding fire and police stations, libraries, and schools to support the anticipated population associated with the Project. However, the services being provided are scaled such that these services will support the anticipated population only. Additional population in areas nearby or surrounding the Project would require

additional support services. Thus, the Project will not provide services to support additional growth beyond what is expected for the Project.

However, nearby landowners could benefit from the proximity of new services available at Centennial, which could, in turn, prompt them to seek approvals for additional development. Such proposals would be subject to environmental analysis pursuant to CEQA and any approvals of future development would be at the discretion of the lead agency.

- 3. Economic and Population Expansion or Growth.** The Project will increase the population within the boundaries of the Project site. The total anticipated increase in population generated by development of the Project (i.e., 57,150 people) represents approximately 4.81 percent of the projected population increase (1,188,600 persons) for the County as a whole between 2020 and 2040, and would represent approximately 23.38 percent of the SCAG growth projections for the North Los Angeles County Subregion for the same period. The Project is also consistent with the population and housing projections included in the AVAP, where 311,920 new residents and 81,441 new dwelling units are expected within the unincorporated areas from 2013 to 2035 (LACDRP 2015b).

The Project is consistent with demographic projections in the 2012–2035 RTP/SCS at the TAZ level, where as many as 68,641 new residents are expected between 2012 to 2035 (refer to Table 5.9-5 in Section 5.9 of this EIR) in the two TAZs that cover the Project site, of which 57,150 persons would be residents of the Project. The Project is consistent with the household and employment projections in the 2016–2040 RTP/SCS at the TAZ level, where 22,225 new households and 23,877 new jobs are projected from 2012 to 2040. The 2040 household projections at the TAZ level in the 2016 RTP/SCS are consistent with the proposed Project’s buildout estimates. The resident population of the Project at buildout is 82.46 percent of the projected resident population of TAZ 20280000 and TAZ 20281000 by 2035, but exceeds the SCAG projections for 2040. The 2016 RTP/SCS states that TAZ level data or any data at a geography smaller than the jurisdictional level is included in the draft growth forecasts for regional modeling purpose only, and is advisory and non-binding. As such, the exceedance of population growth projections at the Project site on a TAZ level is not considered a significant adverse impact. Population, housing, and economic growth relative to the SCAG RTP/SCS would be less than significant as it relates to the exceedance of regional population projections.

The Project would accommodate a projected demand for residential development in the North Los Angeles County Subregion. Development allowed by the proposed Project would also include shopping, entertainment, recreation, institutional, and health care uses. These uses would serve the residential development on the site and the existing residential uses near the site. The increased employment opportunities and businesses in the area could, in turn, induce growth locally and/or regionally to support visitors to the area that are not residents of the Centennial Project.

Long-term growth, should it occur, would primarily be in the form of an economic response to the presence of an increased resident population and employment opportunities that would occur on the Project site and that, in turn, could incrementally increase the area's demand for local goods and services. As the proposed Project would result in the introduction of residents and its associated demand for goods and services and since the Project would create new employment opportunities in the Project's commercial and business park areas, Project implementation would have the potential to induce regional economic growth.

4. **Establishment of a Precedent-Setting Action.** Approval of the proposed Project would require the approval of an amendment to the Highway Plan Policy Map in the *County of Los Angeles General Plan* and an amendment to the AVAP Highway Plan in the *Antelope Valley Area Plan* to include the internal roadway network. The Project would also require a zone change for the adoption of the *Centennial Specific Plan*. However, given that the Specific Plan's regulations would apply only in the Specific Plan area, the proposed Project would not be considered growth inducing with respect to a precedent-setting action.

## 6.6 PROJECT IMPACTS

As discussed in Section 5.9, Population, Housing and Employment, the Project would lead to growth in employment, housing, and population on largely vacant land that is consistent with the household and employment growth projections for the area in SCAG's 2012–2035 RTP/SCS and 2016–2040 RTP/SCS (SCAG 2016b, 2016c, 2012a, 2012b).

The Project is also consistent with the AVAP and proposes development in the West EOA, where the AVAP anticipates future development. The EIR (SCH No. 2014061043) for the AVAP fully evaluated the growth-inducing impacts of buildout of the unincorporated areas of the Antelope Valley, as allowed by the AVAP (LACDRP 2015b). The only amendment to the AVAP proposed by the Project is the inclusion of the internal roadway network into the AVAP Highway Plan. This amendment would require a corresponding amendment the Highway Plan Policy Map in the *County of Los Angeles General Plan* to also show the proposed internal roadway network. These roadways would establish the circulation network that would serve the development contemplated by the AVAP but would not change land use designations; increase the allowable development; or decrease open space areas. Also, no changes to the circumstances under which development would occur have occurred since the EIR for the AVAP was certified in June 2015. Therefore, the Project, as planned, would not result in significant growth-inducing impacts related to approved County and regional plans.

Notwithstanding these constraints on additional development in the Project vicinity, the existence of the Project makes it reasonably foreseeable that additional development proposals seeking AVAP amendments, which could result in a significant impact on the environment, would be made outside the West EOA, which is considered a significant adverse indirect growth-inducing impact.

## 7.0 CUMULATIVE IMPACTS

### 7.1 INTRODUCTION

The California Environmental Quality Act (CEQA) Guidelines require that a project's cumulative impacts be discussed when "the incremental effect is cumulatively considerable" (*California Code of Regulations* [CCR], Title 14, Section 15130). Section 15065(a)(3) of the State CEQA Guidelines specifies that cumulatively considerable means "that the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects". Further, Section 15355 of the State CEQA Guidelines defines cumulative impacts as follows:

- . . . two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.
- a) The individual effects may be changes resulting from a single project or a number of separate projects.
  - b) The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonable foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

When addressing cumulative impacts, Section 15130(b) of the State CEQA Guidelines states that an adequate discussion of significant cumulative impacts involves one of the following two elements, either:

- A. A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or
- B. A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency.

### 7.1.1 SECTION FORMAT

The cumulative impacts of each environmental category analyzed in Section 5.0 (i.e., 5.1–5.21) of this Draft EIR are analyzed under a separate subheading in this section. This section is arranged in the following manner:

- Introduction
- Approach to Cumulative Impact Analysis
  - Regional Growth
  - Related Projects
- Cumulative Impact Analysis
- Conclusion
- References

## 7.2 APPROACH TO CUMULATIVE IMPACT ANALYSIS

As discussed in Section 7.1 above, CEQA establishes that either the “list” or “projection” methods are appropriate to provide a basis to analyze cumulative impacts. To provide a comprehensive cumulative impact analysis, this Environmental Impact Report (EIR) uses both methods.

While not the sole source for the cumulative impact analysis, the regional growth method (i.e., projection method) for analyzing cumulative impacts is especially applicable to the Project because of its location and planned long-range buildout. As discussed further in Section 6.0, Growth-Inducing Impacts, although there is expansive undeveloped land in the area surrounding the Project site, there is limited land proximate to the Project site that is available for future development. The majority of surrounding lands are subject to development constraints, such as permanent conservation, limited infrastructure, public ownership, and/or topography. Refer to Exhibit 3-2, Project Vicinity Map, and Exhibit 4-12, Off-Site Mitigation Preserve, in this Draft EIR that demonstrate the location and extent of surrounding lands with development limitations. As such, the Project site is physically separated from most current, or potential future, development projects. This factor minimizes the potential for cumulative impacts that are associated with proximity to related projects, such as construction-related air quality and long-term aesthetics, for example.

Due to the long-range (20-year) buildout of the Project site, the regional growth projections are considered the best measure of full cumulative impacts for several reasons. The Project is consistent with the Los Angeles County General Plan 2035 and the Antelope Valley Area Plan (AVAP), which is a component of the General Plan and is the applicable Area Plan for the site. The Project is consistent with the goals of the Economic Opportunity Areas (EOAs), as designated in the AVAP. In addition, the Project would be consistent with applicable Southern California Association of Governments (SCAG) plans and policies, including the *2012--2035 Regional Transportation Plan/Sustainable Communities Strategy* (2012 RTP/SCS) and the 2016-2040 RTP/SCS, as discussed in Section 5.8, Land Use, Entitlements, and Planning. As discussed in Section 5.9, Population, Housing and Employment, the Project is consistent with the population, household, and employment growth forecasts for the

North Los Angeles County Subregion and for the traffic analysis zones (TAZs) where the site is located, as used in the 2012 RTP/SCS and would not exceed the housing and employment growth projections in the 2016 RTP/SCS.

An itemized list of currently proposed development projects would capture only a portion of expected growth in the area, and it is likely that over Centennial's 20-year timeframe, other developments will be proposed that cannot be foreseen now and would not be captured through a list of past, present, and probable future projects. Although local and regional planning agencies anticipate eventual growth for the region, the precise location and the characteristics of any future, yet-to-be-defined development cannot be determined at this time. Additionally, most, if not all, of the individual related projects considered in this analysis are included in regional growth projections. Finally, although projects are under consideration at any given time, there is no guarantee that they will be approved and, if they are approved, that they will be developed. For these reasons, the regional growth projections are considered the best measure of full cumulative impacts.

While there are limitations to the assessment of related projects (i.e., the "list" approach) for this Project, this section also includes a discussion of the anticipated growth currently being considered or entitled by local jurisdictions in the Project region to ensure a conservative and comprehensive analysis. The Project region, for purposes of the cumulative analysis, includes unincorporated County areas in the AVAP area, Santa Clarita Valley (SCV), southern Kern County (approximately south of Interstate [I] 5 and State Route [SR] 99) as well as the cities of Lancaster, Palmdale, and Santa Clarita. Collectively, this represents approximately one-half of the County of Los Angeles land area plus the southern portion of Kern County.

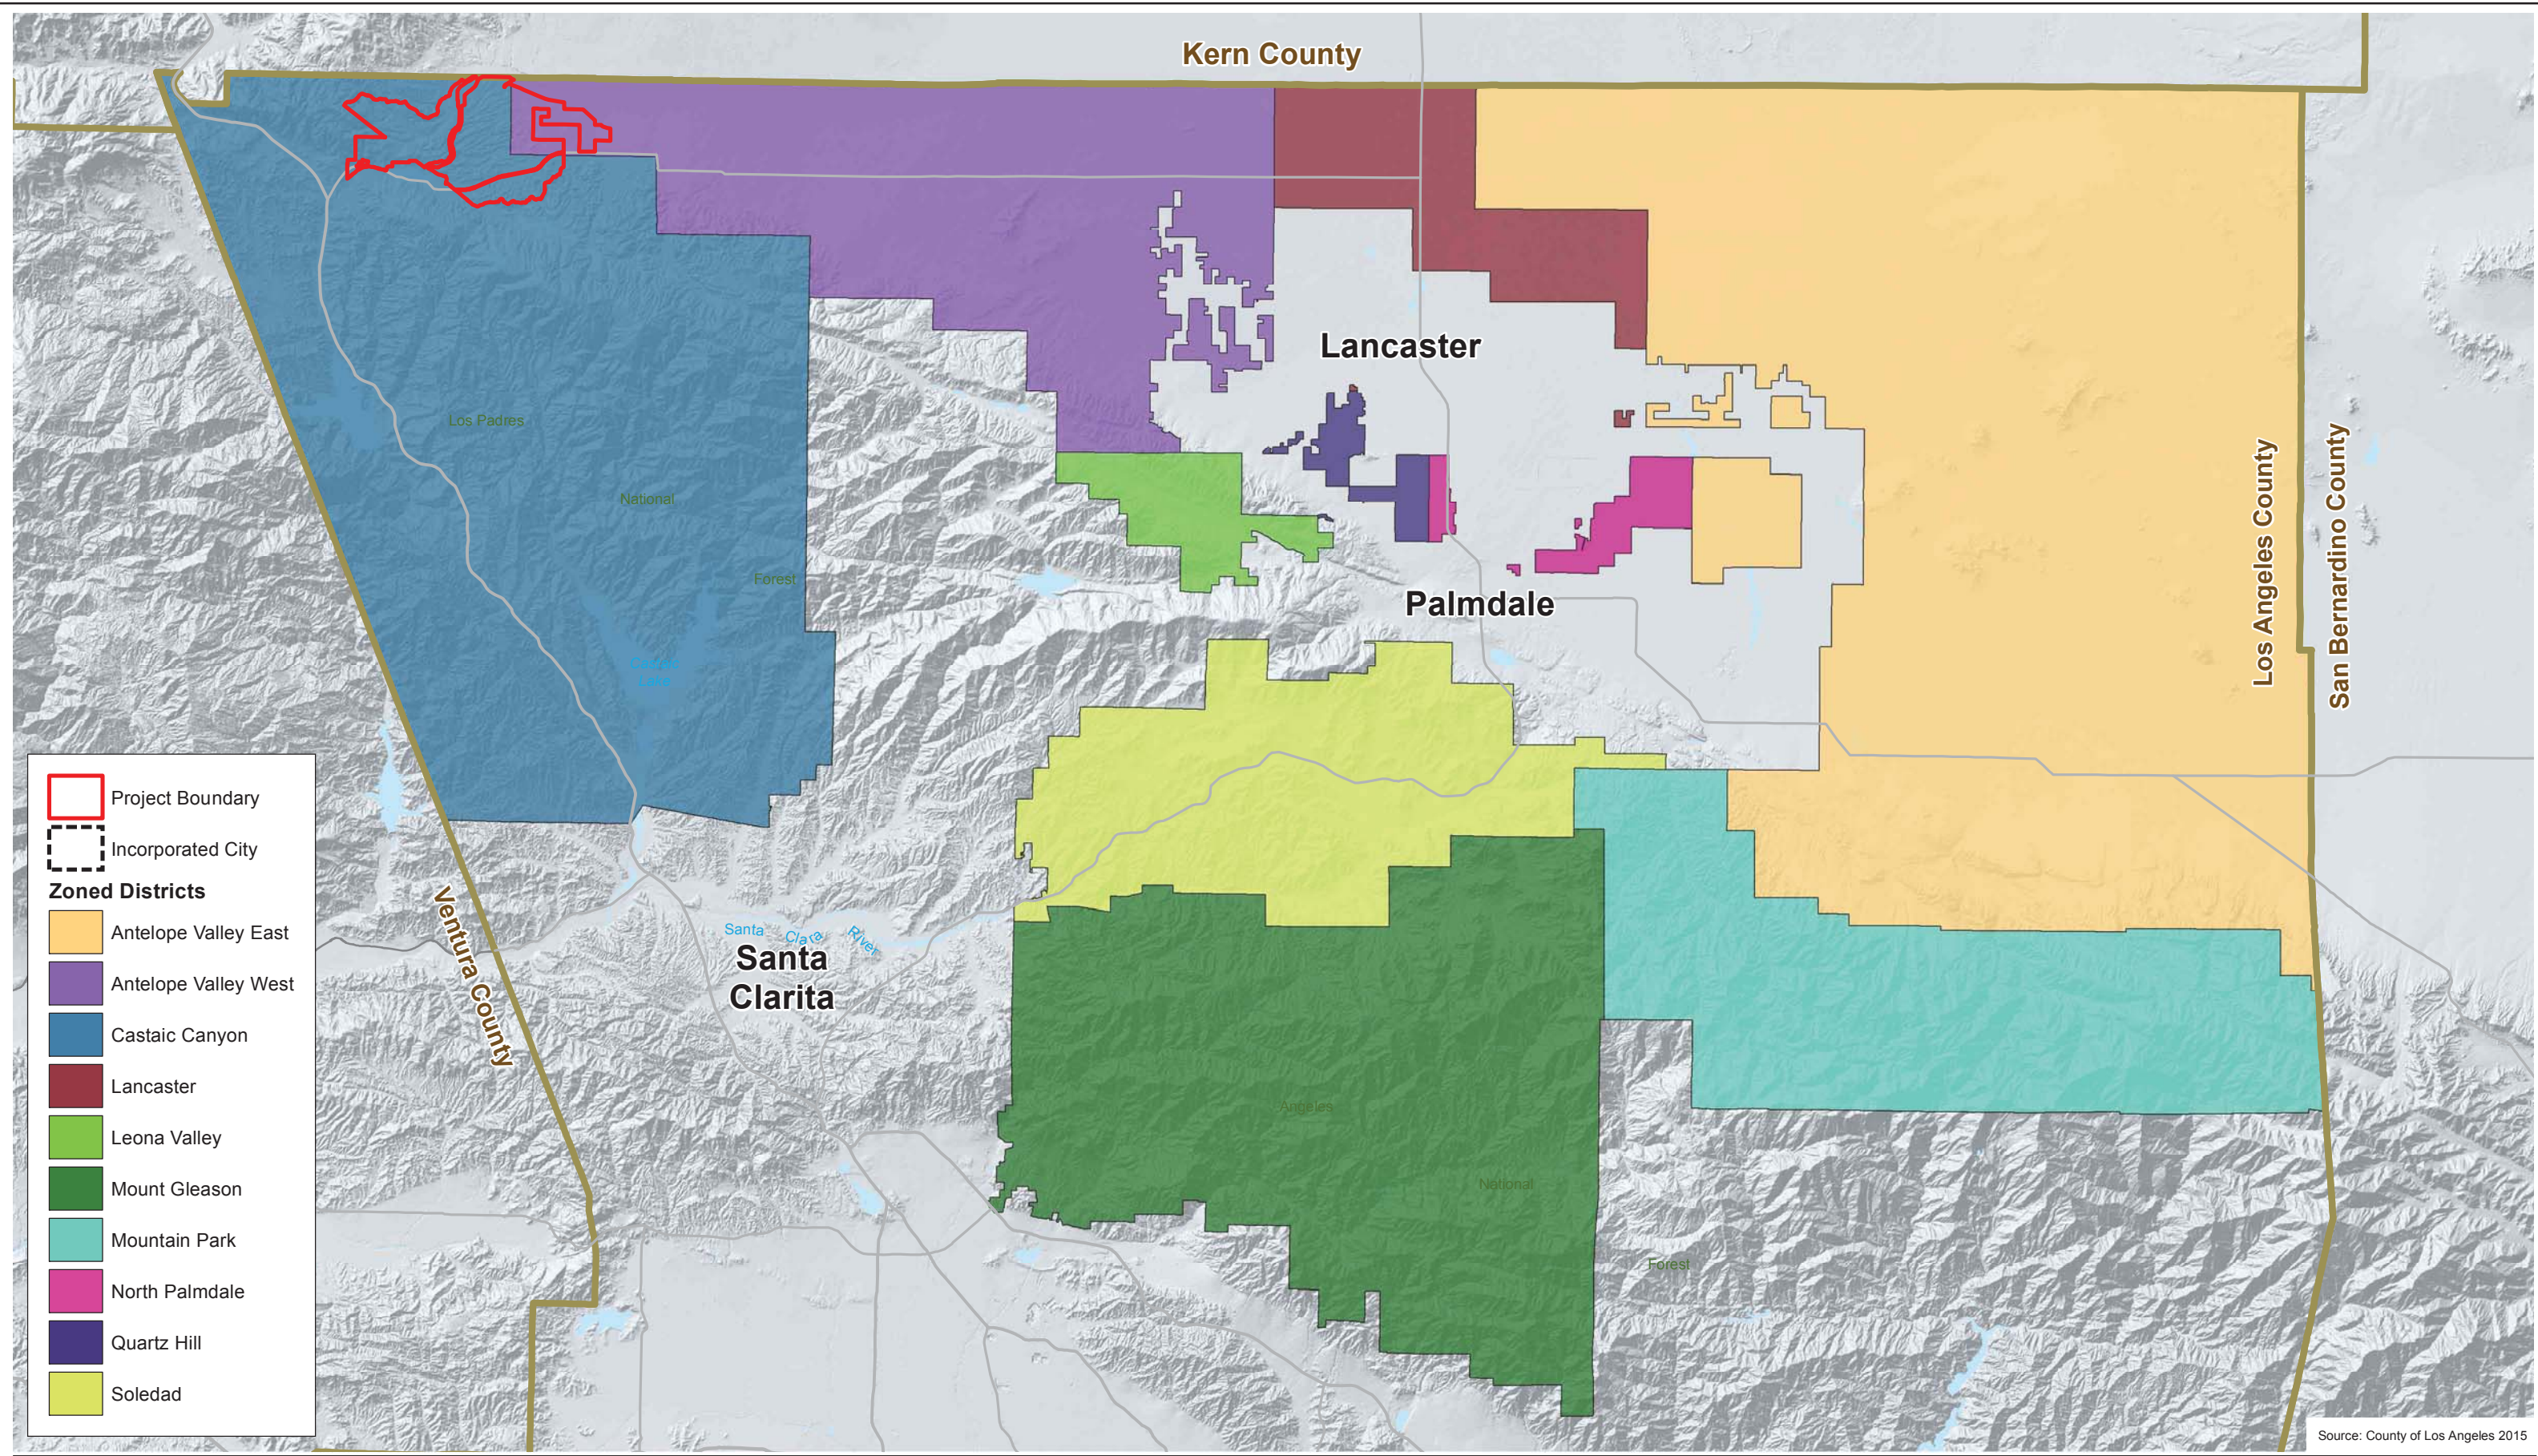

There is overlap between the regional growth projections and known development projects, as the anticipated growth numbers submitted to SCAG by individual jurisdictions are based, in part, on ongoing development activity. Ventura County projects were not included in this analysis because of the topographical barrier represented by the mountainous portion of the County near I-5. However, the traffic model used in this EIR accounts for trips that would cross the regional boundaries into the study area, both from Ventura County to the west and San Bernardino County to the east.

Exhibit 7-1, Los Angeles County Cumulative Impact Area, illustrates the area encompassed within Los Angeles County for the cumulative impact analysis. Further details regarding the method applied for regional growth and related projects, is presented below.

## 7.2.1 REGIONAL GROWTH

Applicable planning documents that serve as local and regional guides for future development include the *Los Angeles County General Plan* (County General Plan), the *Antelope Valley Area Plan* (AVAP), *Kern County General Plan*, and the regional growth projections developed by SCAG and the Kern Council of Governments (Kern COG). SCAG's 2012 RTP/SCS and 2016 RTP/SCS include growth projections for population, household and employment. Future development on the site under the *Centennial Specific Plan* is consistent with the growth projections for the area, as anticipated in the 2012 and 2016 RTP/SCS prepared by SCAG. The most current Kern COG projections were adopted as part of the *Kern*

COG 2014 Regional Transportation Plan/Sustainable Communities Strategy (Kern COG 2014 RTP/SCS) (Kern COG 2014).

The AVAP EIR addressed cumulative impacts using solely the regional growth method. Specifically, SCAG's growth projections from the 2012 RTP/SCS for the North Los Angeles County Subregion were used in the AVAP EIR, for all topics except air quality, greenhouse gas (GHG) emissions, noise, and traffic. The North Los Angeles County Subregion includes the AVAP unincorporated area, Santa Clarita Valley, and the cities of Santa Clarita, Palmdale, and Lancaster. The AVAP EIR's cumulative analysis for the four topics listed above used the data from the North Los Angeles County Sub-Area Traffic Model; this traffic model is also used in this EIR and the cumulative analysis of impacts related to traffic for these topics.

It is noted that the Kern COG 2014 RTP/SCS and its associated growth projections are presented for each city and the unincorporated areas as well as County-wide, and do not have subregional areas defined that would enable the approximation of growth in the southern Kern County area. Therefore, the regional growth projections for SCAG's North County Subregion in the 2016 RTP/SCS and Kern COG's County-wide area in the Kern COG 2014 RTP/SCS are used as the basis of growth projections considered for cumulative impacts. Table 7-1, North Los Angeles County and Kern County Growth Projections, summarizes the SCAG (2012 base year and 2040 horizon year) and Kern COG (2010 base year and 2040 horizon year) projections. As shown, both the North Los Angeles County Subregion and Kern County are expected to experience substantial population, housing, and employment growth in the coming decades. The SCAG and Kern COG projections are discussed in more detail in Section 5.9, Population, Housing, and Employment.

**TABLE 7-1  
NORTH LOS ANGELES COUNTY AND KERN COUNTY GROWTH PROJECTIONS**

	Population			Housing			Employment		
	2012	2040	Change	2012	2040	Change	2012	2040	Change
North Los Angeles County Subregion <sup>a</sup>	657,825	985,840	50%	200,990	331,399	65%	181,089	280,447	55%
Kern County <sup>b</sup>	2010	2040	Change	2010	2040	Change	2010	2040	Change
	839,600	1,444,100	72%	284,367	456,100*	79%	273,900 <sup>c</sup>	426,100 <sup>c</sup>	36%

Utilizing these regional growth projections allows a more comprehensive evaluation of certain categories of cumulative impacts than relying on known projects identified by the local jurisdictions. It takes into account the effects of growth beyond the immediate study area. This information is particularly useful in evaluating the cumulative impacts associated with traffic, air quality, GHG emissions, noise, and traffic, because it provides growth assumptions consistent with the local general plans with a long-range horizon year.

## 7.2.2 RELATED PROJECTS

To determine the scope of growth associated with a listing of related projects to be considered in this cumulative impact analysis, development summaries were provided by the County of Los Angeles Department of Regional Planning; the Kern County Planning and Community Development Department; the City of Lancaster Planning Department; the City of Palmdale Planning Division; and the City of Santa Clarita Planning Division. These development summaries are provided in Appendix 7.0-A.

The development summary data include permits for several types of planning actions that would have no effect on the physical environment and/or would not generate growth that would result in a cumulative impact, such as permits to continue existing uses or renew conditional use permits (CUPs); sell or serve alcohol in an existing establishment; authorize existing, non-compliant uses; and authorize additions or renovations to existing development (e.g., pools/spas, patio covering, decks, room additions). Therefore, the total number of residential dwelling units and total square footage of non-residential development (e.g., commercial, industrial, public/institutional, and renewable energy) were quantified (where this data were available) for those projects with current applications, approved projects, and partially constructed projects in the Project region as a whole.

It is noted that some of the anticipated development may not ultimately be constructed, either in part or in whole. Also, some projects may already be fully constructed at the time the Project begins implementing its first phase, if approved. As such, the summary of related project development is based on a broad, worst-case approach to the anticipated land use development being considered in northern Los Angeles County and southern Kern County that could have the potential to result in cumulative impacts when considered in combination with the Project. Table 7-2, Related Project Development Summary, presents the total residential and non-residential land use development currently expected in each jurisdiction in the northern half of Los Angeles County and in southern Kern County. In the non-residential column, renewable energy projects are presented separately in acres (when present) while all other non-residential development expected to have a physical development impact is presented in square feet (sf).

**TABLE 7-2  
RELATED PROJECT DEVELOPMENT SUMMARY**

<b>Jurisdiction</b>	<b>Residential (du)</b>	<b>Non-Residential</b>
Unincorporated Los Angeles County (AVAP) <sup>a</sup>	9,444	179,912 sf/20 ac (solar)
Southern Kern County <sup>b,c</sup>	15,450	25,308,400 sf
City of Lancaster <sup>d</sup>	14,122	4,379,860 sf/377 ac (solar)
City of Palmdale <sup>e</sup>	301	954,229 sf/224 ac (solar)
City of Santa Clarita <sup>f</sup>	5,551	7,202,640 sf
<b>Totals</b>	<b>44,868</b>	<b>38,025,041 sf (38.0 million sf)/ 621 ac (solar)</b>
AVAP: Antelope Valley Area Plan; du: dwelling unit; sf: square feet; ac: acres Note: All development summaries used in the generation of this table are available in Appendix 7.0-A. In addition to consideration of the total related project development in the region as of summer 2015 (i.e., at the time of Notice of Preparation [NOP] distribution), a second tier of the related project methodology involved assessing individual projects located in close proximity to the Project site that, due to this proximity, would have the most potential for cumulative impacts. As of 2017, these include the Burrows property, Gorman Post Ranch, Tejon Mountain Village, the Tejon Ranch Commerce Center (formerly named the Tejon Industrial Complex), the Grapevine Property, and the Northwest 138 Corridor Improvement Project (NW138 Project). All of these properties are included in the Table 7-2 with the exception of the Burrows property, as an application for development has not yet been filed with the County of Los Angeles Department of Regional Planning.

### **Burrows Property**

The Burrows property occupies approximately 596 acres in a “J” shape located between the eastern Project boundary and 300<sup>th</sup> Street West. This property aligns with the Project site on all sides except the west, which meets 300<sup>th</sup> Street West. This property is also located within the West EOA, as designated within the AVAP. There is no pending application for entitlement with the County. Because of its location immediately adjacent to the Project site and discussions with County staff, this is considered a reasonably foreseeable project for purposes of the cumulative impact analysis. The property owner has indicated an intention to file an application for development of residential, park, school, and greenway uses.

### **Gorman Post Ranch**

The Gorman Post Ranch project occupies approximately 2,720 acres in the northwestern corner of unincorporated Los Angeles County, just south of the Kern County border. Specifically, the site is located on Gorman Post Road approximately four miles to the west of

the Centennial Project's western boundary. The Gorman Post Ranch project proposes to develop 533 residential units and related features, including water tanks, sewer pump stations, debris basins, and street infrastructure on approximately 525 acres with the remaining approximately 2,195 acres as designated open space (County of Los Angeles 2011).

An Initial Study for the Gorman Post Ranch Project dated December 2006 (SCH No. 2007011064) was circulated in January 2007 (County of Los Angeles 2006). The document identifies potential effects associated with most topical areas on the CEQA checklist, including traffic, public services/utilities, aesthetics, biological resources, and cultural resources. Per the Initial Study, many of these potential impacts would be mitigated below the threshold of significance. The Draft Environmental Impact Report for this project remains in preparation as of January 2017.

### **Tejon Mountain Village**

The Tejon Mountain Village (TMV) is a master-planned residential resort development to be located within Tejon Ranch, east of Lebec at the top of the Grapevine in Kern County. Although the TMV project site can presently only be accessed through Lebec at a travel distance of approximately 11 miles from the proposed entrance to the Centennial Project, it is located approximately 1 mile north of the northwesterly corner of the Centennial Project site.

The TMV site consists of approximately 28,000 acres, of which approximately 23,000 acres would be dedicated for permanent open space and approximately 5,000 acres developed with a total of 3,450 residential units, 160,000 sf of commercial uses, 750 hotel rooms, and two golf courses. The environmental documentation prepared for the TMV project identified significant and unavoidable impacts related to aesthetics (visual character and light/glare); air quality emissions of reactive organic gasses (ROG, which are also known as volatile organic compounds [VOCs]), nitrous oxides (NO<sub>x</sub>), and respirable particulate matter with a diameter of 10 microns or less (PM<sub>10</sub>); greenhouse gas emissions; hazards (exposure to wildlife); traffic-generated noise; population and housing; and cumulative traffic (Kern County 2009).

### **Tejon Ranch Commerce Center**

The Tejon Ranch Commerce Center (TRCC) is a master-planned development project located on approximately 1,450 acres within Tejon Ranch, at the junction of the I-5 and SR-99 in the southernmost region of unincorporated Kern County (Kern County 2005). The I-5 freeway runs through the project site, with 350 acres on the west side and 1,100 acres on the east. The project is located approximately 18 miles north of the Project site.

The TRCC is partially constructed, and will contain a total of approximately 19.4 million sf industrial and commercial uses. As of September 2015, approximately 4.6 million sf of the approved 19.4 million sf have been built. As such, the cumulative impact analysis considers construction and operation of the remaining 14.8 million sf of approved development as part of the TRCC. The environmental documentation prepared for the TRCC project identified

significant and unavoidable impacts related to conversion of agricultural land and to air quality emissions of ROG (now known as VOCs), NO<sub>x</sub>, and PM<sub>10</sub> (Kern County 2005).

## **Grapevine Project**

Grapevine is a master-planned development project that encompasses approximately 8,010 acres of the 15,644-acre Grapevine Planning Area located just south of the TRCC employment center. The Grapevine project includes up to 12,000 residential units, up to approximately 10,748,400 sf of commercial development, parks, public and private recreation amenities, schools, public services, helipad(s), a transit center/park and ride, and water- and wastewater- treatment facilities (Kern County Planning Department 2014). A Draft Environmental Impact Report for the Grapevine project was circulated in 2016, and the project was approved by Kern County in December 2016 (Kern County 2017).

## **Northwest 138 Corridor Improvement Project**

In anticipation of necessary regional improvements, the California Department of Transportation (Caltrans) has prepared a Project Study Report/Project Development Support (PSR/PDS) for the NW138 Project that addresses the long-term alignment and right-of-way needs of SR-138 between I-5 and SR-14. There is no implementation schedule in the PSR/PDS for the improvements along SR-138. A portion of Caltrans' SR-138 study area and the proposed re-alignment traverses the Project site, as depicted on Exhibit 4-7, Centennial Project – Circulation Plan, in Section 4.0, Project Description. Caltrans is the lead agency for the completion of the EIR/Environmental Impact Statement (EIS) for the NW138 Project, which was released for public comment in July 2016. The NW138 Project environmental document considers three build alternatives.

Build Alternative 1 improvements would include modifying the existing SR-138 roadway into a six-lane freeway and four-lane expressway sections, generally following the existing alignment of SR-138. A freeway is defined as a divided arterial highway with full control of access and with grade separations at intersections; and an expressway is defined as an arterial highway with at least partial control of access, which may or may not be divided or have grade separations. The portion of SR-138 between 300<sup>th</sup> Street West and I-5, which is applicable to the Project site, is envisioned by Caltrans to be a 6-lane freeway. This alternative would involve grade-separated undercrossings at the Cement Plant Road and 300<sup>th</sup> Street West intersections with SR-138; and a grade-separated overcrossing at the Gorman Post Road intersection; and a new grade separate structure (standard box culvert) east of Quail Lake near the airport. Build Alternative 1 would also include an extension of the existing reinforced concrete box (RCB) culvert at the Quail Lake Outlet into the west branch of the California Aqueduct.

Build Alternative 1 with Design Option is the same as Build Alternative 1 but adds a bypass route around the Antelope Acres community. However, this alternative would be the same in the Project site vicinity.

Build Alternative 2 improvements would include modifying the existing SR-138 roadway into six- or four-lane expressways and six-lane freeway sections, generally following the

existing alignment of SR-138. The portion of SR-138 between 300<sup>th</sup> Street West and Gorman Post Road, which is applicable to the Project site, is envisioned by Caltrans to be a six-lane expressway. This alternative would involve at-grade signalized intersections at Cement Plant Road and 300<sup>th</sup> Street West; a grade-separated overcrossing at the Gorman Post Road intersection (same as Build Alternative 1); and a new grade separate structure (standard box culvert) east of Quail Lake near the airport (same as Build Alternative 1). Same as Build Alternative 1, this alternative would include an extension of the existing RCB culvert at the Quail Lake Outlet into the west branch of the California Aqueduct.

## Other Considerations

Phase 1 of the California High-Speed Rail project involves the construction and operation of the first high-speed rail system in the United States and would connect San Francisco to the Los Angeles Basin. Phase 2 of the system would eventually extend to Sacramento and San Diego, including up to 24 stations. The portion of the alignment nearest to the Project site is the Palmdale to Burbank Project Section, which would connect the Antelope Valley to the San Fernando Valley, with a proposed stations at the Palmdale Transportation Center and near the Burbank Airport. The proposed alignments of this Section would either follow the SR-14, or would be located to the east through the San Gabriel Mountains. The clearance of the environmental documents, and Record of Decision, for this Section is anticipated in 2017 (CHSRA 2016). However, there is no available funding source for this Section. Because the ultimate funding source is unknown, whether this Section is construction cannot be predicted and the timing cannot be assumed. As such, it is not considered a cumulative project for the purposes of this analysis.

## 7.3 CUMULATIVE IMPACT ANALYSIS

The thresholds of significance used in each section to evaluate Project-specific impacts are also applicable to the cumulative evaluation. For the cumulative evaluation, these thresholds are used to evaluate whether the related projects, together with the Centennial Project, would create significant cumulatively considerable impacts on the environment. Much of the cumulative evaluation is a qualitative judgment regarding the combined effects of the Project and buildout of a regional growth and related project development. The cumulative study area varies from one environmental topic to another depending upon the nature of the topic's related impacts. For example, cumulative air quality considerations encompass the air basin, while the cumulative loss of agricultural resources is a regional issue that is analyzed on a broader scale. Where the cumulative study area is different than the northern Los Angeles County area and southern Kern County as whole, the analysis indicates the topic-specific study area.

### 7.3.1 GEOTECHNICAL

As discussed in Section 5.1, Geotechnical, with implementation of Project Design Features (PDFs) and Mitigation Measures (MMs), which ensure compliance with applicable regulations, the Project would result in less than significant impacts related to fault rupture; seismic ground shaking; seismic-related ground failure (e.g., liquefaction, settlement, lateral spreading); or location on an unstable geologic unit (e.g., collapse, expansive soils, corrosive

soils). The Geotechnical Summary Report prepared for the Project concludes that there are no soil or geologic conditions present on or near the Project site that would preclude the safe development of all proposed land uses given incorporation of all existing and future, subdivision map-level, geotechnical recommendations into grading and construction plans and specifications (Geocon 2015). This includes compliance with County subdivision specifications, County building code requirements, and the Project-specific Grading Plan.

Geotechnical impacts tend to be site-specific in nature, while seismic conditions are regional in nature. Each related development site is subject to, at a minimum, uniform site development and construction standards relative to seismic and other geologic conditions that are prevalent within the region. Because future development of other project sites in Los Angeles County and Kern County would have to comply with current State and applicable County building codes and development requirements as they pertain to protection against identified geologic hazards, the Project's incremental contribution to cumulative geotechnical and seismic impacts would be less than significant. Development projects would be subject to applicable Seismic Design requirements and the Alquist-Priolo Earthquake Fault Zone Act, which restricts development on the traces of active faults. The Project components would not exacerbate or otherwise influence any geotechnical hazards for off-site development. Similarly, the related projects are not expected to have an adverse impact on the Project. Therefore, no significant cumulative geotechnical impacts would occur for the Project.

Cumulative impacts associated with landform alteration are more of an aesthetic issue than a geotechnical constraint. This is addressed in Section 7.5.13, Visual Resources. Erosion and downstream sedimentation is addressed as a water quality issue in Section 7.5.4.

### **7.3.2 HYDROLOGY AND FLOOD**

As discussed in Section 5.2, Hydrology and Flood, the Project has been designed to meet or exceed the new development requirements of the National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit, the County's Low Impact Development (LID) standards pursuant to Chapter 12.84 et seq. of the County code, and the County's LID Standards Manual. Specifically, the Project would implement site design, source control, LID, hydromodification, flow control, and runoff water quality best management practices (BMPs) and treatment requirements, ensured with implementation of mitigation. Impacts related to on-site hydrology would be less than significant. The Project would comply with and implement the requirements of the Construction General Permit issued by the State Water Resources Control Board (SWRCB, CAR000002, Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-0006-DWQ), ensuring a less than significant impact during construction activities.

As discussed in Section 4.0, the portions of the site located within the 100-year floodplain would be subject to a Floodplain Safety Overlay that precludes habitable residential, commercial, school, and institutional structures in the floodplain. There would be no housing development in on-site floodplains, and no significant impacts would occur from placing structures within a floodplain.

Potential mudflow impacts would be reduced to less than significant levels by (1) capturing debris flows in on-site basins and engineered and natural stream channels and (2) avoiding disturbance in on-site locations with slopes in excess of 25 percent that could generate mudflows. Storm water basins would be managed to avoid potential mosquito-borne health vectors by implementing California Department of Public Health (CDPH) recommendations and fully discharging captured storm water within 96 hours. Also, an integrated pest management program must be developed and confirmed during the County review and approval process for Project tract maps.

Cumulative impacts are evaluated relative to the approximate watersheds within which the Project site is located. Approximately 97.3 percent of the Project site, including locations that will be preserved in open space and remain undeveloped, is located within the Antelope Valley Watershed (95.5 percent of the site) and the much smaller Quail Lake Watershed to the south (1.8 percent of the site). Only projects within the same watershed would have the potential for cumulative impacts associated with hydrology and flooding. Projects outside the hydrologically defined watershed within which the Project is located could not result in impacts within the Project's watershed. Therefore, additional urbanized uses and increases in impervious surface areas in the Project site's vicinity could produce, if left unmitigated, increases in runoff volume, velocity, and peak discharge rates. Urbanized uses could also lead to potential erosion and sedimentation impacts. All future developments in the Antelope Valley and Quail Lake Watersheds would have to comply with the same flood-control criteria and general storm water drainage requirements with which the Project must comply. For example, the Project and all the related projects in the watershed would be required to comply with the Los Angeles County Department of Public Works' LID Manual. Through this process, applicants are required to demonstrate that their projects would not cause upstream or downstream properties to be adversely affected. All drainage systems in developments that carry runoff from developed areas must be able to carry the 2-year and 25-year storm runoff, while storm drains under major and secondary highways, open (main) channels, debris-carrying systems, and sumps must be designed to carry runoff from 50-year level storm. These requirements serve to minimize direct and cumulative impacts to runoff, debris production, water quality, and flooding potential to downstream areas. Therefore, development of the Project would not contribute to significant cumulative hydrology, flood, or drainage impacts.

### **7.3.3 HAZARDS AND FIRE SAFETY**

#### **Hazards and Hazardous Materials**

After implementation of MMs, Project-specific impacts due to hazardous materials would be reduced to a less than significant level. Although some of the related projects would also have potential impacts associated with hazardous materials, the environmental concerns associated with hazardous materials are generally site-specific. Each project is required to address any issues related to hazardous materials or wastes. Federal, State, and local regulations require mitigation to protect against site contamination by hazardous materials. Therefore, there would be no significant cumulative hazardous materials impacts to which the Project would contribute.

The Quail Lake Skypark Airport, a single strip, private airport, is located east of Quail Lake and south of the Project site. A total of six aircraft, all of which are fixed wing, are currently based out of the Quail Lake Skypark Airport. No heliports are located in the Project vicinity. There is the potential that the number of flights could increase incrementally over time if regional population grows and demand for the Skypark increases. Given that the Project would not result in any flight operations, it would not contribute to a cumulative impact, nor would the impacts associated with related projects result in substantially greater impacts than what has been described Section 5.3. As such, overflights would not constitute a cumulative impact with regards to the Project. Impacts associated with the potential noise impacts of overflights are addressed in Section 5.12, Noise.

## **Fire Safety**

As discussed in Section 5.3, Hazards and Fire Safety, portions of the Project site are designated as a Very High Fire Hazard Severity Zone and portions are designated as a High Fire Hazard Severity Zone. Therefore, consistent with County code requirements, a Fuel Modification Plan must be submitted to the Forestry Division and be preliminarily approved prior to permit issuance for any permanent habitable structure, in addition to compliance with all State and County fire code and access requirements. The extent and location of the fuel modification zones would be finalized with the County of Los Angeles Fire Department as part of implementation of individual tract maps.

With development of related projects located in wildfire hazard areas and projected growth in the region, new development and population would be introduced into the wildland/urban interface. As a result, the number of structures and people that would be affected by a wildland fire, and the potential losses if a fire occurs, would increase. However, each of the related projects would be required to meet local and State fire safety measures dependent on the fire hazard designation, including fuel modification, emergency access, building materials, and/or building methods. Therefore, the Project would result in a less than significant cumulative impact related to wildland fires.

### **7.3.4 WATER QUALITY**

The geographic area for evaluating cumulative water quality impacts is comprised of the four drainage areas on the Project site, as shown on Exhibit 5.2-2, Drainage Areas on the Project Site, the East Drainage Area, the Oso Canyon Drainage Area, the Quail Lake Drainage Area, and the Gorman Creek Tributary Drainage Area. Outside the Project site, the remainder of the drainage areas are also largely undeveloped. Existing major roadways, which represent impervious surfaces and pollutant sources, include I-5, which traverses the Gorman Creek Tributary Drainage Area; Gorman Post Road in the Gorman Creek Tributary and East Drainage Areas; and SR-138 in the Quail Lake and the East Drainage Areas.

## **Surface Water Quality**

As discussed in Section 5.4, Water Quality, the Project's surface runoff water quality, would comply with adopted and applicable federal, State, and County regulations with implementation of planned BMPs, which would be ensured by implementation of mitigation,

both during construction and operation. Regulatory standards applicable to the Project include those set forth by the MS4 Permit and LID Standards Manual; the Lahontan RWQCB and Los Angeles RWQCB Basin Plan benchmark water quality objectives; California Toxics Rule (CTR) criteria; the NPDES Construction General Permit; and the NPDES General Dewatering Permit/Limited Threat Discharge Permit. As determined by the Water Quality Technical Report, the anticipated quality of effluent expected from the Projects' BMPs would not contribute concentrations of pollutants of concern that would be expected to cause or contribute to a violation of the water quality standards in the Project's receiving waters. All future urban development occurring in the four drainage areas must also comply with these requirements. By extrapolating the results of the direct impact analysis, the Water Quality Technical Report states it can be predicted that analysis of other proposed development combined with existing conditions would have similar surface water quality results (Geosyntec 2016). Therefore, cumulative impacts on surface water quality of receiving waters from the Project and future urban development in the four drainage areas are addressed through compliance with the above-mentioned regulatory requirements and with compliance with Total Maximum Daily Loads (TMDLs), which are intended to protect beneficial uses of the receiving waters. Based on compliance with the applicable regulatory requirements, the Water Quality Technical Report (see Appendix 5.4-A) concludes that cumulative surface water quality impacts would be less than significant.

## Groundwater Quality

As discussed in Section 5.4, Water Quality, the Project's discharges to groundwater are predicted to comply with adopted and applicable federal, State, and County regulations, as listed above under "Surface Water Quality"; this would be ensured with implementation of planned BMPs and implementation of mitigation, both during construction and post-development. As determined by the Water Quality Technical Report, the anticipated quality of storm water runoff discharges from the Project's developed areas and from irrigation to groundwater (including with recycled water that is tertiary-treated in compliance with *California Code of Regulations* Title 22 standards) and the operating permits of the wastewater reclamation facilities [WFRs] would not contribute loads or concentrations of pollutants of concern that would be expected to cause or contribute to a violation of the groundwater quality standards (Geosyntec 2016). All future urban development occurring in the Antelope Valley Watershed must also comply with these requirements. Therefore, cumulative impacts on groundwater quality from the Project and future urban development in the Antelope Valley Watershed are addressed through compliance with the above-mentioned regulations. Based on compliance with the applicable regulatory standards, the Water Quality Technical Report concludes that cumulative groundwater quality impacts would be less than significant (Geosyntec 2016).

### 7.3.5 LAND RESOURCES

#### Agricultural and Forestry Resources

As discussed in Section 5.5, Land Resources, the Project site and surrounding area are within the West EOA designation in the AVAP. Implementation of the Project would involve the conversion of approximately 642 acres of Prime Farmland to urban uses. As discussed, this

conversion of farmland on the Project site is consistent with the AVAP's intent to concentrate development that supports economic growth and stability within the designated EOA, which includes localized areas of farmland conversion, thereby preserving Important Farmland and other agricultural resources in the remainder of the Antelope Valley. Regardless, for the same reasons as described in the AVAP EIR, there is no feasible mitigation to reduce this impact to a less than significant level, and therefore would be a significant unavoidable impact of the Project. The on-site conversion of farmland (approximately 642 acres of Prime Farmland) is part of the total of 6,169 acres of Important Farmland that the AVAP EIR identified would be converted as part of future growth. However, the Project's contribution to conversion of agricultural resources is cumulatively considerable and is considered a significant and unavoidable impact.

Section 5.5 identifies less than significant impacts to forest land, timberland, and timberland production. The Project's designated off-site mitigation areas allow tree crops as a permitted use. The Project would not conflict with zoning for timberland or a Timberland Production Zone, as the site has not been designated as such. There would be a less than significant cumulative impact to forest resources with implementation of the Project.

## **Mineral Resources**

Implementation of the Project would not result in cumulative impacts from the loss of availability of a known mineral resource because the Project site does not directly impact any mineral resources.

### **7.3.6 CULTURAL RESOURCES**

Cultural resources (historic built environment, archaeology, tribal cultural resources, and paleontology) are non-renewable and irreplaceable resources. Projects undertaken in the region have the potential to cause direct and cumulative impacts to these resources through land development. On the Project site, no historic built environment resources are located within the Project's Area of Potential Effects (APE), so the Project would not contribute to any cumulative impacts to these resources despite possible impacts to these resources by other public and private developments in the vicinity.

Three prehistoric archaeological sites that meet the definition of a "historical resource" (as defined by CEQA) have been identified within the Project site APE, including within the development footprint. They include CA-LAN-3201, CA-LAN-3240 and CA-LAN-3242. In addition, two sites within the open space areas (CA-LAN-3206 and CA-LAN-3227) would be treated as eligible and protected from secondary impacts as they are immediately adjacent to the development footprint. Mitigation measures are included in this EIR that would ensure the identification, protection, and/or evaluation of these sites, including those that may be tribal cultural resources as defined under CEQA, and would reduce related impacts to a less than significant level. Specifically, data recovered from a site, combined with data from other sites in the region, would enhance the ability to examine and fully appreciate the diversity of human activities in the region. As a result, development of the Project would not contribute to a significant cumulative impact on archaeological resources.

Development of the Project site, in combination with other projects in the region where a parcel is underlain by the Quail Lake or Oso Canyon Formations, could lead to the progressive loss of fossil-bearing strata in either a rock unit that could be prospected for fossil remains or in unrecorded fossil sites. However, mitigation measures are included in this EIR that would require the identification, evaluation, recovery, and curation any significant fossils discovered during construction of the Project. Therefore, this cumulative impact would be reduced to a less than significant level with similar mitigation associated with each related project developed in the cumulative study area. Section 5097.98 of the *California Public Resources Code* and Section 7050.5 of the *California Health and Safety Code* mandate processes to be followed in the event of a discovery of any human remains. Implementation of these processes would be ensured by implementation of mitigation and would reduce potential impacts to a less than significant level.

### 7.3.7 BIOLOGICAL RESOURCES

Each related project identified in this section would result in impacts on biological resources in the region. The combined impacts of the development of the Project and all other aforementioned projects in the region would result in substantial direct and indirect impacts on biological resources. Two of the related projects in particular, Gorman Post Ranch and Tejon Mountain Village, would impact similar biological resources, such as native grasslands, oak woodlands, special status plant and wildlife species, drainages, and wildlife movement. Other general impacts include direct impacts related to habitat removal and loss of open space as well as indirect impacts including increases in disturbances such as noise, night lighting, exotic species introduction, vehicular traffic, and human interaction. Similar types of impacts would be expected with future development associated with regional growth projections. While it is not possible to predict precisely where development associated with regional growth would occur, it is likely that such future development would also result in the conversion of natural open space areas that presently support plants, wildlife, and other biological resources of the region to development of some kind.

As discussed in Section 5.7, Biological Resources, the Project would result in impacts on special status plant and wildlife species. These impacts would be reduced to a level considered less than significant with mitigation, which includes preservation of at least 12,832 acres of grassland. Impacts to most special status vegetation types on the Project site and in off-site areas would also be reduced to less than significant levels with mitigation. However, impacts on native grasslands are considered cumulatively significant after mitigation.

It is likely that most identified related projects, especially Gorman Post Ranch and Tejon Mountain Village, also have impacts on special status species. These impacts would be less than significant for the four following reasons:

- Highly sensitive species, such as those that are federally or State-listed, are uncommon in the region and therefore less likely to be impacted by one of the future projects.
- The California condor (*Gymnogyps californianus*), a highly sensitive species from the region, does not occupy the low lying valley floor areas that are likely to incur the

greatest level of disturbance from future development. In addition, the Tehachapi Upland Multiple Species Habitat Conservation Plan (TUMSHCP) provides for the long-term preservation of essential condor areas and considers development of the Tejon Mountain Village project.

- The open space preserve proposed as part of the Project, the resource protection provided in the nearby National Forest lands, and the Los Angeles County Significant Ecological Areas in the area together encompass a large portion of the region and provide a valuable haven for species as other parts of the region are developed.
- Related projects would mitigate Project-specific impacts related to biological resources, thus reducing the cumulative impacts.

As a result, cumulative impacts on special status plant and animal species are considered less than significant for the Project.

Development of the Project would result in impacts on several sensitive vegetation types including oak woodlands, native grasslands, and wildflower fields. (See Section 5.21, Climate Change, for an analysis of changes in carbon sequestration capacity due to vegetation change.) Implementation of the Project's mitigation measures would enhance, restore, and create these vegetation types within the proposed open space preserve and would therefore reduce impacts to less than significant levels for all vegetation types except native grasslands. It is likely that most of the identified related projects would also have impacts on sensitive vegetation types. Impacts would be mitigated in accordance with County standards with implementation of standard County mitigation requirements and/or "no net loss" conditions of permits from some resource agencies (e.g., Streambed Alteration Agreements issued by the California Department of Fish and Wildlife [CDFW]). Although cumulative impacts would occur, these are expected to be less than significant after mitigation for all but one vegetation type (native grasslands) due to the applicable regulations that substantially minimize such impacts. Due to the cumulative loss of native grasslands in the larger region and the state as a whole and the lack of a widely accepted definition for "native grassland" or a published standard for a mitigation ratio, impacts on native grasslands are considered cumulatively significant after mitigation.

The Project's impacts on federally protected wetland resources and on State-protected wetlands and their associated habitat are reduced to less than significant levels after mitigation. Specifically, a Wetland Habitat Creation and Enhancement Plan would be developed and would further reduce related impacts. Other mitigation requires permits and/or agreements to be obtained from the U.S. Army Corps of Engineers (USACE), the CDFW, and Regional Water Quality Control Board (RWQCB), as well as the development of a Storm Water Pollution Prevention Plan (SWPPP) that incorporates BMPs for reducing or eliminating construction-related pollutants in the site runoff. Although these are Project-specific measures, they would serve to reduce cumulative impacts and, as such, cumulative impacts on riparian habitat and other sensitive vegetation types would be less than significant.

The related projects are likely to reduce such impacts to less than significant through adherence to federal and State regulations. Such regulations normally require the

replacement of all lost functions and values within the same region of impact. Therefore, the region is not expected to incur substantial losses of State or federally protected wetlands, their associated riparian habitat, or other jurisdictional waters. The cumulative impact on State and federally protected wetland resources is considered less than significant. Similarly, cumulative impacts on oak trees, as protected under the County of Los Angeles Oak Tree Ordinance (#88-0157), are expected to be fully mitigated and result in a less than significant cumulative impact for the Project.

The Centennial Project would result in an impact on regional wildlife movement that is reduced to a less than significant level following mitigation; however, the Project may also contribute to a cumulative significant impact when combined with projects in the region. Because movement events for some larger species may occur very rarely, the success of each event may be particularly important. Due to the potentially heightened sensitivity of movement through the region for some species, the potential for a project or set of projects (e.g., Gorman Post Ranch, Tejon Mountain Village, Grapevine, or the Northwest 138 Corridor Improvement Project) to substantially interfere with a wildlife corridor is greater.

Indirect impacts such as increases in disturbances like noise, night lighting, non-native species introduction, vehicular traffic, domestic pet interactions, and human interaction may all also contribute to wildlife movement interference. Since the locations of many future projects in the region are unknown, there is the potential they may occur within important movement corridors. There are no specific regulations or permit conditions protecting this resource, and successful mitigation for such impacts is generally difficult. Therefore, the effects of the Project combined with future regional development would result in a cumulatively significant impact on wildlife movement.

As stated in Section 5.7, Biological Resources, because most of the larger wildlife species in the region do not typically cross large expanses of sparsely vegetated landscape (such as the majority of the Project site), the central and eastern portions of the Project site are not likely to be used by wildlife to move between and within the regional open space areas in the site vicinity. The Project site provides unobstructed local movement opportunities for small animals within large portions of the site. While the Project would result in a cumulatively significant impact on wildlife movement and on native grasslands, no other impacts to biological resources resulting from Project implementation were found to be cumulatively significant.

### **7.3.8 LAND USE, ENTITLEMENTS, AND PLANNING**

As discussed in Section 5.8, Land Use, Entitlements, and Planning, the Project would be consistent with the Los Angeles County General Plan and the AVAP (a component of the General Plan and the applicable Area Plan for the site), with the accompanying amendments to the County General Plan Master Plan of Highways and the AVAP Highway Plan, zone change for the Project site to Specific Plan, and other associated entitlements, and would be consistent with applicable regional (Southern California Association of Governments) plans and policies, including the 2012-2035 RTP/SCS and 2016-2040 RTP/SCS.

The Antelope Valley is a predominantly rural area where significant growth has occurred and is expected to continue. A number of Rural Town Centers are located in the Antelope Valley and three Economic Opportunity Areas (EOAs) have been designated by the AVAP that are slated for more substantial, urbanized growth. The West EOA is located at the northwestern section of the Antelope Valley where future development is anticipated due to its location along the planned Northwest 138 Corridor Improvement Project, the I-5, and new commercial and housing developments in Kern County. This EOA covers the Project site, and the Project would accommodate future development, as planned in the West EOA.

Because the Project is consistent with the Los Angeles County General Plan and the AVAP, with the accompanying plan amendments, zone change and other associated entitlements, and SCAG's RTP/SCS, no mitigation is required. Additionally, related projects would be required to comply with the applicable land use plans or they would not be approved without a general plan amendment. Therefore, implementation of the Project would not conflict with existing land use plans, policies, or regulations of agencies, and the Project would not contribute to a significant cumulative impact.

The AVAP has been challenged in court, but no injunction against implementation of plan has been sought or granted. The County's General Plan was adopted in October 2015, and was not challenged and is in effect. Consistent with land use law and CEQA requirements, these land use plans are being implemented and the environmental impact reports (EIRs) prepared for each plan have been considered as part of this Project EIR and each is incorporated by reference. This EIR does not tier from, nor is it legally reliant upon, the EIRs for either the AVAP or the General Plan. Should the approval and adoption of the AVAP or its accompanying EIR be invalidated, a possible judicial remedy could effectively revive the now-superseded former (1986) Antelope Valley Areawide General Plan (AVAGP). In that case, the Project would require an AVAGP amendment, in addition to a zone change to "Specific Plan" and other entitlements, including a Conditional Use Permit for development within a SEA. Upon approval of these AVAGP plan amendments, the zone change, and other associated entitlements, the Project would have less than significant land use impacts. Therefore, the Project would not result in a cumulatively considerable contribution to impacts related to conflict with applicable land use policy or division of communities.

### **7.3.9 POPULATION, HOUSING, AND EMPLOYMENT**

As discussed in Section 5.9, Population, Housing, and Employment, the Project would accommodate growth in the Antelope Valley consistent with the AVAP and the intent of the designated West EOA. The Project would provide for growth in employment, housing, and population that is consistent with the growth projections for the area, as incorporated into the AVAP and with the housing and employment growth projections used by SCAG in the development of the 2012–2035 RTP/SCS and the 2016–2040 RTP/SCS. The Project would also contribute to meeting the State-mandated Regional Housing Needs Assessment (RHNA) housing production targets for the County of Los Angeles. The Project would be consistent with the AVAP's strategy for increasing the jobs/housing ratio in the unincorporated area of the Antelope Valley, within designated EOAs. There would be less than significant impacts related to the potential displacement of people or housing units as a result of the Project since the majority of the Project site is undeveloped. While the Project would result in

substantial growth, because it would be consistent with local and regional growth assumptions.

Population, housing, and employment impacts would be less than significant and no mitigation would be required in relation to approved County and regional plans. Population, housing and employment growth would be substantial relative to existing Project site conditions because the site is currently undeveloped and unoccupied; hence, this impact is significant. However, no mitigation would be appropriate since the Project is consistent with approved land use and growth plans in the region. Regarding growth-inducing impacts, the existence of the Project makes it reasonably foreseeable that additional development proposals seeking AVAP amendments would be made outside the West EOA, which is considered a significant adverse indirect growth-inducing impact.

### **7.3.10 TRAFFIC, ACCESS AND CIRCULATION**

The traffic analysis provided in Section 5.10, Traffic, Access, and Circulation, indicates that, under existing plus Project conditions and 2035 cumulative conditions, the Project would contribute to significant impacts along SR-138 in regards to the percent of time-spent-following between the I-5 and SR-14 interchanges; it would also contribute to increased delay for side street vehicles, traffic signal requirements, and intersection capacity at multiple locations along SR-138 between the westerly access of the Project area and SR-14. Under cumulative conditions, the Project contributes to a significant cumulative impact to the I-5 mainline freeway; the truck lane in between the Grapevine and Fort Tejon Road interchanges; the segment between the SR-138 and Parker Road interchange and the segment from Magic Mountain Parkway to SR-14 interchange. Impacts are shown at eight intersections at I-5 interchanges when applying the impact criteria of the County of Los Angeles. In addition, at the I-5/SR-138 interchange, the connector ramps from westbound SR-138 to southbound I-5 and from northbound I-5 to eastbound SR-138 are forecasted to exceed 1,500 vehicles per hour under cumulative conditions, which results in the need for an auxiliary lane at the point the connector ramp meets the I-5 mainline. At the SR-14/SR-138 interchange, the SR-14 southbound on-ramp would require a second lane on the on-ramp and the SR-14 northbound off-ramp to SR-138 would need an additional lane and an auxiliary lane on the SR-14 mainline.

For 2035 cumulative conditions, the SR-138 was analyzed as a limited access facility with grade-separated interchanges, consistent with the Northwest 138 Corridor Project currently being advanced by Caltrans. The Project would be fully mitigated and all ramp-arterial intersections would operate at a level of service (LOS) B or better. Mitigation measures for impacts to the I-5 and off-site intersections involving fair share contributions to identified improvements would reduce all cumulative traffic impacts to a less than significant level. The proposed Centennial Transportation Improvement Program (CTIP) Agreement provides a mechanism for the needed transportation improvements to be implemented by providing advance funding for planning, design, and construction of certain improvements and establishing a funding program to collect fair shares for other improvements. With these traffic mitigation assurances, there would not be a significant cumulative impact from Project traffic. However, if Caltrans does not implement planned and needed improvements on State facilities, the Project would contribute to significant unavoidable impacts since the

County (as the Lead Agency) has no control over these facilities and cannot enforce the construction of the needed improvements.

### **7.3.11 AIR RESOURCES**

As discussed in Section 5.11, Air Resources, the northern 91 percent of the site lies within the boundaries of the Antelope Valley Air Quality Management District (AVAQMD), while the remaining 9 percent lies within the South Coast Air Quality Management District (SCAQMD). The Project's construction emissions would exceed AVAQMD annual mass emissions thresholds for nitrogen oxides (NO<sub>x</sub>) and SCAQMD daily mass emissions thresholds for volatile organic compounds (VOC) and NO<sub>x</sub>; these emissions would remain significant and unavoidable with implementation of mitigation. Construction activity near previously completed and occupied residences could result in exceedance of ambient air quality standards and exposure of sensitive receptors to substantial local emissions (i.e., not mass emissions) of respirable particulate matter with a diameter of 10 microns or less (PM<sub>10</sub>) and fine particulate matter with a diameter of 2.5 microns or less (PM<sub>2.5</sub>) that would remain significant and unavoidable with implementation of mitigation. At buildout of the Project, in 2035, long-term operational emissions of VOC, NO<sub>x</sub>, carbon monoxide (CO), PM<sub>10</sub>, and PM<sub>2.5</sub> would exceed AVAQMD and SCAQMD thresholds. These emissions would remain significant and unavoidable with implementation of mitigation.

Pursuant to the Los Angeles County Department of Regional Planning Environmental Checklist, any project that results in "a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)" is considered to result in a cumulatively significant impact, and is addressed under Threshold 11-5 in Section 5.11, Air Resources. Both districts are in federal and State nonattainment for ozone (O<sub>3</sub>). The SCAQMD is also in federal and State nonattainment for particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>). The AVAQMD is in State nonattainment for PM<sub>10</sub>. As concluded in Section 5.11, construction annual emissions of NO<sub>x</sub> (an O<sub>3</sub> precursor) would be directly significant and therefore cumulatively considerable and significant. Construction daily emissions of VOC and NO<sub>x</sub> (O<sub>3</sub> precursors) would be directly significant and therefore cumulatively considerable and significant. Construction mass emissions of PM<sub>10</sub> and PM<sub>2.5</sub> would not be directly or cumulatively significant. Long-term operational emissions of PM<sub>10</sub>, PM<sub>2.5</sub>, and O<sub>3</sub> precursors VOC and NO<sub>x</sub>, would be directly significant and therefore cumulatively considerable and significant.

### **7.3.12 NOISE**

Section 5.12, Noise, of this EIR assesses potential noise impacts from Project construction, Project-related traffic generation, on-site stationary noise sources, and off-site noise sources.

Because noise naturally attenuates with distance, cumulative construction noise impacts would occur only if there was Project construction activity in the immediate proximity of construction activity from another project and if both activities are near a common sensitive receptor at the same time.

The NW138 Corridor Improvement Project would occur along the length of the SR-138, including on the portion that is adjacent to the Project site. It is likely that both the Project and the SR-138 would have construction activities occurring at the same time. However, it is unlikely that the construction for both projects would occur simultaneously adjacent to the same noise-sensitive receptors along SR-138. Because of the large size of the Project site, the potential for this to occur is limited to the perimeter of the Project site at a location where both the NW138 Improvement Project and the Project would be actively constructing facilities at the same time. The potential for this occurrence is also low due to the mobile nature of construction activities (moving from area to area on a site or alignment). The construction schedule for the NW138 Improvement Project is unknown at this time. However, to minimize impacts due to construction noise, Caltrans projects are subject to the Caltrans Standard Specifications in Section 148.02, "Noise Control," and also by Standard Special Provision S5-310, "Noise Control" (Caltrans 2016), which ensure that construction noise does not significantly affect adjacent sensitive receptors.

There is also a possibility of concurrent construction activities on both the Project site and the Burrows Property adjacent to the eastern Project boundary and 300<sup>th</sup> Street West. However, an entitlement application has not yet been filed with the County of Los Angeles for the Burrows Property, and therefore, the potential for overlapping construction cannot be reasonably determined. The Centennial Project's noise analysis (Section 5.12, Noise) determines that there would be less than significant construction and stationary noise impacts with implementation of the mitigation program. Therefore, there would not be cumulative noise impacts related to construction of the Project or proposed stationary noise sources on the Project site.

Stationary source noise is controlled by the standards of the County Noise Ordinance, which limits noise levels at the property line between the Project site and an adjacent off-site receptor. The NW138 Improvement Project would not have operational stationary sources. Stationary source noise from future development projects near the Project site would be limited by the County noise ordinance and would not have the same common property boundary with a sensitive receptor as the Project. There would be no cumulative stationary source noise impact.

In addition to construction and stationary source noise, the Project would generate mobile source noise from traffic. The noise analyses in Section 5.12 of this EIR identifies the future traffic noise exposures that would occur in the Project traffic noise study area both with and without the Project. The analysis of traffic noise is inherently a cumulative analysis because the calculation of buildout traffic noise exposures considers the anticipated future traffic volumes based on regional growth models as described in the Project traffic impact analysis, Appendix 5.11-A of this EIR (Stantec 2017). In other words, the cumulative analysis of traffic volumes includes noise generated by the Project and other projects in the traffic noise study area (as described in Section 5.12). The noise study determines that there would be less than significant traffic noise impacts to proposed on-site land uses with implementation of the mitigation program; therefore, there would not be cumulative traffic noise impacts at future on-site receptors (Wieland Acoustics 2011).

Regarding off-site receptors, the analyses in Section 5.12 determines that, at the completion of Project buildout (2035), operation of the Project would expose some existing off-site noise-sensitive receptors adjacent to SR-138 between Gorman Post Road and Old Ridge Route Road to increases in exterior ambient noise levels that exceed the 3 A-weighted decibels (dBA) threshold criterion due to Project-related traffic. The impact would be considered significant and unavoidable because feasible mitigation to reduce these impacts is not within County jurisdiction. Therefore, when considering the additional regional traffic on SR-138, the Project would contribute to significant and unavoidable cumulative impacts to these receptors.

The vibration analysis in Section 5.12 identifies potential vibration impacts from pile driving and from the operation of heavy equipment very near sensitive receptors. Mitigation would require that vibration-inducing construction activities be designed to limit vibrations to less than the County's performance standard. All projects near the Project site must comply with County standards to minimize vibration impacts to less than significant levels; therefore, cumulative vibration impacts would also be less than significant.

### **7.3.13 VISUAL RESOURCES**

The geographic context for cumulative visual impacts generally encompasses the site and adjacent areas that share viewsheds or lines of sight with the site, as provided by open expanses of open land, agricultural land, and low density developments in the Antelope Valley and distant views of the foothills and ridgelines of the Tehachapi and San Gabriel Mountains.

The cumulative impacts on visual resources from the Project and related projects in the area would be expected with new development throughout the site and surrounding areas. The construction of new structures and associated infrastructure would lead to visual changes that could be cumulatively considerable when assessed in combination with growth and development that would be visible to area residents, employees, visitors, and passing motorists. This growth and development may not necessarily be considered adverse to the visual character of the area, since development would occur in areas planned for development (such as EOAs in the Antelope Valley and City centers) and other areas are protected as permanent open space or designated a rural preserve areas. In addition, applicable design standards (including those contained in the *Centennial Specific Plan*) and the design review process for individual developments would ensure the construction of aesthetically pleasing developments in the area.

Mountain and hillside views are expected to remain visible to public views, as a large portion of these areas have been or would be preserved as permanent open space or would support limited development. Hillside management and scenic resource regulations would limit development in the hillsides and areas with scenic resources. However, the Project would develop a community in a largely undeveloped area, and the accompanying visual change is considered significant and unavoidable, even with mitigation. While the related projects would not all be visible in the same viewsheds as the Project, visual changes in the surrounding areas that would result from continued development would contribute to the

Project's impact. Thus, cumulative impacts on visual resources would also be significant and unavoidable.

There are limited light and glare sources in the area. Although the Project would include preparation of an Exterior Lighting Plan (also referred to as "the Dark Sky Plan") to minimize glare and limit light spillover, Project implementation would introduce development at a scale that would result in significant increases in lighting levels. The related projects would also increase lighting levels at individual development sites. While these related projects would not be located adjacent to the site, increases in ambient lighting levels would occur throughout the Project area. Regulations that prevent glare and light spillover into adjacent properties, including Specific Plan design standards and guidelines, would reduce impacts, but increases in sky glow are expected to occur. This impact would be significant and unavoidable with the Project and would be cumulatively significant and unavoidable, even after mitigation.

### **7.3.14 PARKS AND RECREATION**

As discussed in Section 5.14, Parks and Recreation, the Project would provide abundant on-site park acreage and other recreational facilities, and the planned parkland would meet, and substantially exceed, the State and County parkland requirements; this would be ensured by implementation of mitigation. Each future project in the region that includes implementation of a residential subdivision would be required to meet State (i.e., Quimby Act) and local, if any, parkland requirements. As discussed in Section 5.14, the Project is not anticipated to result in substantial deterioration of any existing recreation facilities or trails, nor would the Project require off-site construction or expansion of recreation facilities or trails. As regional growth occurs, the demand for various types of parks and other recreation facilities would increase. Since the Project provides adequate parkland and trails onsite to serve the Project's residents and since it exceeds the public parks requirement in an area with little local parkland, the Project's contribution to increased demand for parks and recreational facilities would not be cumulatively considerable, and there would be a less than significant cumulative impact.

### **7.3.15 EDUCATION**

As detailed in Section 5.15, Education, the Project site is within the jurisdiction of two public elementary school districts and one public high school district. The Project includes development sites for one Kindergarten (K) through 5<sup>th</sup> grade school, five K-8<sup>th</sup> grade schools, and one high school, which would be ensured by implementation of mitigation. In addition, the Project Applicant has signed agreements with the school districts for a contribution to facilitate the financing, construction, and operation of new school facilities in the Project area. As with the Project, each future project with residential and commercial/industrial development would be required to either pay developer's fees in compliance with Senate Bill (SB) 50 (i.e., the Leroy Greene School Facilities Act) or seek an alternate resolution or agreement with affected school districts to offset the cost of public school construction. Section 65996(b) of the *California Government Code* states that the provisions of the developer fee legislation (i.e., SB 50) provide full and complete school facilities mitigation. As the Project would provide on-site school facilities and would

implement agreements with the three affected school districts, the Project's contribution to increased demand for schools would not be cumulatively considerable, and there would be a less than significant cumulative impact.

### **7.3.16 FIRE AND LAW ENFORCEMENT SERVICES**

#### **Fire Services**

As discussed in Section 5.16, Fire and Law Enforcement Services, the Los Angeles County Fire Department has indicated that the proposed fire stations on the Project site would provide adequate fire service to the Project, which includes conceptual locations for up to four new fire stations. The number, location, and construction of the proposed fire stations would be ensured by implementation of mitigation. The Project, in combination with other development, would contribute to increased demand for fire protection services. Each future project would be required to provide facilities and/or fees, as applicable, for each jurisdiction (i.e., County of Los Angeles, County of Kern, cities of Lancaster, Palmdale, and Santa Clarita) to ensure they would be adequately served by fire protection services. The Project's contribution to increased demand for fire protection services would not be cumulatively considerable, and there would be a less than significant cumulative impact.

#### **Law Enforcement Services**

As discussed in Section 5.16, through coordination with the Los Angeles County Sheriff's Department, facilities required to adequately serve the Project were identified and have been included in the Conceptual Land Use Plan. The Project, in combination with other development, would contribute to increased demand for law enforcement services. As future growth occurs in unincorporated County areas and in other surrounding jurisdictions, the law enforcement agency serving that jurisdiction would be required to assess the demands placed on local stations and the staff and facilities needed to serve that growth, to be supported by general fund, taxes, and other revenues that occur with urban development. As the Project would provide the necessary on-site law enforcement facilities, the Project's incremental contribution to law enforcement services would not be cumulatively considerable, and there would be a less than significant cumulative impact.

There would also be an increased demand placed on the California Highway Patrol (CHP) as regional growth is developed. As stated in Section 5.16, there are no long-range planning documents or uniform staffing requirements used by the CHP to project future needs in each service area. As future projects are implemented, the Area Commander would be required to assess the demands placed on the local office. The increased revenues generated by the Project (via motor vehicle registration fees paid by new on-site residents and businesses) would provide funding that would partially offset increased demand on CHP services. The Project's incremental contribution to CHP's law enforcement services would not be cumulatively considerable and there would be a less than significant cumulative impact.

## 7.3.17 OTHER PUBLIC SERVICES

### Library Services

Development occurring in Los Angeles County and Kern County surrounding the Project site that contributes to the resident population would increase the demand placed on public library facilities and services. To meet the Project's anticipated library demand, the Project includes a conceptual location for a public library in the Town Core in Village 3, just north of SR-138, which would be built and equipped as a turn-key facility to be part of the County of Los Angeles Public Library system; this would be ensured by implementation of mitigation. As with the Project, each related project would be required to meet the respective County's library mitigation fees to allow for construction and/or expansion of facilities and services to accommodate the needs of the surrounding area's population. Also, increases in property taxes due to new development would provide additional funds. In addition, one of the related Projects, Tejon Mountain Village, located in Kern County would also involve the construction of an on-site library (Kern County 2009). The Los Angeles County Library System monitors library use and changes in service demand that may require additional personnel, library materials, or facilities. This evaluation assists in balancing demand with services in different geographic areas of Los Angeles County, to help prevent adverse cumulative impacts on library services to the extent resources are available where needed. As such, the impact on nearby Kern County and Los Angeles County library services attributable to the Project (when combined with other related projects) would not be cumulatively considerable.

### Solid Waste

Solid waste collection services are provided in the Project area under a non-exclusive franchise system, and future growth and development in the region would result in additional demands for private solid waste collection and disposal services. Increases in demand for waste collection services are expected to be met with increases in staffing, facilities, and equipment to provide the needed services. The Project's contribution to impacts on private solid waste collection services would not be cumulatively considerable.

Waste generation from new developments requiring landfill disposal are expected to decrease landfill capacity over time. There is remaining permitted capacity of approximately 133.14 million cubic yards (mcy) at the four major landfills serving the Project area, which have a permitted daily capacity of 25,000 tons per day). The Project's estimated annual solid waste volume would require disposal of 13,849 tons per year (approximately 44.4 tons per day; this is based on 312 days per year, i.e., 6 days a week, which is when most solid waste facilities operate) and would represent approximately 0.18 percent of the landfills' daily permitted capacity, not including capacity at minor landfills, remote landfills, or out-of-County landfills.

County of Los Angeles, County of Kern, and State waste reduction and recycling programs and regulations are expected to reduce solid waste generation, resulting in less landfill disposal demand and, in turn, extend of the life of existing landfills. However, permitted Class III landfill capacity cannot be guaranteed at the time of Project buildout and through the life of the Project, which are beyond the required 15-year Los Angeles Department of Public

Works (LACDPW) planning horizon for solid waste disposal. Therefore, while the County is committed to handling all solid waste generated in the County now and in the future, to be conservative, this EIR concludes that the Project would result in a significant impact on the County's anticipated Class III landfill capacity. The Project's contribution to solid waste disposal and associated landfill capacity during long-term operation would be cumulatively considerable.

The Project allows for a Materials Recovery Facility/Transfer Station (MRF/TS) in the Utility land use designation, which could be operated by a private or public entity. If an MRF/TS is established, it could include a green waste mulching and composting facility, which would assist the County in meeting its solid waste diversion goals.

As described in Section 5.17.3, construction of the Project is estimated to result in approximately 150,728 tons of construction wastes requiring disposal over the 20-year Project buildout period, after waste diversion; this is approximately 7,537 tons per year or 29.0 tons per day. This finite waste stream was determined to result in a less than significant impact related to Class III landfill space. Similarly, the comparatively limited proportion of hazardous waste compared to the total municipal waste stream is expected to be accommodated by the permitted Class I and Class II landfills currently in operation in Southern California, and there would be a less than significant impact. Therefore, the Project's contribution to landfill space for construction and hazardous waste disposal would not be cumulatively considerable.

### **Other Public Facilities**

Implementation of the Project would require County services for the maintenance of on-site public roadways, parks, and other public infrastructure. In order to facilitate the maintenance of County-owned facilities that would be developed as part of the Project, land would be provided to the County for the development of two on-site maintenance yards for the County of Los Angeles Departments of Public Works and Parks and Recreation. The County may also construct, equip, and operate a permanent new animal control facility adjacent to the maintenance yards, if such a permanent facility is needed in the Project area. Impacts on other public facilities would be less than significant. Therefore, the Project's impact on other public facilities attributable to the Project (when combined with other related projects) would not be cumulatively considerable.

### **7.3.18 WATER RESOURCES**

At buildout the Project is estimated to require 11,365 acre-feet per year (afy) of water for residential, commercial, landscaping and other purposes, of which 6,788 afy would be treated for potable use, and 4,577 afy would consist of recycled water treated to state standards under Title 22 of the *California Code of Regulations* for unrestricted reuse in on-site wastewater treatment facilities. The Project would utilize several types of water supply and on- and off-site water banking facilities to meet potable demand. Available supplies include groundwater and imported water return flows in accordance with the approved Antelope Valley Adjudication Judgment and Physical Solution, State Water Project (SWP) supplies secured for Project use and imported to the site under an agreement with the

Antelope Valley–East Kern Water Agency (AVEK), and AVEK service area deliveries that would occur only when SWP supplies are most abundant. Indoor wastewater would be conveyed to on-site treatment facilities, treated, and distributed to meet approximately 38 percent of the buildout water demand.

The Project's water supplies would sustainably meet buildout potable and recycled water demands and would maintain an average annual reserve supply of more than 79,000 acre-feet (af) after buildout has been achieved. The Project's water facilities would be owned and operated by a Project Water Purveyor regulated by the California Public Utilities Commission (CPUC) or organized as a Community Services District, a statutory water district or other entity with the appropriate capacity to own, operate, and maintain the Project's water system. The Project Water Purveyor would be funded through a rate-payer system and fees. Until the Project Water Purveyor is established, Centennial Founders, LLC (Project Applicant) would be responsible for all Project-related water services. All of the Project's water supplies and the design, permitting, financing, and construction of all treatment, collection and distribution infrastructure would be provided by the Project Applicant. The Project is required to provide the County with two water use reports, the first at the end of the fifth year following first occupancy or the occupancy of the 4,000<sup>th</sup> dwelling unit (whichever occurs later) and the second at the end of the 10<sup>th</sup> year or the occupancy of the 10,000<sup>th</sup> dwelling unit (whichever occurs later) to verify that the required water use rates are being achieved and to identify response measures if necessary to meet future water demand. No additional Project development would occur until any required water use report response measures have been implemented to the satisfaction of the County.

As discussed in Section 5.18, potential Project impacts to water supplies would be less than significant with mitigation, and no additional mitigation is required. The construction of off-site systems would not result in significant impacts to water supplies and no mitigation is required.

As discussed in Section 5.18, the AVAP and County General Plan EIRs estimated potential future water demands associated with the full buildout of the AVAP and County General Plan within the Antelope Valley region, which was projected to occur after 2035. The EIRs concluded that, while water supplies within the Antelope Valley would be sufficient to meet demand up to 2035 during average years, available water plans and projections, including the Antelope Valley Integrated Regional Water Management Plan (AVIRWMP) indicated that supplies would not sufficient to meet dry and multiple-dry year demand by 2035. The EIRs also concluded that, since there were no water supply projections extending after 2035, and potential buildout of the AVAP and General Plan in the region after 2035 could further increase regional water demand, it was uncertain if water supplies would be sufficient to meet future AVAP and General Plan demand after 2035 and cumulative impacts to water supplies would be significant and unavoidable (DRP 2014, 2015b).

The Project would help to reduce the water supply cumulative impact identified in the AVAP and General Plan EIRs because it would achieve water use efficiencies that would be below existing average rates in the region and would ensure that the Project-related increment of future regional growth considered in the AVAP and General Plan EIRs would occur with a high level of water conservation, including state-of-the art household and irrigation

installations and significantly enhanced recycled water use. Nevertheless, as determined during the AVAP and General Plan update CEQA review process, assuming buildout of the AVAP and General Plan in the Antelope Valley, regional water demands could exceed existing and planned supplies under post-2035 conditions. The Project has sufficient supplies to meet demand; Project-level impacts to water supply would be less than significant; and the Project would result in an increment of regional growth that incorporates state of art water use and conservation measures that would reduce per capita demand below existing levels. These conservation and efficiency measures would reduce but not eliminate the cumulative regional water supply impacts identified in the AVAP and General Plan EIRs, and would be significant and unavoidable.

### **7.3.19 WASTEWATER**

The Project would construct two new wastewater reclamation facilities (WRFs) providing solids handling, biogas reuse, and recycled water treated to unrestricted reuse standards under Title 22 of the *California Code of Regulations*; a wastewater collection system; and recycled water system that would be dedicated to serve the needs of the Project site, to be ensured with implementation of mitigation. The WRFs would be required to obtain Waste Discharge Requirements and other approvals issued by the Lahontan RWQCB and would comply with the State Water Resources Control Board's Recycled Water Use Policy. Because the Project's wastewater management system would be self-contained and would not connect with or otherwise impact any other existing or planned wastewater systems that may exist in off-site areas in the future, the Project would not result in any cumulative impacts related to compliance with Waste Discharge Requirements of either the Lahontan RWQCB or Los Angeles RWQCB, nor would it result in cumulative impacts to wastewater treatment facilities or capacity in the area.

### **7.3.20 DRY UTILITIES**

#### **Electricity**

Existing, planned, and foreseeable future projects within Southern California Edison's (SCE's) service area would contribute to increased demands for electrical service. As part of their long-range planning efforts, SCE evaluates the long-term growth projections when determining their long-range demand. The CPUC oversees and regulates service providers, including SCE, to ensure that adequate service levels are available to accommodate projected regional growth at fair prices. The Project's increase in demand for electricity would not be cumulatively considerable since SCE has stated its ability to provide service to the Project site and the surrounding area into the foreseeable future (See Section 5.20, Dry Utilities).

#### **Fossil Fuels (Natural Gas and Petroleum)**

Existing, planned, and foreseeable future projects in the Southern California Gas Company (SoCalGas) service area would contribute to increased demands for natural gas service. California's existing natural gas supply is regionally diverse and includes supplies from onshore and offshore California sources, the southwestern United States, the Rocky Mountains, and Canada. Additional pipeline capacity and interstate pipeline access allows

for long-term supply availability to serve existing, planned, and foreseeably future development. SoCalGas has indicated there are adequate natural gas supplies to accommodate the estimated demand of the Project as well as other existing and projected demands (SoCalGas 2006). Therefore, no significant cumulative impacts are anticipated.

The crude oil consumed in California comes from both in-state and out-of-state sources. Project construction and operations would result in consumption of petroleum. The majority of fuel consumption resulting from the Project would involve the use of motor vehicles. Petroleum fuel consumption associated with the Project is a function of the vehicle miles traveled (VMT) as a result of Project construction and operations. As discussed in Sections 5.10 (Traffic, Access, and Circulation), 5.11 (Air Resources), and 5.21 (Climate Change), the Project would result in an increase in VMT which, in turn, could result in additional fuel consumption and energy use associated with transportation. It should, however, be noted that, as a result of anticipated fuel efficiency improvements, additional VMT would not necessarily result in a proportional increase in fuel consumption. Moreover, the Project incorporates a variety of features intended to reduce VMT associated with the Project, thereby reducing petroleum consumption, both through energy-efficient site planning and building design as well as transportation improvements and vehicle trip reductions. As discussed further in Section 5.10, Traffic, Access and Circulation, the Project would construct and/or provide funding for necessary traffic and transit improvements to ensure there are less than significant traffic impacts; without these improvements, the Project-generated trips would otherwise result in increased gasoline usage and less efficient gasoline consumption due to traffic congestion. For these reasons, no significant cumulative transportation energy impacts are anticipated.

## **Telephone**

The CPUC oversees and regulates service providers (including AT&T, who would be the Project's service provider) to ensure that adequate service levels are available to accommodate projected regional growth at fair prices. The Project's increase in demand for telephone lines would not be cumulatively considerable since AT&T has indicated it has the ability to provide service to the Project site and the surrounding area into the foreseeable future.

## **Cable Television**

Existing, planned, and foreseeable future projects within the service area of the cable television (CATV) service provider (CalNeva Broadband or other provider yet to be determined) chosen for the Project would contribute to increased demands for CATV service. The CPUC oversees and regulates CATV service providers to ensure that adequate service levels are available to accommodate projected regional growth at fair prices. The Project's increase in demand for CATV service would not be cumulatively considerable as the CPUC ensures that whichever company chosen would be able to provide service to the Project site and the surrounding area into the foreseeable future.

### 7.3.21 CLIMATE CHANGE

The County acknowledges the consensus among leading scientists that, without action to reduce GHG emissions, climate change due to global warming will pose a considerable threat to the environment and to human health and society (DRP 2015d). Climate change is a global phenomenon and the significance of GHG emissions is most appropriately considered on a cumulative level. The *Final Unincorporated Los Angeles County Community Climate Action Plan 2020* (CCAP) is part of the County General Plan and was adopted along with the General Plan on October 6, 2015. The analysis of Project consistency with each of the CCAP goals and policies shows that the Project is fully consistent with the CCAP. The Project is also consistent with the SCAG 2016–2040 RTP/SCS; AVAP policies; and State GHG-reducing regulatory programs, including those that, as the California Air Resources Board (CARB) has concluded, put California on a trajectory toward meeting the 2050 GHG reduction goals set forth in several Executive Orders. The Project's GHG emissions per service person would be less than the SCAQMD-recommended screening threshold. The Project would nonetheless emit GHGs at an estimated rate of 244,379 metric tons of carbon dioxide equivalent per year (MTCO<sub>2</sub>e/year), which would exceed the AVAQMD's threshold of 100,000 MTCO<sub>2</sub>e/year and would contribute to the global inventory of GHGs.

To date, the vast majority of other states and nations have not followed California's lead in mandating GHG-emission reductions across a broad spectrum of economic sectors and have not enacted regulations similar to those adopted in California, which already has nearly the lowest level of GHGs per capita of any state. The County of Los Angeles has no jurisdictional control or responsibility for GHG reductions in other parts of California, and certainly not in the context of global action. Therefore, because of the global context of GHG emissions and the Project's forecasted GHG emission rate, the environmental impact related to GHG emissions is considered to be cumulatively considerable, and the impact would be significant.

## 7.4 CONCLUSION

The Project's cumulative impact analysis includes the consideration of regional conditions and includes proposed and approved development throughout the Santa Clarita Valley and Southern Kern County. Table 7-3, Significant and Unavoidable Cumulative Impacts, summarizes the information provided in this section and thus identifies significant cumulative impacts that would be associated with Project implementation.

**TABLE 7-3  
SIGNIFICANT AND UNAVOIDABLE CUMULATIVE IMPACTS**

<b>Resource/Impact Category</b>	<b>Specific Impact Conclusion</b>
<b>Biological Resources</b>	As a conservative assessment, the Project would result in cumulatively significant impacts to native perennial grasslands and wildlife movement.
<b>Land Resources</b>	The on-site conversion of farmland (approximately 642 acres of Prime Farmland) is part of the total of 6,169 acres of Important Farmland that the AVAP EIR identified would be converted as part of future growth. However, the Project's contribution to conversion of agricultural resources is cumulatively considerable and is considered a significant and unavoidable impact.
<b>Traffic, Access and Circulation</b>	The Project would contribute to cumulatively significant impacts without pending improvements by Caltrans.
<b>Air Quality</b>	Because the Project would result in both significant and unavoidable construction and operational emissions in the AVAQMD and the SCAQMD, both of which are in federal nonattainment for O <sub>3</sub> and PM <sub>10</sub> , it would contribute to cumulative impacts.
<b>Noise</b>	Traffic noise increases would exceed the 3 dBA CNEL criterion at identified receptors along SR-138, resulting in a significant impact. The impact would be considered significant and unavoidable because feasible mitigation to reduce these impacts is not within County jurisdiction, and would also be considered cumulatively significant in the context of additional regional traffic along the SR-138.
<b>Visual Resources</b>	The Project would be a component of, and result in cumulatively significant changes to, long-range views from public land. The Project would also contribute to cumulatively significant light pollution ("sky glow") impacts.
<b>Solid Waste</b>	The Project's estimated annual municipal solid waste disposal would represent a nominal incremental contribution to the combined daily disposal rate for the landfills serving the Project area. However, permitted Class III landfill capacity cannot be guaranteed at the time of Project buildout and throughout the life of the Project; therefore, the Project's contribution to municipal solid waste disposal is considered a cumulatively significant impact.
<b>Water Resources</b>	With mitigation, there would be a less than significant direct impacts to groundwater supplies, groundwater recharge rates, groundwater levels, and to existing and potential future well uses. As determined during the AVAP and General Plan update CEQA review process, cumulative regional water demands could exceed existing and planned supplies under post-2035 conditions. No feasible mitigation can be incorporated at a Project level to reduce this regional impact. As a result, cumulative water supply impacts would be significant and unavoidable.
<b>Population, Housing, and Employment</b>	Population, housing and employment growth would be substantial relative to existing Project site conditions because the site is currently undeveloped and unoccupied; hence, this impact is significant.

**TABLE 7-3  
SIGNIFICANT AND UNAVOIDABLE CUMULATIVE IMPACTS**

Resource/Impact Category	Specific Impact Conclusion
<b>Climate Change</b>	Although the Project would be consistent with the Los Angeles County CCAP, the SCAG 2016 RTP/SCS, the AVAP policies, complies with GHG-reducing regulatory programs, and the GHG emissions per service person would be less than the SCAQMD-recommended screening threshold, the Project would nonetheless emit GHGs at an estimated rate of 244,379 metric tons per year that would contribute to the global inventory of GHGs. The Project's GHG efficiency would be 3.02 which would not exceed the SCAQMD-staff-proposed "plan-level" 4.1 GHG efficiency threshold, but would exceed the SCAQMD-staff-proposed "project-level" 3.0 GHG efficiency threshold. Therefore, the environmental impact related to greenhouse gas emissions is considered to be cumulatively considerable and the impact would be significant.

## 8.0 ALTERNATIVES TO THE PROPOSED PROJECT

### 8.1 INTRODUCED

#### 8.1.1 PURPOSE

Sections 15126.6(a) and (b) of the California Environmental Quality Act (CEQA) Guidelines (14 *California Code of Regulations* [CCR]) provide guidance on the scope of alternatives to a proposed project that must be evaluated:

- (a) Alternatives to the Proposed Project. An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. An EIR is not required to consider alternatives which are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives. There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason.
  
- (b) Purpose. Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

#### 8.1.2 SUMMARY

This Alternatives section includes a history of the evolution of the proposed Project over time. This includes the Project as originally conceived in the first application to the County and the evolution to its current state based on input from the County, other agencies, organizations, and members of the public.

Following the Project history is an analysis of the Project Alternatives. The State CEQA Guidelines direct the Alternatives section to be both consistent with the objectives and “ . . . avoid or substantially lessen any of the significant effects of the project”. The following list of alternatives for the Project are included in the EIR for these purposes. The analyzed alternatives are:

1. Alternative A – No Project

2. Alternative B – Previously Proposed Project
3. Alternative C – Additional Drainage Avoidance
4. Alternative D – Infrastructure Relocation
5. Alternative E – Density Clustering/East of Aqueduct
6. Alternative F – Central EOA Development

As required by CEQA, each Alternative has a description and a summary of the impacts compared to the proposed Project, and Alternative E (Density Clustering/East of Aqueduct) is considered an environmentally superior alternative to the Project in relation to some impact topics.

### **8.1.3 SECTION FORMAT**

Due to the nature of the analysis, this section is organized differently than other sections. A description of the Project alternative is followed by its impacts under each environmental issue category as listed in Section 5 (i.e., Sections 5.1–5.21), which are listed as separate subheadings. Although the categories are listed in order of importance, the category titles match those in Section 5.0 (e.g., Land Use, Entitlements, and Planning [Section 5.8] and Land Resources [Section 5.5]). This section is arranged in the following manner:

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Summary of the Proposed Project
- Project History
- Alternatives to the Proposed Project
- Alternatives Considered but not Carried Forward
- Alternatives Analyzed
- Alternatives Analysis
- Environmentally Superior Alternative

### **8.1.4 REFERENCES**

All references cited for preparation of this analysis are listed in Section 8.7.

## **8.2 SUMMARY OF THE PROPOSED PROJECT**

The Project site is approximately 12,323 acres and is proposed to include developed or graded areas (6,699 acres) and preserved open space (5,624 acres). The proposed Project would allow for the development of a maximum of 19,333 dwelling units on approximately 4,987 acres. Additional land uses include approximately 7,363,818 square feet (sf) of Business Park uses on 597 acres; 1,034,550 sf of Commercial uses on 102 acres; 1,568,160 sf of Institutional/Civic uses on 110 acres; and 130,680 sf of Recreation/Entertainment uses

on 75 acres. The Project also proposes approximately 146 acres for Kindergarten through 12<sup>th</sup> grade schools and approximately 191 acres for Utility facilities. In addition, approximately 5,787 acres (approximately 47 percent) of the 12,323-acre Project site are proposed for Open Space for natural resource protection and greenways, and Parks for active and passive recreational use (i.e., 163 acres of Park Overlay) or (i.e., 5,624 acres of Open Space designation). For a complete Project description, refer to Section 4.0, Project Description.

The Project objectives are directed toward the development of a new community in a feasible, environmentally sensitive, and fiscally sound manner. The Project objectives (as included in in Section 4.3 of Section 4.0, Project Description) are as follows:

1. Implement the Antelope Valley Area Plan (AVAP) by creating an environmentally and economically sustainable master-planned community on the Project site to help accommodate planned regional population and economic growth within the West EOA.
2. Design the Project to maximize efficient utilization of regional infrastructure while preserving hundreds of thousands of acres of contiguous natural open space and important biological resources.
3. Size the Project to include a broad range of employment, residential, institutional, and recreational land uses to encourage walkability and wellness, while reducing off-site employment-related commuter trips.
4. Ensure that all Project site infrastructure and public services are funded by the Project to avoid creating any financial obligations on existing residents and other taxpayers.
5. Integrate a multi-modal transportation network, renewable energy, water conservation, community wellness, and other green development features into the Project's design, build out, and ongoing operations.

### **8.2.1 SUMMARY OF PROPOSED PROJECT IMPACTS**

The potential environmental impacts that would result from the Project have been evaluated in Sections 5.1 through 5.21 of this EIR. With implementation of the respective Project design features (PDFs) and mitigation measures (MMs) identified for each topical issue, many of the potentially significant impacts that could result from the Project would be reduced to a level considered less than significant. The impacts below would be considered significant and unavoidable after mitigation.

#### **Construction-Related Significant and Unavoidable Impacts**

**Air Resources:** Construction-related emissions of volatile organic compounds (VOC) and nitrogen oxides (NO<sub>x</sub>) would result in significant impacts. Mitigation measures would be implemented to reduce emissions; however, the impacts would remain significant and unavoidable.

Construction emissions could cause a potential temporary exceedance of federal, State, and South Coast Air Quality Management District (SCAQMD) standards for respirable particulate matter with a diameter of 10 microns or less (PM10) and fine particulate matter with a diameter of 2.5 microns or less (PM2.5) at Project residences that would be completed and occupied; this would be a significant impact. Implementation of Antelope Valley Air Quality Management District (AVAQMD) and SCAQMD dust control rules would substantially reduce dust, but it cannot be quantitatively demonstrated that the impact would be reduced to a less than significant level. This impact would be significant and unavoidable.

During construction of the Project, construction emissions of PM10 and PM2.5 could exceed the federal and State ambient air quality standards and SCAQMD-established local significance thresholds, exposing sensitive receptors to substantial pollutant concentrations. This impact would be significant and would be reduced with implementation of standard conditions and mitigation measures; however, they would not reduce impacts to a level considered less than significant.

### **Operational Significant and Unavoidable Impacts**

**Air Resources:** Long-term operational emissions of carbon monoxide (CO), VOCs, NO<sub>x</sub>, PM10, and PM2.5 would result in significant impacts. Mitigation measures would be implemented to reduce emissions; however, the impacts would remain significant and unavoidable after mitigation.

**Land Resources (Agricultural):** The Project would result in the conversion of approximately 642 acres of on-site Prime Farmland, for which there is no feasible mitigation to reduce this impact to a less than significant level. Therefore, this would be a significant and unavoidable impact related to conversion of farmland.

**Population and Growth Inducing-Impacts:** The Project would result in a maximum resident population of approximately 57,150 persons at Project buildout, which is estimated to occur in 2035. This would represent 14.1 percent of the buildout population of the Antelope Valley's unincorporated area, and would result in a population increase that would be consistent with anticipated population increases under the *Antelope Valley Area Plan* (AVAP). Implementation of the Project is considered growth accommodating rather than growth inducing at a regional level based on Southern California Association of Governments (SCAG) projections. Therefore, would be less than significant in relation to planned growth in the region. However, because the Project would substantially increase population and housing relative to the existing Project site conditions, this increase in population and housing on the Project site is considered significant and unavoidable. However, no mitigation would be appropriate because the Project is consistent with approved growth plans in the region.

Regarding growth-inducing impacts, the existence of the Project makes it reasonably foreseeable that additional development proposals seeking AVAP amendments would be made outside the West Economic Opportunity Area (EOA), which is considered a significant adverse indirect growth-inducing impact.

**Solid Waste:** The Project's incremental contribution to the County's solid waste stream during construction, which is a finite waste stream, would be nominal in comparison to available capacity (i.e., less than one percent). However, the permitted Class III landfill capacity in the County cannot be guaranteed at the time of Project buildout and through the life of the Project, which are beyond the County of Los Angeles Department of Public Works' (LACDPW's) 15-year planning horizon for solid waste disposal. Therefore, while the County is committed to handling all solid wastes generated within the County now and in the future, to be conservative, this EIR concludes that the Project buildout would result in a significant impact on the County's anticipated Class III landfill capacity. The Project would result in significant and unavoidable impact related to municipal solid waste during operation of the Project.

**Visual Resources:** The Project would result in significant and unavoidable impacts related to a change in visual character experienced from public vantage points (primarily transportation thoroughfares including State Route (SR) 138, 300th Street West, 290th Street West, and Malinda Avenue). Visual character impacts related to grading and development of the Project would be reduced through implementation of mitigation measures; however, the change of the Project site from a rural to urban condition and the varying degrees of obstruction of existing views of local foothills and the Tehachapi Mountains would be considered a significant unavoidable impact, for which no additional feasible mitigation exists. Since the Project site is in an undeveloped area with few existing light sources, implementation of the Project would result in significant and unavoidable impacts by introducing new sources of daytime and nighttime light and glare into the area. Project implementation would also cause a significant and unavoidable impact regarding a new source of sky glow, even after mitigation.

### **Significant and Unavoidable Impacts with Mitigation Outside the Control of the Lead Agency**

**Traffic, Access, and Circulation:** The on-site roadway network has been designed to accommodate projected traffic from the proposed land uses. However, if improvements at Project access points on SR-138 are not constructed by the California Department of Transportation (Caltrans), impacts would be significant and unavoidable. Also, Project buildout would result in significant traffic impacts on off-site roadways and freeways, including SR-138, I-5 mainline segments and interchange ramps, and arterial roadway intersections. Mitigation measures have been identified to reduce all significant Project impacts. However, it is outside the County's control to implement these measures. If Caltrans does not implement the needed improvements, the Project would result in significant and unavoidable impacts.

**Noise:** Increases in the ambient noise environment adjacent to SR-138 between Gorman Post Road and Old Ridge Route Road would exceed the applicable significance criterion at identified noise-sensitive receptors. Feasible mitigation measures would involve alterations to private property and/or within Caltrans' right-of-way, which are not in the County's or the Project Applicant's control. Therefore, the impact would be significant and unavoidable.

## Significant and Unavoidable Cumulative Impacts

The assessment of cumulative impacts requires forecasting future potential population and economic growth trends, and future projects, and conclusions about the significance of cumulative impacts is accordingly inherently less certain. The AVAP Environmental Impact Report (EIR) concluded that the following cumulative impacts were significant and unavoidable: agricultural resources (conversion of farmland), air quality (short-term/construction and long-term/operation), biological resources (special status species, sensitive vegetation types, wildlife movement), cultural resources (historic resources), mineral resources, noise (traffic noise), greenhouse gas emissions/climate change, traffic (mitigation outside of lead agency jurisdiction), and water supply.

Cumulative impacts of the proposed Project that are considered potentially significant and unavoidable include the following:

**Land Resources (Agricultural):** A significant, unavoidable impact on Important Farmland would occur through the Project's conversion of approximately 642 acres of Prime Farmland to urban uses. The on-site conversion of farmland is part of the total of 6,169 acres of Important Farmland the Antelope Valley Area Plan (AVAP) EIR would be converted as part of future growth consistent with the AVAP. Thus, the Project's contribution to conversion of agricultural resources is cumulatively considerable and is considered a significant and unavoidable impact.

**Air Resources:** Construction annual emissions of NO<sub>x</sub> (an O<sub>3</sub> precursor), construction daily emissions of VOC and NO<sub>x</sub> (O<sub>3</sub> precursors), and operational emissions of PM<sub>10</sub>, PM<sub>2.5</sub>, VOC, and NO<sub>x</sub>, would be directly significant and therefore cumulatively considerable and significant. Feasible mitigation measures to reduce the impacts from construction and operation emissions would be implemented for the proposed Project; however, even after mitigation, the direct and cumulative impact would be significant and unavoidable.

**Biological Resources:** Development of the Project would result in impacts on several sensitive vegetation types including oak woodlands, native grasslands, and wildflower fields. It is likely that most of the identified cumulative projects would also have impacts on sensitive vegetation types. Although cumulative impacts would occur, these are expected to be less than significant after mitigation for all but one vegetation type due to the regulatory requirements which substantially minimize such impacts. Specifically, due to the cumulative loss of native grasslands in the larger region and the State as a whole, and the lack of a widely accepted definition for "native grassland" or a published standard for a mitigation ratio, impacts on native grasslands are considered cumulatively significant after mitigation.

The Project would result in an impact on regional wildlife movement that would be reduced to a less than significant level following mitigation. Because the movement events for some larger species may occur very rarely, the success of each event may be particularly important. Due to the potentially heightened sensitivity of movement through the region for some species, the potential for a project or set of projects to substantially interfere with a wildlife corridor is greater. As such, as a conservative assessment, wildlife movement impacts are considered to be cumulatively significant for the Project.

**Noise:** The noise analyses in Section 5.12 of this EIR identify the future traffic noise exposures that would occur in the Project traffic noise study area both with and without the Project. The analysis of traffic noise is inherently a cumulative analysis because the calculation of buildout traffic noise exposures considers the anticipated future traffic volumes based on regional growth models. At the completion of Project buildout (2035), operation of the Project would expose some existing off-site noise-sensitive receptors adjacent to SR-138 between Gorman Post Road and Old Ridge Route Road to increases in exterior ambient noise levels that exceed the 3 A-weighted decibels (dBA) threshold criterion due to Project-related traffic. The impact would be considered significant and unavoidable because feasible mitigation to reduce these impacts is not within County jurisdiction. Therefore, when considering the additional regional traffic to the SR-138, the Project would contribute to a significant and unavoidable cumulative impacts to these receptors.

**Visual Resources:** The cumulative impacts on visual resources from the Project were assessed based on projected growth in Antelope Valley and projected future projects in the vicinity of the Project site (e.g., expansion of SR-138). This growth and development may not necessarily be considered adverse to the visual character of the area, since development would occur in areas planned for development (such as EOAs in the Antelope Valley and City centers). However, the Project is the development of a new community in a largely undeveloped area, and the accompanying visual change is considered significant and unavoidable after mitigation. While the related projects in the region would not all be visible within the same viewsheds as the Project, visual changes in the surrounding areas that would result from continued development would contribute to the Project's impact. Thus, cumulative impacts on visual resources would be significant and unavoidable.

Project implementation would introduce development at a scale that would result in significant increases in lighting levels, and the related projects would also increase lighting levels at individual development sites. While these related projects would not be located adjacent to the site, increases in ambient lighting levels would occur throughout the Project area. Regulations that prevent glare and light spillover into adjacent properties, including Project design standards and guidelines, would reduce impacts but increases in sky glow are expected to occur. However, this impact would be significant and unavoidable with the Project and would be cumulatively significant and unavoidable with mitigation.

**Climate Change:** The Project is consistent with each of the *Los Angeles County Community Climate Action Plan's* (CCAP's) goals and policies, with SCAG's 2012–20 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the 2016–2040 RTP/SCS, the AVAP policies, and State regulatory programs that reduce greenhouse gas (GHG) emissions, including those that, as CARB has concluded, put California on a trajectory toward meeting the 2050 GHG reduction goals set forth in several Executive Orders. The Project would nonetheless emit GHGs at an estimated rate of 244,379 metric tons of carbon dioxide equivalent per year, and would contribute to the global inventory of GHGs. The Project's GHG efficiency would be 3.02, which would not exceed the SCAQMD-staff-proposed "plan-level" 4.1 GHG efficiency threshold, but would exceed the SCAQMD-staff-proposed "project-level" 3.0 GHG efficiency threshold. To date, the vast majority of other states and nations have not followed California's lead in mandating GHG emission reductions across a

broad spectrum of economic sectors and have not enacted regulations similar to those adopted in California, which already has nearly the lowest level of GHG per capita of any state. The County of Los Angeles has no jurisdictional control or responsibility for GHG reductions from many types of products and activities (e.g., passenger vehicles, consumer products) both on site and elsewhere in California, nor does the County have jurisdiction or control of GHG emissions outside California within or outside the United States. Therefore, because of the global context of GHG emissions and the Project's forecasted GHG emission rate, the environmental impact related to greenhouse gas emissions is considered to be cumulatively significant.

**Solid Waste:** Waste generation from new developments requiring landfill disposal are expected to decrease landfill capacity over time. There is remaining capacity of approximately 133.14 million cubic yards (mcy) at the 4 major landfills serving the Project area. Two of these landfills are expected to close by 2037, in the same timeframe as Project buildout. County of Los Angeles, County of Kern, and State waste reduction and recycling programs and regulations are expected to reduce solid waste generation, resulting in less landfill disposal demand and, in turn, extend of the life of existing landfills. However, permitted Class III landfill capacity cannot be guaranteed at the time of Project buildout and through the life of the Project, which are beyond the required 15-year LACDPW planning horizon for solid waste disposal. Therefore, while the County is committed to handling all solid waste generated within the County now and in the future, to be conservative, this EIR concludes that the Project would result in a significant impact on the County's anticipated Class III landfill capacity. The Project's contribution to solid waste disposal and associated landfill capacity would be cumulatively considerable.

**Water Resources:** As discussed in Section 5.18, Water Resources, the Project's water supplies would sustainably meet buildout potable and recycled water demands and maintain an average annual reserve supply of more than 79,000 acre-feet (af) after buildout has been achieved. Potential Project impacts to water supplies will be less than significant with mitigation. The construction of off-site systems would not result in significant impacts to water supplies and no mitigation is required. Nevertheless, as determined during the AVAP and General Plan update CEQA review process, assuming buildout of the AVAP and General Plan within the Antelope Valley, regional water demands could exceed existing and planned supplies under post-2035 conditions. The Project has sufficient supplies to meet demand, Project-level impacts to water supply are less than significant with mitigation, and the Project will result in an increment of regional growth that incorporates state of art water use and conservation measures that would reduce per capita demand below existing levels. These conservation and efficiency measures would reduce, but not eliminate, the cumulative regional water supply impacts identified in the AVAP and General Plan EIRs be significant and unavoidable.

**Traffic, Access and Circulation:** The traffic analysis indicates that, under 2035 cumulative conditions, the Project contributes to significant impacts along SR-138 in regards to the percent of time-spent-following between the Interstate (I) 5 and SR-14 interchanges, as well as increased delay for side street vehicles, traffic signal requirements and intersection capacity at multiple locations along SR-138 between the westerly access of the Project area to SR-14. Under cumulative conditions, the Project contributes to a significant cumulative

impact to the I-5 mainline freeway; the truck lane in between the Grapevine and Fort Tejon Road interchanges; the segments between SR-138 to Parker Road interchange, as well as segments from Magic Mountain Parkway and SR-14 interchange.

The Project would be fully mitigated with implementation of the Northwest 138 Corridor Project currently being advanced by Caltrans, and mitigation measures for impacts to the I-5 and off-site intersections involving fair share contributions to identified improvements would reduce all cumulative traffic impacts to a less than significant level. The proposed Centennial Transportation Improvement Program (CTIP) Agreement provides a mechanism for the needed transportation improvements to be implemented by providing advance funding for planning, design, and construction of certain improvements and establishing a funding program to collect fair shares for other improvements. With these traffic mitigation assurances, there would not be a significant cumulative impact from Project traffic. However, if Caltrans does not implement planned and needed improvements on State facilities, the Project would contribute to significant unavoidable impacts since the County (as the Lead Agency) has no control over these facilities and cannot enforce the construction of the needed improvements.

### 8.3 PROJECT HISTORY

An Application for the Centennial Project was formally submitted to the County of Los Angeles in 2003 and the Notice of Preparation (NOP) was sent out for public review in March 2004. Over time the Project Applicant changed the design in response to concerns from the County, other agencies, and members of the public over potential impacts. Development was eliminated from areas with dense woodland, pulled out of major canyons with habitat sensitivity, and designed to avoid the County Significant Ecological Area (SEA) to the south along SR-138. Additionally, off site, nearby open space was added to the mitigation package to further offset Project impacts related to the loss of native grassland. The boundary of the Specific Plan area was modified to include additional property on the east side of the Project site, which increased the acreage of the Project site. However, the Project's development footprint was reduced. Exhibit 8-1, Alternative B – Previously Proposed Project, depicts the design and land uses as described in the NOP dated March 2004.

The Project, as now proposed, is a combination of several of the Alternatives that were considered for the earlier proposed project but now conforms to the AVAP development vision for the Project site component of the West EOA. While the Project site boundary has been expanded by approximately 647 acres to include additional lands to the east of 300<sup>th</sup> Street West, the Project now proposes 3,665 fewer dwelling units and approximately 4.12 million square feet (msf) less of commercial and business park development, on a development footprint that is approximately 640 acres less than the earlier proposed project. Refer to Table 8-1 below for additional comparison data between the currently proposed Project and the previously proposed project. As the originally proposed project was in the public eye for so long, it seemed appropriate to include it in the Project Alternatives being addressed in this document.

Map Not to Scale

## 8.4 ALTERNATIVES TO THE PROPOSED PROJECT

In accordance with Section 15126.6(a) of the State CEQA Guidelines (14 CCR), the discussion of alternatives in this section of the EIR focuses on a reasonable range of feasible alternatives.

Because the proposed Project was substantially reduced compared to the previously proposed project (Alternative B) in both development footprint and land use intensity to avoid and/or reduce environmental impacts, further consideration of a reduced development scenario (e.g., reduced grading footprint; reduced dwelling units; reduced non-residential square footage) was not considered reasonable. The current Project design is consistent with the Los Angeles County General Plan 2035 and the AVAP (a component of the General Plan and the applicable Area Plan for the site). Project implementation would require an amendment to the AVAP Highway Plan to show the proposed internal circulation network on the site in the Highway Plan. The Project site would also require a zone change to Specific Plan, consistent with the County's Zoning Ordinance (Title 22 of the County Code), to conform to the General Plan designation as well as the AVAP requirement for a Specific Plan for this EOA. A conditional use permit (CUP) for proposed grading quantities and another CUP for Project-related infrastructure would also be needed. However, the amendment, zone change, and CUPs would not change the land use designation; allow more development; or reduce open space areas. Thus, no conflict with local land use plans, regulations and policies would occur. In addition, the Project would be consistent with applicable SCAG plans and policies, including the 2012–2035 RTP/SCS and 2016–2040 RTP/SCS.

Any reduction in the proposed unit count or in the amount of non-residential development that would be large enough to reduce a potentially significant environmental impact would also result in a development proposal that is not consistent with the goals and policies of the AVAP related to development within the West EOA, or supportive of the Project's objectives. Thus, alternative development scenarios were eliminated from further analysis in this EIR.

The following alternatives were also considered and eliminated from further analysis for the reasons identified in Section 8.4.1 below:

- Alternative Site within or near Tejon Ranch
- Public Input Alternative

Project land use alternatives that are feasible and that are considered in detail in this EIR include:

- **Alternative A:** No Project
- **Alternative B:** Previously Proposed Project (2004 NOP Described Project)
- **Alternative C:** Additional Drainage Avoidance
- **Alternative D:** Infrastructure Relocation
- **Alternative E:** Density Clustering/East of Aqueduct
- **Alternative F:** Central Economic Opportunity Area Development

Based on studies of natural resources (e.g., wildlife habitats and species) and physical constraints (e.g., landform, presence of the California Aqueduct, and the access road to the National Cement Plant) on the Project site, the Applicant recognized that stewardship of site resources should be a major factor in the formulation of any development plan. For this reason, the selection of Project alternatives has focused largely on the identification of changes in aspects of the Project that could avoid and/or minimize impacts on Project site resources.

Although most of the Project alternatives were formulated with the primary objective of avoiding or minimizing Project impacts on natural and physical resources, it should be noted that alternatives would also avoid or reduce other significant adverse impacts of the Project that cannot be mitigated to below a level of significance (as previously described in Section 5.0). Additionally, there are three environmental issues that have mitigation measures to minimize environmental impacts, but the ability to implement the mitigation measures is outside the authority of the County of Los Angeles, the Lead Agency under CEQA.

The first issue is traffic. Implementation of the needed improvements to SR-138 and I-5 must go through Caltrans review, approval, and implementation. These improvements are currently being evaluated for implementation and are expected to be developed in the future. The Project Applicant is working with Caltrans to ensure that the improvements proceed in the needed timeframe. The second issue is noise impacts on existing noise-sensitive receptors. The Project Applicant has discussed this issue with the County, but the County has no enforcement mechanism on private properties and Caltrans right-of-way to implement noise reduction measures. The third issue relates to compliance with Assembly Bill (AB) 32. Even if the County implements measures to comply with their share of the greenhouse gas reduction, they have no control over the compliance of other areas outside the County and in other areas of the State of California. All of these issues are outside the authority of the County and the ability to mitigation to a less than significant level cannot be assured.

In summary, Project-related significant and unavoidable topical areas that are addressed by the alternatives include:

- Air Resources
- Biological Resources
- Climate Change
- Land Resources (Agricultural)
- Noise
- Population and Growth-Inducing Impacts
- Traffic, Access and Circulation
- Solid Waste
- Visual Resources
- Water Resources

## 8.4.1 ALTERNATIVES CONSIDERED BUT NOT CARRIED FORWARD

The planning process that formulated the Project identified a variety of alternatives that could meet most Project Objectives. The following alternatives from that group are not being carried forward as viable Project alternatives for the reasons noted.

### Alternative Site within or Near Tejon Ranch

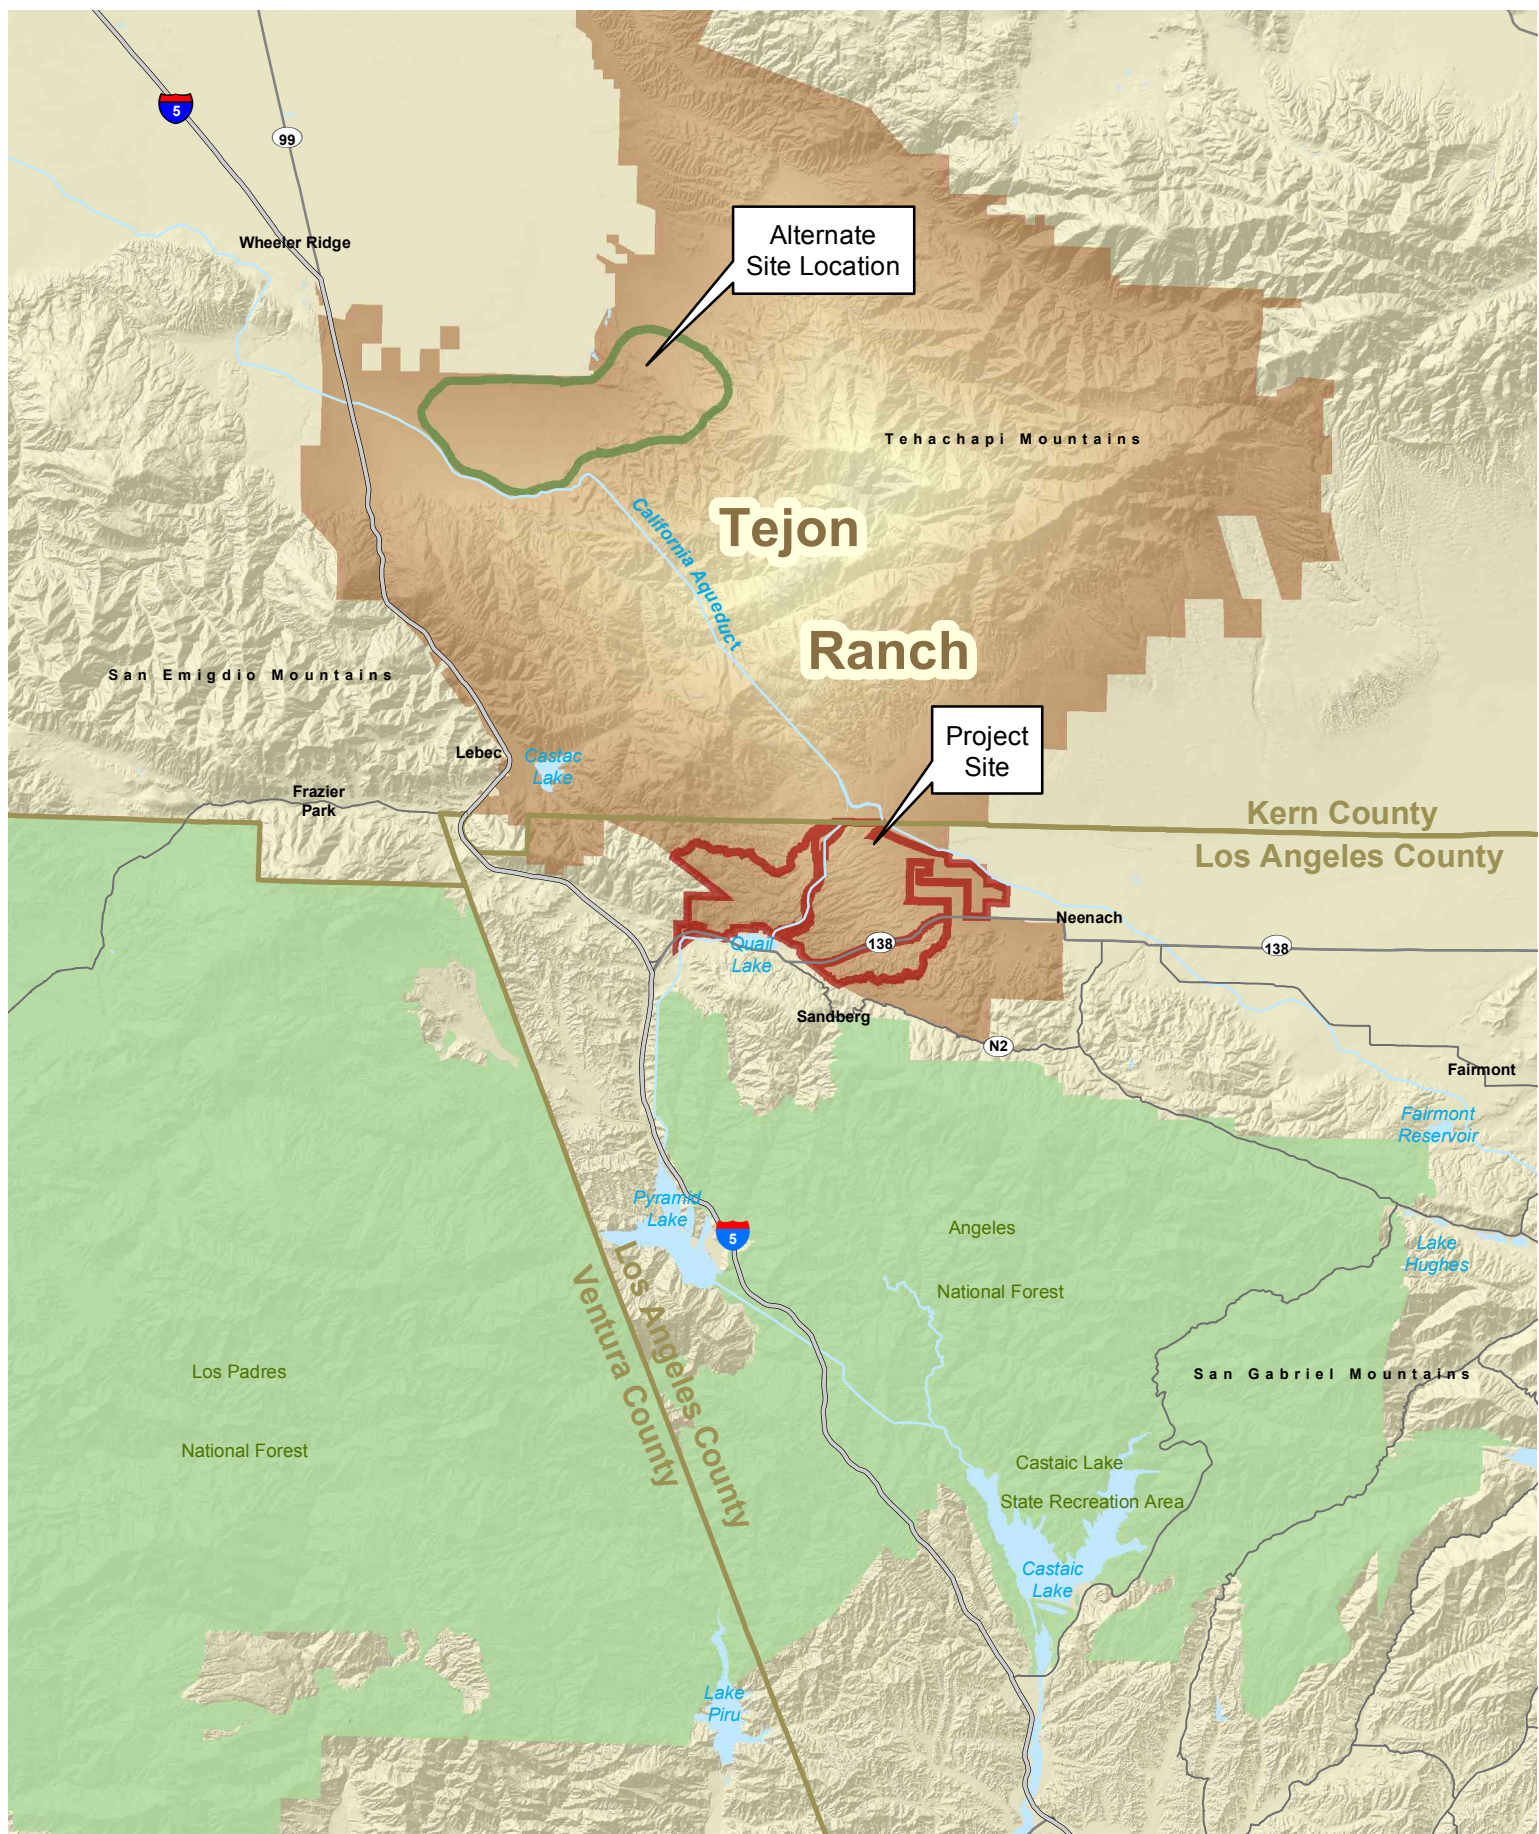

The use of an Alternative site for development of the Project would lead to the same development intensity and type of land uses as the proposed Project but on a different site within or near Tejon Ranch. The alternative site within Tejon Ranch would be the same approximate size and would be located west of the Tejon Industrial Complex Project in Kern County (See Exhibit 8-2, Alternative Site Location within Tejon Ranch).

Additional sites near the Tejon Ranch were also evaluated, including the area on the north side of SR-138 east of the proposed Project site and outside the Tejon Ranch. Much of the land in the immediate Project vicinity is currently under conservation or public ownership and is not available for development, it is already developed, or it has a development application pending for the property, limiting the options for an alternative site to areas farther east.

This alternative was not carried forward for the following reasons:

1. The biological impacts would be greater as the site within the Tejon Ranch is part of the known San Joaquin kit fox habitat area and movement corridor. The kit fox is a federally listed Endangered species and a State-listed Threatened species. Also, there are some areas east of the Project site and north of SR-138 that are within the Joshua Woodlands SEA, which would have to be avoided by the alternative site.
2. The traffic associated with these alternatives would be difficult to mitigate because regional access to the alternative site within the Tejon Ranch would need to use the Tejon Industrial Complex off-ramps from I-5, which are already planned for extensive use by the development in place and entitled for the Tejon Industrial Complex. The alternative site east of the proposed Project site would be located farther away from the I-5 and a linkage to regional traffic routes would limit accessibility.
3. The site alternative within Tejon Ranch would create greater traffic on I-5 because it would not be accessible from SR-138, a major regional route, resulting in greater traffic impacts. The alternative site east of the Project site would direct more traffic to SR-14, resulting in greater impacts to this freeway.
4. The alternative site within the Tejon Ranch would not address the projected population and housing growth in Northern Los Angeles County, as the alternative site is outside Los Angeles County, in Kern County. The other alternative site would be located outside an EOA and would not be consistent with County and regional growth projections.
5. These alternative sites are not currently zoned for the types and densities/intensities of development proposed by the Project, whereas the proposed Project is consistent with the recently adopted AVAP.

D:\Projects\3CEN\Centennial\MXDEIR\EX\_Alt\_Site\_Location\_20151124.mxd

## Alternative Site Location Within Tejon Ranch

Exhibit 8-2

Centennial Project

6. The Project's planned development is not allowed in areas east of the site that are designated as Rural Preserve Areas and Agricultural Reserve Areas by the AVAP.
7. Multiple ownerships of lands east of the site may not allow for the assembly of a contiguous 12,323-acre alternative site east of the Project site.
8. An alternative site within or near the Tejon Ranch would not lessen or avoid significant impacts to visual resources, traffic, noise, and air quality, and offers no substantial benefits that are not addressed by other alternatives.

Thus, alternative sites for the Project within or near Tejon Ranch were considered infeasible and eliminated from further consideration.

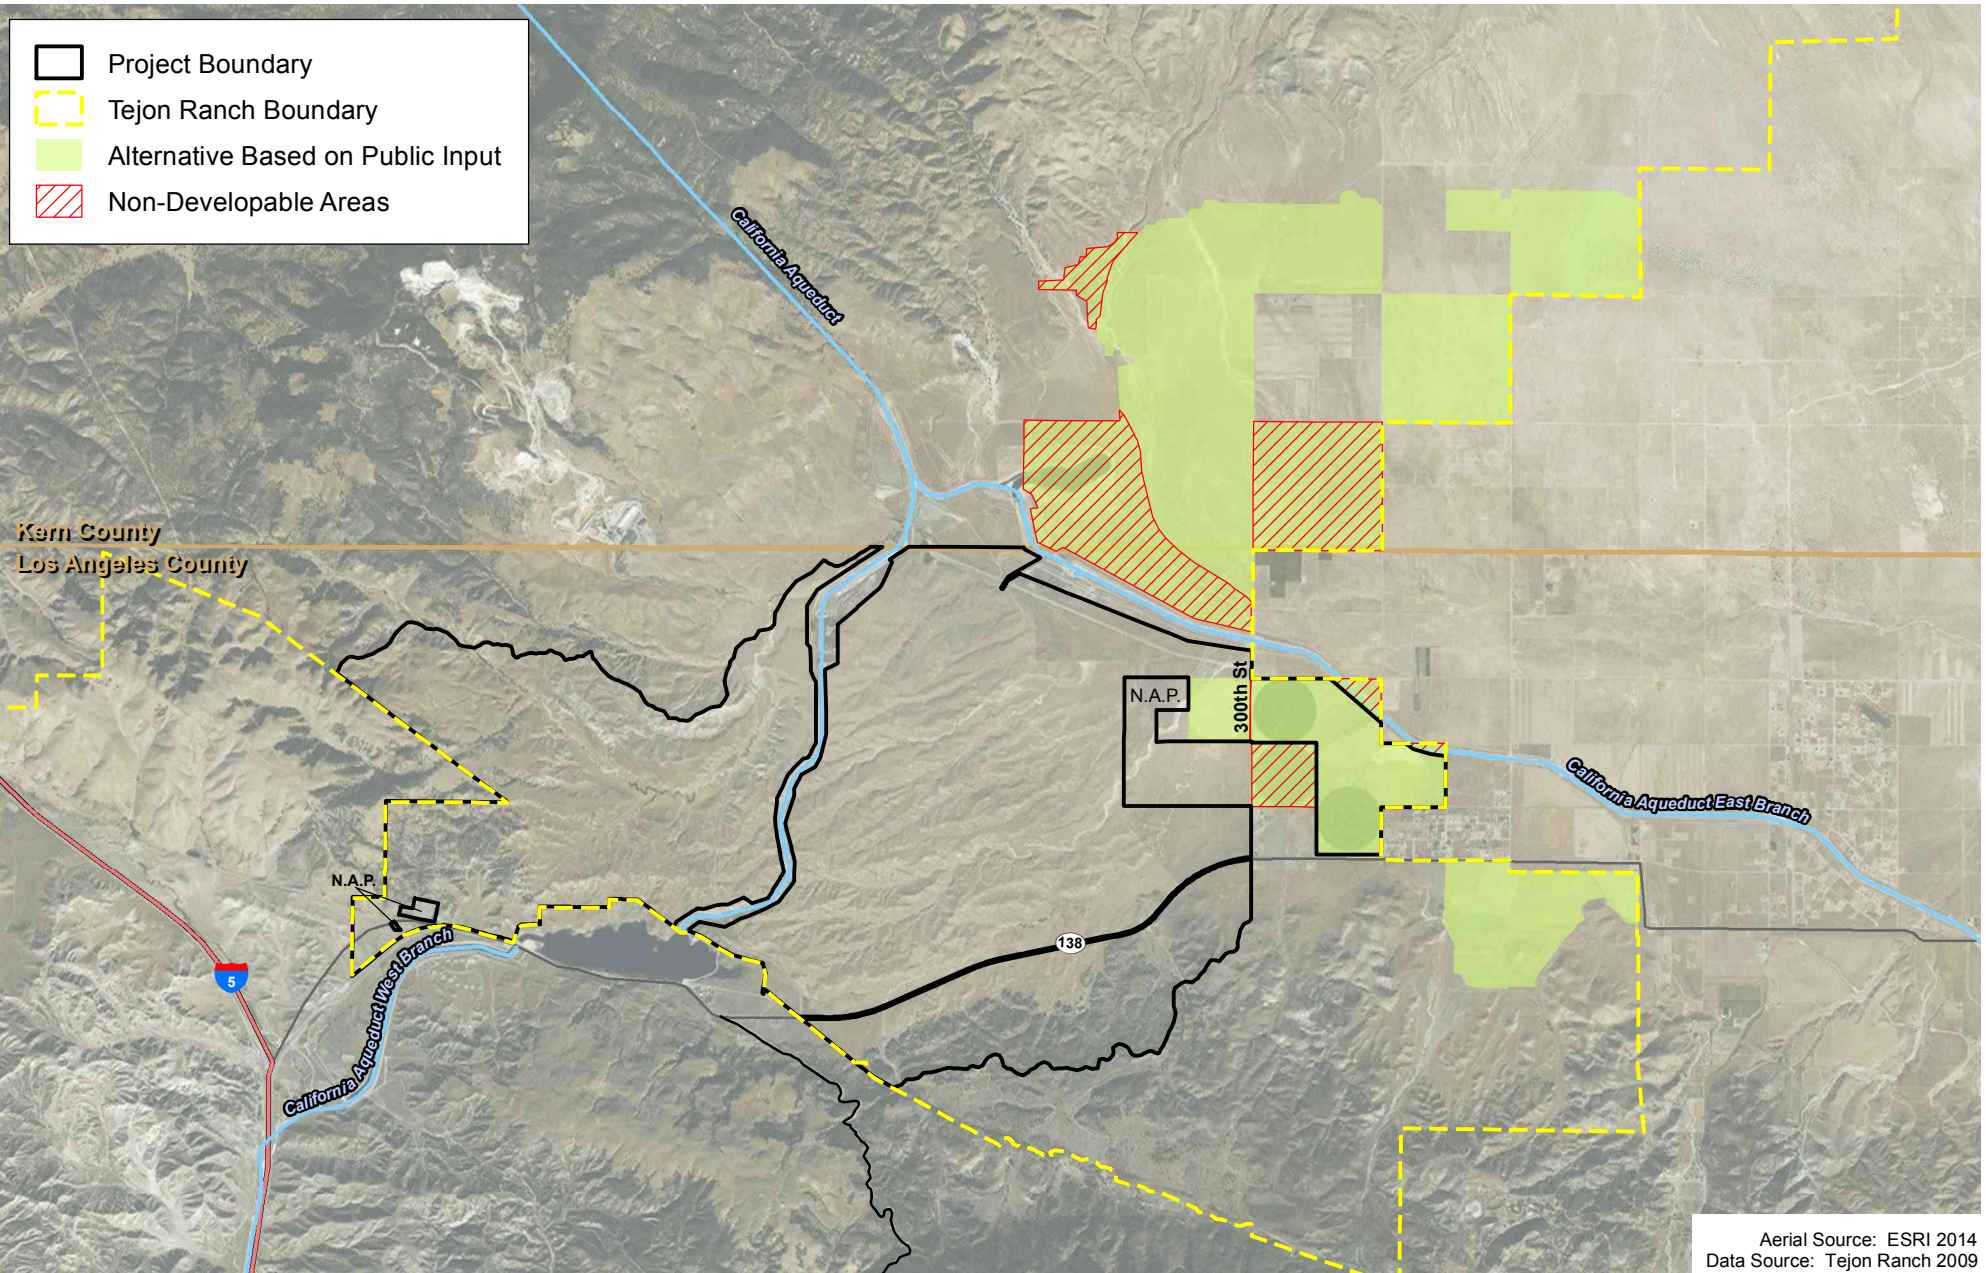

### **Public Input Alternative**

The Public Input Alternative would include the development of approximately 4,990 acres of land located east and northeast of the Project site within 5 separate and noncontiguous areas, as shown on Exhibit 8-3, Public Input Alternative. This alternative was originally suggested by the Conservation Biology Institute and South Coast Wildlands as part of a review of development proposals within the Tejon Ranch (CBI and SCW 2006), prior to approval of the AVAP. The report, entitled *Proposed Reserve Design for Tejon Ranch: A Threatened California Legacy*, indicates that the primary purpose of this approach would be to design a wildland reserve for Tejon Ranch that would conserve a connection among grassland areas in the San Joaquin Valley. The overall plan, presented as the Ranchwide Planning Analysis in the report, encompasses the entire 270,000-acre Tejon Ranch property. The Ranchwide Planning Analysis would set aside the majority of the Tejon Ranch property as open space, with only 5 parcels totaling approximately 6,820 acres identified for future development. Of the total 6,820 acres identified for development, approximately 1,835 acres were eliminated from this Alternative due to land use conflicts. Therefore, this Public Input Alternative would encompass approximately 4,990 acres of developable land as identified on Exhibit 8-3. This Alternative would reflect an approximate 33 percent decrease in developable acreage and does not provide enough acreage to include both Project-proposed land uses and on-site natural open space areas. Because of the reduction in developable acreage, and because this Alternative would leave a substantial amount of off-site land within the Ranch undeveloped, this Alternative includes no on-site natural open space preserve areas.

This alternative does not meet the objectives of the Project and is not consistent with the Land Use Policy Map of the AVAP (e.g., portions of the alternative site are designated as Open Space Conservation). This alternative would also lead to the unavoidable loss of agricultural land, similar to the Project. Therefore, it would not reduce or avoid the significant impacts of the Project and was not carried forward as a viable alternative.

Centennial Project

## 8.4.2 ALTERNATIVES ANALYZED

Included among the six alternatives evaluated in this Draft EIR are: the No Project Alternative, as required by CEQA, and five development alternatives to the proposed Project. The alternatives that would involve development on the Project site have been formulated to provide distinctly different approaches to managing on-site resources and constraints. The mix of land uses proposed for each of the alternatives is generally the same, although they have different densities and/or configurations. The land uses allowed in each land use category are assumed to be the same as those described in Section 4.0, Project Description. Similarly, the restrictions associated with each of the land uses (as contained in the Specific Plan) would also apply to each of the alternatives. These alternatives are summarized in Table 8-1, Centennial Specific Plan Alternatives Comparison, and a description of each follows the table.

**TABLE 8-1  
CENTENNIAL SPECIFIC PLAN ALTERNATIVES COMPARISON**

b includes Schools, Golf Course, Parks, and Utilities							
c includes roads, greenways, internal slopes							
Note: Acreage for all categories is conceptual gross acreage and does not include transitional slopes and/or internal slopes. Actual totals may vary with future detailed planning. Total for Project site may not add due to rounding.							

### **Alternative A: No Project Alternative**

Alternative A assumes that existing cattle grazing and agricultural land uses would remain and that no new development would occur on the Project site.

### **Alternative B: Previously Proposed Project (2004 NOP Described Project)**

Alternative B covers approximately 11,676 acres and was proposed to include 7,847 acres of development planning areas and 3,829 acres of natural open space. Alternative B would allow for the development of a maximum of 22,998 dwelling units on approximately 3,982.5 acres; approximately 12,233,390 square feet (sf) of employment-generating uses (office, research and development, and warehousing or light manufacturing uses) on approximately 702.1 acres; and approximately 1,986,336 sf of retail-serving centers on approximately 182.4 acres. Proposed sites for civic and institutional land uses, such as schools, fire and police stations, transit centers, and a library would cover approximately 943.3 acres. Approximately 1,917.5 acres (16.4 percent) of the 11,676-acre site is for active and passive recreational use (in the form of parks, commercial recreation, greenways, and slopes) and 3,829.1 acres (approximately 32.8 percent of the site) as natural open space. Alternative B also includes vehicular and non-vehicular circulation systems and proposed improvements to SR-138, Gorman Post Road, and 300<sup>th</sup> Street West. The conceptual site plan for Alternative B, the Previously Proposed Project, is shown in Exhibit 8-1. This is a larger alternative than the proposed Project, and would have accommodated a greater share of the County's anticipated growth within the same overall urbanized area, and potentially reduce the need for urbanized development in other areas in Antelope Valley.

### **Alternative C: Additional Drainage Avoidance**

In order to lessen the significant biological resource impacts requiring mitigation, Alternative C includes additional avoidance of drainages on the site that are not being preserved as natural open space in the proposed Project. By decreasing the impact footprint to avoid some of the tributaries to Oso Canyon and the drainage channel running north of and roughly parallel to SR-138, biological resource impacts to riparian communities and wetlands, including jurisdictional resources, would be minimized. These drainages would be designated as Open Space.

Under Alternative C, the development scenario would reduce the development footprint by approximately 37 acres, mainly consisting of the following:

- Two locations in the business park area south of SR-138 (one location west of 300<sup>th</sup> Street West and the other location east of Old Ridge Route).
- Residential areas north of SR-138 and east of the Institutional/Civic Area.
- A business park area north of SR-138 and west of the Institutional/Civic Area.
- A residential area north of SR-138 near National Cement Plant Road.

- Residential areas north of SR-138 and east and west of the main entry driveway to the site.
- Residential areas west of the Aqueduct.

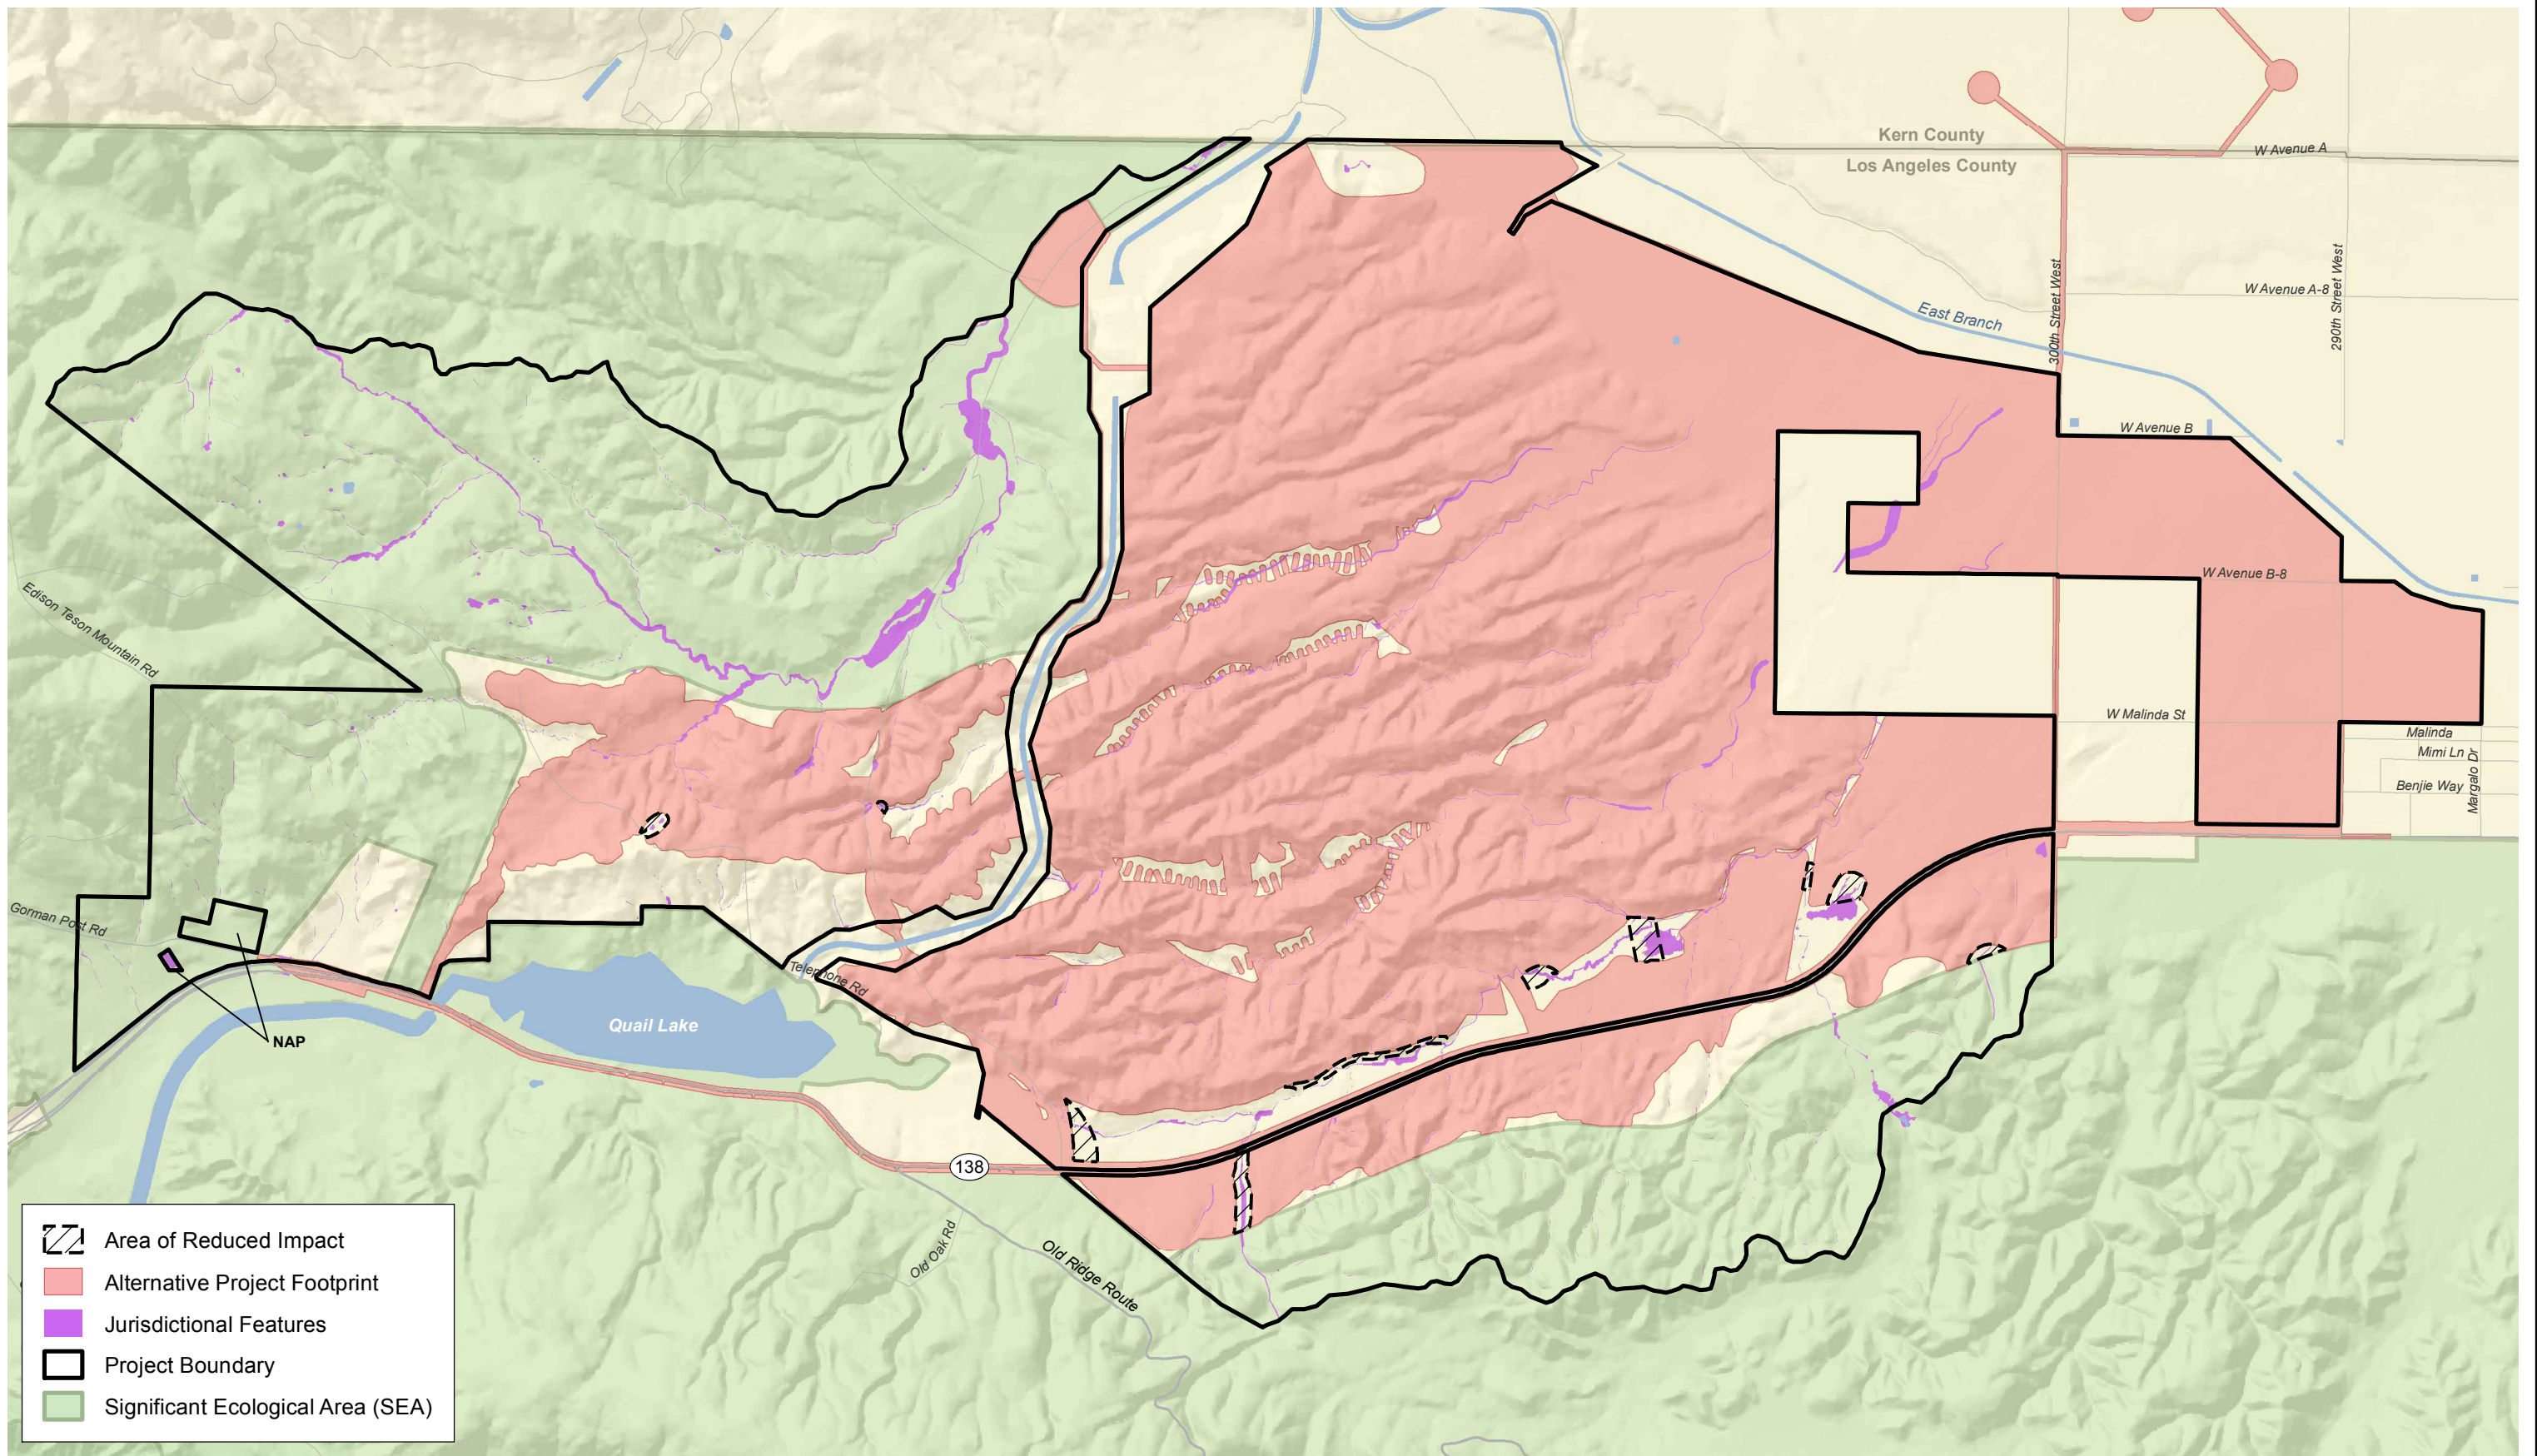

These areas cover approximately 37 acres that would not be developed and would instead be preserved as open space under Alternative C. The main benefit of Alternative C is that it would reduce impacts to jurisdictional drainages that indirectly function as wildlife movement corridors and serve important ecological functions. Alternative C focuses primarily on reducing impacts to drainages or wetlands with high habitat value or those providing connectivity with other high value open space areas. Exhibit 8-4, Alternative C – Additional Drainage Avoidance, depicts the impact and avoidance areas.

### **Alternative D: Infrastructure Relocation**

Alternative D involves the relocation of the two water tanks and the water treatment plant (WTP) to other areas on the Project site. The proposed relocated infrastructure is depicted in Exhibit 8-5, Alternative D – Infrastructure Relocation Alternative. The water tank at the western section of the Project site would be relocated to a higher elevation, west of its current location and in the San Andreas SEA. This location would eliminate the need to grade the tank site and avoid the need for a hydro-pneumatic pumping system. A hydro-pneumatic system uses more energy and also requires stable ongoing energy to avoid pump operational disruptions in the event of a power outage. This type of system has backup generators; however, it is subject to potential outages, even if temporary. Locating the tank at a higher location would result in a more reliable system due to the ability to rely on a gravity system.

The water tank in the proposed Project located to the north of SR-138 would be relocated south of the SR-138 and of the Business Park to a higher elevation, and also located within the San Andreas SEA. At the new location, the tank would be less visible from SR-138 and other areas to the north, since this location is behind a ridge. Approximately 16 acres of additional land would be disturbed and reduced from preservation.

For the water treatment facility, even though the proposed site is outside the San Andreas SEA boundaries, it is located within the Oso Creek drainage, a sensitive habitat. Alternative D would relocate the facility further south to avoid the Oso Creek drainage, thereby eliminating potential Project impacts to the creek and sensitive habitats in the creek. It would also avoid impacts associated with access roads that would be located in the creek. The new location would be at a higher elevation, which would require less pumping of water to the higher elevations, resulting in cost savings and air quality emissions and GHG reductions. While this location is within the San Andreas SEA, it supports less sensitive biological resources than the currently proposed location. No change in development capacity would occur under this Alternative.

-  Area of Reduced Impact
-  Alternative Project Footprint

## **Alternative E: Density Clustering/East of Aqueduct**

Alternative E involves relocating proposed land use development from the east and west portions of the Project site to the central portion of the site, while maintaining the same number of dwelling units, employment-generating uses, and other land uses, in a higher density cluster development pattern. As shown on Exhibit 8-6, Alternative E – Density Clustering/East of Aqueduct Alternative, all development on the west side of the California Aqueduct, except the Cement Plant Road realignment, would be transferred to the areas located east of the Aqueduct. This includes proposed Village 9 and the small area of Commercial, totaling approximately 656 acres of land that would remain undeveloped. Additionally, the new bridge crossing would be eliminated under this alternative.

To the east of 300<sup>th</sup> Street West, the Low Density Residential-designated lands would instead be designated as Very Low Density Residential. The net reduction in dwelling units and the small area of Commercial would be transferred to areas located west of 300<sup>th</sup> Street West. The transferred dwelling units would be accommodated within the existing residential land use density ranges in Village 3 (i.e., the town center); the transferred Commercial land uses would be accommodated in the Business Park designation along SR-138. The 44-acre WTP (located west of the Aqueduct) would be relocated to the westernmost portion of the 102-acre on-site water bank/infiltration basin in the Utility-designated area along the northeastern border of the Project site (refer to Exhibit 4-13, Centennial Project – Conceptual Domestic Water System).

## **Alternative F: Central Economic Opportunity Area Development**

Alternative F considers the AVAP's Central EOA as an alternative location. As shown in Exhibit 8-7, Alternative F – Central Economic Opportunity Area Development, the 23,930-acre Central EOA is an irregularly shaped area located generally between the northern boundary of the City of Lancaster and the Los Angeles County-Kern County border. It is traversed by SR-138 in an east-west direction, and by SR-14 and Sierra Highway in a north-south direction. This alternative assumes that the same types of land uses, amount of development, public facilities, and other amenities as the proposed Project (see Table 4-3 in Section 4.0, Project Description) would be developed within an approximate 12,323-acre, contiguous portion of the EOA.

### **8.4.3 COMPARISON OF ALTERNATIVES**

Table 8-2 provides a summary comparison of each alternative's impacts to those that would occur as a result of the Project. The comparison states whether an alternative has a level of impact that is "less than", "similar" (i.e., generally similar in scale and/or scope), or "greater than" the proposed Project and also identifies each alternative's associated net level of impact: "no impact", "less than significant impact", "impact mitigated", or "significant and unavoidable". When considered together, these factors define the comparative impact for each environmental topic and those of the proposed Project.

<sup>a</sup> "Environmentally Superior" as defined by CEQA. Note: Cumulative impacts for each threshold summarized above are less than significant unless otherwise indicated by notation of a cumulative significant and unavoidable impact in parentheses.							

#### **8.4.4 ALTERNATIVE A: NO PROJECT**

Alternative A assumes that existing cattle grazing and agricultural land uses would remain and that no new development would occur on the Project site.

##### **Geotechnical**

There would be no building, grading activities, or increase in residential population or development with this Alternative. While impacts to seismic hazards (e.g., ground shaking, liquefaction), geologic hazards (e.g., landslides, expansive soils), and hillside management standards would be mitigated to less than significant under the proposed Project, no impacts would occur under this Alternative.

##### **Hydrology and Flood**

Alternative A would not involve changes to the existing hydrological conditions on the site. No urban runoff would be generated. While impacts related to hydrology would be mitigated to a less than significant level under the proposed Project, no impact on the existing hydrology would occur and no development would be exposed to flood hazards under this Alternative.

##### **Hazards and Fire Safety**

###### ***Hazards and Hazardous Materials***

Because Alternative A would not involve any development on the Project site, no impacts related to hazardous material uses or exposure to hazards would occur. The risk from existing hazards, Valley Fever, and wildlife-borne disease vectors would be avoided under this Alternative. Since there would be no construction, there would not be residents or construction workers on site that are exposed to risks. While the proposed Project would result in potentially significant impacts that would be mitigated to a less than significant level, no impacts related to hazards and hazardous materials would occur with this Alternative.

###### ***Fire Safety***

The potential for wildland fire within the Project site would be greater under this Alternative than with the proposed Project because no fire prevention program would be in place. However, without development on the site, the risk of injury to persons or major damage to structures would be less. Still, while the risk to persons would not be as great under this Alternative, the overall likelihood of a wildfire on the Project site would be increased under the No Project Alternative. No development-related impacts, per CEQA, would occur given implementation of Alternative A.

##### **Water Quality**

Because Alternative A would not involve new development on the site, no impacts on existing surface or ground water quality would occur.

## **Land Resources**

### ***Agriculture***

This Alternative would allow current grazing activities to continue, it would not eliminate ongoing agricultural production on Prime Farmland. The proposed Project would result in significant and unavoidable impacts, but no impacts on farmland would result with this Alternative.

### ***Mineral Resources***

As with the Project, Alternative A would not involve the loss of availability of a known mineral resource. No impact on mineral resources would result from implementation of either the proposed Project or this Alternative.

## **Cultural and Tribal Resources**

Because Alternative A would not involve any ground disturbance on the Project site, there would be no impacts related to historical, archaeological, tribal cultural, and paleontological resources or human remains.

## **Biological Resources**

Alternative A would not involve any disturbance to the Project site, although existing agricultural activities and other on-site land uses would continue. Therefore, no impacts to biological resources would occur.

## **Land Use, Entitlements, and Planning**

Under Alternative A, no changes to existing land uses would take place and no significant physical land use impacts would occur. The No Project Alternative would not disrupt or divide a community, create on-site land use incompatibility, or allow for development to meet the future housing and employment needs in Los Angeles County; therefore, it would not further regional planning efforts. Additionally, this Alternative would not be consistent with the intent of the AVAP or the West EOA within the Project's development footprint.

## **Population, Housing, and Employment and Growth-Inducing Impacts**

This Alternative would not help meet the projected housing needs of the region and no affordable housing units would be provided on-site. With no proposed residential development, Alternative A would not generate additional population even though an increased population is projected in the region. Also, this alternative would not create any long-term employment opportunities to balance out the employment demands associated with the residential population in the vicinity. No impacts would result from implementing this Alternative with respect to exceeding population projections or displacing housing, households or businesses, or growth-inducing impacts. However, this Alternative would not support the creation of jobs-housing balance in the Antelope Valley.

## **Traffic, Access, and Circulation**

Alternative A would not generate any new off-site daily trips and there would be no impacts to regional transportation systems (e.g., freeways, interchanges and arterials). Also, no changes to existing roads or access to SR-138 would occur under this Alternative.

## **Air Resources**

Because Alternative A would not involve new development or any changes to the existing land uses on the Project site, no impacts to air quality would occur.

## **Noise**

Because Alternative A would not involve new development or any changes to the land uses on the Project site, no impacts associated with noise would occur.

## **Visual Resources**

Because Alternative A would not involve new development or any changes to the physical characteristics of the Project site, no impacts on views of the site would occur. Also, no new sources of light and glare would be introduced to the area. As such, unlike the significant and unavoidable impacts projected to occur given implementation of the proposed Project, no impact to visual resources would occur under this Alternative.

## **Parks and Recreation**

Because Alternative A would not involve the generation of new residential population, no demand for parks or recreational facilities would be generated, and no impacts would occur.

## **Education**

Because Alternative A would not involve the generation of new residential population, no impacts to schools and educational services are expected.

## **Fire and Law Enforcement Services**

Given the lack of development on the site under the No Project Alternative, no impacts to fire and law enforcement services would occur under this Alternative, unlike the proposed Project, under which the related impacts to fire and law enforcement services would be mitigated to a less than significant level.

## **Other Public Services**

Because Alternative A would not involve new development on the site or the generation of new residential or business population, no impacts to other public services (e.g., library services, solid waste management, and other public facilities) would occur.

## **Water Resources**

Because Alternative A would not involve the generation of new residential or business population, no demand for water or impacts to water resources are expected with this Alternative.

## **Wastewater**

Because Alternative A would not involve the generation of new residential or business population, no impacts related to the generation of wastewater and the need for wastewater treatment are expected.

## **Dry Utilities**

Because Alternative A would not involve the generation of new residential or business population, no impacts related to the provision of new utility infrastructure would be required, and there would be no impacts.

## **Climate Change**

Because Alternative A would not involve new development or any changes to the land uses on the Project site, no impacts associated with GHG and climate change would occur.

## **Summary Conclusion**

Implementation of Alternative A would result in fewer impacts compared to the Project because no new development would occur on the site. Alternative A would not result in significant impacts related to most of the environmental issues, except for land use and fire safety. This Alternative is not consistent with the AVAP and the development anticipated on the site for the West EOA. As indicated above, the potential for wildland fire on the Project site would be greater under this Alternative due to the presence of large areas with brush vegetation and because no fire prevention program would be put in place.

The Project is proposed with the objective of creating a self-contained, self-sustaining community in which people could live and work in the same community; however, implementation of this Alternative would not support this primary goal due to the lack of new development or provision of any housing and employment opportunities on the site.

### **8.4.5 ALTERNATIVE B: PREVIOUSLY PROPOSED PROJECT**

The site under Alternative B covers approximately 11,676 acres in the same general area as the Project site. This Alternative would allow for the development of a maximum of 22,998 dwelling units on approximately 3,982.5 acres; approximately 12,233,390 square feet (sf) of employment-generating uses (office, research and development, and warehousing or light manufacturing uses) on approximately 702.1 acres; and approximately 1,986,336 sf of retail-serving centers on approximately 182.4 acres. Proposed sites for civic and institutional land uses, such as schools, fire and police stations, transit centers, or a library would cover

approximately 943.3 acres. Approximately 1,917.5 acres (approximately 16.42 percent) of the 11,676-acre site was proposed for active and passive recreational use (in the form of parks, commercial recreation, greenways, and slopes) and 3,829.1 acres (approximately 32.79 percent of the site) as natural open space. The Previously Proposed Project Alternative also included vehicular and non-vehicular circulation systems and proposed improvements to SR-138, Gorman Post Road, and 300<sup>th</sup> Street West.

## **Geotechnical**

As with the proposed Project, development of Alternative B would be subject to the same seismic hazards (e.g., ground shaking, liquefaction), geologic hazards (e.g., landslides, expansive soils), and hillside management standards. Because Alternative B has a larger grading impact area (e.g., approximately 640 additional acres) and would have a larger population that would be exposed to geotechnical hazards, including hazards located in the northwest portion of the Project site, all impacts would be greater under Alternative B. There would be less than significant impacts with the incorporation of mitigation for seismic and geologic hazards under this Alternative, similar to the Project. Less than significant impacts with respect to hillside grading would occur under this Alternative, similar to the Project.

## **Hydrology and Flood**

Implementation of Alternative B would create more impervious area than the proposed Project and changes to the existing hydrological conditions on the site would be greater than the proposed Project. Incrementally more urban runoff would also be expected with the greater amount of development on the site. As with the proposed Project, impacts related to hydrology would be less than significant under this Alternative with mitigation. Similar to the proposed Project, impacts related to floodplains would be less than significant with mitigation.

## **Hazards and Fire Safety**

### ***Hazards and Hazardous Materials***

Risks from existing hazards, Valley Fever, wildlife-borne disease vectors, and the use of urban-related hazardous materials would be greater for Alternative B than the proposed Project, as this Alternative would result in a 19 percent increase in the number of dwelling units and a 40.8 percent increase in non-residential development (commercial and employment-generating land uses). As with the proposed Project, impacts would be mitigated to a less than significant level. Similar to the proposed Project, this Alternative would result in less than significant impacts related to airport/airstrip hazards and emergency response or emergency evacuation plans.

### ***Fire Safety***

Exposure to wildland fire risks related to location in areas designated as Very High Fire Hazard Severity Zones (VHFHSZs) and High Fire Hazard Severity Zones (HFHSZs) would be greater than those with the proposed Project, given the proposed development in hillside

areas. The implementation of a fuel modification zone established with a Fire Management Plan would mitigate impacts to a less than significant level.

## **Water Quality**

The potential surface and groundwater quality impacts associated with Alternative B would be greater than those anticipated to occur from implementation of the proposed Project since Alternative B would disturb more acres than the proposed Project and would result in more development. However, the impacts under both the proposed Project and this Alternative to water quality would be less than significant with mitigation. This Alternative would result in similar impacts related to waste discharge requirements and wastewater treatment systems, as there would be the same types of land uses and number of WRFs as the proposed Project.

## **Land Resources**

### ***Agriculture***

This Alternative would have a reduced impact to agricultural resources when compared to the proposed Project since the site for this alternative does not include existing farmlands east of 300<sup>th</sup> Street West. The proposed residential development would eliminate ongoing agricultural production on approximately 120 acres of Prime Farmland, a reduction of 522 acres compared to the proposed Project. Like the proposed Project, this Alternative would not conflict with any Williamson Act contracts. As with the proposed Project, impacts related to the conversion of farmland would be significant and unavoidable under this Alternative.

### ***Mineral Resources***

As with the proposed Project, Alternative B would not involve the loss of availability of a known mineral resource. No impacts to mineral resources would occur under this Alternative.

## **Cultural and Tribal Resources**

Alternative B would result in disturbance of a larger area and impacts on unknown archaeological, tribal cultural, and paleontological resources or human remains would be greater than the proposed Project. It is anticipated that cultural resource-related impacts from implementation of Alternative B would be mitigated in the same manner as those for the proposed Project. Impacts related to cultural resources would be mitigated to a less than significant level.

## **Biological Resources**

Alternative B would disturb a substantially larger number of acres (approximately 640 acres of additional grading) than the proposed Project. In addition to the larger total area, approximately 500 acres of impacts are of much higher biological value for a variety reasons. Alternative B would shift impacts on nearly 500 acres of agricultural area to areas composed primarily of grasslands and other native vegetation types. Total impacts on grasslands would

increase by approximately 675 acres. Alternative B would also result in increased impacts of nearly 100 acres of riparian habitat, 174 acres of oak woodland, 31 acres of jurisdictional features, and 3,486 regulated oak trees. Two additional special status plant species (i.e., Piute Mountains navarretia and Lemmon's syntrichopappus) would be directly impacted and direct impacts to other special status plant populations would be substantially increased. Wildlife species impacts would also increase in general due to the shift from low diversity agricultural lands to higher diversity grasslands and other native vegetation. Also, there would be development impacts within the San Andreas SEA lands and the total open space preserve would be reduced compared to the proposed Project. Lastly, the location of the Alternative B impact area results in a reduced buffer of open space between the Project development areas and higher biological value areas and regional wildlife movement corridors associated with the higher elevation slopes to the west of the site. This reduced buffer would result in greater indirect impacts to these areas, a loss of connectivity through Oso Canyon for local movement, and a reduction in connectivity between open space preserve areas. Like the proposed Project, this Alternative would result in no impact related to habitat conservation plans and natural community conservation plans.

### **Land Use, Entitlements, and Planning**

Implementation of Alternative B would result in the development of a new master planned community at the northwestern section of Los Angeles County. However, this Alternative is not consistent with the land use designations for the site, as contained in the AVAP. A General Plan Amendment would be needed to reflect the proposed land uses. As with the proposed Project, this Alternative would not disrupt or divide a community, but would allow for development to meet the future housing and employment needs in Los Angeles County. Alternative B would exceed the approved population, housing, and employment projections included in the AVAP for the area. As with the proposed Project, a zone change and CUPs would be required under this Alternative. Impacts would be greater under this Alternative than with the Project.

### **Population, Housing, and Employment and Growth-Inducing Impacts**

With a Project site that is 5.3 percent smaller than the proposed Project site, this Alternative may initially appear to be less impactful. However, Alternative B would have 3,665 more residential units, over 4.12 million sf more commercial and business park development, and approximately 1,795 acres less of natural open space. Alternative B would have a larger residential population than would occur with the proposed Project. With the same 10 percent of units as affordable, this Alternative would develop more affordable housing units on-site. This alternative would accommodate more population and related development in a single urbanized community which, like the proposed Project, is designed to achieve a jobs-housing balance, and accordingly could reduce demand for growth elsewhere in the Antelope Valley. This alternative has greater population-related impacts relative to the existing setting than the proposed Project. Alternative B would exceed the approved population, housing, and employment projections included in the AVAP for the area, a significant impact not found for the proposed Project. As with the proposed Project,

displacement of housing would also be less than significant. Also, this Project would result in a greater significant and unavoidable impact related to growth-inducing impacts.

### **Traffic, Access, and Circulation**

Alternative B would provide 19 percent more dwelling units and 41 percent more employment-generating uses, both of which are the primary trip-generating land uses for the proposed Project. Therefore, this Alternative would result in increased off-site vehicle trips. Because this Alternative would have higher off-site trip generation levels, impacts to freeway mainline segments, freeway ramps, and arterial highway intersections would be greater. Significant impacts to the existing transportation system and Congestion Management Plan (CMP) highways would also occur under this Alternative.

This Alternative includes improvements to SR-138, Gorman Post Road, and 300<sup>th</sup> Street West (on and near the site) and payment of fair share fees for other improvements to Caltrans facilities as mitigation for the impacts of this Alternative. While some improvements would be implemented by this Alternative, it is outside the County's control to implement the other needed highway system improvements. Thus, if Caltrans does not construct the necessary improvements, impacts would also be significant and unavoidable, similar to the Project.

As with the proposed Project, impacts related to emergency access and traffic hazards can be mitigated and impacts on air traffic would be less than significant. No conflict with alternative transportation policies would occur, similar to the Project.

### **Air Resources**

Implementation of Alternative B would require a greater amount of grading over the site with the increased amount of development proposed than the Project. As with the proposed Project, this alternative would result in significant unavoidable construction-related emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Operational emissions would be greater when compared to the Project due to the increase in vehicular traffic. As with the proposed Project, this Alternative would also result in significant unavoidable operational emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Consistency with the applicable Air Quality Management Plan and exposure to odors would also represent a less than significant impact under this Alternative.

### **Noise**

Development of Alternative B would involve more construction than the proposed Project, and noise impacts and exposure to groundborne vibration that would result from construction would also be greater. Impacts related to noise increases in excess of Los Angeles County standards at sensitive receptors would be significant, similar to those of the proposed Project. Mitigation would reduce these impacts to less than significant levels.

Off-site traffic noise would be increased when compared to the proposed Project because of the increase in vehicular traffic. This Alternative would also result in a greater increase in long-term stationary noise than would the proposed Project because of the increase in

development associated with this Alternative. Noise impacts on adjacent off-site residences would be significant and unavoidable under this Alternative because it is outside the County's control to implement improvements on private properties or Caltrans right-of-way. Airport noise exposure would be similar to that of the Project and considered less than significant.

## **Visual Resources**

Visual changes to the Project site associated with the implementation of Alternative B would be similar to those anticipated to occur under the proposed Project, since a smaller area would be converted from an undeveloped to a developed condition but more intensive development is proposed. Under the proposed Project and this Alternative, significant and unavoidable impacts would result with respect to alterations to a scenic vista, degradation of the visual quality of the site, and the creation of light and glare due to the size and intensity of development proposed in a largely undeveloped area. Under both the proposed Project and this Alternative, less than significant impacts would occur related to AVAP-designated scenic drives (e.g., I-5, Gorman Post Road, SR-138, Old Ridge Road [Highway N-2], and Three Points Road) This Alternative would have increased light and glare impacts, due to the greater amount of development proposed on site, when compared to the proposed Project. This impact would be significant and unavoidable even after mitigation.

## **Parks and Recreation**

Implementation of Alternative B would result in a greater demand for parks and recreational facilities due to the higher number of proposed dwelling units and anticipated resident population. As with the proposed Project, less than significant impacts would occur with the provision of on-site parks and recreational facilities. Similar to the proposed Project, Alternative B would result in a less than significant impact related to regional open space connectivity, as a connection to the proposed realignment of the Pacific Crest Trail would also be part of this Alternative.

## **Education**

The demand for school facilities and services associated with Alternative B would be greater than those of the proposed Project because of the increase in residential development. As such, more school sites would be provided on site. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative through school facilities and funding agreements with the affected school districts.

## **Fire and Law Enforcement Services**

The demand for fire and law enforcement services associated with Alternative B would be greater than that for the proposed Project because of the increased amount of development. However, overall impacts to fire and law enforcement services would be mitigated through the provision of on-site fire stations and a Sheriff's station, similar to the proposed Project. Impacts to fire and law enforcement services would be mitigated to a less than significant level under this Alternative.

## **Other Public Services**

### ***Library***

The demand for library services under this Alternative would be greater than those of the proposed Project. With the development of 22,998 residential units on site, this Alternative would require, and include, the development of a permanent community library, as with the proposed Project. Therefore, while both the proposed Project and this Alternative would result in less than significant impact, this Alternative would require a larger library due to the increased population size.

### ***Solid Waste***

The solid waste demands associated with Alternative B would be greater than those of the proposed Project because of the increased level of development. This demand for landfill capacity would be considered significant and unavoidable because permitted landfill capacity at existing County landfills cannot be guaranteed at the time of Project buildout and through the life of the Project, which would occur beyond the required 15-year LACDPW planning horizon. Like the proposed Project, this Alternative would result in a significant and unavoidable impact related to solid waste.

### ***Other Public Facilities***

Alternative B would create a demand for County services and facilities but will be subject to the payment of fees for any needed services. Alternative B will provide a maintenance yard on the site for County use for public park and facility maintenance, County-owned roadway maintenance, public right-of-way maintenance, flood-control infrastructure maintenance, and other maintenance activities. Impacts would be less than significant, similar to the Project.

## **Water Resources**

The water demands associated with Alternative B would be greater than those of the proposed Project because of the increased level of development. Direct impacts would be greater than the proposed Project since demand would exceed available supplies and would represent a new significant and unavoidable impact. Impacts to groundwater supplies would be similar to the proposed Project and would remain less than significant. As with the proposed Project, significant unavoidable cumulative impacts to water supplies would result from Alternative B.

## **Wastewater**

Wastewater generation associated with Alternative B would be greater than the Project due to the increase in development. As such, impacts related to wastewater treatment requirements and wastewater facilities would be greater. However, both the proposed Project and this Alternative would result in less than significant impacts with the provision of an on-site sewer system and a WRF.

## **Dry Utilities**

Demands for dry utility services associated with Alternative B would be greater than those of the proposed Project because of the increased level of development. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative.

## **Climate Change**

With an increase in development associated with Alternative B, greenhouse gas emissions would also be increased by a comparable amount. Cumulative impacts to climate change under Alternative B would be significant and unavoidable, similar to the Project. This Alternative would require a General Plan Amendment, and may result in greater impacts related to conflict with County's Climate Action Plan.

## **Summary Conclusion**

Implementation of Alternative B would result in greater impacts compared to the proposed Project due to an increased intensity of development. Thus, none of the significant and unavoidable impacts of the Project would be reduced by this Alternative. Alternative B would result in greater impacts on all issue areas, except for Agriculture Resources. Due to the exclusion of farmlands east of 300<sup>th</sup> Street West from the Project site boundaries, this Alternative would decrease the amount of farmland that would be converted to urban uses.

The Project is proposed with the objective of creating a self-contained, self-sustaining community in which people could live and work in the same community. Implementation of this Alternative would fully support this underlying goal; however, there would be greater impacts associated with the increased development under this Alternative. In addition, no significant and unavoidable impacts of the Project would be avoided, and there would be a new significant and unavoidable direct impact to water supplies.

### **8.4.6 ALTERNATIVE C: ADDITIONAL DRAINAGE AVOIDANCE**

The main benefit of Alternative C is that it would reduce impacts to jurisdictional drainages. Jurisdictional drainages are ecologically important as they indirectly function as wildlife movement corridors, among other important ecological functions. This alternative focuses primarily on reducing impacts to drainages or wetlands with high habitat value (according to the Functional Assessment) or drainages containing connectivity with other large or high value drainages. The Project development footprint would be reduced in size by avoiding natural open space area at various locations around the it's perimeter, as seen in Exhibit 8-4, Alternative C – Additional Drainage Avoidance. As such, impacts related to jurisdictional drainages would be incrementally be reduced. This Alternative would reduce impacts to jurisdictional drainages by 8 acres, and would have an overall reduction on the Project impact footprint by 37 acres. Alternative C would provide 0.5 percent fewer dwelling units (92 units less) and 2 percent fewer employment-generating uses (198,634 sf/0.2 msf).

## **Geotechnical**

As with the proposed Project, development of Alternative C would be subject to the same seismic hazards (e.g., ground shaking, liquefaction), geologic hazards (e.g., landslides, expansive soils), and hillside management standards on the site. Mitigation would reduce potential impacts to less than significant levels, similar to the Project. Impacts related to erosion, grading, and topographic changes would be less than those anticipated to occur with the proposed Project, since development would stay away from major drainage corridors on the site. However, these impacts can be mitigated to less than significant levels. Less than significant impacts would occur under this Alternative with respect to geologic hazards with the implementation of mitigation, similar to the Project.

## **Hydrology and Flood**

Implementation of Alternative C would create less impervious area than the proposed Project and changes to the existing hydrological conditions on the site would be less due to avoidance of grading and disturbance of major drainage channels. Incrementally less urban runoff would also be expected with the decrease in development on the site. As with the proposed Project, impacts related to hydrology would be less than significant under this Alternative with mitigation. Similar to the proposed Project, impacts related to conflict with Low Impact Development (LID) standards, floodplains, inundation, and standing water would be less than significant with mitigation.

## **Hazards and Fire Safety**

### ***Hazards and Hazardous Materials***

Impacts associated with hazards for Alternative C would be less than those associated with the proposed Project. The risk from existing hazards, Valley Fever, and wildlife-borne disease vectors would be less than the proposed Project, as Alternative C would result in 92 fewer dwelling units and a reduction of 198,634 sf of employment-generating land uses (e.g., commercial and business park development) and approximately 37 more acres of natural open space. As with the proposed Project, impacts would be mitigated to a less than significant level. Similar to the proposed Project, this Alternative would result in less than significant impacts with mitigation related to hazardous materials sites and less than significant impacts related to airport/airstrip hazards and emergency response or emergency evacuation plans.

### ***Fire Safety***

Exposure to wildland fire risks related to location in areas designated as Very High Fire Hazard Severity Zones (VHFHSZs) and High Fire Hazard Severity Zones (HFHSZs) would be slightly less than those with the proposed Project given the decrease in development proposed on the site. The implementation of a fuel modification zone established with a Fire Management Plan would mitigate impacts to a less than significant level.

## **Water Quality**

The potential impacts to surface water and groundwater quality associated with Alternative C would be less than those anticipated to occur from implementation of the proposed Project since Alternative C would disturb 37 acres less than the proposed Project and would result in less development. However, the impacts under both the proposed Project and this Alternative to water quality would be less than significant with mitigation. This Alternative would result in similar impacts related to waste discharge requirements and wastewater treatment systems, as there would be the same types of land uses and number of WRFs as the proposed Project.

## **Land Resources**

### ***Agriculture***

This Alternative would have similar impacts to agricultural resources as the proposed Project since the same farmlands would be converted to urban uses. The proposed residential development at the eastern section of the site would eliminate ongoing agricultural production on Prime Farmland, but would not conflict with any Williamson Act contracts. As with the proposed Project, impacts related to the conversion of farmland would be significant and unavoidable under this Alternative.

### ***Mineral Resources***

As with the proposed Project, Alternative C would not involve the loss of availability of a known mineral resource. No impacts to mineral resources would occur under this Alternative.

## **Cultural and Tribal Resources**

Alternative C would result in disturbance of a smaller area and impacts on unknown archaeological, tribal cultural, and paleontological resources or human remains would be less than the proposed Project. However, the location of existing cultural sites would still be developed under this Alternative. It is anticipated that cultural resource-related impacts from implementation of Alternative C would be mitigated in the same manner as those for the proposed Project. Impacts related to cultural resources would be mitigated to a less than significant level.

## **Biological Resources**

Alternative C would disturb approximately 37 acres less than the proposed Project. This Alternative substantially reduces impacts to drainages resulting in a reduction of impacts to jurisdictional features of eight acres. In addition, the drainages avoided are predominantly higher order channels that typically indicate a greater functional value. As a result, Alternative C reduces impacts to a number of associated functions including local wildlife movement, riparian corridor connectivity, open space connectivity, and habitat of common and special status plant and wildlife species associated with these areas. In addition, the open space preserve is larger than the proposed Project. This Alternative would result in 92

fewer dwelling units and a reduction of 198,634 sf of employment-generating land uses. Therefore, the associated population decrease and indirect impacts (e.g., light and glare; domestic pets; introduction of non-native plants and wildlife) would be incrementally decreased. Thus, there would be less mitigation required to offset Alternative C impacts.

Potentially significant direct impacts to biological resources from grading and ground disturbance would still include special status species, riparian communities, wetlands, and wildlife movement. All of these impacts would be reduced to less than significant levels after mitigation under both the proposed Project and this Alternative. No direct significant and unavoidable biological impacts related to these thresholds for Alternative C would remain after mitigation. However, like the proposed Project, Alternative C would result in significant and unavoidable cumulative impacts related to grasslands and wildlife movement. This Alternative would result in similar impacts to oak woodlands and oak trees. Like the proposed Project, this Alternative would result in no impact related to habitat conservation plans and natural community conservation plans.

### **Land Use, Entitlements, and Planning**

Implementation of Alternative C would result in the development of a new master planned community at the northwestern section of Los Angeles County. This Alternative is consistent with the land use designations for the site, as contained in the AVAP and would require the same land use approvals as the proposed Project. As with the proposed Project, this Alternative would not disrupt or divide a community, and would allow for development to meet the future housing and employment needs in Los Angeles County, although with slightly less dwelling units and non-residential development than the Project, and is therefore consistent with regional planning efforts. As with the proposed Project, an amendment to the AVAP Highway Plan, a zone change, and CUPs would be required under this Alternative. Impacts would be similar to the Project under this Alternative.

### **Population, Housing, and Employment and Growth-Inducing Impacts**

Alternative C would result in 92 fewer dwelling units and a reduction of 198,634 sf of employment-generating land uses (e.g., commercial and business park development) and approximately 37 more acres of natural open space. Alternative C would have a lower residential population than the proposed Project, and thus, less potential to induce growth in the surrounding area. Also, slightly fewer affordable housing units would be provided on-site. This alternative would create less demand for long-term employment opportunities when compared to the proposed Project. Neither the proposed Project nor this Alternative would exceed approved population projections. As with the proposed Project, less than significant impacts would result with respect to conformity with population projections, but a significant and unavoidable impact would result based on the substantial growth on the Project site relative to the existing setting. Displacement of housing would be less than significant, as with the proposed Project. This Alternative would also result in a similar, and significant and unavoidable, impact related to growth-inducing impacts.

## **Traffic, Access, and Circulation**

Alternative C would provide 0.5 percent fewer dwelling units (92 units less) and 2 percent fewer employment-generating uses (198,634 sf), both of which are the primary trip-generating land uses for the proposed Project. Therefore, this Alternative would result in decreased off-site vehicle trips. Because this Alternative would have lower off-site trip generation levels, impacts to freeway mainline segments, freeway ramps, and arterial highway intersections would be less. However, significant impacts to the existing transportation system and CMP highways would still occur under this Alternative. Payment of fair share fees for improvements to Caltrans facilities would be made as mitigation for the impacts of this Alternative, but it is outside the County's control to implement these improvements. Thus, if Caltrans does not construct the necessary improvements, impacts would be significant and unavoidable, similar to the Project.

As with the proposed Project, impacts related to emergency access and traffic hazards can be mitigated and impacts on air traffic would be less than significant. No conflict with alternative transportation policies would occur, similar to the Project.

## **Air Resources**

Implementation of Alternative C would involve less grading on the site with the decreased amount of development proposed than the Project. As with the proposed Project, this alternative would result in significant unavoidable construction-related emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Operational emissions would be less when compared to the Project due to the decrease in vehicular traffic. However, as with the proposed Project, this Alternative would result in significant unavoidable operational emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Consistency with the applicable Air Quality Management Plan and exposure to odors would also represent a less than significant impact under this Alternative.

## **Noise**

Alternative C would involve slightly less construction than the proposed Project, and noise impacts and exposure to groundborne vibration that would result from construction would also be less. Impacts related to noise increases in excess of Los Angeles County standards at sensitive receptors would still be significant, similar to those of the proposed Project. Mitigation would reduce these impacts to less than significant levels.

This Alternative would have fewer off-site vehicle trips due to the slight reduction in on-site population, and a corresponding slight decrease in off-site traffic noise. Noise impacts on adjacent existing residences would still be similar to the proposed Project, and would remain significant and unavoidable under this Alternative because it is outside the County's control to implement improvements on private properties or Caltrans right-of-way. Airport noise exposure would be similar to that of the Project and considered less than significant.

## **Visual Resources**

Visual changes to the Project site associated with the implementation of Alternative C would be slightly less to those anticipated to occur under the proposed Project, since a slightly smaller development footprint would be converted from an undeveloped to a developed condition. Under the proposed Project and this Alternative, significant and unavoidable impacts would result with respect to alterations to a scenic vista and degradation of the visual quality of the site due to the size and intensity of development proposed in a largely undeveloped area. Under both the proposed Project and this Alternative, less than significant impacts would occur related to AVAP-designated scenic drives (e.g., I-5, Gorman Post Road, SR-138, Old Ridge Road [Highway N-2], and Three Points Road). This Alternative would have decreased light and glare impacts, due to the decrease in development proposed on site, when compared to the proposed Project. However, this impact would be significant and unavoidable with mitigation.

## **Parks and Recreation**

Implementation of Alternative C would result in less demand for parks and recreational facilities due to the lower number of proposed dwelling units and anticipated resident population. As with the proposed Project, less than significant impacts would occur with the provision of on-site parks and recreational facilities. Similar to the proposed Project, Alternative C would result in a less than significant impact related to regional open space connectivity, as a connection to the proposed realignment of the Pacific Crest Trail would also be part of this Alternative.

## **Education**

The demand for school facilities and services associated with Alternative C would be slightly less than those of the proposed Project because of the decrease in residential development. As such, less school capacity would be needed to serve on-site residents. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative.

## **Fire and Law Enforcement Services**

The demand for fire and law enforcement services associated with Alternative C would be less than that for the proposed Project because of the decreased amount of development. Impacts to fire and law enforcement services would be mitigated through the provision of on-site fire stations and a Sheriff's station, similar to the proposed Project. Impacts to fire and law enforcement services would be mitigated to a less than significant level under this Alternative.

## **Other Public Services**

### ***Library***

The demand for library services under this Alternative would be less than those of the proposed Project because of the decreased level of development. With 92 fewer residential units, this Alternative would require the development of a smaller community library than the proposed Project. Both the proposed Project and this Alternative would result in less than significant impacts after mitigation.

### ***Solid Waste***

The solid waste demands associated with Alternative C would be slightly less than those of the proposed Project because of the decreased level of development. This demand for landfill capacity would still be considered significant and unavoidable because permitted landfill capacity at existing County landfills cannot be guaranteed at the time of Project buildout and through the life of the Project, which would occur beyond the required 15-year LACDPW planning horizon. Like the proposed Project, this Alternative would result in a significant and unavoidable impact related to solid waste.

### ***Other Public Facilities***

Alternative C would create a demand for County services and facilities but will be subject to the payment of fees for any needed services. Alternative C will also provide a maintenance yard on the site for County use for public park and facility maintenance, County-owned roadway maintenance, public right-of-way maintenance, flood-control infrastructure maintenance, and other maintenance activities. Impacts would be less than significant, similar to the Project.

## **Water Resources**

The water demands associated with Alternative C would be less than those of the proposed Project because of the decreased level of development. As with the proposed Project, direct impacts to water supplies would be mitigated to a less than significant level under this Alternative, and there would be less than significant impacts to groundwater supplies. However, as with the proposed Project, significant unavoidable cumulative impacts to water supplies would result from Alternative C.

## **Wastewater**

Wastewater generation associated with Alternative C would be less than the Project due to the decrease in development. As such, impacts related to wastewater treatment requirements and wastewater facilities would be less. Both the proposed Project and this Alternative would result in less than significant impacts with the provision of an on-site sewer system and WRFs.

## **Dry Utilities**

Demands for dry utility services associated with Alternative C would be less than those of the proposed Project because of the decreased level of development. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative.

## **Climate Change**

With a decrease in development associated with Alternative C, greenhouse gas emissions would also be decreased by a comparable amount. However, cumulative impacts to climate change would be significant and unavoidable, similar to the Project, because Alternative C would not substantially reduce development to a degree that could eliminate the cumulative impact. This Alternative and the proposed Project would not conflict with the County's Climate Action Plan.

## **Summary Conclusion**

Implementation of Alternative C would result in fewer impacts compared to the proposed Project due to the decreased development. Alternative C would also result in fewer impacts on riparian communities and wetlands due to the exclusion of drainages from the development footprint. The Project is proposed with the objective of creating a self-contained, self-sustaining community in which people could live and work in the same community. Implementation of this Alternative would fully support this underlying goal; however, significant and unavoidable impacts associated with air quality, agriculture resources, noise, population and growth-inducing impacts, traffic, climate change, visual resources, water supply, and solid waste would still occur under this Alternative, similar to the Project.

### **8.4.7 ALTERNATIVE D: INFRASTRUCTURE RELOCATION**

Alternative D was designed with the objectives of (1) reducing the need for pumping equipment and associated energy demands by relying upon gravity-based water systems; (2) improving the reliability of the water distribution system, especially during a power outage; and (3) reducing biological impacts to the Oso Creek. Exhibit 8-5, Alternative D – Infrastructure Relocation Alternative, shows the proposed relocation sites for the two water tanks and the water treatment plant.

The Project's proposed location of the water treatment facility is outside the boundaries of the SEA; however, it is located within Oso Creek, which contains jurisdictional features and sensitive biological resources. Alternative D would relocate the water facility slightly south to a topographically raised portion of the Project site in order to avoid Oso Creek, but would technically result in an impact to lands within the SEA.

Two water tank sites, one on the east and one of the west side of the Aqueduct, would also be relocated to lands located within the boundaries of the SEA. The location of these water tank sites would be advantageous because they would reduce long-term energy demands associated with water pumping to pressurize the water distribution system. Locating the

water tanks at higher elevations, and thereby decreasing electrical pumping demands, would result in reductions in energy consumption and air pollutants, and would also increase reliability of the system in the instance of a power outage, where back-up generation would otherwise be required to ensure the functioning of the water system. The relocated tanks would be positioned behind ridgelines to make them less visible from public vantage points than they are within the currently proposed Project.

Although Alternative D would reduce impacts on Oso Creek, it would disturb a larger area (approximately 16 acres more) and would increase impacts to SEA-designated lands (on 58 acres). However, the area of Oso Canyon that would be preserved represents an area of high biological value on the site and includes jurisdictional waters, riparian habitat, and a substantial local movement path for wildlife. The preservation of this area would also reduce fragmentation of the Oso Canyon riparian corridor. The relocation of the water treatment plant and water tanks would increase total area of impacts but is expected to affect areas of lower biological value on the site.

## **Geotechnical**

As with the proposed Project, development of Alternative D would be subject to the same seismic hazards (e.g., ground shaking, liquefaction), geologic hazards (e.g., landslides, expansive soils), and hillside management standards. Mitigation would reduce potential impacts to less than significant levels, similar to the Project. Impacts related to erosion, grading, and topographic changes would be greater than anticipated to occur with the proposed Project, since the development footprint would be increased to locate two water tanks at higher elevations on the site. These impacts can be mitigated to less than significant levels. Less than significant impacts would occur under this Alternative with respect to geologic hazards with the implementation of mitigation, similar to the Project.

## **Hydrology and Flood**

Implementation of Alternative D would create slightly more impervious area than the proposed Project and changes to the existing hydrological conditions on the site would be greater due to the increase in the development footprint. Slightly more urban runoff would be expected with the increase in the development area that would occur on the site. As with the proposed Project, impacts related to hydrology would be less than significant under this Alternative with mitigation. Similar to the proposed Project, impacts related to conflict with LID standards, floodplains, and standing water would be less than significant with mitigation.

## **Hazards and Fire Safety**

### ***Hazards and Hazardous Materials***

Impacts associated with hazards for Alternative D would be similar to those associated with the proposed Project. The risk from existing hazards, Valley Fever, and wildlife-borne disease vectors would be similar to the proposed Project, as this Alternative would result in the same number of dwelling units and amount of non-residential development (commercial

and employment-generating land uses). As with the proposed Project, impacts would be mitigated to a less than significant level. Similar to the proposed Project, this Alternative would result in less than significant impacts with mitigation related to hazardous materials sites, and less than significant impacts related to airport/airstrip hazards and emergency response or emergency evacuation plans.

### ***Fire Safety***

Exposure to wildland fire risks related to location in areas designated as Very High Fire Hazard Severity Zones (VHFHSZs) and High Fire Hazard Severity Zones (HFHSZs) would be slightly more than those with the proposed Project, given the increase in the size of the development footprint on the site. The implementation of a fuel modification zone established with a Fire Management Plan would mitigate impacts to a less than significant level.

### **Water Quality**

The potential impacts to surface water and groundwater quality associated with Alternative D would be slightly more than anticipated to occur from implementation of the proposed Project since Alternative D would disturb 16 acres more than the proposed Project but would result in the same development. However, the impacts under both the proposed Project and this Alternative to water quality would be less than significant with mitigation. This Alternative would result in similar impacts related to waste discharge requirements and wastewater treatment systems, as there would be the same types of land uses and number of WRFs as the proposed Project.

### **Land Resources**

#### ***Agriculture***

Alternative D would have similar impacts to agricultural resources as the proposed Project since the same farmlands would be converted to urban uses. The proposed residential development at the eastern section of the site would eliminate ongoing agricultural production on Prime Farmland but would not conflict with any Williamson Act contracts. As with the proposed Project, impacts related to the conversion of farmland would be significant and unavoidable under this Alternative.

#### ***Mineral Resources***

As with the proposed Project, Alternative D would not involve the loss of availability of a known mineral resource. No impacts to mineral resources would occur under this Alternative.

### **Cultural and Tribal Resources**

Alternative D would result in disturbance of a slightly larger area where unknown archaeological, tribal cultural, and paleontological resources or human remains may be present, as compared to the proposed Project. Impacts to cultural resources from

implementation of Alternative D would be mitigated in the same manner as those for the proposed Project. Impacts would be less than significant after mitigation.

## **Biological Resources**

Alternative D would disturb approximately 16 acres more than the proposed Project and would locate the water treatment plant and water tanks within 58 acres of the San Andreas SEA. While the water treatment plant would be relocated to a site within the SEA, this new location is lower in biological value than the location proposed by the Project. Similarly, the water tank locations would increase disturbance within the SEA but would largely avoid more sensitive resource areas such as jurisdictional features and riparian habitat. Existing ranch and utility access roads could be used for construction access to the new water tank sites and only minor grading and access improvements would be required. However, improvements to portions of some of the access roads would impact native vegetation and would result in slight increase in quantity of impacts on vegetation and potentially special status species. Consequently, there would be a need for an increased acreage of mitigation to offset some of these impacts. All of these impacts would be reduced to less than significant levels after mitigation under both the proposed Project and this Alternative.

This Alternative would result in the same development on the site. Potentially significant direct impacts to biological resources from grading and ground disturbance would still include special status species, riparian communities, wetlands, and wildlife movement. Also, the introduction of residents to the area and associated indirect impacts on biological resources (e.g., light and glare; domestic pets; introduction of non-native plants and wildlife) would be similar to the Project. All of these impacts would be reduced to less than significant levels after mitigation under both the proposed Project and this Alternative. No direct significant and unavoidable biological impacts would remain after mitigation. However, like the proposed Project, Alternative D would result in significant and unavoidable cumulative impacts related to grasslands and wildlife movement. This Alternative would result in similar impacts to oak woodlands and oak trees. Like the proposed Project, this Alternative would result in no impacts related to habitat conservation plans or natural community conservation plans.

## **Land Use, Entitlements, and Planning**

Implementation of Alternative D would result in the development of a new master planned community at the northwestern section of Los Angeles County. This Alternative is consistent with the land use designations for the site, as contained in the AVAP and would require the same land use approvals as the proposed Project. As with the proposed Project, this Alternative would not disrupt or divide a community and would allow for development to meet the future housing and employment needs in Los Angeles County; it is therefore consistent with regional planning efforts. As with the proposed Project, an amendment to the AVAP Highway Plan, a zone change, and two CUPs would be required under this Alternative. Impacts would be similar to the Project under this Alternative for these thresholds. However, this Alternative would result in a greater impact related to conflict with the SEA Ordinance and hillside management standards, based on the location of the relocated infrastructure in higher elevation sites (i.e., hillside management areas) and within

58 acres of the San Andreas SEA. This impacts would be reduced to a less than significant level with mitigation.

### **Population, Housing, and Employment and Growth-Inducing Impacts**

Alternative D would have the same number of residential units and commercial and business park development but approximately 16 fewer acres of natural open space. Alternative D would have the same residential population than the proposed Project, and thus, the same potential to induce growth in the surrounding area. This Alternative would not exceed approved population projections. As with the proposed Project, less than significant impacts would result with respect to conformity with population projections, but a significant and unavoidable impact would result based on the substantial growth on the Project site relative to the existing setting. Displacement of housing would be less than significant, as with the proposed Project. This Alternative would also result in a similar, and significant and unavoidable, impact related to growth-inducing impacts.

### **Traffic, Access, and Circulation**

Alternative D would provide the same number of dwelling units and employment-generating uses, both of which are the primary trip-generating land uses for the proposed Project. Therefore, this Alternative would result in the same off-site vehicle trips. With the same off-site trip generation, impacts to freeway mainline segments, freeway ramps, and arterial highway intersections would be similar to the proposed Project. Significant impacts to the existing transportation system and CMP highways would occur under this Alternative. Payment of fair share fees for improvements to Caltrans facilities would be made as mitigation for the impacts of this Alternative, but it is outside the County's control to implement these improvements. Thus, if Caltrans does not construct the necessary improvements, impacts would be significant and unavoidable, similar to the Project.

As with the proposed Project, impacts related to emergency access and traffic hazards can be mitigated and impacts on air traffic would be less than significant. No conflict with alternative transportation policies would occur, similar to the Project.

### **Air Resources**

Implementation of Alternative D would involve slightly more grading on the site with the increase in the development footprint, when compared to the Project. As with the proposed Project, this alternative would result in significant unavoidable construction-related emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. However, long-term operational emissions would be the less when compared to the Project due to the reduction in the need of pumping water. Back-up diesel generators would be required under the Project and under Alternative D; however, in the event of a power outage, substantially more energy and diesel emissions would be required to maintain the functioning of the water system. This Alternative would have the same land use development and would generate the same amount of vehicular traffic; therefore, vehicular emissions would not change. As with the proposed Project, this Alternative would result in significant unavoidable operational emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Consistency with the applicable

Air Quality Management Plan and exposure to odors would also represent a less than significant impact under this Alternative.

## **Noise**

Alternative D would involve the same construction as the proposed Project, with similar impacts and exposure to groundborne vibration resulting from construction. Impacts related to noise increases in excess of Los Angeles County standards at sensitive receptors would be significant, similar to those of the proposed Project. Mitigation would reduce these impacts to less than significant levels.

Off-site traffic noise would be the same when compared to the proposed Project because of the same off-site vehicular traffic generation. Noise impacts on adjacent existing residences would be significant and unavoidable under this Alternative because it is outside the County's control to implement improvements on private properties or Caltrans right-of-way. Airport noise exposure would be similar to that of the Project and considered less than significant.

## **Visual Resources**

Visual changes to the Project site associated with the implementation of Alternative D would be slightly less than those anticipated to occur under the proposed Project, since the water tanks would be located at higher elevations but behind ridgelines. Thus, they would be less visible from public roadways and trails. Under the proposed Project and this Alternative, significant and unavoidable impacts would result with respect to alterations to a scenic vista, degradation of the visual quality of the site, and the creation of new sources of light and glare due to the size and intensity of development proposed in a largely undeveloped area. Under both the proposed Project and this Alternative, less than significant impacts would occur related to an AVAP-designated scenic drive.

## **Parks and Recreation**

Implementation of Alternative D would result in the same demand for parks and recreational facilities since the same number of dwelling units is proposed, resulting in the same resident population. As with the proposed Project, less than significant impacts would occur with the provision of on-site parks and recreational facilities. Similar to the proposed Project, Alternative D would result in a less than significant impact related to regional open space connectivity, as a connection to the proposed realignment of the Pacific Crest Trail would also be part of this Alternative.

## **Education**

The demand for school facilities and services associated with Alternative D would be similar to those of the proposed Project because the same residential development is proposed. As such, schools needed to serve on-site residents would also be the same. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative.

## **Fire and Law Enforcement Services**

The demand for fire and law enforcement services associated with Alternative D would be similar to that for the proposed Project because the same amount of development is proposed. Impacts to fire and law enforcement services would be mitigated through the provision of on-site fire stations and a Sheriff's station, similar to the proposed Project. Impacts to fire and law enforcement services would be mitigated to a less than significant level under this Alternative.

## **Other Public Services**

### ***Library***

The demand for library services under Alternative D would be similar to those of the proposed Project. With the same number of residents on site, this Alternative would require the development of the same size community library as the proposed Project. Both the proposed Project and this Alternative would result in less than significant impacts after mitigation.

### ***Solid Waste***

The solid waste demands associated with Alternative D would be similar to those of the proposed Project because the same development is proposed. Also, the demand for landfill capacity would be considered significant and unavoidable because permitted landfill capacity at existing County landfills cannot be guaranteed at the time of Project buildout and through the life of the Project, which would occur beyond the required 15-year LACDPW planning horizon. Like the proposed Project, this Alternative would result in a significant and unavoidable impact related to solid waste.

### ***Other Public Facilities***

Alternative D would create a demand for County services and facilities but would be subject to the payment of fees for any needed services. Alternative D would also provide a maintenance yard on the site for County use for public park and facility maintenance, County-owned roadway maintenance, public right-of-way maintenance, flood-control infrastructure maintenance, and other maintenance activities. Impacts would be less than significant, similar to the Project.

## **Water Resources**

The water demands associated with Alternative D would be similar to those of the proposed Project because the same development is proposed. There would be no landscaping or irrigation associated with the relocation infrastructure sites. As with the proposed Project, direct impacts to water supplies would be mitigated to a less than significant level under this Alternative, and there would be less than significant impacts to groundwater supplies. However, as with the proposed Project, significant unavoidable cumulative impacts to water supplies would result from Alternative D.

## **Wastewater**

Wastewater generation associated with Alternative D would be similar to the Project due to the same development. As such, impacts related to wastewater treatment requirements and wastewater facilities would also be less. Both the proposed Project and this Alternative would result in less than significant impacts with the provision of an on-site sewer system and a WRF.

## **Dry Utilities**

Demands for dry utility services associated with Alternative D would be similar to the proposed Project, except electrical demand. While the same development is proposed on site, the location of the water tanks at higher elevations would reduce the pumping needs and result in a more efficient water distribution system. This Alternative would reduce electrical power demands over those of the Project. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative.

## **Climate Change**

With the same development associated with Alternative D, greenhouse gas emissions from development would be similar to the Project. However, the use of less energy for water pumping based on the location of the water tanks at higher elevations would slightly reduce GHG emissions. However, cumulative impacts to climate change under Alternative D would be significant and unavoidable, similar to the Project. This Alternative and the proposed Project would be consistent with the County's Climate Action Plan.

## **Summary Conclusion**

Implementation of Alternative D would result in the same effects to most of the population-driven impacts (e.g., noise, traffic, water supply, public services, and utility demands) as the proposed Project since the same development is proposed on site. However, Alternative D would result in decreased impacts to visual resources, energy demands, and climate change. Although the relocation of the water treatment plant would avoid sensitive drainage areas, Alternative D would disturb approximately 16 more acres of biological resources and would locate the water treatment plant and water tanks within 58 acres of the San Andreas SEA. The Project was developed with the objective of creating a self-contained, self-sustaining community in which people could live and work in the same community. Implementation of this Alternative would fully support this underlying goal; however, significant and unavoidable impacts associated with air quality, agriculture resources, noise, population and growth-inducing impacts, traffic, visual resources, climate change, water supply, and solid waste would still occur under this Alternative, similar to the Project.

### 8.4.8 ALTERNATIVE E: DENSITY CLUSTERING/EAST OF AQUEDUCT

This Alternative focuses on increasing the density of development on the east side of the California Aqueduct and 300<sup>th</sup> Street West, by decreasing development in the easternmost and westernmost portions of the site. The proposed Project development footprint would be reduced by approximately 656 acres under this Alternative, while maintaining the same number of dwelling units (19,333 units), employment-generating uses (10,097,208 sf/10.10 msf), and other land uses. Alternative E reflects an approximate 4 percent increase (from approximately 46 percent to 50 percent) in conserved natural open space which does not include parks, greenways, and other types of urban open space. Exhibit 8-6, Alternative E – Density Clustering/East of Aqueduct Alternative, depicts the conceptual land use plan for this Alternative.

On the west side of the Aqueduct, all development except for the Cement Plant Road realignment would be transferred to the central portion of the site. This includes 1,574 dwelling units and 87,120 sf of Commercial uses. The 44-acre WTP proposed west of the Aqueduct would be relocated by converting 44 acres of Low-Density Residential land use to Utility, extending the existing U-designated area along the northeastern border of the Project site. This conversion would require the transfer of 147 low-density dwelling units, which would be readily accommodated throughout the remainder of Village 5. Additionally, relocation of the WTP to the east side of the Aqueduct would require a pipeline to be installed from the Aqueduct turnout, located slightly north of the proposed WTP location, across the Aqueduct and to the WTP site. However, the new bridge crossing to land uses on the west side of the Aqueduct would be eliminated under this Alternative.

On the east side of 300<sup>th</sup> Street West, the Low Density Residential-designated lands would be designated as Very Low Density Residential resulting in a net reduction of 603 dwelling units. These units and 108,900 sf of Commercial uses would be transferred to the central portion of the site. Specifically, all 2,177 transferred dwelling units (not including the 147 units in Village 5) would be accommodated in Village 3—the town center—and all or most transferred Commercial uses (196,020 sf) would instead be accommodated in the Centennial Commerce District (CCD) along SR-138 without changing the conceptual land use plan in these areas.

### Geotechnical

As with the proposed Project, development of Alternative E would be subject to the same seismic hazards (e.g., ground shaking, liquefaction), geologic hazards (e.g., landslides, expansive soils), and hillside management standards. Impacts due to ground rupture related to the two unnamed faults on the Project site and erosion, grading, and topographic changes would be less than those anticipated to occur with the proposed Project due to the transfer of land uses on the west side of the California Aqueduct (except the Cement Plant Road realignment) and associated 656-acre reduction in the development footprint. Less than significant impacts would occur under this Alternative with respect to geologic hazards with the implementation of mitigation, similar to the Project.

## **Hydrology and Flood**

Implementation of Alternative E would create less impervious area than the proposed Project and changes to the existing hydrological conditions on the site would be less due to the transfer of land uses on the west side of the California Aqueduct (except the Cement Plant Road realignment) and associated 656-acre reduction in the development footprint. Incrementally less urban runoff would also be expected with the decrease in development on the site. As with the proposed Project, impacts related to hydrology would be less than significant under this Alternative with mitigation. Similar to the proposed Project, impacts related to conflict with LID standards, floodplains, inundation, and standing water would be less than significant with mitigation.

## **Hazards and Fire Safety**

### ***Hazards and Hazardous Materials***

Impacts associated with hazards for Alternative E would be similar to those associated with the proposed Project. The risk from existing hazards, Valley Fever, and wildlife-borne disease vectors would be similar to the proposed Project, as this Alternative would result in the same number of dwelling units and amount of non-residential development. As with the proposed Project, impacts would be mitigated to a less than significant level. Similar to the proposed Project, this Alternative would result in less than significant impacts with mitigation related to hazardous materials sites, and less than significant impacts related to airport/airstrip hazards and emergency response or emergency evacuation plans.

### ***Fire Safety***

Exposure to wildland fire risks related to location in areas designated as Very High Fire Hazard Severity Zones (VHFHSZs) and High Fire Hazard Severity Zones (HFHSZs) would be less than those with the proposed Project, given the decrease in development proposed on the site. The implementation of a fuel modification zone established with a Fire Management Plan would mitigate impacts to a less than significant level, as with the proposed Project.

## **Water Quality**

The potential impacts to surface water and groundwater quality associated with Alternative E would be less than those anticipated to occur from implementation of the proposed Project since Alternative E would disturb 656 acres less than the proposed Project. However, this Alternative would result in development of the same types and quantity of land uses as the proposed Project within the reduced footprint. The impacts under both the proposed Project and this Alternative to water quality would be less than significant with mitigation. This Alternative would result in similar impacts related to waste discharge requirements and wastewater treatment systems, as there would be the same types of land uses and number of WRFs as the proposed Project.

## **Land Resources**

### ***Agriculture***

This Alternative would have similar impacts to agricultural resources as the proposed Project since the same farmlands would be converted to urban uses. The proposed residential development at the eastern section of the site would eliminate ongoing agricultural production on Prime Farmland, but would not conflict with any Williamson Act contracts. As with the proposed Project, impacts related to the conversion of farmland would be significant and unavoidable under this Alternative.

### ***Mineral Resources***

As with the proposed Project, Alternative E would not involve the loss of availability of a known mineral resource. No impacts to mineral resources would occur under this Alternative.

## **Cultural and Tribal Resources**

Alternative E would result in disturbance of a smaller area and impacts on unknown archaeological, tribal cultural, and paleontological resources or human remains would be less than the proposed Project. The significant cultural resource sites west of the Aqueduct would not be directly impacted by grading activity. These sites would be located within open space areas under this Alternative; there would be significant indirect impacts to these sites, same as the proposed Project. The location of cultural sites to the east of the Aqueduct would still be developed under this Alternative, and result in the same impacts as the Project. It is anticipated that cultural resource-related impacts from implementation of Alternative E would be mitigated in the same manner as those for the proposed Project. Impacts related to cultural resources would be mitigated to a less than significant level under this Alternative.

## **Biological Resources**

Alternative E would disturb approximately 656 acres less than the proposed Project, and would increase the acreage of open space and preserved lands by approximately 4 percent compared to the proposed Project (from approximately 46 percent to approximately 50 percent). Under this Alternative, no different areas or additional acres would be impacted that would have the potential to result in new or more significant biological resources impacts, despite an overall reduction in the development footprint. The reduced impact area would result in an incremental comparable reduction in impacts to various biological resources including vegetation types, potentially suitable habitat for special status plant and wildlife species, and jurisdictional drainages. Thus, there would be less mitigation required to offset Alternative E impacts. Furthermore, the additional preservation area would increase the buffer area between the development footprint and other on- and off-site preserved lands thereby reducing indirect impacts to biological resources. Consequently, no additional impacts would occur and no additional mitigation would be required with Alternative E.

Potentially significant direct impacts to biological resources from grading and ground disturbance would still include special status species, riparian communities, wetlands, and wildlife movement. All of these impacts would be reduced to less than significant levels after mitigation under both the proposed Project and this Alternative. No significant and unavoidable biological impacts related to these thresholds for Alternative E would remain after mitigation. However, like the proposed Project, Alternative E would result in significant and unavoidable cumulative impacts related to grasslands and wildlife movement. This Alternative would result in similar impacts to oak woodlands and oak trees. Like the proposed Project, this Alternative would result in no impact related to habitat conservation plans and natural community conservation plans.

### **Land Use, Entitlements, and Planning and Growth-Inducing Impacts**

As with the proposed Project, implementation of Alternative E would result in the development of a new master planned community at the northwestern section of Los Angeles County. This Alternative is consistent with the land use designations for the site, as contained in the AVAP and would require the same land use approvals as the proposed Project. Like the proposed Project, this Alternative would not disrupt or divide a community, and would allow for development to meet the future housing and employment needs in Los Angeles County; it is, therefore, consistent with regional planning efforts. As with the proposed Project, an amendment to the AVAP Highway Plan, a zone change, and CUPs would be required under this Alternative. Impacts would be similar under this Alternative as the same land use approvals would be required, and this Alternative would equally allow for development to meet planned growth. Because this Alternative has land dedicated to public parks, roads and infrastructure facilities, it could result in lower costs for public infrastructure categories that correlate with acreage (e.g., road maintenance), and could result in higher costs for public infrastructure categories that correlate with intensity of uses (e.g., sports playfields in parks). This Alternative would lessen, but not avoid, the significant impacts of the proposed Project.

### **Population, Housing, and Employment and Growth-Inducing Impacts**

Alternative E would have the same number of residential units and commercial and business park development within a smaller development footprint, by approximately 656 acres. Alternative E would have the same residential population than the proposed Project, and thus, the same potential to induce growth in the surrounding area. As with the proposed Project, less than significant impacts would result with respect to conformity with population projections, but a significant and unavoidable impact would result based on the substantial growth on the Project site relative to the existing setting. Displacement of housing would be less than significant, similar to the proposed Project. This Alternative would also result in a similar, and significant and unavoidable, impact related to growth-inducing impacts.

### **Traffic, Access, and Circulation**

Alternative E would provide the same number of dwelling units and employment-generating uses, both of which are the primary trip-generating land uses for the proposed Project.

Therefore, this Alternative would result in the same off-site vehicle trips, although the transfer of commercial development would result in reduced crossings across 300<sup>th</sup> Street and SR-138. With the same off-site trip generation, impacts to freeway mainline segments, freeway ramps, and arterial highway intersections would be similar to the proposed Project. Increased density may also influence on-site travel mode selection (e.g., reduce car trips within the Project site area).

This Alternative would not result in a significant change to how Project-related traffic accesses SR-138, nor would it change the overall distribution of Project-related traffic. While the amount of traffic generated by this Alternative would be identical to the proposed Project, there would be a corresponding increase to the volume of traffic on the central and western intersections with SR-138. However, the overall increase to these roadways would be minor and would be accommodated by augmenting the capacity of these roadways and their intersections with SR-138 (Stantec 2016a). These augments would be feasible within the limits of the Conceptual Land Use Plan and associated grading plan. Therefore, significant impacts to the existing transportation system and CMP highways would occur under this Alternative, similar to the proposed Project. Payment of fair share fees for improvements to Caltrans facilities would be made as mitigation for the impacts of this Alternative, but it is outside the County's control to implement these improvements. Thus, if Caltrans does not construct the necessary improvements, impacts would be significant and unavoidable, similar to the Project.

As with the proposed Project, impacts related to emergency access and traffic hazards can be mitigated and impacts on air traffic would be less than significant. No conflict with alternative transportation policies would occur, similar to the Project.

## **Air Resources**

Implementation of Alternative E would involve less grading on the site commensurate with the 656-acre reduction in the development footprint. However, the SCAQMD thresholds are based on daily construction emissions, and this Alternative would implement the same daily construction activities as the Project. Therefore, as with the proposed Project, this Alternative would result in significant unavoidable construction-related emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Because increased density may result in further mode shifts (e.g., reduce use of cars and increased walking or biking) within the Project site itself, this Alternative could result in a corresponding decrease in air emissions from avoided on-site vehicle trips. However, since the same land uses and trip generation would occur, the primary vehicular-related emissions occur from offsite trips, operational emissions would be similar but slightly lower than the proposed Project, and would continue to result in significant unavoidable operational emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Consistency with the applicable Air Quality Management Plan and exposure to odors would remain a less than significant impact under this Alternative.

## **Noise**

Alternative E would involve less grading on the site commensurate with the 656-acre reduction in the development footprint, and noise and groundborne vibration that would

result from construction would also be less. However, there would be no receptors in the area with less noise and vibration on the west side of the Aqueduct. Noise generation related to building construction would be similar to the proposed Project, as the same amount of development is proposed. Therefore, impacts related to noise increases in excess of Los Angeles County standards at sensitive receptors would still be significant, similar to those of the proposed Project. Mitigation would reduce these impacts to less than significant levels.

Off-site traffic noise would be the same when compared to the proposed Project because of the same vehicular traffic generation. Noise impacts on adjacent existing residences would be similar, and would remain significant and unavoidable under this Alternative because it is outside the County's control to implement improvements on private properties or Caltrans right-of-way. Airport noise exposure would be similar to that of the Project and would be considered less than significant.

## **Visual Resources**

Visual changes to the Project site associated with implementation of Alternative E would be reduced to the west of the Aqueduct, with the realigned Cement Plant Road remaining as the only land use change. However, under the proposed Project and this Alternative, significant and unavoidable impacts would result with respect to alterations to a scenic vista; degradation of the visual quality of the site; and the creation of light and glare due to the size and intensity of development that would be proposed in a largely undeveloped area. Under both the proposed Project and this Alternative, less than significant impacts would occur related to AVAP-designated scenic drives (e.g., I-5, Gorman Post Road, SR-138, Old Ridge Road [Highway N-2], and Three Points Road). This Alternative would have decreased light and glare impacts, due to the decrease in the development footprint, when compared to the proposed Project. However, this impact would be significant and unavoidable with mitigation.

## **Parks and Recreation**

Implementation of Alternative E would result in the same demand for parks and recreational facilities since the same number of dwelling units is proposed, resulting in the same resident population. However, the transfer of development to the west of the Aqueduct eliminates 13.1 acres of Park Overlay and 5.6 acres of the Recreation/Entertainment land use designation. This Alternative would also provide on-site parks and recreation amenities that would meet and exceed County and State parkland standards, when considering both the park acreage and acreage equivalencies (e.g., public park development costs, private recreation facilities) and result in a less than significant impact. However, this Alternative would result in a higher population per acre of parkland than the proposed Project. The higher population per acre of parkland would require more efficient use of parkland space and amenities, with the potential for both lower costs (e.g., from developing and maintaining fewer acres) partly offset by the potential for increased costs (e.g., from more active maintenance required for high-use park areas such as sports playfields). Alternative E would result in a less than significant impact related to regional open space connectivity, as a connection to the proposed realignment of the Pacific Crest Trail would also be part of this Alternative.

## **Education**

The demand for school facilities and services associated with Alternative E would be similar to those of the proposed Project because the same residential development is proposed. However, the transfer of development to the west of the Aqueduct eliminates 11 acres of School Overlay (a K-5 elementary school), which would have to be provided to the east side of the Aqueduct. Any future school development within the Project site would require coordination with and agreement of the affected school districts, as described in the mitigation program. Therefore, as with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative.

## **Fire and Law Enforcement Services**

The demand for fire and law enforcement services associated with Alternative E would be similar to that for the proposed Project because the same amount of development is proposed. Impacts to fire and law enforcement services would be mitigated through the provision of on-site fire stations and a Sheriff's station, similar to the proposed Project. Emergency response times would be slightly improved given the smaller development footprint of this Alternative. Impacts to fire and law enforcement services would be mitigated to a less than significant level under this Alternative.

## **Other Public Services**

### ***Library***

The demand for library services under Alternative E would be similar to those of the proposed Project. With the same number of residents on site, this Alternative would require the development of the same size community library as the proposed Project. Both the proposed Project and this Alternative would result in less than significant impact after mitigation.

### ***Solid Waste***

The solid waste demands associated with Alternative E would be similar to those of the proposed Project because the same development is proposed. Also, the demand for landfill capacity would be considered significant and unavoidable because permitted landfill capacity at existing County landfills cannot be guaranteed at the time of Project buildout and through the life of the Project, which would occur beyond the required 15-year LACDPW planning horizon. Like the proposed Project, this Alternative would result in a significant and unavoidable impact related to solid waste.

### ***Other Public Facilities***

Alternative E would create a demand for County services and facilities but would be subject to the payment of fees for any needed services. Alternative E would also provide a maintenance yard on the site for County use for public park and facility maintenance, County-owned roadway maintenance, public right-of-way maintenance, flood-control

infrastructure maintenance, and other maintenance activities. Impacts would be less than significant, same as the Project.

## **Water Resources**

The water demands associated with Alternative E would be less than the proposed Project because the elimination of development to the west of the Aqueduct would reduce the amount of landscaping and its associated irrigation demands. As with the proposed Project, direct impacts to water supplies would be mitigated to a less than significant level under this Alternative, and there would be less than significant impacts to groundwater supplies. However, as with the proposed Project, significant unavoidable cumulative impacts to water supplies would result from Alternative E.

## **Wastewater**

Wastewater generation associated with Alternative E would be similar to the Project due to the same development. As such, impacts related to wastewater treatment requirements and wastewater facilities would also be less. Both the proposed Project and this Alternative would result in less than significant impacts with the provision of an on-site sewer system and a WRF.

## **Dry Utilities**

Demands for dry utility services associated with Alternative E would be similar to those of the proposed Project because the same development is proposed. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative.

## **Climate Change**

With the same development associated with Alternative E, greenhouse gas emissions from development would be similar to the Project. Cumulative impacts to climate change under Alternative D would be significant and unavoidable, similar to the Project. Greenhouse gas emissions from vehicle use would be slightly lower based on projected mode shifts (i.e., reduced use of fossil-fired vehicles) for on-site trips as described in Air Quality, above. This Alternative and the proposed Project would result in less than significant impacts at the project-level related to climate change policies.

## **Summary Conclusion**

Implementation of Alternative E would result in similar or slightly reduced effects to most of the population-driven impacts (e.g., noise, traffic, public services, and utility demands) as the proposed Project since the same development, and related population, is proposed on site. However, Alternative E would result in decreased impacts to grading-driven impacts (e.g., biological resources, cultural resources, and visual resources) and would reduce some on-site automobile-driven impacts (e.g., air quality, greenhouse gas emissions).

The Project was developed with the objective of creating a self-contained, self-sustaining community in which people could live and work in the same community. Implementation of this Alternative would fully support this underlying goal; however, significant and unavoidable impacts associated with air quality, agriculture resources, noise, population and growth-inducing impacts, traffic, visual resources, climate change, water supply, and solid waste would still occur under this Alternative, similar to the Project.

#### **8.4.9 ALTERNATIVE F: CENTRAL ECONOMIC OPPORTUNITY AREA DEVELOPMENT**

This Alternative considers the AVAP's Central EOA as an alternative location. As shown in Exhibit 8-7, Alternative F – Central Economic Opportunity Area Development, the 23,930-acre Central EOA is an irregularly shaped area located generally between the northern boundary of the City of Lancaster and the Los Angeles County-Kern County border. It is traversed by SR-138 in an east-west direction, and by SR-14 and Sierra Highway in a north-south direction. This alternative assumes that the same types and numbers of land uses, public facilities, and other amenities as the proposed Project (see Table 4-3 in Section 4.0, Project Description) would be developed within an approximate 12,323-acre, contiguous portion of the EOA.

#### **Geotechnical**

The majority of the Central EOA has not been evaluated under the Alquist-Priolo Earthquake Fault Zoning Act or the Seismic Hazards Mapping Act. The nearest known active fault to the Central EOA is the San Andreas Fault, located approximate nine miles to the southwest at the nearest point along the foothills of the San Gabriel Mountains. Due to this distance from the nearest known fault, impacts related to seismic hazards (e.g., fault rupture, ground shaking, ground failure) would be less under Alternative F when compared to the proposed Project. Additionally, this Alternative would eliminate development adjacent to the unnamed faults on the Project site. Topographically, the Central EOA is relatively flat with a slope generally towards the east-northeast (i.e., towards Rosamond Lake). There are very limited areas with slopes that are at least 25 percent, and these are related to existing development within the EOA along SR-14 and at the Lancaster Landfill and Recycling Center. As such, the risk of landslides is reduced when compared to the proposed Project. There may be liquefaction and/or other soil engineering constraints present within the Central EOA, but it is expected these would be mitigated with appropriate design and construction methods. As with the proposed Project, there would be less than significant geology and soils impacts through compliance with applicable regulations.

#### **Hydrology and Flood**

Implementation of Alternative F would create a similar extent of pervious and impervious areas as the proposed Project. Based on review of aerial photographs, there is one apparent drainage feature, extending in a southwest-northeast direction towards Rosamond Lake from near the intersection of SR-14 and the southern EOA boundary. Because there are less defined drainage channels within the Central EOA compared to the Project site, impacts

related to changes in drainage patterns would be less than the proposed Project. However, the amount of storm water runoff generated would be similar to the Project and would be managed through compliance with LID standards and other regulations. As with the proposed Project, impacts related to hydrology, including storm drainage capacity, would be less than significant under this Alternative with mitigation.

The Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Map designates an approximate one-mile-wide floodplain for this drainage and essentially the entirety of the Central EOA north of SR-138 as within an "A" zone, which has a one percent annual chance of flooding. Similar to the proposed Project, impacts related to floodplains would be less than significant with mitigation. Similar to the proposed Project, impacts related to inundation and standing water would be less than significant with mitigation.

## **Hazards and Fire Safety**

### ***Hazards and Hazardous Materials***

Impacts associated with hazards for Alternative F would be similar to those associated with the proposed Project, as both locations are within the Antelope Valley. Specifically, the risk from Valley Fever and wildlife-borne disease vectors would be similar to the proposed Project, as this Alternative would result in the same number of dwelling units and amount of non-residential development requiring ground disturbance in an area with a potential for Valley Fever spores. The precise location and nature of existing hazards within the Central EOA are not known. It is documented that a portion of Edwards Air Force Base (EAFB) is a federally listed Superfund site and is undergoing remediation. However, the extent of groundwater contaminant plume is mapped as being more than 23 miles to the east-northeast of the Central EOA (DTSC 2016). Therefore, this would not represent a hazard for the EOA. For all hazards, impacts would be mitigated to a less than significant level, same as the proposed Project.

As discussed above under "Traffic, Access, and Circulation", the southwestern portion of the Central EOA is within the Airport Influence Area Boundary of the Fox Airfield, and land use compatibility zones C, D, and E overlap the EOA. Therefore, there would be greater impacts associated with hazards due to proximity to a public airport. However, through compliance with Federal Aviation Administration (FAA) regulations and/or avoidance of the Fox Airfield's Airport Influence Area in the hypothetical placement of the alternative location within the EOA, there would be less than significant impacts with this mitigation. As noted above, EAFB is also adjacent to the Central EOA; however, the Central EOA is not within an area with any land use compatibility restrictions (Perry 2016). Therefore, there would be less than significant impacts related to airport/airstrip hazards, similar to the proposed Project. As with the proposed Project, this Alternative would result in less than significant impacts related emergency response or emergency evacuation plans.

### ***Fire Safety***

The majority of the Central EOA is designated as a Moderate Fire Hazard Severity Zones, with the remainder not designated as a fire hazard zone. Therefore, exposure to wildland fire risks would be reduced under this Alternative compared to the proposed Project. The

implementation of a fuel modification zone established with a Fire Management Plan would mitigate impacts to a less than significant level with the proposed Project. Alternative F would not require implementation of fuel modification.

## **Water Quality**

The potential impacts to surface water and groundwater quality associated with Alternative F would be similar to the proposed Project because the same development area and land uses would be implemented. However, the Project site would not have ready access to the Project's water supplies or banking infrastructure, this alternative would have a greater impact on regional water supplies relative to the proposed Project. Impacts under both the proposed Project and this Alternative to water quality would be less than significant with mitigation. This Alternative would result in similar impacts related to waste discharge requirements and wastewater treatment systems, as there would be the same types of land uses and number of WRFs as the proposed Project.

## **Land Resources**

### ***Agriculture***

The Central EOA contains approximately 469 acres of Prime Farmland, 132 acre of Farmland of Statewide Important, 69 acres of Unique Farmland, and 622 acres of Grazing Land. Dependent on the placement of the contiguous 12,323-acre site within the larger Central EOA, this Alternative has the potential to convert up to 670 acres of Farmland. This Alternative could result in less conversion of Prime Farmland compared to the proposed Project (642 acres), but would result in a similar amount of Farmland whose loss is considered significant under CEQA. As with the proposed Project, conversion of Grazing Land is not considered a significant impact. Therefore, impacts related to the conversion of farmland would be also be significant and unavoidable under this Alternative.

### ***Mineral Resources***

As with the proposed Project, Alternative F would not involve the loss of availability of a known mineral resource. No impacts to mineral resources would occur under this Alternative.

## **Cultural and Tribal Resources**

Alternative F would result in disturbance of the same development footprint acreage, where unknown archaeological, tribal cultural, and paleontological resources or human remains may be present, as with the proposed Project. Impacts to cultural resources from implementation of Alternative F would be mitigated in the same manner, or in a different but appropriate manner depending on the resources, as those for the proposed Project. Impacts would be less than significant after mitigation.

## Biological Resources

Alternative F would result in the same development footprint acreage within the Central EOA. Although specific details regarding the biological resources occurring within the Central EOA are not known, a review of the California Department of Fish and Wildlife's California Natural Diversity Database (CNDDDB) and aerial photographs can provide sufficient information for a preliminary determination regarding potential impacts of this Alternative. In general, the impact on some biological resources would be reduced. For example, the Central EOA is expected to contain fewer jurisdictional drainages due to the flatter terrain with fewer topographic changes; this impact would be less than significant after mitigation, same as the proposed Project. Oak trees and oak woodlands are not likely to be present on the Central EOA, which may indicate impacts to oak trees and oak woodlands would be reduced. Other special status vegetation types (such as alkaline sink) or associated plants, however, are known to be present in the Central EOA but not the Project site. Due to the fairly extensive distribution in the Central EOA, these resources would likely be impacted by Alternative F. As a result, impacts would increase in some regard to those resources that are different from the Project site. Consequently, there would be a need for different mitigation areas to offset these impacts. It is expected that these impacts would be reduced to less than significant levels after mitigation under this Alternative, same as the proposed Project. With regard to cumulative impacts to special status vegetation types, it is expected this impact would be less than the proposed Project and would be less than significant with mitigation based on the existing disturbance of the lands surrounding the alternative location. Additionally, this Alternative would result in a reduced impact to wildlife movement compared to the proposed Project, based on the continuity of the terrain immediately surrounding the Central EOA.

## Land Use, Entitlements, and Planning

The Central EOA is anticipated to have a much lower amount of future development than the West EOA, even when considering buildout of the entire 23,930 acres within the Central EOA, based on the 2016–2040 RTP/SCS as well as the AVAP land use designations and zoning. The majority of the Central EOA has Rural Land designations and an associated agricultural zoning. Alternative F is not consistent with the pattern of land use designations in the Central EOA, as contained in the AVAP. Therefore, this is a new significant impact of this Alternative. Implementation of Alternative F would require a General Plan amendment and a zone change for the entirety of the 12,323-acre footprint within the Central EOA. Like the proposed Project, with adoption of appropriate land use approvals, there would be a less than significant impact. This Alternative would not involve development within an SEA, like the proposed Project, and would not include hillside management areas. Therefore, Alternative F would not conflict with applicable land use criteria, similar to the Project.

Based on the 2016–2040 RTP/SCS, the maximum growth within the Central EOA is estimated at 24,015 people, 8,233 jobs, and 9,505 households (i.e., dwelling units) (Stantec 2016b). Therefore, this alternative would exceed the regional growth projections for this EOA by 33,135 people, 15,442 jobs, and 9,828 dwelling units. Therefore, development of the equivalent land use plan within the Central EOA would be inconsistent with the adopted

RTP/SCS, which is the region's approved land use and transportation plan pursuant to the Sustainable Communities and Climate Protection Act of 2008 (Senate Bill [SB] 375). This inconsistency would represent a new significant and unavoidable impact compared to the proposed Project. Furthermore, the approximate 11,607 acres remaining in the Central EOA with development of the Project's land uses on 12,323 acres, would still be available for development. This would hypothetically result in even higher total development within the Central EOA of the AVAP. In terms of land use compatibility, and as discussed further under relevant topics below, there are two air traffic facilities proximate to the site, the General William J. Fox Airfield (Fox Airfield) immediately to the south and EAFB immediately to the northeast. There would be greater land use and planning impacts under this Alternative, and a new significant and unavoidable impact.

## **Population, Housing, and Employment and Growth-Inducing Impacts**

This Alternative would result in an increase in population, housing stock, and employment that is similar to the Project. As discussed above under Land Use, Entitlements, and Planning, this Alternative would exceed approved growth projections for the Central EOA. Additionally, this Alternative would have a greater potential to induce growth in the surrounding area because the restrictions to development present proximate to the Project site, including topography and presence of public lands, are absent at this alternative location. Therefore, this Alternative would result in a new significant and unavoidable impact with respect to conformity to population projections, and a greater significant and unavoidable impact with respect to growth-inducing impacts. As with the Project, there would be a significant and unavoidable impact based on the substantial growth on the alternative location relative to the existing setting.

There is existing residential and non-residential (primarily the Lancaster Water Reclamation Plant and Lancaster Landfill and Recycling Center) development within the Central EOA. In order to develop a contiguous 12,323-acre site, it is expected that existing households in the scattered residences within the Central EOA would have to be displaced. The proposed Project would result in displacement of one household, which was concluded not be substantial and therefore less than significant. Implementation of this Alternative would likely result in displacement of a greater number of existing households. As such, this would be a greater impact than the proposed Project, but would be also less than significant with implementation of appropriate regulations.

## **Traffic, Access, and Circulation**

Alternative F would generate the same number of off-site vehicle trips as the proposed Project, but these trips would be distributed on SR-138 (in the EOA vicinity), SR-14, Sierra Highway, and local streets within and proximate to the Central EOA. As discussed above under Land Use, Entitlements, and Planning, development of an equivalent land use plan within the Central EOA is inconsistent with the approved 2016–2040 RTP/SCS. As such, it is expected that accommodating the number of off-site vehicle trips would require substantial transportation capacity improvements to the local and regional network beyond that anticipated by regional plans. Construction and use of transportation capacity improvements not anticipated as part of the RTP/SCS would result in greater air quality and

GHG emissions than expected and thereby reduces the ability of the County and the State to achieve its GHG reduction targets under AB 32, as implemented through SB 375.

As with the proposed Project, significant impacts to the existing transportation system and CMP highways would occur under this Alternative. Payment of fair share fees for improvements to Caltrans facilities would be made as mitigation for the impacts of this Alternative, but it is outside the County's control to implement these improvements. Thus, if Caltrans does not construct the necessary improvements, impacts would be significant and unavoidable, similar to the Project.

Impacts on air traffic would be greater than the proposed Project due to the proximity of the General William J. Fox Airfield (Fox Airfield) approximately 1.25 miles to the south at the nearest point. The southwestern portion of the Central EOA is within the Airport Influence Area Boundary of the Fox Airfield, and land use compatibility zones C, D, and E overlap the EOA. These zones represent limitations on land use development, due to flight paths, noise, accidents, risks, and other issues, to maintain compatibility with the airport operations. Although there would be greater constraints related to air traffic than the proposed Project, through compliance with FAA regulations and/or avoidance of the Fox Airfield's Airport Influence Area in the hypothetical placement of the alternative location within the EOA, there would be less than significant impacts, same as the proposed Project. EAFB is also adjacent to the Central EOA. EAFB was contacted to request its Air Installation Compatible Use Zone (AICUZ), if applicable, and/or other information on land use compatibility planning. The EAFB staff reports the Central EOA is not within an area with any land use compatibility restrictions (Perry 2016). It is assumed this is due to the distance between the active EAFB operations and the Central EOA. As such, there would be less than significant impacts related to EAFB.

As with the proposed Project, impacts related to emergency access and traffic hazards can be mitigated. No conflict with alternative transportation policies would occur, similar to the Project.

## **Air Resources**

Implementation of Alternative F would involve the same grading and construction activity, and associated criteria pollutant emissions, as the proposed Project. The entirety of the Central EOA is located within the AVAQMD. Because the AVAQMD thresholds are based on annual construction emissions, with implementation of mitigation (i.e., use of Tier 4 construction equipment) emissions would be less than significant for both the average construction year and peak construction year. Therefore, this alternative would avoid the significant and unavoidable construction-related impacts associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions.

This Alternative would have the same land use development and would generate the same amount of vehicular traffic; therefore, vehicular emissions would not change. As with the proposed Project, this Alternative would result in significant unavoidable operational emissions associated with CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> pursuant to AVAQMD thresholds. Consistency with the applicable Air Quality Management Plan would represent a

less than significant impact under this Alternative, similar to the proposed Project. Based on the presence of the Lancaster Water Reclamation Plant, which has large open basins as part of its facilities, it is unclear whether exposure to odors would also be a less than significant impact under this Alternative.

## Noise

Alternative F would involve the same construction as the proposed Project, with the same noise impacts and exposure to groundborne vibration resulting from construction. Impacts related to noise increases in excess of Los Angeles County standards at sensitive receptors, including existing residences within and immediately adjacent to 12,323-acre alternative location within the Central EOA, would likely be significant, similar to those of the proposed Project. Mitigation would reduce these impacts to less than significant levels.

Off-site traffic noise would be the same when compared to the proposed Project because of the same vehicular traffic generation. Noise impacts on existing residences along roadways that would have much higher capacity would likely also be significant and unavoidable under this Alternative because it is outside the County's control to implement improvements on private properties or Caltrans right-of-way.

Airport noise exposure would be greater than the Project due to the proximity of Fox Airfield; however, as discussed above under "Traffic, Access, and Circulation", through compliance with FAA regulations and/or avoidance of the Fox Airfield's Airport Influence Area in the hypothetical placement of the alternative location within the EOA, there would be less than significant impacts, similar to the proposed Project.

## Visual Resources

Visual changes to the Project site associated with the implementation of Alternative F would be greater than those anticipated under the proposed Project because the Central EOA is more visible from public roadways, and from a farther distance because of the flat topography of the EOA and surrounding areas. Like the proposed Project, impacts with respect to alterations to a scenic vista and degradation of the visual quality of the site would be significant and unavoidable. This Alternative would also result in significant and unavoidable impacts related to creation of new sources of light and glare.

The AVAP identifies scenic drives on roadways that are two miles from the Central EOA boundary at the nearest point (i.e., 90<sup>th</sup> Street West). Under both the proposed Project and this Alternative, less than significant impacts would occur related to a scenic highway corridor since the site is planned for development in the AVAP, though not at the intensity envisioned under the Conceptual Land Use Plan, and based on the distance to the scenic drives.

## Parks and Recreation

Implementation of Alternative F would result in the same demand for parks and recreational facilities since the same number of dwelling units is proposed, resulting in the same resident

population. As with the proposed Project, less than significant impacts would occur with the provision of on-site parks and recreational facilities. This Alternative would also provide on-site trails that may connect to existing County or regional trails; however, this alternative site is not proximate to regional open space (e.g., National Forests, realigned Pacific Crest Trail) in the same manner as the Project site. Regardless, this would remain a less than significant impact, similar to the proposed Project.

## **Education**

The demand for school facilities and services associated with Alternative F would be similar to those of the proposed Project because the same residential development is proposed. As such, schools needed to serve on-site residents would also be the same. This Alternative would require school services from the Lancaster Elementary School District, Westside Union Elementary School District and the Antelope Valley Union High School District. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative through school facilities and funding agreements with the affected school districts.

## **Fire and Law Enforcement Services**

The demand for fire and law enforcement services associated with Alternative F would be similar to that for the proposed Project because the same amount of development is proposed. Impacts to fire and law enforcement services would be mitigated through the provision of on-site fire stations and a Sheriff's station, similar to the proposed Project. Impacts to fire and law enforcement services would be mitigated to a less than significant level under this Alternative.

## **Other Public Services**

### ***Library***

The demand for library services associated with Alternative F would be similar to those of the proposed Project. With the same number of residents, this Alternative would require the development of the same size community library as the proposed Project. Both the proposed Project and this Alternative would result in less than significant impact after mitigation.

### ***Solid Waste***

The solid waste demands associated with Alternative F would be similar to those of the proposed Project because the same development is proposed. Also, the demand for landfill capacity would be considered significant and unavoidable because permitted landfill capacity at existing County landfills cannot be guaranteed at the time of Project buildout and through the life of the Project, which would occur beyond the required 15-year LACDPW planning horizon. Like the proposed Project, this Alternative would result in a significant and unavoidable impact related to solid waste.

### **Other Public Facilities**

Alternative F would create a demand for County services and facilities but would be subject to the payment of fees for any needed services. Alternative F would also provide a maintenance yard on the site for County use for public park and facility maintenance, County-owned roadway maintenance, public right-of-way maintenance, flood-control infrastructure maintenance, and other maintenance activities. Impacts would be less than significant, similar to the Project.

### **Water Resources**

The water demands associated with Alternative F would be similar to those of the proposed Project because the same amount of development is proposed. Unlike the Project site, there is no existing water supply infrastructure (i.e., water bank) and associated water rights to support development of the proposed master-planned community. Therefore, this Alternative would result in greater direct impacts than the proposed Project. It is expected there would not be feasible mitigation to accommodate the water demands of the Conceptual Land Use Plan without the existing water resources associated with the Project site, resulting in a new significant and unavoidable impact. Also, as with the proposed Project, significant unavoidable cumulative impacts to water supplies would result from Alternative F.

### **Wastewater**

Wastewater generation associated with Alternative F would be similar to the Project due to the same development. As such, impacts related to wastewater treatment requirements and wastewater facilities would also be less. Both the proposed Project and this Alternative would result in less than significant impacts with the provision of an on-site sewer system and WRFs.

### **Dry Utilities**

Demands for dry utility services associated with Alternative F would be similar to those of the proposed Project because the same development is proposed. As with the proposed Project, impacts would be mitigated to a less than significant level under this Alternative.

### **Climate Change**

With the same development associated with Alternative F, greenhouse gas emissions from development would be similar to the Project. As discussed above under “Land Use, Entitlements, and Planning”, development of an equivalent land use plan within the Central EOA is inconsistent with the approved 2016–2040 RTP/SCS, which is the region’s approved land use and transportation plan pursuant to SB 375). Accordingly, development of a master planned community on lands not anticipated as part of the RTP/SCS thereby reduces the ability of the County and the State to achieve its GHG reduction targets under AB 32, as implemented through SB 375. Therefore, Alternative F would result in impacts related to climate change would be greater under Alternative F, and would result in a greater significant and unavoidable impact related to climate change impacts.

## Summary Conclusion

Implementation of Alternative F would result in similar impacts as the proposed Project related to land resources, geotechnical, hydrology and flood, water quality, air resources (operation only), noise, cultural resources, parks and recreation, hazards, fire and law enforcement services, other public services, dry utilities, wastewater, and education. Alternative F would result in increased impacts related to land use and planning; population, housing, and employment and growth-inducing impacts; traffic, access, and circulation; visual resources; water resources; and climate change. This Alternative would result in decreased impacts related to air resources (construction only) and wildland fire risk. Regarding biological resources, this Alternative would result in similar impacts related to sensitive plant and wildlife species (impact mitigated) and habitat conservation plans (no impact), and would result in reduced impacts related to sensitive vegetation communities, wetlands, oak trees and oak woodlands, and wildlife movement. This Alternative would avoid significant and unavoidable cumulative impacts to sensitive vegetation communities and wildlife movement, as it is anticipated these impacts would be cumulatively less than significant with mitigation. Like the proposed Project, this Alternative would also result in significant and unavoidable impacts associated with air quality, agriculture resources, noise, traffic, visual resources, climate change, water supply, and solid waste.

## 8.5 ABILITY OF ALTERNATIVES TO MEET OBJECTIVES

Table 8-3 provides a brief discussion of how each alternative meets the Project objectives. For review of all Project objectives, please refer to Section 4.0, Project Description, of this Draft EIR.

**TABLE 8-3  
ABILITY OF EACH ALTERNATIVE TO MEET THE PROJECT OBJECTIVES**

<p>Implement the Antelope Valley Area Plan (AVAP) by creating an environmentally and economically sustainable master-planned community on the Project site to help accommodate planned regional population and economic growth within the West EOA.</p>	<p>All of the alternatives except for Alternatives A and F would meet this objective. Alternative A would not meet this objective since no development is proposed on the site.</p> <p>Alternative B would meet the objective for an environmentally and economically sustainable master-planned community, but would not be consistent with the land use designations for the site, as contained in the AVAP.</p> <p>Alternatives C, D, and E would also meet the objective for an environmentally and economically sustainable master plan while also being largely consistent with the land use designations for the site.</p> <p>However, Alternatives C and D would provide less development than the Project. Under these alternatives, the County would not be able to achieve housing and employment levels anticipated by the AVAP and associated with the adopted growth projections unless development occurs in excess of projections in other areas of the Antelope Valley,</p>
---	--

**TABLE 8-3  
ABILITY OF EACH ALTERNATIVE TO MEET THE PROJECT OBJECTIVES**

	<p>which would result in similar or greater impacts than the proposed Project.</p> <p>Alternative F would not meet this objective because locating the proposed master-planned community in the Central EOA would not be environmentally sustainable, as indicated by the analysis above, nor would it be consistent with the land use designations and associated population, housing, and employment levels anticipated for this area of the Antelope Valley by the AVAP. This Alternative would also exceed SCAG's regional growth projections.</p>
<p>Design the Project to maximize efficient utilization of regional infrastructure while preserving hundreds of thousands of acres of contiguous natural open space and important biological resources.</p>	<p>All of the alternatives except for Alternatives A and F would meet this objective.</p> <p>All of the alternatives except for Alternatives A and F would utilize the northwest segment of SR-138 as primary access to future development, and would preserve in perpetuity the on-site natural open space areas that connect to the approximate 240,000-acre Tejon Ranch Conservancy lands.</p> <p>Alternatives B and D include less open space areas than the proposed Project, while Alternatives A, C, and E would have more open space areas. However, Alternative A would not involve stewardship of the on-site resources to restore and/or create habitats, and the existing grazing activities would continue.</p> <p>Alternatives A and F would not utilize existing (i.e., I-5 and the California Aqueduct) and planned regional infrastructure (i.e., the Northwest 138 Corridor) to the same extent as the Project. Additionally, Alternative F would result in less efficient use of regional transportation infrastructure than Alternative A because accommodating this Alternative would require substantial transportation capacity improvements to the local and regional network beyond that anticipated by regional plans.</p>
<p>Size the Project to include a broad range of employment, residential, institutional, and recreational land uses to encourage walkability and wellness, while reducing off-site employment-related commuter trips.</p>	<p>All of the alternatives except for Alternative A would meet this objective, to varying degrees. Alternative A would not meet this objective since no development is proposed on the site.</p> <p>Alternatives B through F would provide a range of land uses, balanced to encourage alternative transportation (e.g., walking, bicycling) as well as wellness through provision of abundant recreational facilities; walkable and interconnected village centers; and on-site employment.</p> <p>Alternative B includes more land use development than the proposed Project, and Alternative C includes less. Alternative F would include the same types and amounts of land uses, but would not be located adjacent to existing open space and recreation features (e.g., National Forests) and would not be in a location that can connect to the Pacific Crest Trail. Alternative F is, however, situated closer to existing employment-generating land uses in the City of Lancaster and at EAFB, as it relates to commute lengths.</p>

**TABLE 8-3  
ABILITY OF EACH ALTERNATIVE TO MEET THE PROJECT OBJECTIVES**

Ensure that all Project site infrastructure and public services are funded by the Project to avoid creating any financial obligations on existing residents and other taxpayers.	All of the alternatives except for Alternatives A and E would meet this objective. This objective is not applicable to Alternative A since no development is proposed on the site. However, Alternative E would not have ready access to the Tejon Ranch water resource infrastructure or the California Aqueduct.
Integrate a multi-modal transportation network, renewable energy, water conservation, community wellness, and other green development features into the Project's design, build out and ongoing operations.	<p>All of the alternatives except for Alternatives A and F would meet this objective. Alternative A would not meet this objective since no development is proposed on the site.</p> <p>Alternatives B through F would provide essentially the same green development features within the Project site boundaries. However, Alternative F would not meet this objective because development of the equivalent land use plan within the Central EOA would be inconsistent with the adopted RTP/SCS. This, in turn, reduces the ability of the County and the State to achieve its GHG reduction targets under AB 32, as implemented through SB 375. Development that is substantially inconsistent with the primary State and regional land use plans related to sustainability outweighs the benefits of the green development features that would be implemented within this Project location.</p>

## 8.6 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

CEQA requires that an EIR identify the environmentally superior alternative. Section 15126.6 of the State CEQA Guidelines (14 CCR) identifies the following factors that may be used to eliminate alternatives from detailed consideration in an EIR: (1) failure to meet most of the basic Project objectives, (2) infeasibility, or (3) inability to avoid significant environmental impacts. These factors are considered in the selection of the environmentally superior alternative.

The analysis of the potential impacts associated with the proposed Project and the alternatives addressed in this EIR indicate that Alternative A, the No Project Alternative, has the least environmental impact since no development is proposed on site. However, the No Project Alternative would not meet any of the Project objectives. Section 15126.6 of the State CEQA Guidelines states "If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives" (14 CCR 15126.6).

Alternative B would meet most of the Project Objectives but would result in greater impacts on most issues due to the increase in development proposed on a smaller site. It would also not avoid any of the significant impacts of the Project. The currently proposed Project is an amended proposal from a 2003 application submitted to the County of Los Angeles, as described in the NOP dated March 2004. Based on the AVAP community outreach, environmental review, and County approval process, the Project was redesigned to be

consistent with the 2015 AVAP. The current Project has 3,665 fewer dwelling units and 4.12 million sf less of commercial and business park development, on a development footprint that is approximately 640 acres less than the earlier proposed project. The proposed Project is a significantly better and environmentally superior design compared to the earlier proposal.

Alternative C would meet the Project Objectives and would reduce impacts to major drainages on the site as well as other environmental factors due to the reduction in dwelling units (92 fewer units) and commercial and institutional development (198,634 sf less). This Alternative would reduce both its grading-driven impacts (e.g., biological resources, cultural resources, visual resources) and population-driven impacts (e.g., air quality, climate change, noise, traffic, water supply, public services and utility demands). However, it would not avoid any of the significant and unavoidable impacts of the Project.

Alternative D would meet the Project Objectives and would relocate water tanks and the water treatment plant to improve the water system and reduce energy demands for water distribution. It would also reduce its visual impacts, but would increase impacts on biological resources, with 58 acres of the San Andreas SEA disturbed. Since this Alternative would not change the development on the site, it would not avoid any of the significant and unavoidable impacts of the Project.

Alternative E would meet the Project Objectives and would result in decreased impacts to grading-driven impacts (approximately 656 fewer graded acres), increased preservation of open space, as well as reduced impacts to visual resources. This Alternative would result in the same or similar impacts to population-driven impacts and would not avoid any of the significant and unavoidable impacts of the Project.

Alternative F would not meet three of the five Project Objectives, and would result in additional significant and unavoidable impacts to related to land use, population projections, and water supply and greater significant and unavoidable impacts related to growth-inducing impacts and climate change. However, Alternative F would avoid significant and unavoidable impacts to sensitive vegetation communities and wildlife movement, as it is anticipated these impacts would be cumulatively less than significant with mitigation.

Based on the analysis for each Alternative above, although no alternative would entirely avoid any of the significant and unavoidable impacts of the proposed Project, Alternative E, Density Clustering/East of Aqueduct is considered the environmentally superior alternative to the Project in relation to some impact topics. Alternative E would result in a reduced grading footprint of approximately 656 acres; would have a corresponding increase in open space; and would meet all the Project Objectives.

## 9.0 CEQA MANDATED SECTIONS

### 9.1 IRREVERSIBLE CHANGES DUE TO THE PROJECT

Pursuant to Section 15126.2(c) of the California Environmental Quality Act (CEQA) Guidelines, this Draft Environmental Impact Report (EIR) must consider significant irreversible environmental changes that would be caused by the Project, should it be implemented. The Project would result in irreversible environmental changes related to topography/landform, site character, loss of open space, and commitment to non-renewable resources. The analysis and determination of the significance of these changes is discussed below.

#### 9.1.1 TOPOGRAPHY

The existing topography on the Project site would be irreversibly changed with implementation of the Project. Manufactured slopes would be constructed; contoured to conform to the existing topography to the greatest extent feasible; and landscaped to help reduce visual impacts from the change in topography. However, as discussed in Section 5.13, Visual Resources, the Project would result in significant and unavoidable impacts related to a change in visual character of the Project site, in part due to the alteration of topography. Accordingly, the required changes to the existing topography would be considered a significant irreversible environmental change.

#### 9.1.2 SITE CHARACTER AND LOSS OF OPEN SPACE

The overall character of the Project site would be irreversibly changed through conversion from rural, agricultural, and natural open space areas to urban development. Developed portions of the property would no longer be available for grazing activities or other existing rural and agricultural land uses. These changes would also affect the visual character of the site as seen from surrounding properties and public roadways.

Of the 12,323-acre Project site, approximately 5,624 acres are designated as Open Space. Of the 5,624 acres of designated Open Space, approximately 5,116 acres (42 percent of the site) would (1) remain in their original natural condition; (2) be restored; and/or (3) be enhanced by weed abatement, fencing, and native species planting, among other means. Of this amount, approximately 3,861 acres are designated as Significant Ecological Area (SEA) 17 to be preserved in perpetuity within the Project site boundaries. Additionally, approximately 23,547 acres of off-site areas would be set aside for preservation to mitigate impacts to biological resources (see Section 5.7, Biological Resources) to ensure preservation of the total 27,412-acre open space preserve in perpetuity. Some open space would be re-created through the development of the passive open space areas, parks, and a greenway trails and other trails on the Project site. However, the rural character of the site and open space areas being developed would be irreversibly altered. As discussed above, there would be significant and unavoidable impacts to the visual character of the Project site. Accordingly, the change from a rural or urban character and the loss of open space is considered a significant irreversible environmental change.

### 9.1.3 NON-RENEWABLE RESOURCES

Non-renewable resources, such as construction aggregate (e.g., sand, gravel) and fossil fuels, would be committed to the Project, which future generations would be unable to reverse. Non-renewable materials would be used in the construction of the Project; fossil fuels would be used in the construction phase of the Project and would be consumed by the Project inhabitants over the long term.

However, the Project's residential and other land uses are proposed in order to fill an existing need that is based on estimates of future population growth; it would not be creating a need for jobs or housing. Therefore, the non-renewable resources that would be used in the construction of the Project would be expected to be consumed by housing and land development in other locations to eventually fulfill the housing and employment demand that is anticipated, and that is still unfilled, for Los Angeles County. Additionally, the land uses proposed are not unusually wasteful or excessive in terms of construction materials and fossil fuel use. Further, the Project takes advantage of the potential for protecting natural resources, increasing energy efficiency, and promoting sustainable development, through the creation of a master planned community that would include a variety of housing types, business and employment opportunities and a range of civic and recreation uses. Therefore, the Project's consumption of non-renewable resources is not considered a significant irreversible environmental change.

## 9.2 SUMMARY OF PROJECT IMPACTS

A summary of the impacts of each category are below.

### 9.2.1 LESS THAN SIGNIFICANT IMPACTS

Through the analysis presented in this EIR, many environmental factors were found to be less than significant with the implementation of Project Design Features. No mitigation measures are required for these issues, which include:

- Land Resources (forest land/timberland; mineral resources)
- Land Use, Entitlements, and Planning
- Geotechnical
- Population, Housing, and Employment (household displacement)
- Visual Resources (scenic highways)
- Water Resources (groundwater)

### 9.2.2 LESS THAN SIGNIFICANT IMPACTS WITH MITIGATION

The environmental factors that were found to be significant or potentially significant prior to mitigation include the following:

- Hydrology and Flood

- Hazards and Fire Safety
- Water Quality
- Cultural and Tribal Resources
- Biological Resources
- Noise (except traffic noise along segments of State Route [SR] 138)
- Visual Resources (views from trails/bikeways, scenic highways)
- Parks and Recreation
- Education
- Fire and Law Enforcement Services
- Other Public Services (libraries and County facilities)
- Water Resources (water supply)
- Wastewater
- Dry Utilities

However, these direct and/or indirect impacts would be mitigated to a less than significant level with incorporation of the recommended mitigation measures.

### **9.2.3 SIGNIFICANT AND UNAVOIDABLE IMPACTS**

Through the analysis contained in this EIR, the environmental factors that were found to be directly and/or indirectly significant and unavoidable even with the incorporation of mitigation include following:

- Land Resources (loss of Prime Farmland)
- Air Resources (short-term VOC and NO<sub>x</sub>; short-term PM<sub>10</sub>, and PM<sub>2.5</sub> [near previously completed residences only]; and long-term CO, VOC, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions)
- Noise (traffic noise along segments of SR-138)
- Population, Housing, and Employment (population and housing growth; growth-inducing impacts)
- Traffic, Access and Circulation (mitigation outside jurisdiction of Lead Agency)
- Visual Resources (visual character, nighttime light and glare)
- Other Public Services (solid waste)
- Water Resources (regional water supplies beyond 2035)
- Climate Change

Regarding the analysis of traffic impacts, mitigation measures have been established to reduce the Project's significant impacts; as such, these impacts may be considered less than significant with mitigation. However, these mitigation measures call for improvements to California Department of Transportation (Caltrans) facilities, which are outside the control of the County of Los Angeles. The proposed Centennial Transportation Improvement Program (CTIP) Agreement provides a mechanism that makes it reasonably likely that such improvements will be implemented by providing advance funding for planning, design, and construction of certain improvements and establishing a funding program to collect fair share for other improvements.

Accordingly, pursuant to Section 21081 of CEQA, the County determines the following:

- (a) Changes or alterations have been requested or incorporated into the Project which mitigate the traffic effects to a less than significant level, and
- (b) The mitigations are within the responsibility and jurisdiction of Caltrans and can and should be adopted by Caltrans.

It is recognized that, if Caltrans does not implement the improvements outlined in the mitigation measures in the manner or within the timeframe needed to serve the Project, significant and unavoidable direct impacts to traffic circulation may result.

The anticipated significant and unavoidable impacts of the Project are further detailed in Section 1.0, Executive Summary. As stated in Section 15093 of the State CEQA Guidelines, when a lead agency approves a project that would result in significant effects that are not avoided or substantially lessened by feasible mitigation measures, the lead agency shall, based on substantial evidence in the record, state in writing the specific reasons to support its action despite these effects. This document is called a Statement of Overriding Considerations and shall be required for the significant and unavoidable impacts identified above.

#### **9.2.4 CUMULATIVELY SIGNIFICANT IMPACTS**

Through the analysis contained in this EIR, the environmental factors that were found to be cumulatively significant and unavoidable include following:

- Biological Resources (regional wildlife movement, loss of native grasslands)
- Land Resources (loss of Prime Farmland)
- Population, Housing, and Employment (population and housing growth)
- Traffic, Access and Circulation (mitigation outside jurisdiction of Lead Agency)
- Air Resources (short-term VOC and NO<sub>x</sub>; and long-term CO, VOC, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions)
- Noise (traffic noise along segments of SR-138)
- Visual Resources (visual character, nighttime light and glare)
- Other Public Services (solid waste)

- Water Resources (regional water supplies beyond 2035)
- Climate Change

Regarding the analysis of traffic impacts, it is recognized that, if Caltrans does not implement the improvements outlined in the mitigation measures in the manner or within the timeframe needed to serve the Project, significant and unavoidable cumulative impacts to traffic circulation may result.

### 9.3 MITIGATION OUTSIDE THE AUTHORITY OF THE LEAD AGENCY

The environmental impacts below were found to be significant, or potentially significant, prior to mitigation, but the implementation of the needed mitigation in these cases is outside the jurisdiction of the lead agency. If the applicable jurisdictional agency decides to adopt mitigation, these impacts would be less than significant. These impacts include the following, as discussed above:

- Traffic, Access, and Circulation (cumulatively significant without pending highway and freeway improvements by Caltrans).

<b>Stantec</b>	Centennial Specific Plan Traffic Study (May 2017)	Daryl Zeffass, PE, PTP, Principal/Project Manager Maria Manalili, PTP, Senior Transportation Planner Charlie Ho, PE, Transportation Engineer Ashley Day, EIT, Travel Demand Modeler Kendall Elmer, Transportation Specialist
<b>Tree Life Concern</b>	(Addendum 1) Oak Tree Report (July 2008)	Robert W Wallace, Registered Consulting Arborist
	Oak Tree Report: "Centennial" (December 2003)	

Company	Report Title/Date	Preparers/Contributors
<b>Vollmar Consulting</b>	2003/2004 Botanical Survey Report; Landscape Setting, Special-Status Plant Surveys, and Perennial Bunchgrass Community Study (December 2004, revised in May 2006)	John Vollmar, Project Manager/ Senior Field Botanist John Hale, Senior Field Botanist Jon Kelsey, Senior Field Botanist Shannon Hickey, Assistant Field Botanist Vir McCoy, Assistant Field Botanist Gretchen Vos, Assistant Field Botanist Jeffrey Congero, Assistant Field Botanist Michele Disney, Assistant Field Botanist Shannon Hickey, Biologist Jake Schweitzer, GPS and GIS Data Richard Gilligan, Logistical Support Pauline Alessi, Logistical Support
<b>W&amp;S Consultants</b>	Addendum Phase II Test Excavation and Determinations of Significance Within the Centennial Study Area (April 2007)	David S. Whitley, PhD, Principal Investigator
	Phase II Test Excavations and Determinations of Significance at 12 Sites in the Centennial Project Area (September 2004)	David S. Whitley, PhD, Principal Investigator
	Phase I Archaeological Survey of the Centennial Study Area (May 2002)	David S. Whitley, PhD, Principal Investigator Joseph M. Simon Tamara K. Whitley, M.A. Robert Snibbly Viki McFadden Vee Fignole
<b>Wieland Acoustics</b>	Environmental Noise Study (May 2011)	David L. Wieland, Principal Consultant

## 11.0 LIST OF ACRONYMS AND ABBREVIATIONS

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
<b>A</b>	
A	Agricultural Opportunity Areas
AAM	annual arithmetic mean
AB	Assembly Bill
ac	acre
AC	alternating current (electricity)
ACR	aluminum conductor, steel reinforced
ADA	Americans with Disabilities Act
ADT	average daily traffic (or average daily trips)
AEG	Aspen Environmental Group
af	acre-feet
AFB	Air Force Base
afy	acre-feet per year
AGL	above ground level
AGM	Annual Geometric Mean
AIDS	Acquired Immune Deficiency Syndrome
AM	morning (before noon)
AMP	Adaptive Management Plan
ANF	Angeles National Forest
ANPR	Advanced Notice of Proposed Rulemaking
ANSI	American National Standards Institute
AOU	American Ornithologists' Union
AP	Alquist-Priolo
AP Act	Alquist-Priolo Earthquake Fault Zoning Act
APCD	Air Pollution Control District
APHIS	Animal and Plant Health Inspection Service
AQMD	Air Quality Management District
AQMP	Air Quality Management Plan
ASCE	American Society of Civil Engineers
ASR	Aquifer Storage and Recovery
ASTM	American Society of Testing and Materials
ATV	All-terrain Vehicles
AV	Antelope Valley
AVAB	Antelope Valley Air Basin
AVAGP	<i>Antelope Valley Areawide General Plan</i>
AVAP	<i>Antelope Valley Area Plan</i>
AVAQMD	Antelope Valley Air Quality Management District

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
AVCCD	Antelope Valley Community College District
AVECC	Antelope Valley Environmental Collection Center
AVEK	Antelope Valley – East Kern Water Agency
avg	average
AVGB	Antelope Valley Groundwater Basin
AVGP	Antelope Valley General Plan
AVIRMP	Antelope Valley Integrated Regional Water Management Plan
AVO	Average Vehicle Occupancy
AVUHSD	Antelope Valley Unified High School District
<b>B</b>	
BACT	Best Available Control Technology
B/C	benefit to cost ratio
BARBD	Building America Research Benchmark Definition
BAT	Best Available Technology Economically Achievable
BAU	Business As Usual
BCHP	Big Creek Hydroelectric Project
BCT	Best Conventional Pollutant Control Technology
BDCP	Bay-Delta Conservation Plan
bgs	below ground surface
BiOp	Biological Opinion (USFWS)
BLM	Bureau of Land Management
BLS	United States Bureau of Labor Statistics
BMPs	Best Management Practices
BOD	Biochemical Oxygen Demand
BP	Before Present
BP	Business Park
BSC	(California) Building Standards Commission
<b>C</b>	
C	carbon
°C	degrees Celsius
CA	California
CAA	Clean Air Act (federal)
CAAQS	California Ambient Air Quality Standards
CADD	Computer-aided Design
C&D	construction and demolition
C <sub>2</sub> F <sub>6</sub>	hexafluorethane
CA HSRA	California High-speed Railway Authority
CAFE	Corporate Average Fuel Economy
CalOSHA	California Occupational Safety and Health Administration

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
CalEPA	California Environmental Protection Agency
Caltrans	California Department of Transportation
CAO	Cleanup and Abatement Orders
CAP	Corrective Action Plan/Program
CAPCOA	California Air Pollution Control Officers Association
CARB	California Air Resources Board
CAT	Climate Action Team
CATV	Cable Television
CBC	California Building Code
CBECS	Commercial Buildings Energy Consumption Survey
CC	Community Commercial
CC&Rs	Conditions, Covenants, and Restrictions
CCAA	California Clean Air Act
CCAR	California Climate Action Registry
CCCC	California Climate Change Center
ccf/yr	hundred cubic feet per year
CCR	California Code of Regulations
CCTP	U.S. Climate Change Technology Program
CD	Compact disk
CDC	United States Center for Disease Control and Prevention
CDD	Cooling Degree days
CDE	California Department of Education
CDF	California Department of Forestry and Fire Protection
CDFA	California Department of Food and Agriculture
CDFG	California Department of Fish and Game
CDFW	California Department of Fish and Wildlife
CDHS	California Department of Health and Safety
CDP	census-designated place
CDPR	California Department of Parks and Recreation
CE	California Endangered species
CEC	California Energy Commission
CE	carbon equivalents
CEF	California Economic Forecast
CEQA	California Environmental Quality Act of 1970
CESA	California Endangered Species Act
CEV	Controlled Environmental Vaults
cf	cubic feet
CF <sub>4</sub>	tetrafluoromethane
CFC	chlorofluorocarbon
CFL	compact fluorescent light
CFR	Code of Federal Regulations
cfs	cubic feet per second
CFU	colony forming units
CGS	California Geological Survey

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
CH	chlorinated herbicide
CH <sub>4</sub>	methane
CHHSLs	California Human Health Screening Levels
CHP	California Highway Patrol
CHP	Combined Heat and Power
CII	Commercial, industrial, and institutional
CIMIS	California Irrigation Management Information System
cis-1, 2-DCE	cis-1, 2-dichloroethylene
CIWMA	California Integrated Waste Management Act
CIWMB	California Integrated Waste Management Board
CIWMP	California Integrated Waste Management Plan
CKD	cement kiln dust
CLAOTO	County of Los Angeles Oak Tree Ordinance
CLOMR	Conditional Letter of Map Revision
CLSRA	Castaic Lake State Recreation Area
cm	centimeter
CMOM	Capacity Assurance, Management, Operation, and Maintenance Program
CMP	Congestion Management Program
CNDDB	California Natural Diversity Database
CNEL	Community Noise Equivalency Level
CNG	compressed natural gas
CNGA	California Native Grass Association
CNPS	California Native Plant Society
Co	Chino loam
CO	carbon monoxide
CO <sub>2</sub>	carbon dioxide
CO <sub>2</sub> e	CO <sub>2</sub> equivalents
COC	constituents of concern
CoHb	Carboxyhemoglobin
CORP	California Outdoor Recreation Plan
County	County of Los Angeles
County DPR	Los Angeles County Department of Parks and Recreation
CPI	Consumer Price Index
CPUC	California Public Utilities Commission
CR	Commercial Recreation
CR	Community Recreation
CRHR	California Register of Historic Resources
CRWQCB	California Regional Water Quality Control Board
CSA	Condor Study Area
CSC	California Species of Special Concern
CSD	Community Services District
CSFM	California State Fire Marshal
CSO	Community Service Organization
CSRA	Castaic Lake State Recreation Area

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
CTMP	Centennial Transportation Mitigation Program
CWP	Center Watershed Protection
CT	California Threatened Species
CT	Census Tract
CT	current transformer
CTM	Centennial Traffic Model
CTR	California Toxics Rule
CUP	Conditional Use Permit
CVWD	Coachella Valley Water District
CVP	Central Valley Project
CWA	Clean Water Act, Federal (1977)
CWRCB	California Water Resources Control Board
cu	cubic
cy	cubic yards
<b>D</b>	
D	Urban and Built Up Land
DAFIF	Digital Aeronautical Flight Information File
DAWN	Domestic Agricultural Waste Network
dB	decibel
dBA	decibel, A-weighted
dbh	diameter at Breast Height
DCE	dichloroethylene
DCIA	Directly Connected Impervious Area
DDE	Dichlorodiphenyl Dichloroethylene
DDT	Dichlorodiphenyl Trichloroethane (insecticide)
DEIR	Draft EIR
DHS	California Department of Health Services
DHW	Domestic Hot Water
Diesel PM	Diesel Particulate Matter
District	Los Angeles County flood Control District
DMV	Department of Motor Vehicles, State of California
DOC	California Department of Conservation
DOD	U.S. Department of Defense
DOE	Department of Energy
DOF	Department of Finance, California
DOGGR	California Department of Conservation, Division of Oil, Gas and Geothermal Resources
DOT	Department of Transportation
DOVA	Department of Veteran Affairs
DPA	Debris Potential Area
DPH	Department of Public Health Services

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
DPFG	Development Planning and Financing Group
DPW	Department of Public Works
DRMS	Delta Risk Management Study
DTSC	Department of Toxic Substances Control, State of California
du	dwelling unit
du/ac	dwelling units per acre
DWR	California Department of Water Resources
<b>E</b>	
e/o	east of
E85	ethanol blend
EAVTAM2	East Antelope Valley Traffic Analysis Model Version 2
EC	electrical conductivity
ECI	Earth Consultants International
EDB	ethylene dibromide
EDBs	Extended Detention Basins
EDD	Employment Development Department
EDR	Environmental Data Resources
ED	Extended Detention
EEMIS	Enterprise Energy Management Information System
EER	energy efficiency ratio
EGRID	Generation Resource Integrated Database
EIA	United States Energy Information Administration
EIR	Environmental Impact Report (CEQA)
EIS	Environmental Impact Study
EISA	Energy Independence and Security Act of 2007
EMC	Event Mean Concentrations
EMF	electromagnetic field
EMFAC	Emissions Estimation Software Programs
EMS	Emergency Medical Services
ENVIRON	ENVIRON International Corporation
Ep	erosion potential
EPA	Environmental Protections Agency
ESA	Environmental Site Assessment
ET	evapotranspiration
ETo	measurement of evapotranspiration
<b>F</b>	
°F	degrees Fahrenheit
F	Farmland of Statewide Importance
FAA	Federal Aviation Administration
FAR	Federal Aviation Regulations
FC	Fecal Chloroform
FCAA	Federal Clean Air Act
FCU	Functional Capacity Units

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
FCV	fuel cell vehicle
FDC	flow-duration control
FE	Federally Endangered species (USFWS)
FEIR	Final Environmental Impact Report
FEMA	Federal Emergency Management Agency
FESA	Federal Endangered Species Act
FFV	flexible fuel vehicle
FHWA	Federal Highway Administration
FIFRA	Federal Insecticide, Fungicide & Rodenticide Act 1994
FIRM	Flood Insurance Rate Map
FMMP	Farmland Mapping and Monitoring Program
FONSI	Finding of No Significant Impact
FSRS	Fire Suppression Rating Schedule
ft/sec	feet per second
FTA	Federal Transit Administration
<b>G</b>	
G	Grazing Land
G	Greenways
G	Gauss (measurement of EMF strength)
g	percent of gravity (a measurement of earthquake acceleration)
GaE2	Gaviota rocky sandy loam
GAP	Gap Analysis Project
GAP	(California) GAP Analysis Projection
GC	Government code
GCM	General Circulation Model
GDP	Gross Domestic Product
GGE	greenhouse gas equivalent
GHG	Greenhouse Gases
GIS	Geographic Information System
GLA	Glen Lukos Associates
GLC	Gorman Learning Center
GMC	Growth Management Chapter
GPA	General Plan Amendment
gpcpd	gallons per capita per day
GPD	gallons per day
gpd/ac	gallons per day/acre
gpd/du	gallons per day/dwelling unit
GPF	gallons per flush
GPM	gallons per minute
GRP	General Reporting Protocol
gsf	gross square feet
Gt	gigatonnes
GWh	gigawatt/hour
GWP	Global Warming Potential

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
<b>H</b>	
H	high
H <sub>2</sub> O	water vapor
H <sub>2</sub> S	hydrogen sulfide
H <sub>2</sub> SO <sub>3</sub>	sulfurous acid
H <sub>2</sub> SO <sub>4</sub>	sulfuric Acid
HAP	hazardous air pollutant
HARP	Hot Spots Analysis Reporting Program
HAZMAT	hazardous materials
HCD	Department of Housing and Community Development, State of California
HCM	Highway Capacity Manual
HCOC	Hydrologic Conditions Concern
HCP	Habitat Conservation Plan
HDD	Heating Degree Days
HFA	Hybrid Functional Assessment
HFCs	hydrofluorocarbons
HGM	Hydrogeomorphic Modeling
HHWE	Household Hazardous Waste Element
HI	hazard indices
HM/A	Hillside Management/Agriculture Area
HMA	Hillside Management Areas
HOA	Homeowners Association
HOV	High Occupancy Vehicle
hp	Horse-power
HPA	Health Protection Agency
HPS	Hantavirus Pulmonary Syndrome
hr	hour
HRA	health risk analysis/assessment
HRCQ	Highway Route Controlled Quantities
HS	High School
HUD	U.S. Department of Housing and Urban Development
HVAC	Heating, Ventilation, and Air Conditioning
HVLP	High Volume Low Pressure
HVOCs	Halogenated Volatile Organic Compounds
HWY	Highway
Hz	Hertz

**I**

I	Institutional
IB	Infiltration Basin
IBC	International Building Code
ICBO	International Conference of Building Officials
ICF	insulated concrete forming systems
ICU	Interstate Capacity Utilization

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
IDA	International Dark-sky Association
IECC	International Energy Conservation Code
IFC	Insulate Concrete Forming System
in/sec	inches per second
IPCC	Intergovernmental Panel on Climate Change
IPM	Integrated Pest Management
IPS EH AL	International pipe standard extra heavy aluminum
IR	Instrument Flight Routes
IRWD	Irvine Ranch Water District
IRWM	Integrated Regional Water Management
IRWMP	Integrated Regional Water Management Plan
IS	Initial Study
ISCST3	Industrial Source Complex, Short Term Version 3
ISD	Climate Change Internal Services Department
ISO	Insurance Service Office
ITE	Institute of Transportation Engineers
ITP	Incidental Take Permit
ITS	Intelligent Transportation Systems
IWRMS	Integrated Water Resources Management Strategy

**J**

JPA	Joint Powers Authority
JSA	Jones and Stokes Assoc., Inc.

**K**

K	Kindergarten
K-6	Kindergarten through sixth grade
K-8	Kindergarten through eighth grade
K-12	Kindergarten through twelfth grade
k8	school
KCAPCD	Kern County Air Pollution Control District
KCFD	Kern County Fire Department
KCOG	Kern County Council of Governments
kcmil	thousand circular mils
KCWA	Kern County Water Agency
KFE	Kern Fan Element
kg	kilogram
kV	kilovolt
kVAR	kilovolt ampere reactive
KWBA	Kern Water Bank Authority
kWh	kilowatt hours
kW/h	kilowatts per hour

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
<b>L</b>	
L	Farmland of Local Importance
L	liter
L	low
LA	Los Angeles
LACDPW	Los Angeles County Department of Public Works
LACDRP	Los Angeles County Department of Regional Planning
LACFD	Los Angeles County Fire Department
LACSD	Sanitation Districts of Los Angeles County
LADPH	Los Angeles Department of Public Health
LADPW	County of Los Angeles Department of Public Works
LAFCO	Local Agency Formation Commission
LAGP	Los Angeles General Plan
LARWQCB	Los Angeles Regional Water Quality Control Board
lbs	pounds
lbs/yr	pounds per year
LCA	California Land Conservation Act (aka The Williamson Act)
LCA	Life Cycle Assessment
LCFS	Low Carbon Fuel Standard
LCID	Littlerock Creek Irrigation District
LDA	Light-duty Auto
L <sub>dn</sub>	day-night average sound level
LDT1	Light-duty Truck
LDT2	Light-duty Truck 2
LEED	Leadership in Energy and Environmental Design
LEFMF	Law Enforcement Facilities Mitigation Fee
L <sub>eq</sub>	noise level equivalent
LEV	Low-Emission Vehicle
LID	Low Impact Design
LID	Low Impact Development
LIM	Land Inventory and Monitoring
L <sub>max</sub>	maximum noise level
LMD	Landscape Maintenance District
LOS	Level of Service (traffic flow rating)
LPNF	Los Padres National Forest
LRWQCB	Lahontan Regional Water Quality Control Board
LST	Localized Significance Threshold
LULUCF	Land Use, Land Use Change, and Forestry
LUP	Linear Underground Permit
LUST	leaking underground storage tanks
LWCF	Land and Water Conservation Fund
LWRP	Lancaster Water Reclamation Plant

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
<b>M</b>	
m	meter
M	medium
M&I	Municipal and Industrial
MAC	Market Advisory committee
MATES	Multiple Air Toxics Exposure Study
MBAS	Methylene Blue Activated Substances
MBR	membrane bioreactor
MBTA	Migratory Bird Treaty Act
mbtu	million British thermal units
mbtu/hr	million British thermal units per hour
mcf/d	million cubic feet per day
MCL	maximum allowable contaminant level
MCWRA	Monterey County Water Resources Agency
MDAB	Mojave Desert Air Basin
MEER	mechanical-electrical equipment room
MEI	Maximally Exposed Individual
MEL	miscellaneous energy load
MEP	Maximum Extent Practicable
MFR	Multi-Family Residential
mG	milligauss
MG	million gallon
mg/kg	milligrams per kilogram
mg/L	milligrams per liter
mgd	million gallons per day
MhE2, MhF2	Millsholm rocky loam
mi	miles
min/hr	minutes per hour
ml	milliliter
MLD	most likely descendent
mm	millimeter
MM	Mitigation Measure
MMP	Mitigation Monitoring Program
MMRP	Mitigation Monitoring and Reporting Program
MMTCO <sub>2e</sub>	million metric tonnes of CO <sub>2</sub> equivalent
MND	Mitigated Negative Declaration (CEQA)
MOA	military operating area
MOU	Memorandum of Understanding
mpg	miles per gallon
mph	miles per hour
MPN	Most Probable Number
MPO	Metropolitan Planning Organization
MRF	Materials Recovery Facility
MRZ	Mineral Resource Zone

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
MS4	Municipal Separate Storm Sewer System
MSHCP	Multiple Species Habitat Conservation Plan
msl	mean sea level
MTA	Metropolitan Transportation Authority
MTC	Metropolitan Transportation Commission
MTCO <sub>2e</sub>	Metric tonnes of CO <sub>2</sub> equivalent
MTR	Military Training Route
MTYRE	Multi-Track Year Round Education
MVA	megavolt ampere
MW	megawatt
MW	Monitoring Well
MWH	megawatt hour
<b>N</b>	
N	north
N.A.P.	Not a Part
N/A	not available or not applicable
n/o	north of
N <sub>2</sub> O	nitrous oxide
NAAQS	National Ambient Air Quality Standards
NAHB	National Association of Home Builders
NAHC	Native American Heritage Commission
NAICS	North America Industry Classification System
NAS	Naval Air Station
NASA	National Aeronautics and Space Administration
NCCC	National Cement Company of California
NCCP	Natural Community Conservation Plan
NCDC	National Climatic Data Center
NCP	National Contingency Plan
ND	not detected
NDFE	Non-Disposal Facility Element
NEC	No Exposure Certification
NEV	Neighborhood Electric Vehicles
NH <sub>3</sub> -N	ammonia
NHMLAC	Natural History Museum of Los Angeles County
NHTSA	National Highway Traffic Safety Administration
NIMBY	Not In My Back Yard
NLACWC	North Los Angeles County Water Company
nm	Nautical Mile
NMOGs	Non-Methane Organic Gases
NO	nitric oxide
NO <sub>2</sub>	nitrogen dioxide
NOA	Notice of Availability (CEQA)
NOAA	National Oceanic and Atmospheric Administration

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
NOD	Notice of Determination (CEQA)
NOI	Notice of Intent
NOP	Notice of Preparation (CEQA)
NOx	oxides of nitrogen (nitric oxide and nitrogen dioxide)
NPBG	Native Perennial Bunchgrasses
NPDES	National Pollutant Discharge Elimination System
NPDWR	National Primary Drinking Water Regulations
NPS	National Park Service
NRC	Natural Resources Consultants
NRCS	Natural Resources Conservation Service
NRDC	Natural Resources Defense Council
NROSMP	Natural Resource/Open Space Management Plan
NSDWR	National Secondary Drinking Water Regulations
NSR	New Source Review
NTP	National Toxicology Program
NTU	Nephelometric Turbidity Units
NVUM	National Visitor Use Monitoring
NWI	National Wetlands Inventory

**O**

O <sub>2</sub>	oxygen
O <sub>3</sub>	ozone
OaC	Oakdale sandy loam
OCLI	Official California Legislative Information
OCPs	organochlorine pesticides
OdA, OdC	Oak Glen loam
OEHHA	Office of Environmental Health Hazard Assessment
OHM-cm	a measure of resistancy
OHMVR	Off-highway Motor Vehicle Recreation
OHV	Off-highway Vehicle
OHWM	ordinary high water mark
OLR	optimal location review
OMR	Old and Middle Rivers
OPR	Office of Planning and Research
OS	Open Space
OSHA	Occupational Safety and Health Agency

**P**

P	Park
P	Prime Farmland
PA	Planning Area
PA	public address
PA/ED	Project Approval/Environmental Documentation
PAH	Polycyclic Aromatic Hydrocarbons

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
PAOT	persons at one time
Pb	lead
P-C Region	Production-Consumption Region
PC	passenger car
PC/LDT1	Passenger car/light duty truck
PCB	polychlorinated biphenyls
PCE	tetrachloroethane
PCL	Planning and Conservation League
PCM	Parallel Climate Model
PCT	Pacific Crest Trail
PCTA	Pacific Crest Trail Association
PDF	Project Design Feature
PEA	Paleo Environmental Associates
PEAR	Preliminary Environmental Analysis Report
PFC	perfluorocarbon
PG&E	Pacific Gas and Electric
pH	Potential of Hydrogen
PHEV	plug-in hybrid electric vehicle
PHG	Public Health Goal
PID	photoionization detection
PIPP	Public Information and Participation Program
PM	evening (after noon)
PM10	respirable particulate matter less than 10 micrometers in diameter
PM2.5	respirable particulate matter less than 2.5 micrometers in diameter
PMI	Point of Maximum Impact
ppb	parts per billion
ppm	parts per million; used interchangeably with mg/L (milligrams per liter)
PRC	Public Resources Code
PRG	Preliminary Remediation Goal
PRMP	Paleontological Resource Monitoring Plan
psf	per square foot
PSR/PDS	Project Study Report/Project Development Support
PTD	Proprietary treatment device
PTMP	Paleontological Treatment and Monitoring Plan
PUC	Public Utility Commission
PUMS	Public Use Micro-Data Sample
PUP	Power/Utility Protocol
PVC	polyvinyl chloride
PWD	Palmdale Water District
<b>Q</b>	
Q	flow rate
Qc	Colluvium (Surficial Units)
Qls	Landslide Debris (Surficial Units)

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
Qoal	Older Alluvium (Surficial Units)
QHWD	Quartz Hill Water District
<b>R</b>	
R	non-urban
R&D	Research & Development
RACT	Reasonable Available Control Technology
RCBP	recycled content building products
RCP	Regional Comprehensive Plan
RCP	Regional Comprehensive Plan
RCSD	Rosamond Community Services District
RC <sub>x</sub>	Facility Retrocommissioning Program
RdE2, ReC	Ramona coarse sandy loam and gravely sandy loam
REA	Recreation Enhancement Act
REA	Registered Environmental Assessor
RECs	recognized environmental conditions
RECS	Residential Energy Consumption Survey
RELS	reference exposure levels
RFS	Renewable Fuel Standard
RGGI	Regional Greenhouse Gas Initiative
RHNA	Regional Housing Needs Assessment
ROD	Record of Decision
ROG	Reactive Organic Gas
ROW	Right-of-Way
RPC	Regional Planning Commission
RPPI	Reason Public Policy Institution
RPS	Renewables Portfolio Standard
RPZ	Root Protection Zone
RSABG	Rancho Santa Ana Botanical Garden
RTIP	Regional Transportation Improvement Plan
RTP	Regional Transportation Plan
RTPA	Regional Transportation Planning Agency
RWMP	Ranch-Wide Management Plan
RWQCB	Regional Water Quality Control Board

<b>S</b>	
S	school
S	south
s/o	south of
SANDAG	San Diego Association of Governments
SAOT	Skiers at One Time
SAR	Second Assessment Report
SB	Senate Bill
SB	soil boring

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
SB	Southbound
SC	Standard Condition
SCA	Standard Condition of Approval
SCAG	Southern California Association of Governments
SCAQMD	South Coast Air Quality Management District
SCCIC	South Central Coastal Information Center
SCE	Southern California Edison
SCH	Screencheck
SCS	Soil Conservation Service
SCVCTM	Santa Clarita Valley Consolidated Traffic Model
SDC	Standard Development Conditions
SDWA	Safe Drinking Water Act
SEA	Significant Ecological Area
SEATAC	SEA Technical Advisory Committee
SEER	Seasonal Energy Efficiency Ratio
SEIR	Supplemental Environmental Impact Report
SEL	Single Noise Event Level
SEL	Sound Exposure Level
sf	square foot (or feet)
SF <sub>6</sub>	sulfur hexafluoride
SFA	Single-family attached
SFD	Single-family detached
SGF	Student Generation Factors
SHP	State Historic Park
SHPO	State Office of Historic Preservation
SIC	Standard Industrial Classification
SIP	State Implementation Plan
SIPs	structural insulated panels
SLF	Sanitary Landfill
SMA	Special Management Area
SMAQMD	Sacramento Metropolitan Air Quality Management District
SMARA	Surface Mining and Reclamation Act
SMCL	secondary maximum contaminant level
SO <sub>2</sub>	sulfur dioxide
SO <sub>3</sub>	sulfur trioxide
SO <sub>4</sub>	sulfates
SOAR	Save Our Agricultural Resources
SoB	Soboba cobbly loamy sand
SoCAB	South Coast Air Basin
SoCalGas	Southern California Gas Company
SO <sub>x</sub>	sulfur oxide
SQMP	Stormwater Quality Management Program
SR	State Route
SR-126	State Route 126

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
SR-138	State Route 138
SR-14	State Route 14
SR-58	State Route 58
SR-99	State Route 99
SRA	State Recreation Area
SRRE	Source Reduction and Recycling Element
SUA	Special Use Airspace
SUSMP	Standard Urban Stormwater Mitigation Plans
SVOC	Semi-volatile organic compound
SVRA	State Vehicular Recreation Area
SWP	State Water Project
SWPPP	Storm Water Pollution Prevention Plan
SWQCB	State Water Quality Control Board
SWRCB	State Water Resources Control Board

**T**

T-BACT	best available control technology for toxics
TAC	Toxic Air Contaminant
TAR	Third Assessment Report
TAZ	Traffic Analysis Zone
TCE	trichloroethylene
TCM	Transportation Control Measures
TCR	The Climate Registry
TDF	tire-derived-fuel
TDM	Transportation Demand Management
TDS	total dissolved solids
TDV	Time Dependent Valuation
TIC	Tejon Ranch Industrial Complex
TKN	Total Kjeldahl Nitrogen
TLBWS	Tulare Lake Basin Water Storage District
TMA	Transportation Management Association
TMDL	Total Maximum Daily Load
TMV	Tejon Mountain Village
Tonnes	Metric tonnes; 1,000 kilograms
Toc	Oso Canyon Formation
TON	Threshold Odor Numbers
Tons	Short tons; 2,000 pounds
Tons/yr	Tons per year
TP	Total Phosphorus
tpd	tons per day
TPH	Total Petroleum Hydrocarbons
TPH-cc	Total Petroleum Hydrocarbon carbon chain
TPL	Trust for Public Land
TPTP	Temporary Package Treatment Plant

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
tpy	tons per year
Tql	Quail Lake Formation
TRB	Transportation Research Board
TRC	Tejon Ranch Company
TRCRWA	Tejon Ranch Conservation and Land Use Agreement
TRM	turf reinforcement matting
TS	Transfer Station
TsF	Terra Escarpment
TSS	Total Suspended Solids
TTP	Tertiary Treatment Plant
TUMSHCP	Tehachapi Upland Multiple Species Habitat Conservation Plan
Tva	Neenach Volcanic Formation
TWRF	Temporary wastewater reclamation facility
<b>U</b>	
U	Unique Farmland
U	Utility
UA	Urbanized Area
UBC	Uniform Building Code
UC	Urban Cluster
UN	United Nations
UNEP	United Nations Environment Programme
UNFCCC	United Nation Framework Convention on Climate Change
URBEMIS	Urban Emissions Model
USACE	U.S. Army Corps of Engineers
U.S.C.	United States Code
USDA	U.S. Department of Agriculture
USDOI NPS	U.S. Department of Interior, National Park Service
USDOT	U.S. Department of Transportation
USEPA	U.S. Environmental Protection Agency
USFS	U.S. Forest Service
USFWS	U.S. Fish and Wildlife Service
USGS	United States Geological Survey
USOSM	Office of Surface Mining
UST	underground storage tanks
UV	ultraviolet
UWMP	Urban Water Management Plan
<b>V</b>	
V/C	volume-to-capacity ratio
VAMP	Vernalis Adaptive Management Plan
VbA	Vernalis loam
VC	Village Commercial
VCAPCD	Ventura County Air Pollution Control District

<b>Acronym</b>	<b>Acronym and Abbreviation Description</b>
VH	very high
VHFHSZ	Very High Fire Hazard Severity Zone
VL	very low
VMT	vehicle miles traveled
VOC	volatile organic compounds
VR	Visual Flight Routes
VSC	Visitor Serving Commercial
VTPM	Vesting Tentative Parcel Map
VTTM	Vesting Tentative Tract Map
<b>W</b>	
w/o	west of
WAVGB	Western Antelope Valley Groundwater Basin
WCB	Wildlife Conservation Board
WCI	Western Regional Climate Action Initiative
WDID	Waste Discharge Identification
WDR	Waste Discharge Requirements
WMA	Watershed Management Areas
WMC	Watershed Management Committees
WM	Waste Management, Inc.
WMO	World Meteorological Organization
WRC	Water Reclamation Criteria
WRCC	Western Regional Climate Center
WRF	Wastewater Reclamation Facilities
WRF	Wastewater Recycling Facilities
WRI	World Resource Institute
WRP	Wastewater Reclamation Plant
WRP	Water Reclamation Plant
WSA	Water Supply Assessment
WSC	W & S Consultants
WTF	water treatment facility
WTP	Wastewater Treatment Plant
WTRS	waste water treatment plant
WUESD	Westside Union Elementary School District
WUHSD	Westside Union High School District
WWTP	Wastewater Treatment Plant
<b>X</b>	
X	Other Land
<b>Y</b>	
YBP	Years Before Present
yd	Yard

**Acronym                      Acronym and Abbreviation Description**

**Z**

ZEV                      Zero Emission Vehicle

**SYMBOLS**

$\mu\text{g}/\text{kg}$                       micrograms per kilogram  
 $\mu\text{g}/\text{m}^3$                       micrograms per cubic meter  
 $\mu\text{g}/\text{L}$                       micrograms per liter  
 $\mu\text{ohms}/\text{cm}$                       microohms per centimeter

---

## 12.0 GLOSSARY

**A-Weighted Decibel Sound Level (dBA):** See decibel, A-Weighted

**Acceptable Risk:** A hazard deemed to be a tolerable exposure to danger given the expected benefits to be obtained. Different levels of acceptable risk may be assigned according to the potential danger and the criticalness of the threatened structure. The levels may range from "near zero" for nuclear plants and natural gas transmission lines to "moderate" for open space, ranches and low-intensity warehouse uses.

**Access/Egress:** The ability to enter a site from a roadway and exit a site onto a roadway by motorized vehicle.

**Acoustics:** (1) The science of sound, including the generation, transmission, and effects of sound waves, both audible and inaudible. (2) The physical qualities of a room or other enclosure (such as size, shape, amount of noise) that determine the audibility and perception of speech and music.

**Acre:** A unit of land equal to 43,560 square feet.

**Acre-Foot:** The amount of water needed to cover an acre (approximate a football field) to a depth of one foot, or 325,900 gallons. One acre-foot can support the annual indoor and outdoor needs of between one and two households per year and, on average, three acre-feet are needed to irrigate one acre of farmland.

**Acre, Gross:** The total area within the lot lines of a lot of land before public streets, easements or other areas to be dedicated or reserved for public use are deducted from such lot, and not including adjacent lands already dedicated for such purposes. Most communities calculate gross acreage to the centerline of proposed bounding streets and to the edge of the right-of-way of existing or dedicated streets.

**Acre, Net:** The portion of a site that can actually be built upon. The following generally are not included in the net acreage of a site: public or private road right-of-ways, public open space, and flood ways.

**Active Fault:** The Alquist-Priolo Earthquake Fault Zoning Act defines an active fault as one that has evidence of rupture within the last 11,000 years (Holocene time). The Alquist-Priolo Zone only applies to surface traces of faults that the State Geologist considers "active" and the Zone itself does not define a potentially active fault. However, a potentially active fault is commonly considered to be a fault that shows evidence of movement within Quaternary time (within the last 1.8 million years) but not within recent (Holocene) time.

**Addendum:** A lead agency or responsible agency can prepare an addendum to a previously certified EIR or an addendum to an adopted negative declaration/mitigated negative declaration if some changes or additions are necessary but none of the conditions described in Section 15162 of the State CEQA Guidelines calling for preparation of a subsequent EIR

have occurred. An Addendum does not need to be circulated for public review (State CEQA Guidelines, Section 15164).

**Adjudication:** The action of a court as in making an order, judgment, or decree.

**Adsorption:** The accumulation of gases, liquids, or solutes on the surface of a solid or liquid.

**Adverse Impact:** A term used to describe unfavorable, harmful, or detrimental environmental changes. Adverse impacts may be significant or not significant (See Significant Impact).

**Affordable Housing:** Housing capable of being purchased or rented by a household with very low, low, or moderate income, based on a household's ability to make monthly payments necessary to obtain housing. "Affordable to low and moderate income households" means that at least 20 percent of the units in a development will be sold or rented to lower income households, and the remaining units to either lower or moderate income households. Housing units for lower income households must sell or rent for a month cost not greater than 30 percent of 60 percent of area median income as periodically established by the Housing and Community Development Department of the State of California (HCD). Housing units for moderate income must sell or rent for a monthly cost not greater than 30 percent of the area median income.

**Afterbay:** A short stretch of stream, conduit, pond, or reservoir.

**Agglomeration:** A jumbled cluster or mass of varied parts.

**Agricultural Land Use:** The use of land primarily for farming, ranching, horse breeding, dairy farming and other forms of food and crop production. From a planning perspective, agricultural land use connotes primary economic use of the property.

**Agricultural Preserve:** Land designated for agriculture or conservation (See Williamson Act).

**Agriculture:** Use of land for the production of food and fiber, including the growing of crops and/or the grazing of animals on natural prime or improved pasture land.

**Agriculture-Related Business:** Feed mills, dairy supplies, poultry processing, creameries, auction yards, veterinarians and other businesses supporting local agriculture.

**Air Basin:** An area of the state designated by the Air Resources Board pursuant to the *California Health and Safety Code* (Section 39606[a]) for air quality planning purposes.

**Air District:** A political body responsible for managing air quality on a regional or county basis. California is currently divided into 35 air districts.

**Air Monitoring:** The periodic or continuous sampling and analysis of air pollutants in ambient air or from individual pollutant sources.

**Air Pollution/Pollutants:** Substances that are foreign to the atmosphere or are present in the natural atmosphere to the extent that they may result in adverse effects on humans, animals, vegetation, and materials. Common air pollutants are ozone, nitrogen dioxide, particulate matter, and carbon monoxide. Air pollution is defined in the California Health and Safety Code as any discharge, release, or other propagation into the atmosphere and includes, but is not limited to, smoke, charred paper, dust, soot, grime, carbon, fumes, gases, odors, particulate matter, acids, or any combination thereof.

**Air Pollution Control District (APCD):** A local agency with authority to regulate stationary sources of air pollution (such as refineries, manufacturing facilities, and power plants) within a given county, and governed by a District Air Pollution Control Board composed of elected county supervisors and city representatives.

**Air Quality Index (AQI):** A numerical index used for reporting severity of air pollution levels to the public. It replaces the formerly used Pollutant Standards Index (PSI). Like the PSI, the AQI incorporates five criteria pollutants—ozone, particulate matter, carbon monoxide, sulfur dioxide, and nitrogen dioxide—into a single index. The new index also incorporates the 8-hour ozone standard and the 24-hour PM<sub>2.5</sub> standard into the index calculation. AQI levels range from 0 (good air quality) to 500 (hazardous air quality). The higher the index, the higher the level of pollutants and the greater the likelihood of health effects. The AQI incorporates an additional index category—unhealthy for sensitive groups—that ranges from 101 to 150. In addition, the AQI comes with more detailed cautions.

**Air Quality Management District (AQMD):** A group of counties or portions of counties, or an individual county specified in law with authority to regulate stationary, indirect, and area sources of air pollution within the region and governed by a regional air pollution control board comprised mostly of elected officials from within the region.

**Air Quality Management Plan (AQMP):** A plan prepared by an air pollution control district or air quality management district for a county or region designated as a non-attainment area, for the purpose of bringing the area into compliance with the requirements of the federal Clean Air Act and/or the California Clean Air Act. An AQMP contains measures that will be taken to attain and maintain federal and State ambient air quality standards. In California, air districts prepare air quality management plans that are included in the state's State Implementation Plan (SIP) that is required by the federal Clean Air Act. Such plans are also referred to as Clean Air Plans or Clean Air Attainment Plans.

**Air Quality Model:** An algorithmic relationship between pollutant emissions and pollutant concentrations used in the prediction of a project's pollutant impact.

**Air Quality Standards:** Standards promulgated by State or federal pollution control districts. The specified average concentration of an air pollutant in ambient air during a specified time period at or above which undesirable effects may be produced. The prescribed level of a pollutant in the outside air that should not be exceeded during a specific time period to protect public health. Established by both federal and State governments.

**Airshed:** A subset of an air basin, the term denotes a geographical area that shares the same air because of topography, meteorology, and climate.

**Airport-related Use:** A use that supports airport operations including, but not limited to, aircraft repair and maintenance, flight instruction, and aircraft chartering.

**Airside:** Facilities principally related to the airfield. Airside facilities often include the runway and taxiway system, runway safety areas, the runway approach area, and associated equipment such as airfield lighting and navigational aids.

**Air Toxics:** Any air pollutant for which a national ambient air quality standard (NAAQS) does not exist (i.e., excluding ozone, carbon monoxide, PM10, sulfur dioxide, nitrogen dioxide) that may reasonably be anticipated to cause cancer, developmental effects, reproductive dysfunctions, neurological disorders, heritable gene mutations, or other serious or irreversible chronic or acute health effects in humans. Substances that are especially harmful to health, such as those considered under the U.S. Environmental Protection Agency's (USEPA's) hazardous air pollutant program or California's Assembly Bill (AB) 1807 and/or AB 2588 air toxics programs, are considered to be air toxics. Technically, any compound that is in the air and has the potential to produce adverse health effects is an air toxic.

**Alluvial:** Soils deposited by stream action.

**Alluvium:** Soil or sediments deposited by running water, either presently or historically. Alluvium is composed of a variety of materials, ranging from finer particles of clay and silt to larger particles, such as sand, gravel, and boulders.

**Alquist-Priolo Earthquake Fault Zoning Act:** Legislation signed into California law on December 22, 1972, to mitigate the hazard of surface rupture along faults on structures for human occupancy. The act directs the State of California Division of Mines and Geology to compile detailed maps of the surface traces of known active faults and prohibits new construction of houses within these zones unless a comprehensive geologic investigation shows that the fault does not pose a hazard to the proposed structure. The Act only addresses the hazard of surface fault rupture and does not address other earthquake hazards, including liquefaction and seismically induced landslides.

**Alquist-Priolo Special Study Zone:** In 1972, the State of California began delineating Special Studies Zones around active and potentially active faults in the State. The zones extend about 660 feet on either side of identified fault traces. No structures for human occupancy may be built across an identified fault trace. An area of 50 feet on either side of an active fault trace is assumed to be underlain by the fault unless proven otherwise. Proposed construction within the Special Studies Zone can take place only following completion of a geotechnical report prepared by a California Registered Geologist or Certified Engineering Geologist.

**Ambient Air:** The air occurring at a particular time and place outside of structures. Often used interchangeably with "outdoor air."

**Ambient Air Quality Standards (AAQS):** Health- and welfare-based standards for outdoor air which identify the maximum acceptable average concentrations of air pollutants during a specified period of time.

**Ambient Conditions:** Initial background concentration sensed/measured at a monitoring/sampling site, as in air quality or noise.

**Ambient Noise:** The background noise associated with a given environment, usually a composite of sounds from many sources near and far. The ambient noise level constitutes the normal or existing level of environmental noise at a given location.

**American Period:** California regional history after the transfer of California from Mexican to American control in 1848.

**Andesite Flow:** A type of rock body created by lava flows on the surface.

**Anion:** A negatively charged ion.

**Annoyance:** The psychological state of being irritated or annoyed.

**Annual Average Daily Traffic (AADT):** Total volume of traffic over the period of one year, divided by 365 days.

**Antelope Valley Integrated Management Plan:** A regional planning document developed to address regional concerns regarding water supply reliability, water quality, flood protection, environmental resources and land use management in the Antelope Valley.

**Anthropogenic:** Caused or produced by humans.

**Apartment:** (1) One or more rooms of a building used as a place to live, in a building containing at least one other unit used for the same purpose. (2) A separate suite, not owner occupied, which includes kitchen facilities and is designed for and rented as the home, residence, or sleeping place of one or more persons living as a single housekeeping unit.

**Applicant:** Applicant means a person who proposes to carry out a project which needs a lease, permit, license, certificate, or other entitlement for use or financial assistance from one or more public agencies when that person applies for the governmental approval or assistance (State CEQA Guidelines, Section 15351).

**Approach Zone:** The air space at each end of a landing strip that defines the glide path or approach path of an aircraft and that should be free from obstruction.

**Approval:** Approval means the decision by a public agency which commits the agency to a definite course of action in regard to a project intended to be carried out by any person. The exact date of approval of any project is a matter determined by each public agency according to its rules, regulations, and ordinances. Legislative action in regard to a project often constitutes approval. With private projects, approval occurs upon the earliest commitment to issue or the issuance by the public agency of a discretionary contract, grant, subsidy, loan, or other form of financial assistance, lease, permit, license, certificate, or other entitlement for use of the project (State CEQA Guidelines, Section 15352).

**Aquifer:** A natural underground formation that is saturated with water, and from which water can be withdrawn. A geologic formation of sand, rock, and gravel through which water can pass and which can store, transmit, and yield significant quantities of water to wells and springs. Aquifers generally hold sufficient water to be used as a water supply.

**Aqueduct:** A structure for transporting water from one place to another by means of a pipeline, canal, conduit, tunnel, or a combination of these things.

**Arable:** Land capable of being cultivated for farming.

**Archeological Resources Protection Act (ARPA):** Primary federal statute governing archeological resources.

**Area; Area Median Income:** As used in State of California housing law with respect to income eligibility limits established by the U.S. Department of Housing and Urban Development (HUD), "area" means metropolitan area or non-metropolitan county. In non-metropolitan areas, the "area median income" is the higher of the county median family income or the statewide non-metropolitan median family income.

**Area Sources:** Those sources for which a methodology is used to estimate emissions. This can include areawide, mobile, and natural sources, and also groups of stationary sources (such as dry cleaners and gas stations). The California Clean Air Act requires air districts to include area sources in the development and implementation of the Air Quality Management Plan. In the California emission inventory, all sources which are not reported as individual point sources are included as area sources. The federal air toxics program defines a source that emits less than 10 tons per year of a single hazardous air pollutant (HAP) or 25 tons per year of all hazardous air pollutants as an area source.

**Area-Wide Sources:** Sources of pollution where the emissions are spread over a wide area, such as consumer products, fireplaces, road dust and farming operations. Area-wide sources do not include mobile sources or stationary sources.

**Arroyo:** A small, sometimes deep, usually dry channel eroded by a short-lived or intermittent stream.

**Arterial Road:** A vehicular right-of-way whose primary function is to carry through traffic in a continuous route across an urban area while also providing some access to abutting land. Medium-speed (30–40 miles per hour), medium-capacity (10,000–35,000 average daily trips) roadway that provides intra-community travel and access to the county-wide highway system. Access to community arterials should be provided at collector roads and local streets, but direct access from parcels to existing arterials is common.

**Article 21 Water:** Available surplus water (i.e., interruptible water) that is distributed on an equal basis among State Water Project (SWP) contractors rather than to agricultural SWP contractors.

**Artifact:** A single, portable man-made or man-altered object; usually culturally diagnostic.

**Assemblage:** A collection of things (www.dictionary.com).

**Artificial Recharge:** The addition of surface water to a groundwater reservoir by human activity, such as putting surface water into recharge basins.

**Attainment:** Achieving and maintaining the air quality standards (both State and federal) for a given air pollutant.

**Attainment Area:** A geographical area considered to have air quality as good as or better than the National Ambient Air Quality Standard as defined in the Clean Air Act or California ambient air quality standards. An area may be an attainment area for one pollutant and a non-attainment area for others.

**Attenuate:** To reduce in force, value, amount, or degree.

**Attitude (bedding attitude):** The angle of a rock body relative to the ground surface. May provide evidence of past seismic activity.

**Automobile-intensive Use:** A use of a retail area that depends on exposure to continuous auto traffic.

**Average Daily Traffic (ADT):** Generally used to measure the total two-directional traffic volumes passing a given point on a roadway over a 24-hour period.

**Back of Curb:** the location where the curb ends and transitions to the sidewalk, utility strip, or property line.

**Background Concentration:** Air pollutant concentration due to natural sources and distant unidentified man-made sources.

**Background Noise:** See Ambient Noise.

**Background View:** View beginning at a distance from the observer and extending as far toward the horizon as the eye can detect the presence of objects. Skylines or ridge lines against other land surfaces are the strongest visual elements of the "background."

**Background Zone:** Visual elements in this zone can be seen at a long distance and typically do not dominate the view, but are part of the overall visual composition of the viewshed.

**Basalt:** The dark, dense igneous rock of a lava flow or minor intrusion.

**Base Flood:** In any given year, a 100-year flood that has a one percent likelihood of occurring, and is recognized as a standard for acceptable risk.

**Base Flow:** River surface flow, not counting storm flow and/or purchased imported water.

**Basin Plan:** A water quality control plan developed by a Regional Water Quality Control Board (RWQCB) for a specific geographic area. The Basin Plan identifies beneficial uses of

waters, the water quality objectives needed to maintain these beneficial uses, and an implementation plan.

**Bedrock:** The rock formations underlying surficial sediments.

**Benches:** A shelf-like area of rock with steep slopes above and below.

**Beneficial Uses:** The resources, services, and qualities of State waters that may be protected against quality degradation. The uses include, but are not limited to, domestic, municipal, agricultural and industrial supply, power generation, recreation, aesthetic enjoyment, navigation, and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves. The specific uses such as “cold freshwater habitat” and “water contact recreation” are defined in Section 2 of the Regional Water Quality Control Boards’ Basin Plans. Beneficial Uses are defined in Section 13050 of the *California Water Code*.

**Bentonitic:** Bentonite is an absorbent aluminum silicate clay formed from volcanic ash.

**Best Available Control Measure (BACM):** A term used to describe the "best" measures (according to USEPA guidance) for controlling small or dispersed sources of particulate matter and other emissions from sources such as roadway dust, woodstoves, and open burning.

**Best Available Control Technology (BACT):** Under the South Coast Air Quality Management District (SCAQMD) rules, for example, BACT is defined as the most stringent emissions control which for a given air emission source has been (1) achieved in practice; (2) is identified in a State Implementation Plan; or (3) has been found by the SCAQMD to be technologically achievable and cost-effective.

**Best Management Practice (BMP):** A BMP is any program, technology, process, siting criteria, operating method, measure, or device which controls, prevents, removes, or reduces pollution.

**Bicycle Lane (Class II facility):** A corridor expressly reserved for bicycles, existing on a street or roadway in addition to any lanes for use by motorized vehicles.

**Bicycle Path/Trail (Class I facility):** A paved route not on a street or roadway and expressly reserved for bicycles traversing an otherwise unpaved area. Bicycle trails may parallel roads, but typically are separated from them by landscaping.

**Bicycle Route (Class III facility):** A facility shared by motorists and identified only by signs, a bicycle route has not pavement markings or lane stripes.

**Bifacial:** Having the opposite surfaces alike, as some tools.

**Bike Lane:** A lane devoted to non-motorized bicycles.

**Bikeway:** A term that encompasses bicycle lanes, bicycle paths, and bicycle routes.

**Bioaccumulation:** The process by which toxic chemicals accumulate in an organism when the rate of intake of a substance is greater than the rate of excretion or metabolic transformation of that substance.

**Biological Diversity:** The variety of life forms and its processes, including the variety of living organisms, the genetic differences among them, and the communities and ecosystems in which they occur.

**Biomass:** Plant material, used for the production of such things as fuel alcohol and non-chemical fertilizers. Biomass sources may be plants grown especially for that purpose or waste products from livestock, harvesting, milling, or from agricultural production or processing.

**Biotic Community:** A group of living organisms characterized by a distinctive combination of both animal and plant species in a particular habitat.

**Borrow Area:** An area where soil, sand, gravel, or rock is extracted and removed for use as fill, grades, or embankments on property of a different ownership or noncontiguous property of the same ownership.

**Brooder box:** A heated box where chicks or other baby birds are kept.

**Buffer Zone:** An area of land separating two distinct land uses that acts to soften or mitigate the effects of one land use on the other.

**Building:** Any structure having a roof supported by columns or walls and intended for the shelter, housing or enclosure of persons, animals, or property of any kind.

**Building Code:** A set of rules that specify the minimum acceptable level of safety for constructed objects such as buildings and nonbuilding structures. Examples of building codes include the International Building Code, the California Building Code, and the County of Los Angeles Building Code.

**Building Height:** The vertical distance from the average contact ground level of a building to the highest point of the coping of a flat roof or to the deck line of a mansard roof or to the mean height level between eaves and ridge for a gable, hip, or gambrel roof. The exact definition varies by community. For example, in some communities building height is measured to the highest point of the roof, not including elevator and cooling towers.

**Buildout:** Development of land to its full potential or theoretical capacity as permitted under current or proposed planning or zoning designations. The year in which project construction has been completed.

**Bulk:** The mass or volume of buildings.

**Business Services:** A subcategory of commercial land use that permits establishments primarily engaged in rendering services to other business establishments on a fee or contract basis, such as advertising and mailing; building maintenance; personnel and

employment services; management and consulting services; protective services; equipment rental and leasing; photo finishing; copying and printing; travel; office supply; and similar services.

**Busway:** A vehicular right-of-way or portion thereof (often an exclusive lane) reserved exclusively for buses.

**Buttress/Buttress fill:** A designed compacted earth fill used for providing lateral support to an unstabilized earth or rock mass.

**Cairn:** A heap of stones set up as a landmark, monument, tombstone, etc.

**Calcine:** To heat (a substance) to a high temperature but below the melting or fusing point, causing loss of moisture, reduction or oxidation, and the decomposition of carbonates and other compounds.

**California Air Resources Board (CARB):** California's lead air quality agency, consisting of an 11-member Governor-appointed board, responsible for motor vehicle air pollution control, and having oversight over California's air pollution management program. CARB is responsible for attainment and maintenance of the State and federal air quality standards, and is fully responsible for motor vehicle pollution control. It oversees county and regional air pollution management programs.

**California Ambient Air Quality Standards (CAAQS):** A legal limit that specifies the maximum level and time of exposure in the outdoor air for a given air pollutant and which is protective of human health and public welfare (*California Health and Safety Code*, Section 39606b). CAAQSs are recommended by the California Office of Environmental Health Hazard Assessment and adopted into regulation by the CARB. CAAQSs are the standards which must be met per the requirements of the California Clean Air Act (CCAA).

**California Clean Air Act (CCAA):** A California law passed in 1998 that provides the basis for air quality planning and regulation independent of federal regulations, and which establishes new authority for attaining and maintaining California's air quality standards by the earliest practicable date. A major element of the CCAA is the requirement that local Air Pollution Control Districts in violation of the California Ambient Air Quality Standards must prepare attainment plans that identify air quality problems, causes, trends, and actions to be taken for attainment.

**California Coastal Commission:** The lead agency responsible for carrying out California's federally-approved coastal management program. The Coastal Commission plans for and regulates land and water uses in the coastal zone consistent with policies of the Coastal Act.

**California Code of Regulations (CCR):** The regulations that implement California laws.

**California Department of Transportation (Caltrans):** The State government agency responsible for the construction, maintenance, and operation of state and federal highways in California.

**California Endangered Species Act (CESA):** The CESA (*California Fish and Game Code*, Section 2050, et seq.) generally parallels the main provisions of the Federal Endangered Species Act (FESA) and is administered by the California Department of Fish and Wildlife. The Act prohibits the take of plant and Animal species designated by the Fish and Game Commission as either Threatened or Endangered in the State. Under CESA the term “Endangered species” is defined as a species of plant, fish, or wildlife which is “in serious danger of becoming extinct throughout all, or a significant portion of its range” and is limited to species or subspecies native to California.

**California Environmental Protection Agency (CalEPA):** The State agency established in 1991 for unifying environmental activities related to public health protection in the State of California. There are six boards, departments, and offices under the organization of CalEPA including the California Air Resources Board (CARB), California Integrated Waste Management Board (CIWMB), State Water Resources Control Board (SWRCB) and its nine Regional Water Quality Control Boards (RWQCBs), Department of Pesticide Regulation (DPR), Department of Toxic Substances Control (DTSC), and Office of Environmental Health Hazard Assessment (OEHHA). The CalEPA boards, departments, and offices are directly responsible for implementing California environmental laws, or play a cooperative role with other regulatory agencies at regional, local, State, and federal levels.

**California Environmental Quality Act (CEQA):** CEQA is defined in the *California Public Resources Code* (Sections 21000 et seq.). It is a statute that requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible. CEQA applies to certain activities of state and local public agencies. A public agency must comply with CEQA when it undertakes an activity defined by CEQA as a “project”. A project is an activity undertaken by a public agency or a private activity which must receive some discretionary approval (meaning that the agency has the authority to deny the requested permit or approval) from a government agency which may cause either a direct physical change in the environment or a reasonably foreseeable indirect change in the environment. Most proposals for physical development in California are subject to the provisions of CEQA, as are many governmental decisions which do not immediately result in physical development (such as adoption of a general or community plan). Every development project which requires a discretionary governmental approval will require at least some environmental review pursuant to CEQA, unless an exemption applies (CNRA 2009).

**California Housing Finance Agency (CHFA):** A State agency, established by the Housing and Home Finance Act of 1975, which is authorized to sell revenue bonds and generate funds for the development, rehabilitation, and conservation of low and moderate income housing.

**California Irrigation Management Information System (CIMIS):** Developed to assist irrigators in managing their water resources efficiently, CIMIS is a program of the Office of Water Use Efficiency (OWUE) that manages a network of over 120 automated weather stations in the State of California.

**California Proposition 50:** Passed by California voters in 2002, the proposition authorized the sale of \$3.4 billion in general obligation bonds to fund a variety of specified water and

wetlands projects. It set aside \$380 million for grants related to the implementation of IRWM Plans and is jointly administered by the California Department of Water Resources (DWR) and the State Water Resources Control Board (SWRCB).

**California Protected Species:** Those species that may not be taken or possessed at any time except under special permit from CDFW.

**California Rare Plant Rank (CRPR):** The CRPR is a summary of information on the distribution, rarity, and endangerment of California's vascular plants. This rare plant inventory is comprised of four lists. The CRPR presumes that List 1A plant species are extinct in California because they have not been seen in the wild for many years. The CRPR considers List 1B plants as Rare, Threatened, or Endangered throughout their range. Plants with a CRPR of 2A are presumed extirpated from California, but are more common elsewhere. Plants with a CRPR of 2B are considered Rare, Threatened, or Endangered in California, but are more common elsewhere. Plant species for which more information is needed are considered List 3. List 4 plant species are those of limited distribution in California whose susceptibility to threat appears low at this time.

**California Species of Special Concern:** An informal designation which the CDFW uses for some declining wildlife species that are not State candidates. This designation does not provide legal protection, but signifies that these species are recognized as special status by the CDFW.

**California State Water Project (SWP):** The world's largest publicly built and operated water and power development and conveyance system. The SWP provides drinking water for over 23 million people in Southern California and generates an average 6,500 GWh of hydroelectricity annually. Primary features of the project include Oroville Dam, San Luis Reservoir, and the California Aqueduct.

**California Toxics Rule (CTR):** A regulatory action that establishes numeric water quality criteria for priority toxic pollutants necessary for the State of California to meet the requirements of the Clean Water Act.

**Call Water:** The water supply right of Tejon Ranch Company that was not taken in earlier years and, through an agreement with the Antelope Valley-East Kern Water Agency (AVEK), the right is maintained and can be called in a future year.

**Candlepower:** The total light output expressed in candelas. One candlepower is approximately equal to the light emitted from one candle.

**Capital Improvements:** The building of infrastructure or public works projects.

**Capital Improvements Program (CIP):** A program established by a city or county government which schedules infrastructure improvements necessary to accommodate existing and anticipated future development. Most CIPs are for a minimum of five years into the future, and include a financing mechanism, to fit the projected fiscal capability of the local jurisdiction. The program generally is reviewed annually for conformance to and consistency with the general plan.

**Carbon Cycling:** A chain of nuclear reactions, involving carbon at its intermediate stages that transforms four hydrogen atoms into one helium atom with a resulting release in energy (CalSpace Virtual Museum 2002).

**Carbon Dioxide (CO<sub>2</sub>):** A colorless gas that enters the atmosphere as the result of natural and artificial combustion processes. Significant quantities are also emitted into the air by fossil fuel combustion. It is also a normal part of the ambient air.

**Carbon Monoxide (CO):** A colorless, odorless gas resulting from the incomplete combustion of fossil fuels. CO interferes with the blood's ability to carry oxygen to the body's tissues and can result in adverse health effects. CO is a criteria air pollutant.

**Carbon Sequestration:** Defined as the in-take or process of the gas by vegetation. In the Climate Change section (5.21), it is assumed that all mature land-types (at least 20 years old) are at a steady state.

**Carrying Capacity:** Used in determining the potential of an area to absorb development: (1) The level of land use, human activity, or development for a specific area that can be accommodated permanently without an irreversible change in the quality of air, water, land, or plant and animal habitats; (2) The upper limits of development beyond which the quality of human life, health, welfare, safety or community character within an area will be impaired; or (3) The maximum level of development allowable under current zoning.

**Cartridge media filtration:** A passive, flow-through storm water media filtration system typically comprised of a vault (or catch basin for small drainage catchments) that houses rechargeable, media-filled cartridges which trap particulates and remove pollutants (such as dissolved metals, nutrients, and hydrocarbons).

**Catch Basin:** A storm drain inlet having a sump below the outlet to capture settled solids.

**Categorical Exemption:** Categorical exemption means an exemption from CEQA for a class of projects based on a finding by the Secretary for Resources that the class of projects does not have a significant effect on the environment unless exceptions to the exemption apply (State CEQA Guidelines, Section 15354). A Categorical Exemption does not apply in the following situations: (1) a reasonable possibility exists that the activity may have a significant environmental impact because of unusual circumstances; (2) the cumulative impacts of the project would be considerable and therefore significant; (3) the project occurs within specified sensitive environments; (4) a project affects scenic resources within official State scenic highways; (5) a project is located on a toxic site that is listed by the California Environmental Protection Agency; or (6) a project causes substantial adverse changes in a significant historic resource (State CEQA Guidelines, Section 15300.2).

**Census:** The official United States decennial enumeration of the population conducted by the federal government.

**Centennial Specific Plan:** The document that describes the various Project characteristics, including the land use plan designations, overlay districts, mobility plan, parks/recreation, open space, utilities and associated infrastructure, public services/facilities, landscape and

lighting, solid waste management, technology plan, affordable housing program, and construction and grading. Implementation of the *Centennial Specific Plan* through buildout is addressed at a program level (as described in Section 2.2, Type of Environmental Impact Report). The document proposes development of 19,333 dwelling units and anticipates creation of approximately 20,809 permanent jobs within its commercial areas and employment centers.

**Centennial Specific Plan Footprint:** Overall impact of the Project. The Project's impact footprint is comprised of all temporary and permanent impact areas that would result from implementation of all Project phases, including off-site impacts.

**Central Business District (CBD):** The major commercial downtown center of a community. General guidelines for delineating a downtown area are defined by the U.S. Census of Retail Trade, with specific boundaries being set by the local municipality.

**Certified Applicator:** A Certified Applicator is an individual licensed through successful completion of education and examination requirements to apply pesticides with restricted use, as defined by the USEPA. In California, such licensing is administered through the California Department of Pesticide Management's Licensing and Certification Program.

**Channel:** A water course with a definite bed and banks which confine and conduct the normal continuous or intermittent flow of water.

**Channelization:** (1) The straightening and/or deepening of a watercourse for purposes of storm runoff control or ease of navigation. Channelization often includes lining of stream banks with a retaining material such as concrete. (2) At the intersection of roadways, the directional separation of traffic lanes through the use of curbs or raised islands that limit the paths that vehicles may take through the intersection.

**Charter School:** Non-sectarian public schools of choice that can provide education in any of the grades kindergarten through 12. A charter school is generally exempt from most laws governing school districts, except where specifically noted in the law. California public charter schools are required to participate in the statewide assessment test, STAR (Standardized Testing and Reporting). A charter school is usually created or organized by a group of teachers, parents and community leaders or a community-based organization, and it is usually sponsored by an existing local public school board or county board of education. Specific goals and operating procedures for the charter school are detailed in an agreement (or "charter") between the sponsoring board and charter organizers.

**Chert:** A compact rock consisting essentially of microcrystalline quartz.

**Circulation Element:** One of the seven State-mandated elements of a general plan, it contains adopted goals, policies, and implementation programs for the planning and management of existing and proposed thoroughfares, transportation routes, and terminals, as well as local public utilities and facilities, all correlated with the land use element of the general plan.

**Circulation System:** A network of transit, automobile, bicycle, and pedestrian rights-of-way that connect origins and destinations.

**Class I Landfill:** Class I landfills may accept hazardous and non-hazardous wastes.

**Class II Landfill:** Class II landfills may accept “designated” and non-hazardous wastes.

**Class III Landfill:** Class III landfills may accept all non-hazardous wastes.

**Clean Air Act (CAA):** A federal law passed in 1970 and amended in 1977 and 1990 that sets primary and secondary National Ambient Air Quality Standards for major air pollutants and forms the basis for the national air pollution control effort.

**Clean Water Act (CWA):** The primary federal law in the United States governing water pollution. The act established the goals of eliminating releases to water of high amounts of toxic substances. The NPDES permit program is authorized by Section 402 of the CWA.

**Clustered Development:** Development in which a number of dwelling units are placed in closer proximity than usual, or are attached, with the purpose of retaining an open space area.

**Code of Federal Regulations (CFR):** The document that codifies all rules of the executive departments and agencies of the federal government. It is divided into 50 volumes, known as titles. Title 40 of the CFR (referenced as 40 CFR) lists all the environmental regulations.

**Cohesionless Soil:** A soil that when confined has little or no strength when air-dried, and that has little or no cohesion when submerged.

**Collapsible soil:** Loose, dry, low-density soil that collapses and compacts under the addition of water or excessive loading.

**Collector:** Relatively low speed (25–30 miles per hour [mph]), relatively low volume (5,000–20,000 average daily trips) street that provides circulation within and between neighborhoods. Collectors usually serve short trips and are intended for collecting trips from local streets and distributing them to the arterial network.

**Colloidal:** Having the nature of a colloid, which is a system where finely divided particles are dispersed within a continuous medium in a manner that prevents them from being filtered easily or settled rapidly.

**Colluvium:** Loose bodies of sediment that have been deposited or built up at the bottom of a low grade slope or against a barrier on that slope, transported by gravity.

**Comfort Wise:** Homes earning the Environmental Protection Agency’s Energy Star seal and the Comfort Wise designation have been independently inspected and certified to incorporate at least 30 percent energy savings in design and construction standards.

**Commercial:** A land use classification that permits facilities for the buying and selling of commodities and services.

**Commercial Strip:** Commercial development, usually one store deep, that fronts on a major street for a distance of one city block or more. Includes individual buildings on their own lots, with or without on-site parking, and small linear shopping centers with shallow on-site parking in front of the stores.

**Community Center:** A public facility in which educational, therapeutic, and/or recreational programs are provided.

**Community Facilities District (CFD):** Under the Mello-Roos Community Facilities Act of 1982 (*California Government Code*, Section 53311 et seq.), a legislative body may create within its jurisdiction a special district that can issue tax-exempt bonds for the planning, design, acquisition, construction, and/or operation of public facilities, as well as provide public services to district residents. A specific geographic area upon which is levied a special tax, approved by a two thirds vote of property owners, used to finance public facilities. CFDs finance the public facilities through the sale of bonds. The bonds are repaid by increased property taxes which are the result of property improvements and the construction of the public facilities (tax increment financing). CFDs are also referred to as Mello-Roos, after the State legislators who sponsored the enabling legislation.

**Community Noise Equivalent Level (CNEL):** A noise compatibility level established by the *California Administrative Code* (Title 21, Section 5000). Represents a time-weighted 24-hour average noise level based on the A-weighted decibel. The CNEL scale includes an additional 5-decibel (dB) adjustment to sounds occurring in the evening (7 PM to 10 PM) and a 10-dB adjustment to sound occurring in the late evening and early morning between (10 PM and 7 AM).

**Community Park:** Land with full public access intended to provide recreation opportunities beyond those supplied by neighborhood parks. Community parks are larger in scale than neighborhood parks, but smaller than regional parks.

**Complexed:** Bound with

**Comprehensive Environmental Response, Compensation and Liability Act (CERCLA):** CERCLA, also known as Superfund, was enacted in 1980 to ensure that a source of funds was available to clean up abandoned hazardous waste dumps, compensate victims, address releases of hazardous materials, and establish liability standards for responsible parties. CERCLA also requires the creation of a National Priorities List which sets forth the sites considered to have the highest priority for cleanup under Superfund.

**Compressibility/compressible soil:** The ability of a soil or rock to reduce in volume with applied pressure or collapse with loading.

**Concretion:** A hard mass of mineral matter formed by precipitation of minerals from water in concentric layers about a nucleus in a sedimentary or pyroclastic (volcanic sedimentary) rock.

**Conditional Use:** A land use which is not permitted by right, but which may be appropriate in a given zoning district under certain circumstances. The use may occur only upon approval of a conditional use permit.

**Conditional Use Permit (CUP):** A permit based on a discretionary decision required prior to initiation of particular uses not allowed as a matter of right. The use may be desirable under appropriate circumstances, but are not permitted by right in the applicable zone. The purpose of the CUP process is to determine whether, and under what conditions, a specific use may be appropriate in a given location. Further, the intent is that each use be developed so as to fully protect the public health, safety, and welfare of the community. To provide this protection, conditions may be applied to address potential adverse effects associated with the proposed use.

**Condominium:** A building or group of buildings in which units are owned individually, but the structure, common areas, and facilities are owned by all owners on a proportional, undivided basis.

**Conductivity:** Ability of water to migrate in the aquifer.

**Confined Aquifer:** A water-bearing subsurface stratum that is bounded above and below by formations of impermeable, or relatively impermeable, soil or rock.

**Conformity:** A demonstration of whether a federally-supported activity is consistent with the State Implementation Plan (SIP) per Section 176(c) of the Clean Air Act. Transportation conformity refers to plans, programs, and projects approved or funded by the Federal Highway Administration or the Federal Transit Administration. General conformity refers to projects approved or funded by other federal agencies.

**Congestion Management Plan/Program (CMP):** A State-mandated program (*California Government Code*, Section 65089a) that requires each county to prepare a plan to relieve congestion and reduce air pollution. Growth management techniques include traffic level of service requirements, standards for public transit, trip reduction programs involving transportation systems management and jobs/housing balance strategies, and capital improvement programming, for the purpose of controlling and/or reducing the cumulative regional traffic impacts of development.

**Conglomeratic:** Said of a sedimentary rock containing rounded to subangular fragments larger than two millimeters in diameter.

**Conservation Agreement:** A formal signed agreement between the U.S. Fish and Wildlife Service or National Marine Fisheries Service and other parties that implements specific actions, activities, or programs designed to eliminate or reduce threats or otherwise improve the status of a species. Conservation Agreements can be developed at a State, regional, or national level and generally include multiple agencies at both the State and federal level, as well as tribes.

**Conservation Element:** One of the seven State-mandated elements of a local general plan, it contains adopted goals, policies, and implementation programs for the conservation,

development, and use of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources.

**Conservation Strategy:** A strategy outlining current activities or threats that are contributing to the decline of a species, along with the actions or strategies needed to reverse or eliminate such a decline or threats. Conservation strategies are generally developed for species of plants and animals that are designated or that have been determined by the U.S. Fish and Wildlife Service or National Marine Fisheries Service to be federal candidates under the Endangered Species Act.

**Consistency, Consistent With:** Free from significant variation or contradiction. The various diagrams, text, goals, policies, and programs in the general plan must be consistent with each other, not contradictory or preferential. The term "consistent with" is used interchangeably with "conformity with." The courts have held that the phrase "consistent with" means "agreement with; harmonious with." Webster defines "conformity with" as meaning harmony, agreement when used with "with." The term "conformity" means in harmony therewith or agreeable to (Sec 58 Ops.Cal.Atty.Gen. 21, 25 [1975]). California State law also requires that a general plan be internally consistent and also requires consistency between a general plan and implementation measures such as the zoning ordinance.

**Consistent:** Free from variation or contradiction. Programs in the general plan are to be consistent, not contradictory or preferential. State law requires consistency between a general plan and implementation measures such as the zoning ordinance.

**Construction:** Any site preparation, assembly, erection, substantial repair, alteration, or similar action for or of public or private rights-of-way, structures, utilities, or similar property.

**Contacts:** The surface between two rock bodies. A scoured contact means that when this surface was exposed to the elements it underwent scouring.

**Contiguous:** Lands or legal subdivisions having a common boundary; lands having only a common corner are generally not contiguous.

**Contour Grading:** A grading technique which uses curvilinear, horizontal, and vertical undulations in order to simulate the characteristics of natural topography.

**Contributing Structure:** Building or structure in historic district that generally has historic, architectural, cultural, or archeological significance.

**Council of Governments (COG):** An association of cities and counties that often acts as a regional planning agency with some power under State and federal law.

**Covenants, Conditions, and Restrictions (CC&Rs):** A term used to describe restrictive limitations that may be placed on property and its use, and which usually are made a condition of holding title or lease. The master CC&Rs and each neighborhood CC&Rs will each be in furtherance of its own plan of planned development as described in the *California Civil*

*Code* (Sections 1350–1352) for the subdivision, improvement, protection, maintenance, and sale of each ownership interest, all of which are for the purposes of enhancing, maintaining, and protecting the value and attractiveness of the subject real property. Notwithstanding the foregoing, non-residential (e.g., commercial or industrial) developments may be exempt from certain of those code provisions; CC&Rs for such non-residential developments are exempt from review by the DRE and are not subject to those DRE regulation governing residential declarations. Consistent with California DRE Regulation 2792.8, the CC&Rs for each association will include provisions addressing the following: legal description of the subject real estate; recitals and creation of equitable servitudes; nature of the common interest subdivision (e.g., single-family dwelling, condominium project, mixed residential, industrial or commercial; provided, however that the master planned community will provide for multiple land uses); definitions; rights of ownership and easements; name of the association; association membership; association membership voting rights, and, for the master association, delegate voting rights; association assessments; restrictions on the use and enjoyment of any portion of the subject property; architectural control; destruction and eminent domain; limitations on partition and severance; annexation; mortgagee protections; enforcement of bonded obligations; general provisions; amendment provisions; and such additional provisions (if any) required by law.

**Criteria Air Pollutant:** An air pollutant for which acceptable levels of exposure can be determined and for which an ambient air quality standard has been set in order to protect public health. Examples include ozone, carbon monoxide, nitrogen dioxide, sulfur dioxide, respirable particulate matter with a diameter of 10 microns or less (PM<sub>10</sub>), and fine particulate matter with a diameter of 2.5 microns or less (PM<sub>2.5</sub>). The term "criteria air pollutants" derives from the requirement that the U.S. Environmental Protection Agency (USEPA) must describe the characteristics and potential health and welfare effects of these pollutants. The USEPA and the California Air Resources Board (CARB) periodically review new scientific data and may propose revisions to the standards as a result.

**Critical Facility:** Facilities housing or serving many people, which are necessary in the event of an earthquake or flood, such as hospitals, fire, police, and emergency service facilities, utility "lifeline" facilities, such as water, electricity, and gas supply, sewage disposal, and communications and transportation facilities.

**Critical Water Shortage Contingency Plan (Contingency Plan):** A 2000 report, published by the California Governor's Drought Panel, that made recommendations for actions that the State government could take to reduce the impacts of critical water shortages. The recommendations included a critical water shortage reduction marketing program to facilitate intra-regional, short term, and dry year transfers, financial and planning assistance to local agencies for drought-related response activities, and assistance to small water systems and home owners in rural counties.

**Cul-de-Sac:** A short street or alley with only a single means of ingress and egress at one end with a large turnaround at its other end.

**Cumulative Impact:** A cumulative impact refers to two or more individual affects which, when considered together, are considerable or which compound or increase other

environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonable foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time (State CEQA Guidelines, Section 15355).

**Cupule petroglyphs:** Small abraded pits.

**Cut:** The excavation of a bank required to lower the natural ground line to the desired profile.

**Day-Night Average Sound Level ( $L_{dn}$ ):** The A-weighted average sound level in decibels during a 24-hour period with a 10 decibel (dB) weighing applied to nighttime sound levels (10 PM to 7 AM). This exposure method is similar to the CNEL, but deletes the evening time period (7 PM to 10 PM) as a separate factor.

**Daytime Glare:** Indirect reflected light generated on the Project site during the day. Sources would primarily be generated by human activities and from the sun's reflection off glass windows of structures, automobiles, and trucks.

**Debitage:** Flakes and lithic waste.

**Debris:** Any organic material transported by storm water, including leaves, twigs, and grass clippings.

**Debris potential area zone:** Zones, as delineated by County or regional authorities, that yield similar volumes of sediment under similar conditions.

**Decibel (dB):** A unit for expressing the relative intensity (loudness) of sounds. The decibel is the logarithm of the ratio of the intensity of a given sound to the faintest sound discernible by the human ear.

**Decibel, A-Weighted (dBA):** The "A-weighted" scale for measuring sound in decibels; weighs or reduces the effects of low and high frequencies in order to simulate human hearing. Every increase of 10 dBA doubles the perceived loudness though the noise is actually ten times more intense.

**Decision Making Authority:** Decision-making authority means any person or body vested with the authority to make recommendations or act on application requests. The final decision-making authority is the one which has the authority to act on a request by approving or denying the request. This may include the Community Development Director or his/her designee, Planning Commission, or the City Council.

**Decision Making Body:** Any person or group of people within a public agency permitted by law to approve or disapprove the project at issue (State CEQA Guidelines, Section 15356).

**Dedication:** The turning over by an owner or developer of private land for public use, and the acceptance of land for such use by the governmental agency having jurisdiction over the

public function for which it will be used. Dedications for roads, parks, school sites, or other public uses often are made conditions for approval of a development by a city or county.

**Dedication, In lieu of:** Cash payments that may be required of an owner or developer as a substitute for a dedication of land, usually calculated in dollars per lot, and referred to as in lieu fees or in lieu contributions.

**Defensible Space:** (1) In fire-fighting and prevention, a 30-foot area of non-combustible surfaces separating urban and wildland areas. (2) In urban areas, open spaces, entry points, and pathways configured to provide maximum opportunities to rightful users and/or residents to defend themselves against intruders and criminal activity.

**Deficiency Plan:** An action program for improving or preventing the deterioration of level of service on the Congestion Management Agency street and highway network.

**Delay:** According to the Regional Transportation Plan (RTP), “delay” is defined as excess travel time resulting from the difference between a reference speed and actual speed. Total daily delay and daily delay per capita are the indicators used.

**Deleterious:** Harmful, injurious to health ([www.dictionary.com](http://www.dictionary.com)).

**Delta Smelt Ruling:** On August 31, 2007, U.S. District Court Judge Oliver Wanger ruled to restrict water deliveries from the California Delta’s export pumps to the Bay Area, Central Valley, and Southern California to protect the Delta smelt. Under the remedy ruling, operational limits on delta pumping would be put in place from the end of December, when fish are about to spawn, until June, when the smelt migrate westward. Impacts from the federal ruling will likely have an effect on 2008 State Water Project (SWP) supplies. The Delta smelt is found only in the Bay-Delta estuary and is considered by scientists to be an indicator species demonstrating the health of the estuary.

**Demolition:** Any dismantling, intentional destruction, or removal of structures, utilities, public or private rights-of-way surfaces, or similar property.

**Density:** The gross site area which shall include local roadways, slopes, and open space areas, unless otherwise specified. Density is usually expressed “per acre.” For example, a development with 100 dwelling units located on 20 acres has a density of 5 units per acre.

**Density, Control of:** A limitation on the occupancy of land. Density can be controlled through zoning in the following ways: use restrictions, minimum lot-size requirements, floor area ratios, land use-intensity ratios, setback and yard requirements, minimum house-size requirements, ratios comparing number and types of housing units to land area, limits on units per acre, and other means. Allowable density often serves as the major distinction between residential districts.

**Density, Employment:** A measure of the number of employed persons per specific area (for example, employees/acre).

**Density, Residential:** The number of permanent residential dwelling units per acre of land. Densities specified in a general plan may be expressed in units per gross acre or per net developable acre.

**Design Capacity:** The capacity at which a street, water distribution pipe, pump or reservoir, or a wastewater pipe or treatment plant is intended to operate.

**Destination Retail:** Retail businesses that generate a special purpose trip and that do not necessarily benefit from a high-volume pedestrian location.

**Detention Basin:** A facility that holds storm water temporarily and allows it to drain slowly over time to ensure that downstream storm drain capacities are not exceeded.

**Developable Acres, Net:** The portion of a site that can be used for density calculations. Some communities calculate density based on gross acreage. Public or private road rights-of-way are not included in the net developable acreage of a site.

**Developable Land:** Land that is suitable as a location for structures and that can be developed free of hazards to, and without disruption of, or significant impact on, natural resource areas.

**Developer:** An individual who or business that prepares raw land for the construction of buildings or causes to be built physical building space for use primarily by others, and in which the preparation of the land or the creation of the building space is in itself a business and is not incidental to another business or activity.

**Developer Fee Agreement:** A fee or tax imposed on developers to pay for the costs to the community of providing services to a new development. It is a means of providing a fund for financing new improvements without resorting to deficit financing.

**Development:** The physical extension and/or construction of land uses. Development activities include: subdivision of land; construction or alteration of structures, roads, utilities, and other facilities; installation of septic systems; grading; deposit of refuse, debris, or fill materials; and clearing of natural vegetative cover (with the exception of agricultural activities).

**Development Agreement:** A legislatively-approved contract between a jurisdiction and a person having legal or equitable interest in real property within the jurisdiction (*California Government Code*, Sections 65865 et seq.) that “freezes” certain rules, regulations, and polices applicable to development of a property for a specified period of time, usually in exchange for certain concessions by the owner.

**Development Area:** The portion of the Project site that will be developed.

**Development Impact Fees:** A fee or tax imposed on developers to pay for the costs to the community of providing services to a new development. It is a means of providing a fund for financing new improvements without resorting to deficit financing.

**Development Rights:** The right to develop land by a land owner who maintains fee-simple ownership over the land or by a party other than the owner who has obtained the rights to develop. Such rights usually are expressed in terms of density allowed under existing zoning. For example, one development right may equal one unit of housing or may equal a specific number of square feet of gross floor area in one or more specified zone districts.

**Direct Effects:** Effects which are caused by an action and occur at the same time and place.

**Discoidal:** Stone artifact having a circular shape. Specific to earlier periods of prehistory. Actual function uncertain.

**Discrete Early Actions:** Measures that can be fully adopted as regulations and made effective no later than January 1, 2010, as defined in AB 32. Other “early actions” are measures that are underway or are to be initiated by the California Air Resources Board (CARB) in the 2007–2012 timeframe (ENVIRON 2009).

**Discretionary Approval/Decision:** A decision requiring the exercise of judgment, deliberation, or decision on the part of the decision-making authority in the process of approving or disapproving a particular activity, as distinguished from situations where the decision-making authority merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations. An approval by a decision-making body which has the legal discretion to approve or deny a project or action.

**Discretionary Project:** A project which requires the exercise of judgment or deliberation when the public agency or body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations (State CEQA Guidelines, Section 15357).

**District:** (1) An area of a city or county that has a unique character identifiable as different from surrounding areas because of distinctive architecture, streets, geographic features, culture, landmarks, activities, or land uses. (2) A portion of the territory of a city or county within which uniform zoning regulations and requirements apply; a zone.

**Diversion:** The direction of water in a stream away from its natural course (i.e., as in a diversion that removes water from a stream for human use).

**Diversity:** Differences among otherwise similar elements that give them unique forms and qualities (i.e., housing diversity can be achieved by differences in unit size, tenure, or cost.)

**Dose:** A function of the concentration of a substance or substances in the environment and the extent of exposure that a person has with the substance

**Drainage:** An area that collects and diverts rain water and urban runoff down slope.

**Drainage Area:** The portion of the Earth’s surface from which precipitation or other runoff flows to a given location. With respect to a highway, this location may be a culvert, the farthest point of a channel, or an inlet to a roadway drainage system.

**Drainage Swale:** A storm drainage conveyance structure designed to intercept, divert, and convey surface runoff (generally sheet flow) to prevent erosion and reduce pollution loading.

**Drought Water Bank:** Established in 1991, the Bank resulted from the California Department of Water Resources purchasing more than 800,000 acre-feet of water for approximately \$100 million in response to requests by water-short agencies.

**Duplex:** A detached building under single ownership that is designed for occupation as the residence of two families living independently of each other.

**Dwelling, Single-Family:** A structure with one dwelling unit, typically with a single family living in it ([www.reference.com](http://www.reference.com)).

**Dwelling, Two-Family:** A classification of housing where multiple separate housing units are contained within one building ([www.reference.com](http://www.reference.com)).

**Dwelling Unit:** A room or group of rooms (including sleeping, eating, cooking, and sanitation facilities, but not more than one kitchen), which constitutes an independent housekeeping unit, occupied or intended for occupancy by one household on a long-term basis. Used in quantifying residential land use.

**Early Horizon (aka Early Millingstone):** Approximately 7,500 Years Before Present (YBP) through 3,500 YBP.

**E-200 Corridor:** The E-200 corridor is the High-Desert Corridor, which runs from Los Angeles to Las Vegas through Palmdale.

**Earthquake Fault Zones:** Regulatory zones, as established by the Alquist-Priolo Earthquake Fault Zoning Act (see above), and located around the surface traces of active faults.

**Easting:** A Geographical Information System term which refers to a rectangular (x,y) coordinate measurement of distance east from a north-south reference line, usually a meridian used as the axis of origin within a map zone or projection.

**Economic Poisons:** Economic poisons are substances used to control pests and defoliate cash crops such as cotton.

**Effects:** “Effects” and “impacts” as used in the State CEQA Guidelines are synonymous. Effects include (a) Direct or primary effects which are caused by the project and occur at the same time and place; (b) Indirect or secondary effects which are caused by the project and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect or secondary effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density, or growth rate, and related effects on air and water and other natural systems, including ecosystems. Effects analyzed under CEQA must be related to a physical change (State CEQA Guidelines, Section 15358).

**Effluent:** Wastewater or other liquid, partially or completely treated or in its natural state, flowing from a treatment plant.

**Embodied Energy:** Refers to the quantity of energy required to manufacture, and supply to the point of use, a product, material or service (ENVIRON 2009).

**Emergency:** Emergency means a sudden, unexpected occurrence, involving a clear and imminent danger, demanding immediate action to prevent or mitigate loss of, or damage to life, health, property, or essential public services. Emergency includes such occurrences as fire, flood, earthquake, or other soil or geologic movements, as well as such occurrences as riot, accident, or sabotage (State CEQA Guidelines, Section 15359)

**Emission:** Released or discharged air contaminants in the ambient air from any source (CARB 2017).

**Emission Factor:** For stationary sources, the relationship between the amount of pollution produced and the amount of raw material processed or burned. For mobile sources, the relationship between the amount of pollution produced and the number of vehicle miles traveled. By using the emission factor of a pollutant and specific data regarding quantities of materials used by a given source, it is possible to compute emissions for the source. This approach is used in preparing an emissions inventory (CARB 2017).

**Emission Inventory:** An estimate of the amount of pollutants emitted into the atmosphere from major mobile, stationary, area-wide, and natural source categories over a specific period of time such as a day or a year (CARB 2017).

**Emission Offsets (Emissions Trading):** A rule-making concept whereby approval of a new or modified stationary source of air pollution is conditional on the reduction of emissions from other existing stationary sources of air pollution. These reductions are required in addition to reductions required by best available control technology (CARB 2017).

**Emission Rate:** The weight of a pollutant emitted per unit of time (e.g., tons per year) (CARB 2017).

**Emission Standards:** The U.S. Environmental Protection Agency (USEPA), California Air Resources Board (CARB), or air district standards or limits for air contaminant emissions. The maximum amount of a pollutant that is allowed to be discharged from a polluting source (e.g., an automobile or smoke stack).

**Encroachment:** The occupancy of project right-of-way by non-project structures or objects of any kind or character; also, activities of other parties within the operating right-of-way.

**Endangered Species:** In accordance with CEQA, "Species" means a species or subspecies of animal or plant or a variety of plant. A species of animal or plant is considered "Endangered" if its prospects of survival and reproduction are in immediate jeopardy. The CESA authorizes the CDFW to issue permits authorizing incidental take of Threatened and Endangered Species.

**Enterprise Zone:** An area designated by the federal or State government as a distressed area where regulatory and tax burdens are loosened to stimulate private investment.

**Environment:** The physical conditions which exist within the area which will be affected by a proposed project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance. The area involved shall be the area in which significant effects would occur either directly or indirectly as a result of the project. The "environment" includes both natural and man-made conditions (State CEQA Guidelines, Section 15360).

**Environmental Documents:** Environmental documents means Initial Studies, Negative Declarations, draft and final EIRs, documents prepared as substitutes for EIRs and Negative Declarations under a program certified pursuant to the *California Public Resources Code* (Section 21080.5) and documents prepared under the National Environmental Policy Act (NEPA) and used by a State or local agency in the place of an Initial Study, Negative Declaration, or an EIR (State CEQA Guidelines, Section 15361).

**Environmental Impact Report:** A detailed statement prepared under the California Environmental Quality Act (CEQA) describing and analyzing the significant environmental effects of a project and discussing ways to mitigate or avoid the effects. The term "EIR" may mean either a draft or a final EIR depending on the context. A Draft EIR means an EIR containing the information specified in the State CEQA Guidelines (Sections 15122–15131). A Final EIR means an EIR containing the information contained in the draft EIR, comments either verbatim or in summary received in the review process, a list of persons commenting, and the response of the Lead Agency to the comments received (State CEQA Guidelines, Section 15362).

**Environmental Justice:** The fair treatment of people of all races and incomes with respect to development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment implies that no person or group of people should shoulder a disproportionate share of negative environmental and economic impacts resulting from the execution of environmental programs.

**Ephemeral:** Lasting a short time (i.e., not present year-long) ([www.dictionary.com](http://www.dictionary.com)).

**Epicenter:** The part of the Earth's surface directly above the focus of an earthquake.

**Equivalent Noise Level ( $L_{eq}$ ):** A single-number representation of the fluctuating sound level in decibels over a specified period of time. It is a sound-energy average of the fluctuating level.

**Erosion:** The process by which material is removed from the Earth's surface (including weathering, dissolution, abrasion, and transportation), most commonly by wind or water.

**Erosion Control:** The stabilization of cut and fill slopes and other areas.

**Ethnography:** A cultural anthropologic research method that strives to answer anthropological questions about different cultures' ways of life.

**Ethnohistory:** A branch of anthropology dealing with the development of cultures, as through the analysis of archaeological findings.

**Ethnolinguistics:** The study of language as an aspect or part of culture, esp. the study of the influence of language on culture and of culture on language.

**Eutrophication:** An increase in chemical nutrients, typically compounds containing nitrogen or phosphorus, in an ecosystem. These nutrients support a dense growth of algae and other organisms, the decay of which depletes the shallow waters of oxygen in summer.

**Evapotranspiration:** The sum of evaporation and plant transpiration from the Earth's land surface to atmosphere. Evaporation accounts for the movement of water to the air from sources such as the soil, canopy interception, and water bodies. Transpiration accounts for the movement of water within a plant and the subsequent loss of water as vapor through stomata in its leaves.

**Exceedance:** A measured level of an air pollutant higher than the national or State ambient air quality standards.

**Excess Storm Water Runoff Volume ( $\Delta V$ ):** The post-developed runoff volume minus the pre developed runoff volume for the 85th percentile storm event.

**Executive Order 11198:** A 1977 Executive Order designed to regulate impacts associated with development within a designated 100-year floodplain. This Executive Order is implemented through the Federal Emergency Management Agency's (FEMA) Floodplain Mapping Program and through federal agency review of projects that may require federal permits or approvals.

**Expansive Soils:** Soils that swell when they absorb water and shrink as they dry.

**Expressway:** A divided multi-lane major arterial street for through traffic with partial control of access and with grade separations at major intersections.

**Extant:** Existing.

**External Trips:** Trips with one trip end within the project site and one trip end outside of the project site. (e.g., traveling from your home in Lancaster directly to your job in Centennial is an external trip.)

**Fair Market Rent (FMR):** Fair Market Rents are freely set rental rates defined by HUD as the median gross rents charged for available standard units in a county or Standard Metropolitan Statistical Area (SMSA). Fair Market Rents are used for the Section 8 Rental Program and other HUD programs and are published annually by HUD.

**Family:** (1) Two or more persons related by birth, marriage, or adoption (U.S. Bureau of the Census). (2) An individual or a group of persons living together who constitute a bona fide single-family housekeeping unit in a dwelling unit, not including a fraternity, sorority, club, or other group of persons occupying a hotel, lodging house or institution of any kind (California).

**Farmland:** Refers to eight classifications of land mapped by the U.S. Department of Agriculture Soil Conservation Service. The five agricultural classifications, except Grazing Land, do not include publicly owned lands for which there is an adopted policy preventing agricultural use. They are Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, and Grazing Land.

**Farmland of Local Importance:** Lands of importance, as identified by appropriate local agencies, for the production of food, feed, fiber, forage, and oilseed crops. These may also include lands that have been designated for agriculture by local ordinance (NRCS 2017a).

**Farmland of Statewide Importance:** Lands of importance, as defined and delineated by the appropriate State agencies, for the production of food, feed, fiber, forage, and oilseed crops. Generally, this land includes areas of soils that nearly meet the requirements for Prime Farmland and that economically produce high yields of crops when treated and managed according to acceptable farming methods. Some areas may produce as high a yield as Prime Farmland if conditions are favorable. Farmland of Statewide Importance may include tracts of land that have been designated for agriculture by State law (NRCS 2017a).

**Fault:** A fracture in the Earth's crust forming a boundary between rock masses that have shifted. An active fault is a fault that has moved recently and which is likely to again. An inactive fault is a fault which shows no evidence of movement in recent geologic time and no potential for movement in the relatively near future.

**Faulted and Folded Bedrock Structure:** The bedrock has been subject to folding and faulting activity resulting in a change in bedrock structure.

**Feasible:** Feasible means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors (State CEQA Guidelines, Section 15364).

**Federal Antidegradation Policy:** A 1968 Federal Policy which includes a three-tiered approach to maintaining and protecting water quality. First, all existing beneficial uses and levels of water quality necessary to protect those uses must be preserved and protected from degradation. Second, water quality must be protected in areas where the quality cannot support the propagation of fish, shellfish, and wildlife and recreation ("fishable/swimmable"). Third, the policy provides special protection of waters for which the ordinary water quality criteria are not sufficient.

**Federal Aviation Administration (FAA):** The FAA is an agency of the United States Department of Transportation and is the principal agency responsible for implementing federal law regulating aviation activities in the United States.

**Federal Clean Air Act (FCAA):** A federal law passed in 1970 and amended in 1974, 1977, and 1990 which forms the basis for the national air pollution control effort. Basic elements of the act include national ambient air quality standards for major air pollutants, mobile and stationary control measures, air toxics standards, acid rain control measures, and enforcement provisions.

**Federal Emergency Management Agency (FEMA):** The federal agency under which the National Flood Insurance Program is administered.

**Federal Endangered Species Act (FESA):** Signed in 1978, the Act was designed to protect critically imperiled species from extinction as a “consequence of economic growth and development untended by adequate concern and conservation.” The FESA only protects species which are officially listed as “Threatened” or “Endangered”, as well as the habitat thereof. There are two categories on the list: Endangered and Threatened. Endangered species are closer to extinction than Threatened species.

**Fill:** Earthen material used to level or replace cut regions in an area prior to construction.

**Filter strips:** Land areas of either planted or indigenous vegetation, situated between a potential, pollutant-source area and a surface-water body that receives runoff. Filter strips also provide localized erosion protection since the vegetation covers an area of soil that otherwise might have a high erosion potential.

**Filtration:** The mechanical process that removes particulate matter from water by passing through sand or other media.

**Final Map:** A map of an approved subdivision filed in the county recorder’s office. It shows surveyed lot lines, street rights-of-way, easements, monuments, and distances, angles, and bearings, pertaining to the exact dimensions of all parcels, street lines, and so forth.

**Findings of Fact:** Findings required by CEQA are the conclusions made regarding the significance of a project in light of its environmental impacts. A public agency cannot approve or carry out a project for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding (State CEQA Guidelines, Section 15091).  
**Fire Hazard Severity Zone:** An area where, due to slope, fuel, weather, or other fire-related conditions, the potential loss of life and property from a fire necessitates special fire protection measures and planning before development occurs. There are three zones, based on increasing fire hazard: medium, high, and very high.

**First-Time Home Buyer:** Defined by the U.S. Department of Housing and Urban Development (HUD) as an individual or family who has not owned a home during the three-year period preceding the HUD-assisted purchase of a home. Jurisdictions may adopt local definitions for first-time home buyer programs which differ from non-federally funded programs.

**Fiscal Impact Assessment/Fiscal Impact Report:** A projection of the direct public costs and revenues resulting from population or employment change to the local jurisdiction(s) in which the change is taking place. Enables local governments to evaluate relative fiscal merits of general plans, specific plans, or projects. A Fiscal Impact Report (FIR) projects the public costs and revenues that will result from a proposed program or development.

**Fissure:** A long narrow opening; a crack or cleft.

**Fixed Noise Source:** A stationary device which creates sounds while fixed or motionless, including but not limited to, residential, agricultural, industrial, and commercial machinery and equipment, pumps, fans, compressors, air conditioners, and refrigeration equipment.

**Flood:** A general and temporary condition of partial or complete inundation of normally dry land areas from: (1) overflow of inland or tidal waters; (2) the unusual and rapid accumulation or runoff of surface waters from any source; (3) mudslides (i.e., mudflows) which are proximately caused by flood, and are akin to a river of liquid and flowing mud on the surface of normally dry land areas, as when earth is carried by a current of water and deposited along the path of the current; and (4) the collapse or subsidence of land along the shore of a lake or other body of water as a result of erosion or undermining caused by waves or currents of water exceeding the cyclical levels which result in flood.

**Flood, 25-Year:** A hydrologic event, such as a flood, having a 25-year average recurrence interval. In other words, a flood of this magnitude has a 4 percent chance of happening in any year.

**Flood, 50-Year:** A hydrologic event, such as a flood, having a 50-year average recurrence interval. In other words, a flood of this magnitude has a 2 percent chance of happening in any year.

**Flood, 100-Year:** The magnitude of a flood expected to occur on the average every 100 years, based on historical data. The 100-year flood has a 1/100, or one percent, chance of occurring in any given year.

**Flood Insurance Rate Map (FIRM):** For each community, the official map on which the Federal Insurance Administration has delineated areas of special flood hazard and the risk premium zones applicable to that community.

**Floodplain:** Any land area susceptible to being inundated by flood waters from any source. The relatively level land area on either side of the banks of a stream regularly subject to flooding. That part of the floodplain subject to a one percent chance of flooding in any given year is designated as an “area of special flood hazard” by the Federal Insurance Administration.

**Flood Plain Fringe:** All land between the floodway and the upper elevation of the 100-year flood.

**Floodplain Management:** The operation of an overall program of corrective and preventive measures for reducing flood damage, including but not limited to, emergency preparedness plans, flood control works, and floodplain management regulations.

**Floodway:** The channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the “base flood” without cumulatively increasing the water surface elevation more than one foot. No development is allowed in floodways.

**Floor Area Ratio (FAR):** The ratio of gross floor area of all buildings permitted on a site divided by the total net area of the site, expressed in decimals to one or two places. For

example, on a site with 10,000 net square feet of land area, a Floor Area Ratio of 1.0 will allow a maximum of 10,000 gross square feet of building floor area to be built. On the same site, an FAR of 1.5 would allow 15,000 square feet of floor area; an FAR of 2.0 would allow 20,000 square feet; and an FAR of 0.5 would allow only 5,000 square feet. Also commonly used in zoning, FARs typically are applied on a parcel-by-parcel basis as opposed to an average FAR for an entire land use or zoning district.

**Flow:** A flow is a sudden movement of a soil mass in which individual particles travel separately in a fluid motion. Debris and mudflows are rapid and can be related to excess rainfall on slopes often where vegetation has been removed. Debris flows often have the consistency of cement and can result in catastrophic effects to structures.

**Fluted:** Grooved or furrowed, as in a ruffle of cloth or on a piecrust ([www.dictionary.com](http://www.dictionary.com)).

**Foot-Candle:** The amount of light produced by this candle on one-square-foot of a spherical surface one foot from the light source.

**Foothill:** A relatively low hill on the lower slope of a mountain ([wordnet.princeton.edu](http://wordnet.princeton.edu)).

**Footprint (Building):** The outline of the ground area covered by a building.

**Foreground Zone:** Visual elements in this zone can be seen at a close distance and typically dominate the entire view. View impacts on this zone are often considered to be substantial because they are so visually prominent.

**Formation:** A geologic unit possessing similar characteristics and a shared history.

**Freeboard:** An additional amount of height above the Base Flood Elevation (in the case of flood control) used as a factor of safety (e.g., two feet above the Base Flood) in determining the level at which a structure's lowest floor must be elevated or flood proofed to be in accordance with State or community floodplain management regulations.

**Freeway:** A high-speed, high-capacity, limited-access road serving regional and county-wide travel. Such roads are free of tolls, as contrasted with "turnpikes" or other "toll roads" now being introduced into southern California. Freeways generally are used for long trips between major land use generators. At Level of Service "E", they carry approximately 1,875 vehicles per lane per hour, in both directions. Major streets cross at a different grade level.

**Freeway Mainline Segment:** A freeway mainline segment is a portion of a freeway/highway between ramps consisting of a continuous roadway without stop signs, stop lights, or intersections.

**Fugitive Dust:** Dust particles that are introduced into the air through certain activities such as soil cultivation, or vehicles operating on open fields or dirt roadways. A subset of fugitive emissions.

**Fugitive Emissions:** Emissions not caught by a capture system which are often due to equipment leaks, evaporative processes, and windblown disturbances.

**General Plan:** A compendium of city or county policies regarding long-term development, in the form of maps and accompanying text. A General Plan is a legal document required of each local agency by Section 65301 of the *California Government Code* and adopted by a city council or board of supervisors. California law requires the preparation of seven elements or chapters in a General Plan: Land Use, Housing, Circulation, Conservation, Open Space, Noise, and Safety. Additional elements are permitted.

**General Plan Amendment:** A change or addition to a community's general plan. A general plan can be amended up to four times a year.

**General Plan Consistency:** Compatibility and agreement with a general plan. Consistency exists when the standards and criteria of a general plan are met or exceeded.

**General Obligation Bond:** A tax-exempt bond issued by a public agency that must be repaid from general tax revenues rather than from specific revenue sources.

**Geographic Information System (GIS):** A computer system capable of storing, analyzing, and displaying data and describing places on the Earth's surface.

**Geologic Hazard Overlay (District):** A region subject to additional earthquake-related building requirements designed to protect the public health, safety and welfare.

**Geologic Review:** The analysis of geologic hazards, including all potential seismic hazards, surface ruptures, liquefaction, landsliding, mudsliding, and the potential for erosion and sedimentation.

**Geological:** Pertaining to rock or solid matter.

**Geometric Improvements:** Improvements to roads such as widening, adding signals to intersections, or adding turning lanes. These are required to mitigate traffic impacts and maintain a required level of service.

**Geomorphic:** Relating to the form or surface features of the Earth.

**Glare:** (1) Difficulty seeing in the presence of very bright light or, by extension, any sort of bright light capable of causing glare. (2) A form of light pollution or over-illumination ([www.reference.com](http://www.reference.com)).

**Global climate change:** A broad term used to describe any worldwide, long-term change in the Earth's climate.

**Global Warming:** More specific than global climate change and refers to a general increase in temperatures across the Earth. Global warming, characterized by rising atmospheric temperatures, can cause other climatic changes, such as a shift in the frequency and intensity of rainfall or hurricanes, but does not necessarily imply that all locations will be warmer. Global warming can be caused by natural processes, but there is a general scientific consensus that most current global warming is the result of human activity on the planet (ENVIRON 2009). This man-made warming is primarily caused by increased emissions of

“greenhouse gases”, which keeps the Earth’s surface warm and is called “the greenhouse effect”.

**Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32):** Passed by the California Legislature in 2006, the Act caps global warming emissions at 1990 levels by 2020 (a 25 percent reduction); establishes a mandatory reporting program to the California Air Resources Board (CARB) for significant greenhouse gas emissions; requires CARB to adopt regulations for significant greenhouse gas emission sources (allowing CARB to design a cap and trade program) and gives CARB the authority to enforce the regulations beginning in 2012.

**Grade:** Adjacent ground level. For purposes of building height measurement, grade is the average of the finished ground level at the center of all walls of a building or other datum point established by the division of building and safety.

**Grading:** Alteration of existing slope and shape of the ground surface.

**Granodiorite:** An intrusive igneous rock similar to granite.

**Grazing Land:** Lands that include grazed forest lands, grazed croplands, haylands, and native/naturalized pasture. These lands provide significant forage resource for U.S. livestock production (NRCS 2017b).

**Greenbelt:** Statements of local policy adopted by one or more cities and the County of Ventura, either by resolution or ordinance. In Ventura County, greenbelts are areas where cities have agreed not to annex territory and the County has pledged to permit only open space or agricultural uses.

**Greenfield:** Farmland and open areas where there has been no prior industrial or commercial activity and therefore where the threat of contamination is much lower than in urbanized areas.

**Green infrastructure:** an alternative approach to traditional development that integrates, rather than fragments, natural systems. It aims to enhance natural open spaces and ecosystems while providing the utility of a traditional infrastructure system (Placeworks 2017).

**Gross Site Area:** The area within the lot lines of a parcel of land before public streets, alleys, easements, or other areas to be dedicated or reserved for public use have been deducted.

**Gross Square Feet/Gross Floor Area:** The total enclosed building area of all floors measured to the outside face of the structural members in exterior walls, and including the halls, stairways, elevator shafts at each floor level, service and mechanical equipment rooms, and habitable basement or attic areas, but excluding area of vehicle parking and loading. Parking structures shall not be considered building area for the purposes of calculating allowable floor area ratios.

**Ground Failure:** Ground movement or rupture caused by strong shaking during an earthquake. Includes landslide, lateral spreading, liquefaction, and subsidence.

**Ground-Modification Techniques:** Provide in-situ (i.e., without removal/in place) remediation of liquefaction potential by making the underlying granular materials more dense. Because one of the factors necessary for liquefaction to occur is loose soils, making the soils denser through techniques such as deep dynamic compaction, stone columns, and/or vibro-replacement remediates the potential for liquefaction. Ground-modification techniques are implemented where groundwater levels are less than about ten feet bgs and are specified in the geotechnical reports where appropriate.

**Ground Shaking:** Ground movement resulting from the transmission of seismic waves during an earthquake.

**Groundwater:** The term usually refers to the “saturated” zone in the ground where all the pore space between the soil particles is occupied by water. Water under the Earth's surface, often confined to aquifers capable of supplying wells and springs. Does not include water which is being produced with oil in the production of oil and gas or in a bona fide mining operation.

**Groundwater Basin:** A groundwater reservoir defined by the entire overlying land surface and the underlying aquifers that contain water stored in the reservoir. Boundaries of successively deeper aquifers may differ and make it difficult to define the limits of the basin.

**Groundwater Overdraft:** The condition of a groundwater basin in which the amount of water withdrawn by pumping exceeds the amount of water that recharges the basin over a period of years during which water supply conditions approximate average.

**Groundwater Recharge:** The natural process of infiltration and percolation of rainwater from land areas or streams through permeable soils into water-holding rocks that provide underground storage (i.e., aquifers); the action of increasing groundwater storage by natural conditions or by human activity. See also Artificial Recharge.

**Groundwater Table:** The upper surface of the zone of saturation (all pores of subsoil filled with water), except where the surface is formed by an impermeable body.

**Group Quarters:** A residential living arrangement, other than the usual house, apartment, or mobile home, in which two or more unrelated persons share living quarters and cooking facilities. Institutional group quarters include nursing homes, orphanages, and prisons. Non-institutional group quarters include dormitories, shelters, and large boardinghouses.

**Growth Area:** A geographic subarea used in Ventura County population forecasts to refer to an area where urban development has already taken place or is expected to take place.

**Growth Management:** The use by a community of a wide range of techniques in combination to determine the amount, type, and rate of development desired by the community and to channel that growth into designated areas. Growth management policies

can be implemented through growth rates, zoning, capital improvement programs, public facilities ordinances, urban limit lines, standards for levels of service, and other programs.

**Growth Management Plan (GMP):** A plan developed for a given geographical region (e.g., by the Southern California Association of Governments [SCAG]) that contains demographic projections (i.e., housing units, employment, and population for the region. The plan provides recommendations for local governments to better accommodate the growth projected by occur and reduce environmental impacts.

**Habitable Structures:** In this document, this term refers to man-made structures that are permanently (e.g., housing) or temporarily (e.g., stores, churches) inhabited by people and that could represent a danger in the event of a collapse due to seismic shaking. Small structures that can be vacated immediately (e.g., guard stations, gazebos, parking structures) are not considered to be habitable structures for seismic discussions.

**Habitat:** A place where a plant or animal naturally or normally lives or grows.

**Habitat Conservation Plan (HCP):** A plan required in support of a federal Section 10(a) permit under the federal Endangered Species Act.

**Hazard Index (HI):** The sum of hazard quotients for substances that affect the same target organ or organ system. A calculated HI exposure less than 1.0 will likely not result in adverse non-cancer health effects over a lifetime of exposure. However, an HI greater than 1.0 does not necessarily mean that adverse effects will occur.

**Hazard Quotient:** The ratio of the potential exposure to a substance and the level at which no adverse effects are expected.

**Hazardous Material:** A substance or combination of substances which because of its quantity, concentration, or physical, chemical or infectious characteristics, may either (1) cause, or significantly contribute to, an increase in mortality or an increase in serious, irreversible, or incapacitating reversible, illness or (2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported, disposed of or otherwise managed.

**Hazardous Waste:** A waste or combination of wastes that, because of its quantity, concentration, or physical, chemical, or infectious characteristics, may either cause or significantly contribute to an increase in mortality or an increase in serious irreversible illness, or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed. A hazardous material than cannot be reused or recycled. A hazardous waste possesses at least one of four characteristics—ignitability, corrosivity, reactivity, or toxicity—or appears on special U.S. Environmental Protection Agency (USEPA) or State lists. Hazardous waste is regulated under the federal Resource Conservation and Recovery Act and the *California Health and Safety Code*.

**Health Risk Assessment (HRA):** A document that identifies the risks and quantities of possible adverse health effects that may result from exposure to emissions of toxic air

contaminants. A health risk assessment cannot predict specific health effects; it only describes the increased possibility of adverse health effects based on the best scientific information available.

**Hearing loss:** The loss of auditory capacity. Can be caused by prolonged exposure to loud noise.

**Height:** The vertical distance from the adjacent grade to the highest point of that which is being measured.

**Heliport:** An identifiable area on land or water, including any building or facilities thereon, used or intended to be used for the landing and takeoff of helicopters. Does not include temporary landing and takeoff sites. Refueling and overnight maintenance are permitted.

**Helistop:** An identifiable area on land or water, including any building or facilities thereon, used or intended for the landing and takeoff of helicopters. Does not include temporary landing and takeoff sites. Refueling and overnight maintenance are not permitted.

**Herbicides:** Chemical compounds that are used to destroy or control the growth of weeds and other undesirable plants.

**Heritage Oak:** As detailed in the County of Los Angeles Oak Tree Ordinance, any tree in the genus *Quercus* that (1) measures 36 inches or more in diameter, as measured 4.5 feet above natural ground or (2) any oak of 36 inches or less in diameter having a significant historical or cultural importance.

**Hertz:** Unit of measurement of frequency, numerically equal to cycles per second.

**High-Occupancy Vehicle (HOV):** A motor vehicle that is carrying at least a minimum specified number of passengers (normally at least two or more, sometimes three or more). It can be a bus, a taxi with passengers, or a car or van used for carpooling.

**Hillside Management Area:** Any portion of a lot or parcel of land which contains terrain with a natural slope gradient 25 percent or greater (County of Los Angeles 2014).

**Highway:** High-speed, high-capacity, limited-access transportation facility serving regional and county-wide travel. Highways may cross at a different grade level.

**Hillsides:** Land that has an average percent of slope equal to or exceeding 15 percent.

**Historical resource:** A resource listed or eligible for listing on the California Register of Historical Resources, or included in a local register of historical resources. A determination of the nature of an unlisted historical resource can also be made by a lead agency, as detailed in the *California Public Resources Code* (Section 5020.1[j] or 5024.1). Historic resources include buildings, sites, objects, districts, and structures.

---

**Historically Significant (per CEQA):** The resource meets the criteria for listing on the California Register of Historical Resources” (*California Public Resources Code*, Section 5024.1; 14 CCR 4852), including if the resource:

- (1) Is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage;
- (2) Is associated with lives of persons important in our past;
- (3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- (4) Has yielded, or may be likely to yield, information important in prehistory or history.

**Holocene Era:** A geologic epoch extending from approximately 14,000 Years Before Present (YBP) through the present day.

**Holocene Maximum:** A period beginning in 3,500 YBP and exhibiting significantly warmer and wetter conditions than were experienced previously. Archaeologically, it was marked by a large population increase and movement into new environments along the south-central California coast and the Mojave Desert.

**Holocene time:** A geologic period, which began approximately 9600 BCE. The Holocene continues to the present.

**Hot Spot:** A localized concentration of an air pollutant associated with restricted dispersion conditions, often occurring in such places as street intersections or close to the source of emissions.

**Household:** The U.S. Census Bureau defines a household as all persons living in a housing unit whether or not they are related. A single person living in an apartment as well as a family living in a house is considered a household. Household does not include individuals in dormitories, prisons, convalescent homes, or other group quarters.

**Household Income:** The total income of all the persons living in a household. A household is usually described as very low income, low income, moderate income, and upper income based upon household size and income, relative to the regional median income.

**Households, Market Rate:** Households who, as determined by the county or county, have the financial capability to meet their housing needs without sacrificing other essential needs.

**Households, Non-Market-Rate:** Households who, as determined by the city or county, do not have the financial capability to meet their housing needs without sacrificing other essential needs.

**Housing and Community Development, California Department of (HCD):** The department of the California State Government which has responsibility for housing policy

and programs. HCD establishes the guidelines for preparation of local housing elements, prepares the statewide housing element, and offers technical assistance to local jurisdictions.

**Housing and Urban Development, U.S. Department of (HUD):** The cabinet level department of the federal government responsible for housing, housing assistance, and urban development at the national level. Housing programs administered through HUD include Community Development Block Grant (CDBG), HOME, and Section 8.

**Housing Element:** One of the seven State-mandated elements of a local general plan, it assesses the existing and projected housing needs of all economic segments of the community, identifies potential sites adequate to provide the amount and kind of housing needed, and contains adopted goals, policies, and implementation programs for the preservation, improvement, and development of housing. Under State law, a housing element must be updated every five years.

**Housing and Urban Development, U.S. Department of (HUD):** A cabinet-level department of the federal government that administers housing and community development programs.

**Housing Subsidy:** Housing subsidies refer to government assistance aimed at reducing housing sales or rent prices to more affordable levels. Two general types of housing subsidy exist. Where a housing subsidy is linked to a particular house or apartment, housing subsidy is "project" or "unit" based. In Section 8 rental assistance programs the subsidy is linked to the family and assistance provided to any number of families accepted by willing private landlords. This type of subsidy is said to be "tenant based."

**Housing Unit:** The place of permanent or customary abode of a person or family. A housing unit may be a single-family dwelling, a multi-family dwelling, a condominium, a modular home, a mobile home, a cooperative, or any other residential unit considered real property under State law. A housing unit has, at least, cooking facilities, a bathroom, and a place to sleep. It also is a dwelling that cannot be moved without substantial damage or unreasonable cost.

**Human Scale:** The proportional relationship of a particular building, structure, or streetscape element to human form and function.

**Hydraulic conductivity:** The ability of water to migrate in the aquifer.

**Hydraulics:** The study and technological application of the behavior of fluids.

**Hydrocarbons (HC):** Compounds containing various combinations of hydrogen and carbon atoms. They may be emitted into the air by natural sources (e.g., trees) and as a result of fossil and vegetative fuel combustion, fuel volatilization, and solvent use. Hydrocarbons are a major contributor to smog.

**Hydroconsolidation:** Collapse with the addition of water, but under different mechanisms than liquefaction.

**Hydrogen Sulfide (H<sub>2</sub>S):** A colorless, flammable, poisonous compound having a characteristic rotten-egg odor. It is used in industrial processes and may be emitted into the air.

**Hydrology:** The study of the water cycle.

**Hydromodification:** Changes to the storm water runoff characteristics of a watershed caused by changes in land use.

**Hydrophobic:** Having low solubility in water.

**Illuminance:** The amount of total light received from a source by a unit of surface area.

**Impact:** The effect, influence, or imprint of an activity or the environment. Impacts include: direct or primary effects which are caused by the project and occur at the same time and place; indirect or secondary effects which are caused by the project and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect or secondary effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density, or growth rate and related effects on air and water and other natural systems, including ecosystems.

**Impact Fee:** A fee, also called a development fee, levied on the developer of a project by a city, county, or public agency as compensation for otherwise-unmitigated impacts the project will produce. The *California Government Code* (Sections 66000 et seq.) specifies that development fees shall not exceed the estimated reasonable cost of providing the service for which the fee is charged. To lawfully impose a development fee, the public agency must verify its method of calculation and document proper restrictions of use of the fund.

**Impervious Surface:** Ground surface that cannot be penetrated by water. Includes paved and compacted surfaces, as well as those covered by buildings.

**Important Farmlands:** Important farmlands include prime farmlands, farmlands of statewide importance, unique farmlands, and farmlands of local importance as defined and mapped by the California Department of Conservation (NRCS 2017a).

**Imported Water:** Water that has originated from one hydrologic region and is transferred to another hydrologic region.

**Impoundment:** A body of water, such as a pond, confined by a dam, dike, floodgate, or other barrier.

**Income Categories/Levels:** Four categories are used to classify a household according to the median income for the county. Under State housing statutes, these categories are as follows: Very Low (0 to 50 percent of county median); Low (50 percent to 80 percent of county median); Moderate (80 percent to 120 percent of county median); and Upper (over 120 percent of county median). Four levels are included relating to the Orange County HUD median income: Income I is defined as households earning 0 to 30 percent of the HUD county median income. Income II is defined as households earning 30 to 50 percent of the HUD

county median income. Income III is defined as households earning 50 to 80 percent of the HUD county median income. Income IV is defined as households earning 80 to 120 percent of the HUD county median income.

**Incorporation:** Creation of a new city.

**Incorporation by Reference:** Reliance on a previous environmental document for some portion of the environmental analysis of a project. An EIR or Negative Declaration may incorporate by reference all or portions of another document which is a matter of public record or is generally available to the public. Where all or part of another document is incorporated by reference, the incorporated language shall be considered to be set forth in full as part of the text of the EIR or Negative Declaration (State CEQA Guidelines, Section 15150).

**Indirect Impact:** Effects caused by an action that are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.

**Indirect Source:** Any facility, building, structure, or installation, or combination thereof, which generates or attracts mobile source activity that results in emissions of any pollutant (or precursor) for which there is a State ambient air quality standard. Examples of indirect sources include employment sites, shopping centers, sports facilities, housing developments, airports, commercial and industrial development, and parking lots and garages.

**Indirect Source Control Program:** Rules, regulations, local ordinances and land use controls, and other regulatory strategies of air pollution control districts or local governments used to control or reduce emissions associated with new and existing indirect sources. Indirect source control programs include regulatory strategies such as transportation control measures (e.g., South Coast's Regulation XV for employer-based trip reduction); parking charges; land use controls that reduce the need for vehicle travel and increase transit, bicycle, and pedestrian access; and source-specific regulations such as truck idling and travel schedule requirements.

**Industrial:** The manufacture, production, and processing of consumer goods. Industrial is often divided into "heavy industrial" uses, such as construction yards, quarrying, and factories; and "light industrial" uses, such as research and development and less intensive warehousing and manufacturing.

**Inert Waste:** Includes materials that do not undergo physical or other changes after disposal, such as asphalt, concrete, dirt, and rock.

**Infiltration:** The introduction of underground water, such as groundwater, into wastewater collection systems. Infiltration results in increased wastewater flow levels.

**Infiltration basin:** A shallow impoundment that is designed to infiltrate storm water into the soil. Infiltration basins are believed to have a high pollutant removal efficiency, and can also help recharge the groundwater, thus restoring low flows to stream systems.

**Infiltration System:** An infiltration basin designed to capture runoff volume from the water quality design storm and infiltrate it to the soil.

**Infiltration trench:** A long, narrow, rock-filled trench with no outlet that receives storm water runoff. Runoff is stored in the void space between the stones and infiltrates through the bottom and into the soil matrix.

**Inflow:** Surface water, such as rainfall runoff, that enters a wastewater collection system through manhole covers and joints or cracks in pipes. Inflow results in increased wastewater flow levels.

**Infrastructure:** Permanent utility installations, including roads, water supply lines, sewage collection pipes, and power and communications lines.

**Initial Study:** Under CEQA, a preliminary analysis prepared by the Lead Agency to determine whether an EIR, a Negative Declaration, or Mitigated Negative Declaration must be prepared, or to identify the significant environmental effects to be analyzed in an EIR (State CEQA Guidelines, Section 15365).

**In-Situ:** A rock, mineral or fossil in its natural position, i.e., the situation in which it was originally formed or deposited.

**Institutional Use:** (1) Publicly or privately owned and operated activities such as hospitals, convalescent hospitals, intermediate care facilities, nursing homes, museums, and schools and colleges; (2) churches and other religious organizations; and (3) other non-profit activities of a welfare, educational, or philanthropic nature that cannot be considered residential, commercial, or industrial.

**Institute of Transportation Engineers (ITE):** Organization for professional transportation engineers. ITE publishes the Trip Generation Manual, which provides information on trip generation for land uses and building types. For instance, if an individual needs to know the number of trip ends produced by an industrial park, the report provides a trip rate based upon the size of the building. The report also divides the trip rate into peak hour rates, weekday rates, etc.

**Integrated Waste Management Act (IWMA):** Also known as Assembly Bill (AB) 939 (Chapter 1095, Statutes of 1989), the IWMA created the Integrated Waste Management Board, required each jurisdiction in the state to submit detailed solid waste planning documents for Board approval, set diversion requirements of 25 percent in 1995 and 50 percent in 2000, established a comprehensive statewide system of permitting, inspections, enforcement, and maintenance for solid waste facilities, and authorized local jurisdictions to impose fees based on the types or amounts of solid waste generated.

**Integrated Waste Management Board (IWMB):** The State agency within CalEPA responsible for solid waste management (non-hazardous).

**Integrated Water Resources Management Strategy (IWRMS):** A planning policy document which identifies watershed management principles and related infrastructure and water resources planning initiatives incorporated into the Centennial Specific Plan. The Strategy provides a comprehensive framework for demonstrating the interrelationship of proposed systems for water supply, wastewater treatment/reclamation, flood control/drainage, water quality and sediment management.

**Intelligent Transportation System (ITS):** ITS improves transportation safety and mobility and enhances productivity through the integration of advanced communications technologies into the transportation infrastructure and in vehicles. ITS encompasses a broad range of wireless and wire line communications-based information and electronics technologies.

**Intensity, Building:** For residential uses, the actual number or the allowable range of dwelling units per net or gross acre. For non-residential uses, the actual or the maximum permitted floor area ratios (FARs).

**Inter-Agency:** Indicates cooperation between or among two or more discrete agencies in regard to a specific program.

***inter alia:*** Literally, “Among other things” (Latin). A term used in formal extract minutes to indicate that the minute quoted has been taken from a fuller record of other matters.

**Interest, Fee:** Entitles a land owner to exercise complete control over use of land, subject only to government land use regulations.

**Intermittent Stream:** A stream that normally flows for at least 30 days after the last major rain of the season and is dry a large part of the year.

**Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA):** This Congressional act requires states to develop a Statewide Transportation Plan and a Statewide Transportation Improvements Program (STIP) that identifies short-term project needs and priorities. It has also been a major source of funding for transportation planning and encourages the linking of transportation and community planning.

**Internal Trips:** Trips with both their origin and destination within the project site (e.g., traveling from your home in Centennial directly to the grocery store in Centennial is an internal trip).

**Intersection Capacity:** The maximum number of vehicles that has a reasonable expectation of passing through an intersection in one direction during a given time period under prevailing roadway and traffic conditions.

**Intersection Capacity Utilization (ICU):** A measure of the volume to capacity ratio for an intersection. Typically used to determine the peak hour level of service for a given set of

intersection volumes (e.g., an intersection with an ICU of 0.60 has 60 percent of the total available capacity being used by traffic).

**Intersection Capacity Utilization Method (ICU):** A method of analyzing intersection level of service by calculating a volume-to-capacity (V/C) ratio for each governing "critical" movement during a traffic signal phase. The V/C ratio for each phase is summed with the others at the intersection to produce an overall V/C ratio for the intersection as a whole. The ICU is usually expressed as a percent. The percent represents that portion of the hour required to provide sufficient capacity to accommodate all intersection traffic if all approaches operate at capacity. The V/C ratio represents the percent of intersection capacity used. For example, a V/C ratio of 0.85 indicates that 85 percent of capacity is being used.

**Intrusive Noise:** Noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or information content as well as the prevailing ambient noise level.

**Inversion Layer:** A condition in the atmosphere through which the temperature increases with altitude, holding cooler surface air down along with its pollutants.

**Jobs/Housing Balance or Jobs/Housing Ratio:** The jobs/housing ratio divides the number of jobs in an area by the number of employed residents. A ratio of 1.0 typically indicates a balance. A ratio greater than 1.0 indicates a net in-commute; less than 1.0 indicates a net out-commute.

**Jurisdiction by Law:** Jurisdiction by law means the authority of any public agency: (1) To grant a permit or other entitlement for use; (2) To provide funding for the project in question; or (3) To exercise authority over resources which may be affected by the project. A city or county will have jurisdiction by law with respect to a project when the city or county having primary jurisdiction over the area involved is: (1) The site of the project; (2) The area in which the major environmental effects will occur; and/or (3) The area in which reside those citizens most directly concerned by any such environmental effects. Where an agency having jurisdiction by law must exercise discretionary authority over a project in order for the project to proceed, it is also a Responsible Agency (State CEQA Guidelines, Section 15366).

**Kilowatt (kW):** One kilowatt is equal to 1,000 watts. Refers to the instantaneous amount of electricity used or generated.

**Lacustrine:** Deposited in a lake environment.

**Landfill:** An area of land or an excavation in which wastes are placed for permanent disposal, and that is not a land application unit, surface impoundment, injection well, or waste pile. Class I and Class II landfills are both hazardous waste landfills. Class I landfills have stricter controls than Class II landfills and can accept wastes not permitted in Class II facilities.

**Landmark:** (1) A building, site, object, structure, or significant tree, having historical, architectural, social, or cultural significance and marked for preservation by the local, State,

or federal government. (2) A visually prominent or outstanding structure or natural feature that functions as a point of orientation or identification.

**Landslide:** Down slope movement of soil and/or rock, which typically occurs during an earthquake or following heavy rainfall.

**Landslide Complex:** The association of geologic structure and deep-seated landsliding.

**Landslide debris:** Geologic evidence and debris resulting from previous hillside earth movements.

**Land Use:** The purpose or activity for which a piece of land or its buildings is designed, arranged, or intended, or for which it is occupied or maintained.

**Land Use Classification:** A system for classifying and designating the appropriate use of properties.

**Land Use Element:** A required element of the General Plan that uses text and maps to designate the future use or reuse of land within a given jurisdiction's planning area. The land use element serves as a guide to the structuring of zoning and subdivision controls, urban renewal, and capital improvements programs, and to official decisions regarding the distribution and intensity of development and the location of public facilities and open space. Designates the general location and intensity of housing, business, industry, open space, education, public buildings and grounds, waste disposal facilities, and other land uses.

**Land Use Plan:** An adopted map depicting the approximate location of residential, commercial, public, semi-public, and private uses, open space, and road systems with a statistical summary of areas and densities for these land uses.

**Land Use Regulation:** A term encompassing the regulation of land in general and often used to mean those regulations incorporated in the General Plan, as distinct from zoning regulations (which are more specific).

**Large Family/Household:** A family of 5 or more persons.

**Late Horizon:** A period of time beginning in approximately 1,000 Years Before Present (YBP) and corresponding with the Little Ice Age.

**Late Pleistocene Era:** A geologic epoch within the Pleistocene, extending from approximately 130,000 YBP through 14,000 YBP.

**Lateral Spreading:** Lateral movement of soil, often as a result of liquefaction during an earthquake.

**L<sub>dn</sub>:** Day-Night Average Sound Level. The A-weighted average sound level for a given area (measured in decibels) during a 24-hour period with a 10-decibel (dB) weighting applied to night-time sound levels. The L<sub>dn</sub> is approximately numerically equal to the Community Noise Equivalent Level (CNEL) for most environmental settings.

**Leachate:** A product or solution formed by leaching (The removal of soluble material from a substance, such as soil or rock, through the percolation of water), especially a solution containing contaminants picked up through the leaching of soil ([www.dictionary.com](http://www.dictionary.com)).

**Lead Agency:** The public agency which has the principal responsibility for carrying out or approving a project. The Lead Agency will decide whether an EIR or Negative Declaration will be required for the project and will cause the document to be prepared (State CEQA Guidelines, Section 15367).

**Leq:** The energy equivalent level, defined as the average sound level on the basis of sound energy (or sound pressure squared). The  $L_{eq}$  is a “dosage” type measure and is the basis for the descriptors used in current standards, such as the 24-hour CNEL used by the State of California.

**Level of Concern (LOC):** The concentration of a potentially hazardous material in the air above which there may be serious irreversible health effects or death as a result of a single exposure for a relatively short period of time.

**Level of Service (LOS):** LOS is the qualitative measure that incorporates the collective factors of speed, travel time, traffic interruption, freedom to maneuver, safety, driving comfort and convenience, and operating costs provided by a highway facility under a particular volume condition. A scale based on a rating of A (best) to F (worst) used to evaluate circulation system performance based on Intersection Capacity Utilization (ICU) values, average vehicle delay, vehicle density, or volume/capacity ratios of arterial segments.

*Level of Service A:* Indicates a relatively free flow of traffic, with little or no limitation on vehicle movement or speed.

*Level of Service B:* Describes a steady flow of traffic, with only slight delays in vehicle movement and speed. All queues clear in a single signal cycle.

*Level of Service C:* Denotes a reasonably steady, high-volume flow of traffic, with some limitations on movement and speed, and occasional backups on critical approaches.

*Level of Service D:* Designates the level where traffic nears an unstable flow. Intersections still function, but short queues develop and cars may have to wait through one cycle during short peaks.

*Level of Service E:* Represents traffic characterized by slow movement and frequent (although momentary) stoppages. This type of congestion is considered severe, but is not uncommon at peak traffic hours, with frequent stopping, long-standing queues, and blocked intersections.

*Level of Service F:* Describes unsatisfactory stop-and-go traffic characterized by “traffic jams” and stoppages of long duration. Vehicles at signalized intersections usually have to wait through one or more signal changes, and “upstream” intersections may be blocked by the long queues.

**Life-Cycle Costing:** A method of evaluating a capital investment that takes into account the sum total of all costs associated with the investment over the lifetime of the project.

**Light (duty) Rail Transit (LRT):** “Street cars” or “trolley cars” that typically operate entirely or substantially in mixed traffic and in non-exclusive, at-grade rights-of-way. Passengers typically board vehicles from the street level (as opposed to a platform that is level with the train) and the driver may collect fares. Vehicles are each electrically self-propelled and usually operate in one or two-car trains.

**Light Spill:** When light shines beyond the intended area and illuminates an unintended area.

**Lignitic:** Coal-bearing.

**Lineament:** A linear topographic feature, often used to describe a portion of a fault line.

**Line Source:** A long, narrow source of air pollutant emissions such as a roadway or runway.

**Linked Trips:** A series of individual trips made between a primary origin and a primary destination. (e.g., traveling from your home in Centennial to a school in Centennial, then to a coffee shop in Centennial, then to your job in Valencia represents three trips (two internal and one external), and six trip ends.

**Liquefaction:** Liquefaction is the state or process in which surface and near-surface material (e.g., soils, alluvium) is transformed from a solid into a liquid state. This occurs due to increased pore pressure and reduced effective stress. Soil may become liquefied, for example, during and immediately following an earthquake.

**Little Ice Age:** A period of global cooling and advancement of ice sheets between 1280 and 1860.

**L<sub>max</sub>:** the highest noise level measured during the time noise is measured.

**Local Agency:** Local agency means any public agency other than a State agency, board, or commission. Local agency includes but is not limited to cities, counties, charter cities and counties, districts, school districts, special districts, redevelopment agencies, local agency formation commissions, and any board, commission, or organizational subdivision of a local agency when so designated by order or resolution of the governing legislative body of the local agency (State CEQA Guidelines, Section 15368).

**Local Agency Formation Commission (LAFCO):** A five- or seven-member commission for each County that reviews and evaluates all proposals for formation of special districts, incorporation of cities, annexation to special districts or cities, consolidation of districts, and merger of districts with cities. Each County's LAFCO is empowered to approve, disapprove, or conditionally approve such proposals. The five LAFCO members generally include two county supervisors, two city council members, and one member representing the general public. Some LAFCOs include two representatives of special districts.

**Local Enforcement Agency (LEA):** The local government entity that acts in the capacity as solid waste enforcement agency (*California Code of Regulations*, Title 14, Section 18011[a][14]).

**Los Angeles County Flood Control Act of 1915:** An Act of the California State Legislature which authorized the formation of the Los Angeles County Flood Control District (District or LACFCD) for the purpose of controlling and conserving the district's flood, storm, and other waste waters for beneficial and useful purposes. The act enables the District to identify projects that would improve conservation and replenishment of water resources. The act also empowers the District to protect the harbors, waterways, public highways, and property within its jurisdiction from damage from such waters, providing for recreational use of district facilities and enhancing scenic beauty are also part of its duties.

**Lot:** An area of land created or established for purposes of sale, lease, finance, division of interest or separate use, separated from other lands by description on a final map or parcel map.

**Lot of Record:** A lot that is part of a recorded subdivision or a parcel of land that has been recorded at the county recorder's office containing property tax records.

**Low-Income Household:** A household with an annual income usually no greater than 80 percent of the area median family income adjusted by household size, as determined by a survey of incomes conducted by a city or a county, or in the absence of such a survey, based on the latest available eligibility limits established by the U.S. Department of Housing and Urban Development (HUD) for the Section 8 housing program.

**Mano:** The upper or hand-held stone used when grinding maize or other grains on a metate.

**Manufactured Slope:** A slope created by grading that consists of cut and fill material.

**Massive:** Rocks of any origin that are more or less homogenous in texture or fabric.

**Mass Grading:** A grading technique in which all lots, building pads, and streets are generally graded over the entire area resulting in the disruption of the majority of the onsite natural grade and vegetation and/or often resulting in, but not required to result in, a successive pad/terrace configuration.

**Master Association and Neighborhood Associations:** Each association will be a California nonprofit mutual benefit corporation or substantially similar entity.

*Master Association:* The master association will be established by the master developer. Through the master Declaration of Covenants, Conditions and Restrictions (the "master CC&Rs"), the master developer as "Declarant" will subject the entire master planned development to (1) a common plan of development to implement a master planned community pursuant to California Department of Real Estate (DRE) Regulation 2792.32 and (2) the master association. Without limiting the generality of the foregoing, the master association will be responsible for the maintenance of all

common areas which are not subject to any neighborhood CC&Rs as defined below. As envisioned, the master association will incorporate communities of various types.

*Neighborhood Associations:* Neighborhood associations will have subordinate, concurrent jurisdiction with the master association. Any one neighborhood association will have jurisdiction over only a delineated, usually contiguous portion (rather than the entirety) of the master planned development. Neighborhood associations will reflect the various land uses; some neighborhood associations may be residential, while other may be commercial or industrial. Each merchant builder, acting as "Declarant" pursuant to a neighborhood Declaration of Covenants, Conditions and Restrictions ("neighborhood CC&Rs") as developed by such merchant builder, will subject the corresponding real property owned by such merchant builder to (1) a common plan of development and (2) the corresponding neighborhood association. It is anticipated that each merchant builder will re-subdivide such real property in furtherance of that merchant builder's common plan of development for such real property.

**Master Plan of Arterial Highways (MPAH):** A diagram in the Circulation Element which illustrates the arterial designation of roadways. Each arterial designation defines the number of ultimate lanes planned for a given roadway. Arterial designations include: Freeway, Transportation Corridor, Expressway, Major Highway, Primary Highway, Secondary Highway, and Commuter Highway.

**Materials Recovery Facility (MRF):** An intermediate processing facility designed to remove recyclables and other valuable materials from the waste stream for purposes of recycling or composting. A "dirty MRF" removes reusable materials from unseparated trash. A "clean MRF" separates materials from commingled recyclables, typically collected from residential or commercial curbside programs.

**Maximum Contaminant Level (MCL):** Standards/limits set for Primary Drinking Water Standards for public water systems with respect to levels of contaminants that may cause adverse health effects.

**Maximum Credible Earthquake:** The largest Richter magnitude (M) seismic event that appears to be reasonably capable of occurring under the conditions of the presently known geological framework.

**Maximum Extent Practicable (MEP):** The extent to which storm water management practices are required to be implemented to reduce storm water pollution. All management practices that are effective at reducing storm water pollution are required to be implemented, except when any of the following conditions are met: (1) other effective management practices would achieve greater or substantially the same pollution control benefits; (2) the management practices would not be technically feasible; (3) the cost of management practice implementation would greatly outweigh pollution control benefits; or, (4) implementation of the management practice would compromise other legal or institutional constraints, expectations, and obligations imposed by federal or State statute or case law.

**Median:** A physical divider separating lanes of traffic that typically are traveling in opposite directions. A median is often installed to prohibit unsafe turning movements. It can also be used to beautify a streetscape.

**Median Income:** The annual income of each household size within a region which is defined annually by HUD. Half of the households in the region have incomes above the median and half have incomes below the median.

**Median Strip:** The dividing area, either paved or landscaped, between opposing lanes of traffic on a roadway.

**Megawatt (mW):** One megawatt is equal to 1,000 kilowatts, or one million watts. Refers to the instantaneous amount of electricity being used or generated.

**Memorandum of Understanding (MOU):** A common form of formal agreement between government agencies.

**Mercalli Intensity Scale:** A subjective measure of the observed effects (human reactions, structural damage, geologic effects) of an earthquake. Expressed in Roman numerals from I to XII.

**Merger (District):** Elimination of a special district by transferring its service responsibilities to a city government. The merging district's territory must be totally included inside the city.

**Metate:** A flat stone that has a shallow depression in the upper surface for holding maize or other grains to be ground with a mano.

**Mexican Period:** California regional history between 1821 through 1848.

**Midden:** A mound of domestic refuse containing shells and animal bones marking the site of a prehistoric settlement.

**Middle Horizon (aka Intermediate Period):** Between 3,500 Years Before Present (YBP) and 1,500 YBP.

**Middleground Zone:** Visual elements in this zone can be seen at a moderate distance and partially dominate the view.

**Military Operations Area (MOA):** airspace established outside Class A airspace to separate or segregate certain nonhazardous military activities (Federal Aviation Regulations, Part 1, Section 1.1).

**Mineral Resource:** Land on which known deposits of commercially viable mineral or aggregate deposits exist. This designation is applied to sites determined by the State Division of Mines and Geology as being a resource of regional significance, and is intended to help maintain the quarrying operations and protect them from encroachment of incompatible land uses.

**Mineral Resource Zones:** Zones that have been identified as having potential mineral and aggregate resources. The State Mining and Geology Board recommends that these lands be preserved as open space or used for interim uses to allow for future extraction.

**Ministerial (Administrative) Decision:** Describes a governmental decision involving little or no personal judgment by the public official as to the wisdom or manner of carrying out the project. The public official merely applies the law to the facts as presented, but uses no special discretion or judgment in reaching a decision. A ministerial decision involves only the use of fixed standards or objective measurements, and the public official cannot use personal, subjective judgment in deciding whether or how the project should be carried out. Common examples of ministerial permits include automobile registrations, dog licenses, and marriage licenses. A building permit is ministerial if the ordinance requiring the permit limits the public official to determining whether the zoning allows the structure to be built in the requested location, the structure would meet the strength requirements in the Uniform Building Code, and the applicant has paid his fee (State CEQA Guidelines, Section 15369).

**Mitigation:** Mitigation refers to (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the impacted environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or, (5) compensating for the impact by replacing or providing substitute resources or environments (State CEQA Guidelines, Section 15370).

**Mitigation Measure:** Action taken to reduce or eliminate environmental impacts. Mitigation includes avoiding the impact altogether by not taking a certain action or parts of an action; minimizing impacts by limiting the degree or magnitude of the action and its implementation; rectifying the impact by repairing, rehabilitating, or restoring the affected environment; reducing or eliminating the impact over time by preservation and maintenance during the life of the action; and compensating for the impact by replacing or providing substitute resources or environments.

**Mitigation Monitoring Program:** When a lead agency adopts a mitigated negative declaration or an EIR, it must adopt a program of monitoring or reporting which will ensure that mitigation measures are implemented. (See *California Public Resources Code*, Section 21081.6[a]; State CEQA Guidelines, Sections 15091[d] and 15097).

**Mixed Use:** Properties on which various uses, such as office, commercial, institutional, and residential, are combined in a single building or on a single site in an integrated development project with significant functional interrelationships and a coherent physical design. A “single site” may include contiguous properties.

**Mobile Sources:** A source of air pollution that is related to transportation vehicles, such as automobiles, motorcycles, trucks, off-road vehicles, boats, and airplanes.

**Moderate Income Household:** A household with an annual income between the lower income eligibility limits and 120 percent of the area median family income adjusted by

household size, usually as established by the U.S. Department of Housing and Urban Development (HUD) for the Section 8 housing program.

**Monterey Agreement:** Signed by California Department of Water Resources (DWR) and many of the agricultural and urban State Water Project (SWP) contractors in 1994, it established principles to be incorporated in contract amendments (the Monterrey Amendments) to be offered to the SWP contractors. The overall goals of the Agreement were to resolve conflicts and disputes among SWP contractors regarding water allocations and financial responsibilities for SWP operations, to restructure and clarify procedures for SWP water allocation and delivery during times of shortage and surplus, and to reduce financial pressures on agricultural contractors in times of drought and supply reductions.

**Motor Vehicle:** A motor vehicle shall include any and all self-propelled vehicles as defined in the *California Motor Vehicle Code* including all on-highway type motor vehicles subject to registration under said code and all off-highway type motor vehicles subject to identification under said code.

**MS4:** See municipal separate storm sewer system.

**Mudflow (Mudslide):** A river flow or inundation of liquid mud down a hillside, usually as a result of a dual condition of loss of brush cover and the subsequent accumulation of water on or under the ground, preceded by a period of unusually heavy or sustained rain.

**Muller:** An implement of stone or other substance with a flat base for grinding paints, powders, etc., on a slab of stone.

**Multimodal:** More than one mode of transportation in the same geographic area.

**Multiple-Family (Multi-Family) Dwelling Unit:** A building or portion of a building containing two or more dwelling units with each dwelling unit occupied by only one household.

**Multiple Species Conservation Program (MSCP):** A cooperative, long-term habitat conservation planning program for southwestern San Diego County, as authorized under the federal and California Endangered Species Acts and the California Natural Communities Conservation Planning Act. The MSCP is designed to preserve an interconnected system of viable native habitat for the protection of multiple sensitive species by identifying priority conservation areas, Multiple-Habitat Planning Areas (MHPA), where development will be restricted and areas outside the MHPA where future development will be directed.

**Municipal Separate Storm Sewer System (MS4) Permit, Los Angeles:** The Los Angeles County MS4 Permit is being used as a benchmark for the entire Project site even though it only technically applies to that portion of the Project site located in the boundaries of the Los Angeles Regional Water Quality Control Board (LARWQCB) because the portion of the Project site within the Lahontan Region is not currently covered under a separate MS4 Permit.

**Municipal Services:** Services traditionally provided by local government, including water and sewer, roads, parks, schools, and police and fire protection.

**National Ambient Air Quality Standards (NAAQS):** Standards set by the U.S. Environmental Protection Agency for the maximum levels of air pollutants that can exist in the ambient air without unacceptable effects on human health or public welfare. There are two types of NAAQS. Primary standards set limits to protect public health and secondary standards set limits to protect public welfare.

**National Environmental Policy Act (NEPA):** In 1969, the National Environmental Policy Act was enacted establishing a national environmental policy and the Council on Environmental Quality (CEQ) to advise the President on environmental issues. NEPA requires the preparation of environmental impact statements (EIS) for all major federal actions which would have a significant effect on the environment. NEPA served as a model for the California Environmental Quality Act (CEQA) enacted in 1970.

**National Flood Insurance Program:** A federal program that authorizes the sale of federally subsidized flood insurance in communities where such flood insurance is not available privately.

**National Pollutant Discharge Elimination System (NPDES) Permits:** Under the NPDES Program (Federal Clean Water Act), any person responsible for the discharge of a pollutant or pollutants into any waters of the United States from any point source must apply for and obtain a permit. According to Section 402 of the Clean Water Act, the Environmental Protection Agency (EPA) is the issuing authority for all NPDES permits in a state until such time as the State elects to take over the administration and obtains EPA approval of its programs. (The State Water Resources Control Board [SWRCB] has this authority in California.) Dischargers are required to disclose the volume and nature of their discharges. Further, the EPA or equivalent State Agency has the authority to specify limitations to be imposed on discharges and to require monitoring and reporting as to compliance or non-compliance.

**National Primary Drinking Water Regulations:** Legally enforceable standards that apply to public water systems. Primary standards protect public health by limiting the levels of contaminants in drinking water. These limits are also known as maximum contaminant levels (MCLs).

**National Register of Historic Places:** The official inventory established by the National Historic Preservation Act of districts, sites, buildings, structures, and objects significant in American history, architecture, archeology, engineering and culture.

**National Secondary Drinking Water Regulations:** Non-enforceable guidelines regulating contaminants that may cause cosmetic effects (such as skin or tooth discoloration) or aesthetic effects (such as taste, odor, or color) in drinking water. The U.S. Environmental Protection Agency (USEPA) recommends secondary standards to water systems, but does not require systems to comply.

**Natural Community Conservation Plan (NCCP):** NCCP generally refers to a plan authorized pursuant to the Natural Communities Conservation Planning Act.

**Natural Grade:** The grade unaffected by construction techniques such as fill, landscaping, or berming.

**Neighborhood:** A planning area commonly identified as such in a community's planning documents, and by the individuals residing and working within the neighborhood. Documentation may include a map prepared for planning purposes, on which the names and boundaries of the neighborhood are shown.

**Neighborhood Park:** City- or county-owned land intended to serve the recreational needs of people living or working within one-half mile radius of the park.

**Net Site Area:** The total horizontal area within the property lines of a parcel of land. All rights-of-way or easements which physically prohibit the surface use of that portion of the property for other than vehicular ingress and egress are excluded.

**New Source Review (NSR):** A Clean Air Act requirement that State Implementation Plans must include a permit review, which applies to the construction and operation of new and modified stationary sources in non-attainment areas, to ensure attainment of national ambient air quality standards. The two major requirements of NSR are Best Available Control Technology and Emission Offsets.

**Nighttime Light and Glare:** Indirect reflected light generated on the Project site during the night. Nighttime sources of light would include streetlights, vehicle headlights, and lights used within and around buildings located throughout the Project site.

**Nitric Oxide (NO):** Precursor of ozone, nitrogen dioxide (NO<sub>2</sub>), and nitrate; nitric oxide is usually emitted from combustion processes. Nitric oxide is converted to NO<sub>2</sub> in the atmosphere, and then becomes involved in the photochemical processes and/or particulate formation.

**Nitrogen Dioxide (NO<sub>2</sub>):** A secondary contaminant formed through a reaction between nitric oxide (NO) and atmospheric oxygen, irritates the lungs at high concentrations and contributes to ozone formation.

**Nitrogen Oxides (NO<sub>x</sub>):** Chemical compounds containing nitric oxide (NO), nitrogen dioxide (NO<sub>2</sub>), and oxygen; reacts with volatile organic compounds in the presence of heat and sunlight to form ozone. It is also a major precursor to acid rain. A reddish brown gas that is a byproduct of combustion and ozone formation processes. Often referred to as NO<sub>x</sub>, this gas gives smog its "dirty air" appearance. NO<sub>2</sub> is a criteria air pollutant, and may result in numerous adverse health effects.

**Noise:** Any sound that is undesirable because it interferes with speech and hearing, or is intense enough to damage hearing, or is otherwise annoying. Noise is unwanted sound.

**Noise Attenuation:** Reduction of the level of a noise source with distance using a substance, material, or surface, such as earth berms and/or solid concrete walls.

**Noise Barrier:** A wall or other solid structure constructed with the objective of attenuating (i.e., reducing) noise behind the barrier; commonly, a noise wall along a roadway.

**Noise Cone:** A three-dimensional cone-shaped representation of noise impacts of aircraft use.

**Noise Contour:** A line connecting points of equal noise level as measured on the same scale. Noise levels greater than the 60 L<sub>dn</sub> contour (measured in dBA) require noise attenuation in residential development.

**Noise Disturbance:** An alleged intrusive noise which violates an applicable standard, as set forth in the Los Angeles County Code (see Section 12.08.230, Noise disturbance, of the Los Angeles County Code).

**Noise Element:** One of the seven State-mandated elements of a local general plan. It assesses noise levels of highways and freeways, local arterials, railroads, airports, local industrial plants, and other ground stationary sources, and adopts goals, policies, and implementation programs to reduce the community's exposure to noise.

**Noise Sensitive Use:** Any use (i.e., residential development) or designated geographic area (i.e., hospital complex) where “intrusive noise” is incompatible with the conduct of the noise sensitive uses or constitutes a “noise disturbance” for residents or works. “Noise sensitive areas” are not specifically defined in the County Code. Typical noise-sensitive uses can include schools, day-care centers, hospitals, and other types of uses.

**Non-Attainment:** The condition of not achieving a desired or required level of performance. Frequently used in reference to air quality. A geographic area identified by the USEPA and/or the California Air Resources Board as not meeting either National or California Ambient Air Quality standards for a given pollutant.

**Non-Conforming Use:** A use that was valid when brought into existence, but by subsequent regulation becomes no longer conforming. "Non-conforming use" is a generic term and includes (1) non-conforming structures (by virtue of size, type of construction, location on land, or proximity to other structures), (2) non-conforming use of a conforming building, (3) non-conforming use of a non-conforming building, and (4) non-conforming use of land. Thus, any use lawfully existing on any piece of property that is inconsistent with a new or amended General Plan, and that in turn is a violation of a zoning ordinance amendment subsequently adopted in conformance with the General Plan, will be a non-conforming use. Typically, non-conforming uses are permitted to continue for a designated period of time, subject to certain restrictions.

**Non-Growth Area:** A geographic subarea used in Ventura County population forecasts to refer to an area where urban development is not expected to occur.

**Non-Point Source:** Air pollution sources that are not at individual, stationary locations (i.e., mobile source or area source).

**Non-Point Source Discharge:** Discharge from a diffuse pollution source (i.e., without a single point of origin or not introduced into a receiving stream from a specific outlet).

**Non-Storm Water Discharge:** Any discharge to a storm drain system or receiving water that is not composed entirely of storm water.

**Notice of Completion:** A brief notice filed with the Office of Planning and Research (OPR) by a Lead Agency as soon as it has completed a draft EIR, and is prepared to send out copies for review (State CEQA Guidelines, Section15372).

**Notice of Determination (NOD):** A brief notice to be filed by a public agency after it approves or determines to carry out a project which is subject to the requirements of CEQA (State CEQA Guidelines, Section15373). The filing of the NOD starts the statute of limitations period.

**Notice of Exemption:** A brief notice which may be filed by a public agency after it has decided to carry out or approve a project and has determined that the project is exempt from CEQA as being ministerial, categorically exempt, an emergency, or subject to another exemption from CEQA. Such a notice may also be filed by an applicant where such a determination has been made by a public agency which must approve the project (CEQA Guidelines, Section15374).

**Notice of Preparation:** A brief notice sent by a Lead Agency to notify responsible agencies, trustee agencies, and involved federal agencies that the Lead Agency plans to prepare an EIR for the project. The purpose of the notice is to solicit guidance from those agencies as to the scope and content of the environmental information to be included in the EIR. Public agencies are free to develop their own formats for this notice (State CEQA Guidelines, Section15375).

**Oak Woodland Conservation Act:** Passed by the California Legislature in 2001, the Act established the Oak Woodland Conservation Program to be administered by the Wildlife Conservation Board (WCB). The Oak Woodland Conservation Program was designed to provide \$10 million to help local jurisdictions protect and enhance their oak woodland resources. It offers landowners, conservation organizations, and cities and counties an opportunity to obtain funding for projects designed to conserve and restore California's oak woodlands, and authorizes the WCB to purchase oak woodland conservation easements and provide grants for land improvements and oak restoration efforts.

**Objective:** A description of a desired condition for a resource. A specific statement of desired future condition toward which the City or County will expend effort in the context of striving to achieve a broader goal. An objective should be achievable and, where possible, should be measurable and time-specific. The *California Government Code* (Section 65302) requires that general plans spell out the "objectives," principles, standards, and proposals of the general plan. "The addition of 100 units of affordable housing by 1995" is an example of an objective.

**Off-Site Noise-Sensitive Receptor:** Considered to be a single-family or multi-family residence, school, convalescent or acute care hospital, park or recreation area, and/or church.

**Office of Environmental Health Hazard Assessment (OEHHA):** A department within the California Environmental Protection Agency that is responsible for evaluating chemicals for adverse health impacts and establishing safe exposure levels. OEHHA also assists in performing health risk assessments and developing risk assessment procedures for air quality management purposes.

**Office Use:** The use of land by general business offices, medical and professional offices, administrative or headquarters offices for large wholesaling or manufacturing operations, and research and development.

**Ohm-cm:** In physics, ohm is a measure of resistivity. Resistivity is measured in ohm-centimeters (cm).

**Older Alluvium:** Soil or sediments deposited by a previously existing river or other running water. Alluvium is typically made up of a variety of materials, including fine particles of silt and clay and larger particles of sand and gravel.

**Open Space:** Land that has been left in its natural state and has not been developed with primary or accessory structures.

**Open Space Element:** One of the seven State-mandated elements of a local general plan. It contains an inventory of privately and publicly owned open-space lands, and adopted goals, policies, and implementation programs for the preservation, protection, and management of open space lands.

**Ordinance:** A law or regulation set forth and adopted by a governmental authority, usually a city or county.

**Organic Compounds:** A large group of chemical compounds containing mainly carbon, hydrogen, nitrogen, and oxygen. All living organisms are made up of organic compounds.

**Outdoor Advertising Structure:** Any device used or intended to direct attention to a business, profession, commodity, service, or entertainment conducted, sold, or offered elsewhere than upon the lot where such device is located.

**Outdoor Recreation Use:** A privately or publicly owned or operated use providing facilities for outdoor recreation activities.

**Outer Approach Zone:** Airspace in which an air-traffic controller initiates radar monitoring for incoming flights approaching an airport.

**Overcrowding:** As defined by the U.S. Census, a household with greater than 1.01 persons per room, excluding bathrooms, kitchens, hallways, and porches. Severe overcrowding is defined as households with greater than 1.51 persons per room.

**Overexcavate:** To excavate beyond a project footprint, or to a specific depth, as a means to remove soils exhibiting undesirable engineering characteristics.

**Overlay:** A land use designation on the land use map, or a zoning designation on a zoning map, that modifies the basic underlying designation in some specific manner.

**Overpayment:** The extent to which gross housing costs, including utility costs, exceed 30 percent of gross household income, based on data published by the U.S. Census Bureau. Severe overpayment, or cost burden, exists if gross housing costs exceed 50 percent of gross income.

**Oxides of Nitrogen:** A reddish-brown gas with an odor similar to bleach. The major source of this pollutant is the high temperature combustion of fossil fuels. Health effects include irritation and damage to lungs and lower resistance to respiratory infections.

**Ozone (O<sub>3</sub>):** A compound consisting of three oxygen atoms that is the primary constituent of smog. It is formed through chemical reactions in the atmosphere involving volatile organic compounds, nitrogen oxides, and sunlight. Ozone can irritate the lungs as well as damage to trees, crops, and materials. There is a natural layer of ozone in the upper atmosphere which shields the earth from harmful ultraviolet radiation. Ozone is a criteria pollutant.

**Ozone Precursors:** Chemicals such as non-methane hydrocarbons and oxides of nitrogen, occurring either naturally or as a result of human activities, which contribute to the formation of ozone, a major component of smog.

**PM:** Particulate matter (PM) pollution consists of very small liquid and solid particles floating in the air. These particles represent a concern to public health because the particles are small enough to be inhaled into the deepest part of the lung. There are two classifications of PM: PM<sub>10</sub> and PM<sub>2.5</sub>. PM<sub>10</sub> particles are less than 10 microns in diameter, and PM<sub>2.5</sub> particles are less than 2.5 microns in diameter.

**Paleoclimatic:** Relating to climate of some former period of geologic time.

**Paleoindian Period:** Approximately 12,000–10,500 Years Before Present (YBP).

**Paleontological Resource:** A geologic unit or formation from which fossils have previously been recovered, including unique or important fossils.

**Paleontological Site:** Any area or location containing a trace or impression, or the remains, of plants or animals from past ages.

**Palliative:** Tending or serving to relieve or lessen without curing; mitigate; alleviate.

**Palustrine:** A non-tidal marsh without flowing water.

**Parcel:** The basic unit of land entitlement. A designated area of land established by plat, subdivision, or otherwise legally defined and permitted to be used or built upon. A lot, or contiguous group of lots, in single ownership or under single control, usually considered a unit for purposes of development.

**Parcel Map:** A map depicting the establishment of up to four new lots by splitting a recorded lot. Parcel maps are subject to the California Subdivision Map Act and a city's subdivision regulations.

**Parks, Park Land, Parkland:** Open space lands whose primary purpose is recreation. Land that is publicly owned or controlled for the purpose of providing parks, recreation, or open space for public use.

**Parking Area, Public:** An open area, excluding a street or other public way, used for the parking of automobiles and available to the public, whether for free or for compensation.

**Parking Management:** An evolving TDM technique designed to obtain maximum utilization from a limited number of parking spaces. Can involve pricing and preferential treatment for high occupancy vehicles, non-peak period users, and short-term users.

**Parking Ratio:** The number of parking spaces provided per 1,000 square of floor area (e.g., 2:1 or "two per thousand").

**Parking, Shared:** A public or private parking area used jointly by two or more uses.

**Parking Space, Compact:** A parking space (usually 7.5 feet wide by 16 feet long when perpendicular to a driveway or aisle) permitted in some localities on the assumption that many modern cars are significantly smaller, and require less room, than a standard automobile. A standard parking space, when perpendicular to a driveway or aisle, is usually 8.5 feet wide by 18 feet long.

**Parkway:** An expressway or freeway designed for non-commercial traffic only; usually located within a strip of landscaped park or natural vegetation.

**Parkway Strip:** A piece of land located between the rear of a curb and the front of a sidewalk, usually used for planting low ground cover and/or street trees, also known as "planter strip."

**Particulate Matter:** Any material except uncombined water which exists in a finely divided form and is a liquid or solid at standard conditions. The size of particulate matter can vary from coarse, wind-blown dust particles to fine particle combustion products.

**Particulate Matter, Fine (PM<sub>2.5</sub>):** PM<sub>2.5</sub> is a mixture of very small particulates with an aerodynamic diameter equal to or less than 2.5 microns. PM<sub>2.5</sub> consists of particles directly emitted into the air and particulates formed in the air from the chemical transformation of gaseous pollutants. PM<sub>2.5</sub> particulates are emitted from activities such as industrial and residential combustion, and from vehicle exhaust. Particles 2.5 microns or smaller infiltrate the deepest portions of the lungs, increasing the risks of long-term disease, including chronic respiratory disease, cancer, and increased and premature death.

**Particulate Matter, Respirable (PM10):** PM10 is any particulate matter with an aerodynamic diameter equal to or less than 10 microns (about  $1/7$  the diameter of a single human hair). PM10 consists of particles directly emitted into the air and particulates formed in the air from the chemical transformation of gaseous pollutants. PM10 particulates are emitted from activities such as industrial and residential combustion, and from vehicle exhaust. PM10 causes adverse health effects, atmospheric visibility reduction. It is a criteria pollutant.

**Parts Per Million (ppm):** The number of weight or volume units of a minor constituent present within each one million units of the major constituent of a solution or mixture, such as salts in water.

**PC:** Passenger cars.

**PC/H:** Passenger cars per hour.

**PC/H/LN:** Passenger cars per hour per lane.

**Passenger Trips:** Relate to the volume of passenger service provided by public transportation—such as buses, trains, and aircraft.

**Passive Solar System:** system that distributes collected heat via direct transfer from a thermal mass rather than mechanical power. Passive systems rely on building design and materials to collect and store heat and to create natural ventilation for cooling.

**Peak Hour or Peak Period:** The one hour period during which the roadway carries the greatest number of vehicles. Traffic volumes are not constant throughout the day. Peak hours are the times during which volumes are significantly higher than others. Most areas have two peak hours—morning while people travel to work and late afternoon or evening as they leave work and return home. In some cases as third, though usually smaller, peak occurs during the middle of the day. As development intensifies and traffic volumes increase, the durations of the peaks are extended until eventually the peak hour becomes a peak period which may last for two or three hours. Peak period volumes are important as these are the times of day when the most severe congestion occurs, and intersections must be designed to accommodate these volumes if smooth traffic flow is to be maintained. The peak hour refers to the one-hour period during the a.m. peak period (typically 7 AM to 9 AM) and the one-hour period during the PM peak period (typically 3 PM to 6 PM) in which the greatest number of vehicle trips are generated by a given land use or are traveling on a given roadway.

**Percent Slope:** A common way of expressing the steepness of the slope of terrain, which is derived by dividing the change in elevation by the horizontal distance traversed. An increase of 20 feet elevation over a 100 foot distance is a 20 percent slope.

**Percent Variation in Travel Time:** The RTP defines this as the day-to-day change in travel times experienced by travelers. Variability results from accidents, weather, road closures, system problems, and other non-recurrent conditions.

**Perched Groundwater:** Groundwater supported by a zone of material of low permeability located above an underlying main body of groundwater with which it is not hydrostatically connected.

**Percolation:** The downward movement of water through the soil or alluvium to the groundwater table.

**Performance Standards:** Zoning regulations that permit uses based on a particular set of standards of operation rather than on particular type of use. Performance standards provide specific criteria limiting noise, air pollution, emissions, odors, vibration, dust, dirt, glare, heat, fire hazards, wastes, traffic impacts, and visual impact of a use.

**(Permanent) Open Space:** The area which will be preserved as natural open space lots, minor greenway lots, and landscape lots as identified on the VTTMs.

**Permeability (soil):** That quality of the soil or other geologic formations that enables it to transmit water or air.

**Permit:** The possession of a permit issued by the city, or where no permits are issued, the sanctioning of the activity by the jurisdiction as noted in a public record.

**Permittees:** The Permittees are the Los Angeles County cities and the County (collectively “the Co-Permittees”).

**Person:** Person includes any person, firm, association, organization, partnership, business, trust, corporation, limited liability company, company, district, city, county, city and county, town, the State, and any of the agencies or political subdivisions of such entities (State CEQA Guidelines, Section 15376).

**Person Trips:** Indicates the number of people, and are of interest in situations where there may be opportunities to accomplish more one-person trips with less vehicle trips—such as a carpool.

**Pesticide:** Any material used to control pests. Includes insecticides, herbicides, and rodenticides.

**Petroglyphs:** Small abraded pits.

**pH:** A measure of acidity or alkalinity of a material, liquid, or solid. It is measured on a scale of 0 to 14 with 7 representing a neutral state, 0 representing the most acid and 14 the alkaline.

**Photochemical Smog:** The atmospheric condition that results when reactive organic gases and nitrogen oxides emitted into the atmosphere react in the presence of sunlight to form other pollutants, such as oxidants.

**Photoionization Detector:** A portable vapor and gas detector that detects a variety of organic compounds.

**Photovoltaic:** The conversion of sunlight into a photovoltaic cell into electricity.

**Physiographic:** Physical geography of the Earth.

**Physiological responses:** An automatic instinctive reaction to a stimulus. Can include changes in pulse rate and blood pressure.

**Pivot Field:** A “pivot field” is a circular agricultural field with a centralized “pivot” irrigation system.

**Plan Line:** A precise line that establishes future rights-of-way along any portion of an existing or proposed street or highway and that is depicted on a map showing the streets and lot line or lines and the proposed right-of-way lines, and the distance thereof from the established centerline of the street or highway, or from existing or established property lines.

**Plane-parallel Shears:** This term describes a deformation of rock resulting from stresses that cause contiguous parts of a geologic body to slide in relation to each other in a direction parallel to their plane of contact (The American Geologic Institute 1984).

**Planned Community:** A large-scale development whose essential features are a definable boundary; a consistent, but not necessarily uniform, character; overall control during the development process by a single development entity; private ownership of recreation amenities; and enforcement of covenants, conditions, and restrictions by a master community association.

**Planned Unit Development (PUD):** A description of a proposed unified development, consisting at a minimum of a map and adopted ordinance setting forth the regulations governing, and the location and phasing of all proposed uses and improvements to be included in the development.

**Planning and Research, Governor's Office of (OPR):** A division of the Governor's Office responsible for coordinating State, regional, and local planning in California, including publishing guidelines for the preparation and content of city and county general plans.

**Planning Area:** The area directly addressed by the general plan. A city's planning area typically encompasses the city limits and potentially annexable land within its sphere of influence.

**Planning Commission:** A body, usually having five or seven members, created by a city or county in compliance with California law that requires the assignment of the planning functions of the city or county to a planning department, planning commission, hearing officers, and/or the legislative body itself, as deemed appropriate by the legislative body.

**Plans, Specifications, and Estimates (PS&E):** The bid documents, including general design, specifications, and estimated costs.

**Plant Community:** A group of plant species commonly occurring together in roughly similar proportions.

**Pleistocene Era:** A geologic epoch extending from approximately 1.8 million Years Before Present (YBP) through 14,000 YBP.

**Point Source:** Specific points of origin where pollutants are emitted into the atmosphere or water system such as from factory smokestacks or effluent discharge.

**Policy:** A specific statement of principle or of guiding actions that implies clear commitment but is not mandatory. A general direction that a governmental agency sets to follow, in order to meet its goals and objectives before undertaking an action program.

**Pollutant:** Any introduced gas, liquid, or solid that makes a resource unfit for its normal or usual purpose.

**Pollution:** The presence of matter or energy whose nature, location, or quantity produces undesired environmental effects.

**Pollution, Non-Point:** Sources for pollution that are less definable and usually cover broad areas of land, such as agricultural land with fertilizers that are carried from the land by runoff, or automobiles.

**Pollution, Point:** In reference to water quality, a discrete source from which pollution is generated before it enters receiving waters, such as a sewer outfall, a smokestack, or an industrial waste pipe.

**California Porter-Cologne Water Quality Control Act (Porter-Cologne Act):** A 1969 Act of the California Legislature designed to preserve, enhance and restore the quality of the State's water resources. The Act established the State Water Resources Control Board and nine Regional Water Quality Control Boards as the principal State agencies with the responsibility for controlling water quality in California. Under the Act, water quality policy was established and the discharges of pollutants from point and non-point sources were regulated.

**Potable Water:** Suitable and safe for drinking.

**Poverty Level:** As used by the U.S. Census, families, and unrelated individuals are classified as being above or below the poverty level based on a poverty index that provides a range of income cutoffs or "poverty thresholds" varying by size of family, number of children, and age of householder. The income cutoffs are updated each year to reflect the change in the Consumer Price Index.

**Precursor:** A chemical compound that leads to the formation of a pollutant. Reactive organic gases and nitrogen oxides are precursors of photochemical oxidants.

**Preservation:** As used in historic preservation, the process of sustaining the form and extent of a structure essentially as it exists. Preservation aims at halting further deterioration and providing structural stability but does not contemplate significant rebuilding.

**Preserve:** An area in which beneficial uses in their present condition are protected; for example, a nature preserve or an agricultural preserve. To keep safe from destruction or decay; to maintain or keep intact.

**Previously placed fill:** Fill material placed prior to the implementation of a proposed project, most often found in previously disturbed project sites.

**Prime Agricultural Land:** (1) Land used actively in the production of food, fiber, or livestock. (2) All land which qualifies for rating as Class I or Class II in the Soil Conservation Service land use compatibility classifications. (3) Land which qualifies for rating 80 through 100 in the Storie Index Rating (See Prime Farmland).

**Prime Farmland:** Lands with the best combination of physical and chemical features able to sustain long-term production of agricultural crops. The land must be supported by a developed irrigation water supply that is dependable and of adequate quality during growing season. The land must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date (NRCS 2017a).

**Private Project:** A "private project" means a project which will be carried out by a person other than a governmental agency, but the project will need a discretionary approval from one or more governmental agencies for: (a) a contract or financial assistance, or (b) a ease, permit, license, certificate, or other entitlement for use (State CEQA Guidelines, Section 15377).

**Private Road/Private Street:** Privately owned (and usually privately maintained) motor vehicle access that is not dedicated as a public street. Typically the owner posts a sign indicating that the street is private property and limits traffic in some fashion. For density calculation purposes, some jurisdictions exclude private roads when establishing the total acreage of the site; however, aisles within and driveways serving private parking lots are not considered private roads.

**Professional Offices:** A use providing professional or consulting services in the fields of law, medicine, architecture, design, engineering, accounting, and similar professions, but not including financial institutions or real estate or insurance offices.

**Program:** An action, activity, or strategy carried out in response to adopted policy to achieve a specific goal or objective. Policies and programs establish the "who," "how" and "when" for carrying out the "what" and "where" of goals and objectives.

**Program EIR:** An EIR prepared on a series of actions that can be characterized as one large project. A program EIR generally establishes a framework for tiered or project-level environmental documents that are prepared in accordance with the overall program (See CEQA Guidelines, Section 15168[a]).

**Project:** “Project: means the whole of an action which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment, and that is any of the following: (1) an activity directly undertaken by any public agency including but not limited to public works construction and related activities clearing or grading of land, improvements to existing public structures, enactment and amendment of zoning ordinances, and the adoption and amendment of local General Plans or elements thereof pursuant to Sections 65100–65700 of the *California Government Code*; (2) an activity undertaken by a person which is supported in whole or in part through public agency contacts, grants, subsidies, loans, or other forms of assistance from one or more public agencies; (3) an activity involving the issuance to a person of a lease, permit, license, certificate, or other entitlement for use by one or more public agencies. The definition of “project” does not include (1) proposals for legislation to be enacted by the State Legislature; (2) continuing administrative or maintenance activities, such as purchases for supplies, personnel-related actions, general policy and procedure making (except as they are applied to specific instances covered above); (3) the submittal of proposals to a vote of the people of the state or of a particular community; (4) the creation of government funding mechanisms or other government fiscal activities, which do not involve any commitment to any specific project which may result in a potentially significant physical impact on the environment. The term “project” refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term “project” does not mean each separate governmental approval. Where the Lead Agency could describe the project as either the adoption of a particular regulation under subsection (a)(1) or as a development proposal which will be subject to several governmental approvals under subsections (a)(2) or (a)(3), the Lead Agency shall describe the project as the development proposal for the purpose of environmental analysis. This approach will implement the Lead Agency principle as described in Article 4 (State CEQA Guidelines, Section 15378).

**Project Description:** Describes the basic characteristics of the project including location, need for the project, project objectives, technical and environmental characteristics, project size and design, project phasing, and required permits. The level of detail provided in the project description varies according to the type of environmental document prepared.

**Project EIR:** An EIR that examines the impacts that would result from development of a specific project (See State CEQA Guidelines, Section 15161).

**Project Lot Area:** The total land area of a project after all required dedications or reservations for public improvements, including, but not limited to, streets, parks, schools, flood control channels, etc.

**Projectile Point:** An object affixed to a pole or stick of some kind, which has been fashioned for use as a weapon, out of stone, metal, bone, or other material.

**Prominent Landform or Ridgeline:** A visually prominent landform or ridgeline means any landform visible from the valley floor that forms a part of the skyline or is seen as a distinct edge against a backdrop of land at least 500 feet horizontally behind it.

**Prominent Visual Features:** As used in this EIR, features that are unique to the west Antelope Valley and/or are prominent in relation to their relative surroundings.

**Property Line:** The boundary line between two pieces of property ([www.thefreedictionary.com](http://www.thefreedictionary.com)).

**Proposed or Candidate Species:** A third species designation under the Endangered Species Act. A third status is that of "candidate species". Under this status, the U.S. Fish and Wildlife Service (USFWS) has concluded that listing of a species as Threatened or Endangered is warranted but immediate listing is precluded. Because Proposed Species may soon be listed as Threatened or Endangered, these species could become listed prior to or during implementation of a proposed development project.

**Pro Rata:** Refers to the proportionate distribution of the cost of something to something else or to some group, such as the cost of infrastructure improvements associated with new development apportioned to the users of the infrastructure on the basis of projected use.

**Pseudo-Static:** Earthen material under seismic stress but not presently in motion.

**Public Agency:** Public agency includes any State agency, board, or commission and any local or regional agency, as defined in these Guidelines. It does not include the courts of the State. This term does not include agencies of the federal government (State CEQA Guidelines, Section 15379).

**Public Facilities:** Institutional response to basic human needs, such as health, education, safety, recreation, and inspiration. Also, includes facilities and services such as, but not limited to, police, fire, libraries, parks, and flood control.

**Public Right-of-Way:** Any street, avenue, boulevard, highway, sidewalk, or alley or similar place which is owned or controlled by a governmental entity.

**Public Space:** Any real property or structures thereon which are owned or controlled by a governmental entity.

**Pump Station:** A complete pumping installation, including a storage box, pump or pumps, standby pumps, connecting pipes, electrical equipment, pump house, and outlet chamber.

**Quasi-public:** A use owned or operated by a non-profit, religious or charitable institution and providing educational, cultural, recreational, religious, or similar types of public programs.

**Quiescent:** Still

**Rare Species:** In accordance with the State CEQA Guidelines, a "Species" means a species or subspecies of animal or plant or a variety of plant. A Rare Species as one present in such small numbers throughout its range that it may become Endangered if its present environment worsens. The Rare Species designation applies only to California native plants.

**Re-Refined Oil:** Re-refined oil is recycled oil product (CIWMB 2006).

**Reactive Organic Compound (ROC)/Reactive Organic Gases (ROG):** A photochemically reactive chemical gas, composed of non-methane hydrocarbons, which may contribute to the formation of smog. Also sometimes referred to as Non-Methane Organic Gases (NMOGs).

**Recharge:** The physical process where water naturally percolates or sinks into a groundwater basin.

**Recharge Basin:** A surface facility, often a large pond, used to increase the infiltration of surface water into a groundwater basin.

**Reclamation:** The reuse of resources, usually those present in solid wastes or sewage.

**Recompaction:** The reconsolidation of disturbed earth.

**Recreation, Active:** A type of recreation or activity that requires the use of organized play areas including, but not limited to, softball, baseball, football and soccer fields, tennis and basketball courts, and various forms of children's play equipment.

**Recreation, Passive:** Type of recreation or activity that does not require the use of organized play areas.

**Recycle:** Per Section 40180 of the *California Public Resources Code*, the process of collecting, sorting, cleansing, treating, and reconstituting materials that would otherwise become solid waste, and returning them to the economic mainstream in the form of raw material for new, reused, or reconstituted products that meet the quality standards necessary to be used in the marketplace.

**Regional:** Pertaining to activities or economies at a scale greater than that of a single jurisdiction, and affecting a broad geographic area.

**Regional Housing Needs Assessment (RHNA):** The Regional Housing Needs Assessment (RHNA) is based on State projections of population growth and housing unit demand and assigns a share of the region's future housing need to each jurisdiction within the SCAG region. These housing need numbers serve as the basis for the update of each California city and county Housing Element.

**Regional Park:** A park typically 150–500 acres in size focusing on activities and natural features not included in most other types of parks and often based on a specific scenic or recreational opportunity.

**Regional Transportation Plan (RTP):** The RTP is created by the Metropolitan Planning Organization (MPO) or the regional planning commission.

**Registered Environmental Assessor:** The Registered Environmental Assessor (REA) Program, under the jurisdiction of the California Department of Toxic Substances Control, registers environmental compliance experts on a voluntary basis. Each registrant listed in

the REA registry has been evaluated by the REA program staff and found to possess suitable education and experience. An Environmental Site Assessment (ESA) performed by a Registered Environmental Assessor (REA) is your primary means to minimize liability from the “innocent landowner” defense.

**Regulation:** A rule or order prescribed for managing government.

**Remediate:** To mitigate a specific environmental impact.

**Reservoir:** A pond, lake, tank, basin, or other space either natural or created in whole or in part by the building of engineering structures.

**Residential Land Use:** Land designated in the city or county general plan and zoning ordinance for buildings consisting only of dwelling units. May be improved, vacant, or unimproved. Any parcel or area of land devoted to housing and ancillary uses.

**Residential Care Facility:** A facility that provides 24-hour care and supervision to its residents.

**Residential, Multiple Family:** Usually three or more dwelling units on a single site, which may be in the same or separate buildings.

**Residential, Single-family:** A single dwelling unit on a building site.

**Resistivity:** A measure of how strongly a material opposes the flow of electric current. Resistivity is measured in ohm-centimeters (cm).

**Resources, Non-renewable:** Refers to natural resources, such as fossil fuels and natural gas, which, once used, cannot be replaced and used again.

**Resource Sector:** An area judged to contain a significant deposit of construction-quality aggregate.

**Responsible Agency:** A public agency that proposes to carry out or approve a project, for which a Lead Agency is preparing or has prepared an EIR or Negative Declaration. For the purposes of CEQA, the term "Responsible Agency" includes all public agencies other than the Lead Agency which have discretionary approval power over the project (State CEQA Guidelines, Section 15381).

**Return Flow:** Irrigation water not consumed by evapotranspiration but returned to either ground or surface water. Also known as “return water”.

**Reverse:** A type of fault similar to a normal fault, except the footwall moves downward relative to the hanging wall.

**Reverse Commute:** The travel from the city center to suburban locations, moving counter to the primary or major volume of traffic flow.

**Reviewing Agencies:** Local, State, and federal agencies with jurisdiction over the project area or resources potentially affected by the project. Cities and counties are also considered reviewing agencies.

**Rezoning:** An amendment to the map and/or text of a zoning ordinance to effect a change in the nature, density, or intensity of uses allowed in a zoning district and/or on a designated parcel or land area.

**Rhyolite:** A usually light-colored, fine-grained extrusive igneous rock that is compositionally similar to granite.

**Richter Scale:** A logarithmic scale developed in 1935–1936 by Dr. Charles F. Richter and Dr. Beno Gutenberg to measure earthquake magnitude by the amount of energy released, as opposed to earthquake intensity as determined by local effects on people, structures, and earth materials. A measure of the size or energy release of an earthquake at its source. The scale is logarithmic; the wave amplitude of each number on the scale is ten times greater than that of the previous whole number.

**Rideshare:** A travel mode other than driving alone, such as buses, rail transit, carpools, and vanpools.

**Ridgeline:** A line connecting the highest points along a ridge and separating drainage basins or small-scale drainage systems from one another.

**Right-Lateral:** Movement of a strike-slip fault where, if an observer were standing on one side of the fault, the opposite side would move to the right.

**Right-of-Way (ROW):** That portion of property which is dedicated or over which an easement is granted for public streets, utilities, or alleys.

**Rilling:** An erosion process which forms numerous small shallow channels.

**Riparian Lands:** Riparian lands are comprised of the vegetative and wildlife areas adjacent to perennial and intermittent streams. Riparian areas are delineated by the existence of plant species normally found near freshwater.

**Rippability:** A measure of an earthen material's ability to be excavated with conventional excavation equipment.

**Risk Assessment:** The qualitative and quantitative evaluation of the risk posed to human health and/or the environment by the actual or potential presence and/or use of specific pollutants.

**Risk of Upset:** The risk associated with potential explosions, fires, or release of hazardous substances in the event of an accident or natural disaster.

**Road Deck:** The part of the bridge structure on which the road is constructed.

**Runoff:** That portion of rain or snow that does not percolate into the ground and is discharged into streams instead.

**Road Deck:** The part of a bridge structure which the road is constructed on.

**Roadway Capacity:** The RTP defines roadway capacity as vehicles per hour per lane (vphpl) by type of facility.

**Safe Drinking Water Act:** The Act (*California Health and Safety Code*, Sections 116350–116405) is intended to protect public health by regulating the nation’s public drinking water supply and authorizes the United States Environmental Protection Agency (USEPA) to set national standards for drinking water to protect against both naturally occurring and man-made contaminants.

**Safe Drinking Water Bond Act (2006) (Proposition 84):** Passed by voters in 2006, the Act authorized the State to issue \$5.4 billion in bonds for a wide variety of projects related to water safety, rivers, beaches, levees, watersheds, and parks and forests.

**Safety Element:** One of the seven State-mandated elements of the general plan. It establishes the policies and programs to protect the community from risks associated with seismic, geologic, flood, and wildfire hazards.

**Sanitary Landfill:** The controlled placement of refuse within a limited area, followed by compaction and covering with a suitable thickness of earth and other containment material.

**Sanitary Sewer:** A system of subterranean conduits that carries refuse liquids or waste matter to a plant where the sewage is treated, as contrasted with storm drainage systems (that carry surface water) and septic tanks or leech fields (that hold refuse liquids and waste matter on the site). Underground pipes that carry off only domestic or industrial waste, not storm water.

**Santa Clarita Valley Consolidated Traffic Model:** A model jointly developed by Los Angeles County and the City of Santa Clarita.

**Scale:** Refers to the geographic area and data resolution under examination in an assessment or planning effort.

**Scarified:** To break up the surface of (topsoil or pavement) ([www.dictionary.com](http://www.dictionary.com)).

**Scarp:** A transition zone between different geologic features that involves a sharp elevation differential, characterized by a cliff or steep slope. Can include a line of cliffs formed by the faulting or fracturing of the Earth’s crust.

**Scenic Highway Corridor:** The area outside a highway right-of-way that is generally visible to persons traveling on the highway.

**Scenic Highway/Scenic Route:** A highway, road, drive, or street that, in addition to its transportation function, provides opportunities for the enjoyment of natural and man-made

scenic resources and access or direct views to areas or scenes of exceptional beauty or historic or cultural interest. The aesthetic values of scenic routes often are protected and enhanced by regulations governing the development of property or the placement of outdoor advertising.

**Scrubber:** An air pollution control device that uses a high energy liquid spray to remove aerosol and gaseous pollutants from an air stream. The gases are removed either by absorption or chemical reaction.

**Secondary Maximum Contaminant Level (SMCL):** Standards set for public water systems with respect to levels of contaminants that do not cause adverse health effects but can impact the color and odor of water.

**Secondary Treatment:** Generally, a level of treatment that produces 85 percent removal efficiencies for biological oxygen demand and suspended solids. Usually carried out through the use of trickling filters or by the activated sludge process.

**Section 106:** Provision in National Historic Preservation Act that requires federal agencies to consider effects of proposed undertakings on properties listed or eligible for listing in the National Register of Historic Places.

**Section 4(d):** A section of the Federal Endangered Species Act (FESA) that allows special rules to apply to a species listed as Threatened. Can specify the conditions allowing incidental take.

**Section 2081:** A section of the California Endangered Species Act (CESA) that governs the take of listed Endangered species.

**Section 4(f):** Provision in U.S. Department of Transportation Act that prohibits federal approval or funding of transportation projects that require “use” of any historic site unless (1) there is “no feasible and prudent alternative to the project” and (2) the project includes “all possible planning to minimize harm”.

**Section 10(a):** A section of the federal ESA that governs issuance of a permit to allow incidental take of a listed Endangered species.

**Sediment:** Organic or inorganic material that is carried by or is suspended in water and that settles out to form deposits in the storm drain system or receiving waters.

**Sedimentation:** Process by which material suspended in water is deposited in a body of water.

**Seiche:** A free or standing-wave oscillation of the surface of water in an enclosed or semi-enclosed basin (such as a lake, bay, or harbor). It is generally caused by local changes in atmospheric pressure, aided by winds, tidal currents and small earthquakes.

**Seismic:** Caused by or subject to earthquakes or earth vibrations.

**Seismic Hazards Mapping Act:** Legislation acted by the California legislature in April of 1997. Unlike the Alquist-Priolo Earthquake Fault Zoning Act, the Seismic Hazards Mapping Act addresses non-surface fault rupture earthquake hazards, including liquefaction and seismically induced landslides. The act requires the creation and publication of maps showing areas where such impacts could occur.

**Seismically induced settlement:** The densification of soils resulting from seismic motion. During strong ground-shaking, soil grains may become more tightly packed due to the collapse of voids or pore spaces, resulting in a reduction in the thickness of the soil column.

**Seismicity:** The frequency or magnitude of earthquake activity in a given area.

**Senescence:** Growing old; aging ([www.dictionary.com](http://www.dictionary.com)).

**Sensitive Receptors:** Sensitive receptors are people or institutions with people that are particularly susceptible to illness from environmental pollution, such as the elderly, very young children, people already weakened by illness (e.g., asthmatics), and persons engaged in strenuous exercise.

**Septic System:** A sewage-treatment system that includes a settling tank through which liquid sewage flows and in which solid sewage settles and is decomposed by bacteria in the absence of oxygen. Septic systems are often used for individual-home waste disposal where an urban sewer system is not available.

**Setback:** The horizontal distance between the property line and any structure.

**Settlement:** (1) The drop in elevation of a ground surface caused by settling or compacting. (2) The gradual downward movement of an engineered structure due to compaction. *Differential* settlement is uneven settlement, where one part of a structure settles more or at a different rate than another part.

**Shall:** In accordance with Section 15005 of the State CEQA Guidelines, “shall” or “must” identifies a mandatory element which all public agencies are required to follow.

**Shatter:** A splintered or fragmented condition.

**Shears:** The deformation of a rock in response to compressive stress resulting in the formation of particular textures.

**Shopping Center:** A group of commercial establishments, planned, developed, owned, or managed as a unit, with common off-street parking provided on the site.

**Short-Term Noise:** Noise from a temporary noise source that would occur for a limited period of time such that a substantive reduction in the quality of the receptor’s environment is not realized.

**Should:** In accordance with Section 15005 of the State CEQA Guidelines, “should” identifies guidance provided by the Secretary for Resources based on policy considerations contained

in CEQA, in the legislative history of the statute, or in federal court decisions which California courts can be expected to follow. Public agencies are advised to follow this guidance in the absence of compelling, countervailing considerations.

**Significant Ecological Area:** First identified in the County of Los Angeles General Plan of 1976, SEAs are areas that contain unique, dwindling, or other rare plant and animal resources that need to be more specifically studied for the purpose of public education, research, and other non-disruptive outdoor uses.

**Significant Impact or Significant Effect on the Environment:** As defined by the State CEQA Guidelines, a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant. The lead agency will determine whether a project may have a significant effect on the environment based on substantial evidence in light of the whole record (State CEQA Guidelines, Section 15382).

**Siltation:** The accumulating deposition of eroded material; the gradual filling in of streams and other bodies of water with sand, silt, and clay.

**Single Noise Event Level (SEL):** The cumulative (not average) sound exposure during a particular noise event, integrated into a one-second time frame.

**Single-family Dwelling, Attached:** A dwelling unit occupied or intended for occupancy by only one household that is structurally connected with at least one other such dwelling unit. Single-family attached units are typically defined by school districts as units that share a common wall and are not for rental purposes.

**Single-family Dwelling, Detached:** A dwelling unit occupied or intended for occupancy by only one household that is structurally independent from any other such dwelling unit or structure intended for residential or other use.

**Single-Family Housing:** A conventionally built house consisting of a single dwelling unit occupied by one household.

**Single Occupant Vehicle (SOV):** One person per vehicle.

**Single Room Occupancy (SRO):** A single room, typically with a sink and closet, but which requires the occupant to share a communal bathroom, shower, and kitchen.

**Site:** A parcel of land used or intended for one use or a group of uses and having frontage on a public or an approved private street. A lot.

**Site Acceleration:** Site acceleration during a seismic event is measured as a percent of gravity, or g. For instance, 0.76g is 76 percent of the force of gravity.

**Sky Glow (Light pollution):** An adverse effect of manmade light. It is often used to denote urban sky glow (brightening of the night sky due to man-made lighting) but also includes glare (intense and blinding light), light trespass (light falling where it is not wanted or needed; spill light), visual clutter, and other adverse effects of lighting (IDA 2005). In many cases, sky glow is visible from great distances, particularly in evenings when there is moisture in the air.

**Sleep Interference:** The capacity for noise to hamper normal sleep patterns.

**Slide:** A slide is a down slope movement of a soil or rock mass occurring dominantly on shallower slopes at surfaces of rupture or on relatively thin zones of intense shear strain. The displaced mass often slides beyond the toe of the surface rupture covering the original ground surface of the slope. Slides consist of two main types: rotational and translational. Rotational slides move along a surface of rupture that is curved and concave. Translational slides move along a planar or undulating surface of rupture

**Slope:** Land gradient described as the vertical rise divided by the horizontal run, and expressed in percent.

**Slope Face:** The slopes located directly below, or leading up to, the crest of a significant ridgeline or prominent landform.

**Slope Steepness:** The relationship (the ratio) between the change in elevation (rise) and the horizontal distance (run) over which that change in elevation occurs. The percent of steepness of any given slope is determined by dividing the rise by the run on the natural slope of land, multiplied by 100.

**Sloughing/Sloughage:** Shallow slides of loose or crumbling material.

**Slump:** Loosely consolidated materials or rock layers that move a short distance down a slope leaving a concave scarp, or eroded face.

**Smart Growth:** A movement in urban and transportation planning that concentrates density within central core areas of urban development. Smart Growth advocates compact, transit-oriented, walkable, bicycle-friendly land uses, including mixed-use development with a range of housing choices. It also advocates preservation of open space and many other environmental amenities.

**Smog:** A combination of smoke and other particulates, ozone, hydrocarbons, nitrogen oxides, and other chemically reactive compounds which, under certain conditions of weather and sunlight, may result in a murky brown haze that causes adverse health effects. The primary source of smog in California is motor vehicles.

**Solar System, Active:** A system using a mechanical device, such as a pump or a fan, and energy in addition to solar energy to transport a conductive medium (air or water) between a solar collector and the interior of a building for the purpose of heating or cooling.

**Solar System, Passive:** A system that uses direct heat transfer from thermal mass instead of mechanical power to distribute collected heat. Passive systems rely on building design and materials to collect and store heat and to create natural ventilation for cooling.

**Solid Waste:** Any non-hazardous garbage, refuse or sludge, which is primarily solid but may also include portions of liquid, semi-solid or contained gaseous material resulting from residential, industrial, commercial, agricultural, mining operations, and community activities.

**Source Reduction:** Per Section 40196 of the *California Public Resources Code*, “source reduction” means any action which causes a net reduction in the generation of solid waste. Source reduction includes, but is not limited to, reducing the use of nonrecyclable materials, replacing disposable materials and products with reusable materials and products, reducing packaging, reducing the amount of yard wastes generated, establishing garbage rate structures with incentives to reduce waste tonnage generated, and increasing the efficiency of the use of paper, cardboard, glass, metal, plastic, and other materials.

**Source Reduction and Recycling Element (SRRE):** Plans prepared by all jurisdictions in accordance with the *California Public Resources Code*, Section 41000 et seq. (cities) and Section 41300 et seq. (counties). The SRRE sets forth a jurisdiction's basic strategy for management of solid waste generated within its borders, with emphasis on implementation of source reduction, recycling, and composting programs. The SRRE should also identify the amount of landfill and/or transformation capacity necessary to dispose of solid waste that cannot be reduced at the source, recycled, or composted. It is one of several solid waste planning documents required by the Integrated Waste Management Agency.

**South Coast Air Basin (SoCAB):** A geographic area defined by the San Jacinto Mountains to the east, the San Bernardino Mountains to the north, and the Pacific Ocean to the west and south. The SoCAB is under the jurisdiction of the South Coast Air Quality Management District.

**South Coast Air Quality Management District (SCAQMD):** The agency responsible for protecting public health and welfare through the administration of federal and State air quality laws, regulations, and policies in the South Coast Air Basin.

**Southern California Association of Governments (SCAG):** The organization, known in federal law as a Council of Governments or Metropolitan Planning Organization. As the designated Metropolitan Planning Organization, Southern California Association of Governments (SCAG) represents the counties of Imperial, Riverside, San Bernardino, Orange, Los Angeles, and Ventura, and the cities within these six counties. SCAG is mandated by the federal government to research and prepare plans for transportation, growth management, hazardous waste management, and air quality. Additional mandates exist at the State level.

**Special Animal:** A species of interest to the California Natural Diversity Database.

**Species of Local Concern:** A species that has no official status with the resource agencies, but is being watched because, in the region, there is a unique population.

**Specific Plan:** A legal tool authorized by Section 65450 et seq. of the *California Government Code* for the systematic implementation of the general plan for a defined portion of a community's planning area. A specific plan must specify in detail the land uses, public and private facilities needed to support the land uses, phasing of development, standards for the conservation, development, and use of natural resources, and a program of implementation measures, including financing measures. The Office of Planning and Research's *The Planners Guide to Specific Plans* provides direction and references to planning practitioners for the development of specific plans.

**Speech interference:** The capacity for noise to prevent intelligible oral communication.

**Speed:** a rate of motion; experienced by travelers regardless of mode.

**Sphere of Influence:** A plan for the probable physical boundaries and service area for a local agency, as determined by the Local Agency Formation Commission. Typically, a sphere of influence is the territory that a city or district is expected to annex. Therefore, spheres of influence are usually larger in area than the actual boundaries of a city or district, although they can be the same as the city or district boundaries.

**Spillover:** Spillover occurs when light goes over its intended range (eSchoolToday 2017).

**Spread:** A spread is a sudden lateral movement of a cohesive rock or soil mass along softer underlying material generally composed of homogenous clays or cohesionless fill. Spread includes a general subsidence of fractures of the mass of cohesive material into the softer underlying material. This type of landslide is often triggered by seismic activity.

**Stabilization fill:** Placement of compacted earthen material along a slope face to mitigate surficial slope failures, such as raveling, erosion, and/or rockfalls.

**Stacking:** The process of vehicles forming a line or queue. If the stacking extends into the through-lanes, delays and unsafe conditions become prevalent.

**Standard Urban Stormwater Mitigation Plan (SUSMP):** A document which identifies practicable policies to ensure to the maximum extent practicable that development does not increase pollutant loads from a project site and considers urban runoff flow rates, velocities and durations. The SUSMP addresses only land development and capital improvement projects and is focused on project design requirements and related post-construction requirements, not on the construction process itself.

**State Agency:** State agency means a governmental agency in the executive branch of the State Government or an entity which operates under the direction and control of an agency in the executive branch of State Government and is funded primarily by the State Treasury (State CEQA Guidelines, Section 15383).

**State Historic Preservation Officer (SHPO):** Official appointed or designated, pursuant to the National Historic Preservation Act, to administer a State's historic preservation program.

**State Implementation Plan (SIP):** A plan prepared by each State, and subject to U.S. Environmental Protection Agency (USEPA) approval, which describes existing air quality conditions and identifies actions and programs to be undertaken by the State and its subdivisions to attain and maintain National Ambient Air Quality Standards. A SIP is a compilation of all of a State's air quality plans and rules that have been approved by the federal USEPA. In California, air districts prepare non-attainment plans that are included in the State's SIP.

**Statement of Overriding Considerations:** A statement indicating that even though a project would result in one or more unavoidable adverse impacts, specific economic, social or other stated benefits are sufficient to warrant project approval.

**State Transportation Improvement Plan (STIP):** A capital improvement program of transportation projects funded with revenues from the State Highway Account and other sources.

**State Water Project (SWP):** An aqueduct system that delivers water from northern California to central and southern California.

**Static:** Not prone to seismic forces, motion; still.

**Stationary Source:** A source of air pollution that is not mobile. Any building, structure, facility, or installation which emits or may emit any affected pollutant directly or as a fugitive emission. Building, structure, facility, or installation means any pollutant-emitting activities, including activities located in California coastal waters adjacent to the District boundaries, which (1) belong to the same industrial grouping and (2) are located on one or more contiguous or adjacent properties (except for activities located in coastal waters) and (3) are under the same or common ownership, operation, or control or which are owned or operated by entities which are under common control.

**Statute of Limitations:** The time period within which a lawsuit may be filed or other legal action to challenge a CEQA document and approval.

**Statutory Exemptions:** Exemptions from CEQA granted by the Legislature (See State CEQA Guidelines, Sections 15260–15285).

**Storie Index:** A numerical system (0p100) rating, the degree to which a particular soil can grow plants or produce crops, based on four factors: soil profile, surface texture, slope, and soil limitations.

**Storm Drain Inlet:** A drainage structure that collects surface runoff and conveys it to an underground storm drain system.

**Storm Runoff:** Surplus surface water generated by rainfall that does not seep into the Earth but flows overland to flowing or stagnant bodies of water.

**Storm Water:** Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage.

**Storm Water Drainage System:** Streets, gutters, inlets, conduits, natural or artificial drains, channels and watercourses, or other facilities that are owned, operated, maintained, and used for the purpose of collecting, storing, transporting, or disposing of storm water.

**Storm Water Quality Management Program (SQMP):** A document which summarizes the measures to be taken to comply with the NPDES Permit and reduce the discharges of pollutants in storm water to the maximum extent practicable.

**Streetscapes:** Landscaped areas adjacent to public or private streets to buffer adjacent developments which may serve as a means for reducing noise impact.

**Structure:** Anything, including a building, located on the ground in a permanent location or attached to something having a permanent location on the ground.

**Stream:** A body of water that flows at least periodically or intermittently through a bed or channel that has banks and supports fish or other aquatic life.

**Street Cross-Section:** A term used to describe the total number of lanes on a street. For instance, a street that has two lanes of northbound traffic, two lanes of southbound traffic, and a refuge lane is commonly referred to as a five-lane cross-section.

**Strike-Slip:** a fault in which the primary displacement is horizontal and parallel to the direction of the fault plane.

**Structure:** Anything constructed or erected which requires a fixed location on the ground, or is attached to something having a fixed location on the ground (Section 22.08.190 S. of the Los Angeles County Code).

**Subdivision:** The division of a lot, tract, or parcel of land into two or more lots, tracts, parcels, or other division of land for lease, sale, or financing, in accordance with the Subdivision Map Act (*California Government Code*, Section 66410 et seq.). The lots can either improved or unimproved, and be separately conveyed by sale or lease, and which can be altered or developed.

**Subdivision Development Plan:** Specific development plans for an unapproved tentative map, including, but not limited to: plot plans, building elevations, grading plans, and landscape plans applicable to individual lots within a tentative map.

**Subdivision Map Act:** Division 2 (Sections 66410 et seq.) of the *California Government Code*, this act vests in local legislative bodies the regulation and control of the design and improvement of subdivisions, including the requirement for tentative and final maps.

**Subregional:** Pertaining to a portion of a region.

**Subsidence:** Sinking of the land surface due to a number of factors, of which groundwater extraction is one; the gradual settling or sinking of an area with little or no horizontal motion.

**Subsidize:** To assist by payment of a sum of money or by the granting of terms or favors that reduce the need for monetary expenditures. Housing subsidies may take the forms of mortgage interest deductions or tax credits from federal and/or State income taxes, sale or lease at less than market value of land to be used for the construction of housing, payments to supplement a minimum affordable rent, and the like.

**Sustainable Yield:** The average amount of water that can be pumped from an aquifer on an annual basis without affecting its long-term capacity.

**Substantial Adverse Effect:** The loss or harm of a magnitude which, based on current scientific data and knowledge, would (1) substantially diminish population numbers of a species or distribution of a habitat type within the region or (2) eliminate the functions and values of a biological resource in the region.

**Substantial Adverse Change:** Demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired (*California Public Resources Code*, Section 5020.1[q]).

**Sulfate:** A salt of sulfuric acid. Many examples of sulfates are known, and many of these are highly soluble in water.

**Sulfur Dioxide (SO<sub>2</sub>):** A strong smelling, colorless gas that is formed by the combustion of fossil fuels. Power plants, which may use coal or oil high in sulfur content, can be major sources of SO<sub>2</sub>. SO<sub>2</sub> and other sulfur oxides contribute to the problem of acid deposition. SO<sub>2</sub> is a criteria air pollutant.

**Sulfur Oxides:** Pungent, colorless gases (sulfates are solids) formed primarily by the combustion of sulfur-containing fossil fuels, especially coal and oil. Considered major air pollutants, sulfur oxides may impact human health and damage vegetation.

**Sump:** a pit, well, or the like in which water or other liquid is collected ([www.dictionary.com](http://www.dictionary.com)).

**Surcharging:** The placement of fill to a specified height above grade.

**Surficial landslide:** A landslide involving only top layers of earthen material.

**Surficial unit/deposit:** Deposits of loose sediment on the surface above underlying bedrock and can include previously placed fill, topsoil, colluvium, alluvium, and landslide debris.

**Sustainability:** Community use of natural resources in a way that does not jeopardize the ability of future generations to live and prosper.

**Sustainable Development:** Development that maintains or enhances economic opportunity and community well-being while protecting and restoring the natural environment upon which people and economies depend. Sustainable development meets the needs of the present without compromising the ability of future generations to meet their own needs.

**Substantial Evidence:** Substantial evidence as used in these guidelines means enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached. Whether a fair argument can be made that the project may have a significant effect on the environment is to be determined by examining the whole record before the lead agency. Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence. Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts (State CEQA Guidelines, Section 15384).

**Sulfur Dioxide (SO<sub>2</sub>):** A colorless, extremely irritating gas or liquid. Sulfur dioxide enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. There are National Ambient Air Quality Standards and California Air Quality Standards for sulfur dioxide.

**Sump:** In drainage, any low area that does not permit the escape of water by gravity flow.

**Surface Water:** Water in lakes, streams or rivers, as distinct from subsurface groundwater.

**Surface Water Runoff:** Precipitation, snow melt, or irrigation water in excess of what can infiltrate the soil surface and be stored in small surface depressions.

**Swale:** An elongated or depressed landform within a landscaped area, which is designed to carry storm or other runoff.

**Table A Amount:** The maximum contractual quantity of water that an SWP Contractor can request each year.

**Take:** Under the Federal Endangered Species Act (FESA), it means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or to attempt to engage in any such conduct. In the context of the California Endangered Species Act (CESA) means to hunt, pursue, kill, or capture a listed species, as well as any other actions that may result in adverse impacts when attempting to take individuals of a listed species. The CESA definition of "Take" is more inclusive than the FESA definition.

**Taking:** A real estate term traditionally used to mean acquisition by eminent domain but broadened by the U.S. Supreme Court to mean any government action that denies economically viable use of property.

**Tax-Increment Financing District:** A special district created from a redevelopment area in which the future growth in property tax revenues generated is used to finance the redevelopment program itself. In most cases, redevelopment agencies issue bonds against this property tax increment to pay for public investments inside the redevelopment area.

**Temporal Attribution:** Assessment of time.

**Temporary Construction Site Best Management Practices (BMPs):** BMPs that are only temporarily required to address a short-term storm water contamination threat.

**Telecommuting:** An arrangement in which a worker is at home or in a location other than the primary place of work, and communicates with the workplace and conducts work via wireless or telephone lines, using modems, fax machines, or other electronic devices in conjunction with computers.

**Temporary Noise:** Noise from a noise source that is not permanent. A temporary noise source can be considered long-term, as audible noise level increases at the same receptor that occur for several years.

**Tentative Map:** The initial map setting forth in detail a proposed land subdivision, which must comply with the city's or county's subdivision and zoning regulations and the State Subdivision Map Act. The subdivision of land depicted on the tentative map does not take effect until approval and recordation of the Final Map.

**Tertiary Treatment:** The treatment of wastewater beyond the secondary or biological stage. Normally implies the removal of nutrients, such as phosphorous and nitrogen, and a high percentage of suspended solids.

**Therm:** The amount of energy necessary to raise 100,000 pounds of water one degree Fahrenheit.

**Thermal Mass:** Large quantities of heavy or dense material with a high heat capacity, used in solar buildings to absorb heat, which is then stored and re-radiated as needed for heating and cooling.

**Thousand Square Feet (TSF):** Used in quantifying non-residential land uses, and refers to building floor area.

**Threatened Species:** The State of California considers a Threatened species to be one present in such small numbers throughout its range that it is likely to become an Endangered Species in the near future in the absence of special protection or management. The CESA authorizes the CDFW to issue permits authorizing incidental take of Threatened and Endangered Species.

**Threshold of Significance:** Criteria for each environmental issue area to assist with determinations of significance of project impacts.

**Title 24 of the California Code of Regulations:** Title 24 is part of the California Buildings Standards Code, the building regulations of California. Part 6 is the Energy Code.

**Tonnes:** Metric tons.

**Topographic Map:** A map showing the various topographic features of a given area, such as hills, valleys, mountains, slope of land surfaces, usually by means of contours or lines connecting points of equal elevation.

**Topography:** The physical shape of the ground surface. Configuration of a surface, including its relief and the position of natural and man-made features.

**Topple:** A topple is a forward rotation of a mass of soil or rock out of a steep slope at a hinge or pivot point below the center of gravity of the displaced mass. Topples usually involve the overturn of interacting columns or blocks at or near a vertical face and may lead to falls or slides of the displaced mass. Movement of material during a topple ranges from extremely slow to extremely rapid.

**Topsoil:** The upper layer of soil, usually the top 2 to 8 inches.

**Total Dissolved Solids (TDS):** A quantitative measure of the residual minerals dissolved in water that remains after evaporation of a solution. Usually expressed in milligrams per liter or parts per million.

**Total Maximum Daily Load (TMDL):** An estimate of the total quantity of pollutants (from all sources: point, non-point, and natural) that may be allowed into waters without exceeding applicable water quality criteria.

**Total Organic Gases (TOG):** Gaseous organic compounds, including reactive organic gases and the relatively unreactive organic gases such as methane.

**Total Suspended Particulate (TSP):** Particles of solid or liquid matter—such as soot, dust, aerosols, fumes, and mist—up to approximately 30 microns in size.

**Townhouse; Townhome:** A one-family dwelling in a row of at least three such units in which each unit has its own front and rear access to the outside, no unit is located over another unit, and each unit is separated from any other unit by one or more common and fire-resistant walls. Townhouses usually have separate utilities; however, in some condominium situations, common areas are serviced by utilities purchased by a homeowners association on behalf of all townhouse members of the association.

**Toxic Air Contaminant (TACs):** Airborne chemical compounds determined by the U.S. Environmental Protection Agency (USEPA) and the California Environmental Protection Agency (CalEPA), including the Office of Environmental Health Hazard Assessment and the California Air Resources Board, to pose a present or potential threat to public health. Air pollutants (excluding ozone, carbon monoxide, PM10, sulfur dioxide, and nitrogen dioxide) that may reasonably be anticipated to cause cancer, developmental effects, reproductive dysfunctions, neurological disorders, heritable gene mutations, or other serious or irreversible acute or chronic health effects in humans. Toxic air pollutants are considered under a different regulatory process (*California Health and Safety Code*, Sections 39650 et seq.) than pollutants subject to California Ambient Air Quality Standards. Health effects to TACs may occur at extremely low levels, and it is typically difficult to identify levels of exposure which do not produce adverse health effects.

**Traffic Calming:** The process of designing streets or adding design elements to tame fast traffic and address unsafe traffic conditions. Design elements include, for example, speed humps, narrowed streets, added traffic circle.

**Traffic Model:** A mathematical representation of traffic movement within an area or region based on observed relationships between the kind and intensity of development in specific areas. Many traffic models operate on the theory that trips are produced by persons living in residential areas and are attracted by various non-residential land uses.

**Transit:** The conveyance of persons or goods from one place to another by means of a local, public transportation system.

**Transit Capacity:** The RTP defines this as the seating capacity utilized by mode.

**Transit-dependent:** Refers to persons unable to operate automobiles or other motorized vehicles, or those who do not own motorized vehicles. Transit-dependent citizens must rely on transit, para-transit, or owners of private vehicles for transportation. Transit-dependent citizens include the young, the handicapped, the elderly, the poor, and those with prior violations in motor vehicle laws.

**Transit-Oriented Development (TOD):** A mixed-use community within an average 2,000-foot walking distance of a transit stop and core commercial area. TODs mix residential, retail, office, and public uses in a walkable environment, making it convenient for residents and employees to travel by transit, bicycle, foot, or car.

**Transit, Public:** A system of regularly-scheduled buses and/or trains available to the public on a fee-per-ride basis. Also called “Mass Transit.”

**Transition Zone:** Controlled airspace extending upward from 700 or more feet above the ground wherein procedures for aircraft approach have been designated. The transition zone lies closer to an airport than the outer approach zone and outside of the inner approach zone.

**Translational Slide:** A mass that moves down and outward along a relatively planar surface and has little rotational movement or backward tilting.

**Transportation Analysis Zone (TAZ):** A geographic area that identifies land uses and associated trips that is used for making land use projections and performing traffic modeling.

**Transportation Control Measures (TCMs):** Air pollution control measures in the Air Quality Management Plan that are directed to reducing air emissions by reducing vehicle miles traveled, vehicle idling, or traffic congestion. Federal and State law specifies requirements for TCMs. Steps taken by a locality to adjust traffic patterns (e.g., bus lanes, right turn on red) or reduce vehicle use (ridesharing, high-occupancy vehicle lanes) to reduce vehicular emissions of air pollutants.

**Transportation Demand Management (TDM):** A strategy for reducing demand on the road system by reducing the number of vehicles using the roadways and/or increasing the number of persons per vehicle. TDM attempts to reduce the number of persons who drive alone on the roadway during the commute period and to increase the number in carpools, vanpools, buses and trains, walking, and biking. TDM can be an element of Transportation Systems Management. Strategies to change travel behavior in order to increase the efficiency of the transportation system and achieve specific objectives such as reduced traffic

congestion, road and parking cost savings, increased safety, improved mobility for non-drivers, energy conservation and pollution emission reductions.

**Transportation Equity Act of the 21<sup>st</sup> Century (TEA 21):** TEA 21 was enacted June 9, 1998, as Public Law 105-178. TEA-21 authorizes and funds the federal surface transportation programs for highways, highway safety, and transit for the 6-year period of 1998-2003. The TEA 21 Restoration Act, enacted July 22, 1998, provided technical corrections to the original law.

**Transportation Systems Management (TSM):** A comprehensive strategy developed to address the problems caused by additional development, increasing trips, and a shortfall in transportation capacity. Transportation Systems Management focuses on more efficiently utilizing existing highway and transit systems rather than expanding them. TSM measures are characterized by their low cost and quick implementation time frame, such as computerized traffic signals, metered freeway ramps, and one-way streets.

**Trash:** Any human-derived materials including paper, plastics, metals, glass, and cloth.

**Travel route:** A landscape feature (such as a ridgeline, drainage, canyon, or riparian strip) within a larger open space that is used frequently by animals to facilitate movement and to provide access to necessary resources.

**Trip:** The trip is the basic measurement used to describe transportation volumes. A one-way journey that proceeds from an origin to a destination via a single mode of transportation; the smallest unit of movement considered in transportation studies. Each trip has one “production end” (or origin, often from home, but not always), and one “attraction end” (destination). A trip represents travel between a single origin and a single destination, and each trip is made up of two trip ends. (e.g., traveling from home to the grocery store with no stops in between is one trip, and it is made up of a home trip end and a grocery store trip end.)

**Trip Assignment:** The allocation of vehicle trips to available routes between locations in a traffic study area.

**Trip End:** Every trip has two ends—an origin and a destination. Conversely, every origin or destination generates two trip ends—one arriving and one leaving. For example, traveling from home to work and back involves two trips—home to work and work to home, and four trip ends—home as the origin and home as the destination. Quantification of trip ends is useful in describing the contribution of specific land uses to traffic volumes. A trip generation measure which represents the total trips entering and leaving a location. (e.g., a building that generates 100 daily trip ends has 50 vehicles entering the site and 50 vehicles leaving the site each day.)

**Trip Generation:** The number of vehicle trip ends associated with (i.e., produced by) a particular land use or traffic study site. A trip end is defined as a single vehicle movement. Roundtrips consist of two trip ends.

**Trophic:** Of or involving the feeding habits or food relationship of different organisms in a food chain.

**Trustee Agency:** A State agency having jurisdiction by law over natural resources affected by a project which are held in trust for the people of the state of California. Trustee agencies include the California Department of Fish and Wildlife, State Lands Commission, the State Department of Parks and Recreation, and the University of California (with regard to sites within the Natural Land and Water Reserves System) (State CEQA Guidelines, Section 15386).

**Tsunami:** A sea wave produced by large-scale, short-duration disturbance of the ocean floor such as from subsidence, an earthquake, or a volcanic eruption.

**Tuffaceous:** Rock formed as a deposit from springs or streams.

**Tuff beds:** Clusters of consolidated rocks of any size ejected from a volcano. Tuff is a general term for all consolidated pyroclastic rocks, meaning rocks formed of unworked solid material of any size ejected from a volcano.

**Turbidity:** The cloudiness or haziness of a fluid caused by individual particles (suspended solids) that are generally invisible to the naked eye. The measurement of turbidity is a key test of water quality.

**Turn Lane:** A lane devoted to vehicles making a turning movement to go in a different direction. Turn lanes are necessary to ensure the free-flow of traffic in the through lanes by providing a separate area/lane for turning traffic to slow down and complete the turning maneuver without impeding the through traffic.

**Undercutting:** Excavation at the base of an unstable slope to allow for stabilization measures.

**Underground Storage Tank (UST):** Refers to tanks used to store gasoline underground.

**Unifacial:** Flaked in such a way as to produce a cutting edge that is sharp on one side only.

**Uniform Building Code (UBC):** A national, standard building code that sets forth minimum standards for construction, published by the International Conference of Building Officials (ICBO).

**Uniform Housing Code (UHC):** State housing regulations governing the condition of habitable structures with regard to health and safety standards, and which provide for the conservation and rehabilitation of housing in accordance with the Uniform Building Code (UBC).

**United States Environmental Protection Agency (USEPA):** The federal agency with primary responsibility setting of policy and guidelines and carrying out legal mandates for the protection of natural interests in environmental resources, including the Clean Water

Act, Clean Air Act, Safe Drinking Water Act, and the Resource Conservation and Recovery Act. California is included within USEPA Region IX, headquartered in San Francisco.

**Unique archaeological resource:** An archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- (1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
- (2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.
- (3) Is directly associated with a scientifically recognized important prehistoric or historic event or person.

**Unique Farmland:** Lands used for the production of specific high-value food and fiber crops, such as citrus, tree nuts, olives, cranberries, and other fruits and vegetables. It has the special combination of soil quality, growing season, moisture supply, temperature, humidity, air drainage, elevation, and aspect needed for the soil to economically produce sustainable high yields of these crops when properly managed. The water supply is dependable and of adequate quality. Nearness to markets is an additional consideration. Unique farmland is not based on national criteria. It commonly is in areas where there is a special microclimate, such as the wine country in California (NRCS 2017a).

**Unit:** A “unit” is defined as a structure or foundation on which uses associated with development are placed. Uses may include and are not limited to residential, industrial, commercial, construction, institutional, public administration purposes, railroad yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants, water control structures, and other development purposes. Highways, railroads, and other transportation facilities are mapped as part of this unit if they are part of a surrounding urban area.

**Urban:** Of, relating to, characteristic of, or constituting a city. Urban areas are generally characterized by moderate and higher density residential development (i.e., three or more dwelling units per acre), commercial development, and industrial development, and the availability of public services required for that development, specifically central water and sewer, an extensive road network, public transit, and other such services (e.g., safety and emergency response). Development not providing such services may be “non-urban” or “rural.” CEQA defines “urbanized area” as an area that has a population density of at least 1,000 persons per square mile (*California Public Resources Code*, Section 21080.14[b]).

**Urban and Built-Up Land:** Lands occupied by residential, industrial, commercial, and institutional land; construction sites; public administrative sites; railroad yards; cemeteries; airports; golf courses; sanitary landfills; sewage treatment plants; water control structures and spillways; other land used for such purposes; small parks (less than 10 acres) within urban and built-up areas; and highways, railroads, and other transportation facilities if they are surrounded by urban areas. Also included are tracts of less than 10 acres that do not meet the above definition but are completely surrounded by Urban and Built-up land (NRCS 2017c).

**Urban Design:** The attempt to give form, in terms of both beauty and function, to selected urban areas or to whole cities. Urban design is concerned with the location, mass, and design of various urban components and combines elements of urban planning, architecture, and landscape architecture.

**Urbanized Area:** Urbanized area means a central city or a group of contiguous cities with a population of 50,000 or more, together with adjacent densely populated areas having a population density of at least 1,000 persons per square mile. A Lead Agency shall determine whether a particular area meets the criteria in this section either by examining the area or by referring to a map prepared by the U.S. Bureau of the Census which designates the area as urbanized. Use of the term “urbanized area” in Section 15182 is limited to areas mapped and designated as urbanized by the U.S. Bureau of the Census. (State CEQA Guidelines, Section 15387).

**Use Permit:** The discretionary and conditional review of an activity or function or operation on a site or in a building or facility.

**Utility Corridors:** Rights-of-way or easements for utility lines on either publicly or privately owned property.

**Variance:** An adjustment in regulations. Variances are based on discretionary decisions and may be granted to allow deviations from ordinance regulations governing such development factors such as setbacks, height, lot coverage, lot area and width, signs, off-street parking, landscaping, and wall, fencing, and screening standards. Variances may not be granted to authorize a use or activity which is not otherwise expressly authorized by the zone regulations governing the property. A variance usually is granted only upon demonstration of hardship based on the peculiarity of the property in relation to other properties in the same zone district.

**Vegetated buffers:** Strips of natural vegetation along wetlands and waterways designed to mimic natural systems, slow down surface runoff, capture storm water to improve infiltration, and filter out contaminants. In addition to protecting surface waters, vegetated buffers can improve groundwater supplies by promoting recharge and filtering contaminants.

**Vehicle Miles Traveled (VMT):** The total number of vehicle miles traveled over a specified length of time (e.g., daily, monthly, or yearly) or over a specified road or transportation corridor.

**Vehicle Trip:** Vehicle trip describes the number of vehicles traveling from point to point.

**Vehicle Trip Ends:** A single or one-direction vehicle movement with either the origin or destination inside a traffic study site.

**Vehicles Per Day (VPD):** Similar to ADT, but more typically applied to trip generation (i.e., the amount of traffic generated by a given amount of land use).

**Vehicles Per Hour (VPH):** Used for roadway volumes (counts or forecasts) and trip generation estimates. Measures the number of vehicles in a one hour period, typically the AM or PM peak hour.

**Vernalis Adaptive Management Plan (VAMP):** An agreement between multiple water agencies to maintain targeted stream flows for 31 days each spring, typically mid-May through mid-April. The purpose of VAMP is to help salmon smolt migrate downstream.

**Very Low Income Household:** A household with an annual income usually no greater than 50 percent of the area median family income adjusted by household size, as determined by a survey of incomes conducted by a city or a county, or in the absence of such a survey, based on the latest available eligibility limits established by the U.S. Department of Housing and Urban Development (HUD) for the Section 8 housing program.

**Vesting Tentative Tract Map:** A map which meets the requirements of subdivision (a) and Section 66452 of the *California Government Code*.

**Vibration:** Ground and structure oscillations due to low frequency sound-waves. Vibration is measured either in Hertz (oscillations in pressure resulting from low frequency sound waves) or in inches per second (physical motion of structures). Los Angeles County Code prohibits the operation of any device that creates vibration velocity levels of more than 0.01 inch per second (in/sec) over the frequency range of 1 to 100 Hertz (Hz) at or beyond the property boundary of the source if on private property, or at 150 feet from the source if on a public space or public right-of-way.

**View Corridor:** The line of sight—identified as to height, width, and distance—of an observer looking toward an object of significance to the community (e.g., ridgeline, river, historic building, etc.); the route that directs the viewers' attention.

**Viewpoint:** A location from which a site is visible; a specific location from which a view perspective is taken.

**Viewshed:** The surface area that is visible from a given viewpoint or series of viewpoints. It is also the area from which that viewpoint or series of viewpoints may be seen (a collection of viewpoints). The viewshed aids in identifying the views that could be affected by the proposed action. A viewshed is a broader perspective of a geographic area and incorporates both close-range and long-range elements.

**Volatile:** Any substance that evaporates readily.

**Volatile Organic Compound (VOC):** Carbon-containing compounds that evaporate into the air, except for specific exempt compounds found to be non-photochemically reactive and thus not participating in smog formation. VOCs contribute to the formation of smog and/or may themselves be toxic. VOCs often have an odor; some examples include gasoline, alcohol, and solvents used in paints. VOC is synonymous with reactive organic gases and reactive organic compounds.

**Volume-to-Capacity Ratio (V/C):** In reference to public services or transportation, ratio of peak hour use to capacity. A measure of the operating capacity of a roadway or intersection, in terms of the number of vehicles passing through, divided by the number of vehicles that theoretically could pass through when the roadway or intersection is operating at its designed capacity. Abbreviated as "V/C". At a V/C ratio of 1.0, the roadway or intersection is operating at capacity. If the ratio is less than 1.0, the traffic facility has additional capacity. Although ratios slightly greater than 1.0 are possible, it is more likely that the peak hour will elongate into a "peak period." In evaluating the performance of a roadway, V/C ratios should be considered together with the letter grade system, which is more of a qualitative assessment based heavily on speeds and travel time. This is typically used to describe the percentage of capacity utilized by existing or projected traffic on a segment of an arterial or intersection. (e.g., a roadway with a V/C of 0.60 has 60 percent of the total available capacity being used by traffic.)

**Warehousing Use:** A use engaged in storage, wholesale, and distribution of manufactured products, supplies, and equipment, excluding bulk storage of materials that are inflammable or explosive or that present hazards or conditions commonly recognized as offensive.

**Waste Stream:** Any and all waste that has been generated and is being processed toward permanent disposition.

**Wastewater:** Water that has been previously used by a municipality, industry, or agriculture and has suffered a loss of quality as a result of use.

**Wastewater Reclamation:** Treatment and management of municipal, industrial, or agricultural wastewater to produce water of suitable quality for additional beneficial uses.

**Water Quality Basin:** A storm water detention facility that holds water for a period of time and that provides natural treatment of storm water runoff (through vegetation) in compliance with Standard Urban Stormwater Management Plan (SUSMP) requirements.

**Water Quality Criteria:** A policy identifying beneficial uses for a particular receiving water body (e.g., wildlife habitat, agricultural supply, fishing), along with the water quality criteria necessary to support those uses. This can include the identification of specific levels of constituents, such as lead, suspended sediment, and fecal coliform bacteria, that represent the quality of water that support a particular use.

**Water Reclamation Facility:** A site at which wastewater is cleaned using biological and chemical processes so that it can be returned to the environment to augment the natural systems. It can include both aquifer and stream enhancement.

**Water Recycling Act of 1991:** Legislation, (*California Water Code*, Sections 13575–13583), that established a statewide water recycling goal. As defined by the Act, recycled water is wastewater that has been treated to a quality that allows the water to be used again.

**Watercourse:** Natural or once natural flowing (perennially or intermittently) water including rivers, streams, and creeks. Includes natural waterways that have been

channelized, but does not include manmade channels, ditches, and underground drainage and sewage systems.

**Waters of the State:** Any surface water or groundwater, including saline waters, within the boundaries of the state (as defined by the Porter-Cologne Act).

**Waters of the U.S.:** "Waters of the U.S." can be divided into three categories: territorial seas, tidal waters, or non-tidal waters. The term "waters of the U.S." is defined by the *Code of Federal Regulations* (CFR, Title 33, Navigation and Navigable Waters; Part 328, Definition of waters of the United States; §328.3, Definitions) and includes (1) all waters that have, are, or may be used in interstate or foreign commerce (including sightseeing or hunting); (2) all interstate waters including interstate wetlands; (3) all other where the use, degradation, or destruction of which could affect interstate or foreign commerce; (4) all impoundments of waters otherwise defined as "waters of the U.S." under the definition; (5) all tributaries of waters identified above; (6) the territorial seas; and (7) all wetlands adjacent to waters (other than waters that are themselves wetlands) identified above.

**Watershed:** The land area that drains into a stream. The watershed for a major river may encompass a number of smaller watersheds that ultimately combine at a common point (SWRCB 2011).

**Weaving:** The process of exiting a site and merging across multiple lanes "with traffic" to reach an intersection and go in a different direction.

**Weekday:** Any day, Monday through Friday, which is not a legal holiday.

**Wetlands:** An area at least periodically wet or flooded; where the water table stands at or above the land surface (bogs and marshes). Also those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

**Whole of an Action:** An action that may result in either a direct or reasonably foreseeable indirect physical change in the environment (See State CEQA Guidelines, Section 15378).

**Wildlife Corridor:** A natural corridor, such as an undeveloped ravine, that is frequently used by wildlife to travel from one area to another.

**Wildlife Crossing:** A small, narrow area, relatively short in length and generally constricted in nature, that allows wildlife to pass under or through an obstacle or barrier that otherwise hinders or prevents movement.

**Williamson Act:** Known formally as the "California Land Conservation Act of 1965", it was designed as an incentive to retain prime agricultural land and open space in agricultural use, thereby slowing its conversion to urban and suburban development. The program entails a 10-year contract between the city or county and an owner of land whereby the land is taxed on the basis of its agricultural use rather than the market value. The land becomes subject to

certain enforceable restrictions, and certain conditions need to be met prior to approval of an agreement.

**Williamson Act Lands:** Lands preserved for agricultural production. Lands under Williamson Act contracts are assessed according to their agricultural use value rather than as potentially developable lands.

**Windrow:** A line of trees to reduce the force of a prevailing wind.

**Xeriscape:** Environmental design of residential and park land using various methods for minimizing the need for water use ([www.dictionary.com](http://www.dictionary.com)).

**Years Before Present (YBP):** “Before Present” assumes that 1950 is “present,” so in this case 10,000 YBP would be 8,050.

**Zero Lot Line:** A detached single family unit distinguished by the location of one exterior wall on a side property line.

**Zone:** A specifically delineated area or district in a municipality within which regulations and requirements uniformly govern the use, placement, spacing and size of land and buildings.

**Zoning:** The division of a municipality by legislative regulations into areas or zones for the purpose of regulating land use, types of buildings, required yards and setbacks, parking, and other prerequisites to development. Zones are generally shown on a map and the text of the zoning ordinance specifies requirements for each zoning category. A program that implements policies of the General Plan.

**Zoning Map:** Section 65851 of the *California Government Code* permits a legislative body to divide a county, a city, or portions thereof, into zones of the number, shape, and area it deems best suited to carry out the purposes of the zoning ordinance. These zones are delineated on a map or maps, called the Zoning Map.

**Zoning Ordinance:** A law dividing all land in the city into zones that specifies uses permitted and standards required in each zone.
