## **Centennial Project**

# **Draft Environmental Impact Report**

**State Clearinghouse No. 2004031072**

**County Project No. 02-232**

**General Plan Amendment No. 02-232**

**Zone Change No. 02-232**

**Vesting Tentative Parcel Map No. 060022**

**Conditional Use Permit No. 02-232**

**Development Agreement No. RPPL2016003940**

Lead Agency:

County of Los Angeles  
Department of Regional Planning  
Hall of Records, 13th Floor, Room 1348  
320 West Temple Street  
Los Angeles, California 90012

May 2017

**TABLE OF CONTENTS**

<b><u>Section</u></b>	<b><u>Page</u></b>
<b>1.0 Executive Summary .....</b>	<b>1-1</b>
1.1 General Introduction .....	1-1
1.2 Purpose and Scope of This Environmental Impact Report.....	1-1
1.3 Project Setting .....	1-2
1.3.1 Project Location.....	1-2
1.3.2 Physical Setting.....	1-3
1.4 Project Description.....	1-4
1.4.3 Land Use Overview .....	1-4
1.4.4 Public Services and Infrastructure.....	1-6
1.4.5 Off-site Project Features .....	1-7
1.5 Project Objectives .....	1-8
1.6 Summary of the Environmental Analysis .....	1-9
1.6.1 Geotechnical.....	1-9
1.6.2 Hydrology and Flood.....	1-9
1.6.3 Hazards and Fire Safety .....	1-10
1.6.4 Water Quality .....	1-11
1.6.5 Land Resources.....	1-11
1.6.6 Cultural and Tribal Resources.....	1-12
1.6.7 Biological Resources.....	1-13
1.6.8 Land Use, Entitlements, and Planning.....	1-14
1.6.9 Population, Housing, and Employment.....	1-16
1.6.10 Traffic, AccEss, and Circulation .....	1-17
1.6.11 Air Resources.....	1-18
1.6.12 Noise.....	1-20
1.6.13 Visual Resources .....	1-21
1.6.14 Parks and Recreation .....	1-22
1.6.15 Education .....	1-23
1.6.16 Fire and Law Enforcement Services .....	1-23
1.6.17 Other Public Services .....	1-24
1.6.18 Water Resources .....	1-25
1.6.19 Wastewater Collection .....	1-26
1.6.20 Dry Utilities .....	1-26

<b><u>Section</u></b>	<b><u>Page</u></b>
1.6.21 Climate Change .....	1-27
1.7 Growth-Inducing Impacts.....	1-28
1.8 Cumulative Impacts.....	1-28
1.9 Summary of Impacts .....	1-29
1.10 Alternatives.....	1-97
1.11 Areas of Controversy .....	1-97
1.12 Referenced Documents and Availability of Studies and Reports .....	1-98
1.13 References .....	1-99
<b>2.0 Introduction .....</b>	<b>2-1</b>
2.1 Purpose of the Environmental Impact Report .....	2-1
2.2 Type of Environmental Impact Report .....	2-1
2.2.1 Standards of Adequacy for Environmental Impact Reports Under the California Environmental Quality Act.....	2-2
2.2.2 Review of an Environmental Impact Report.....	2-3
2.3 Scope of the Environmental Impact Report .....	2-3
2.3.1 2004 Notice of Preparation and Scoping Process.....	2-3
2.3.2 2015 Notice of Preparation and Scoping Process.....	2-4
2.3.3 Scope of this Environmental Impact Report.....	2-5
2.4 Planning Context .....	2-2
2.4.1 County General Plan .....	2-2
2.4.2 Antelope Valley Area Plan.....	2-3
2.5 Project Sponsors and Contact Persons .....	2-3
2.6 Environmental Impact Report Review .....	2-3
2.7 Organization of the Environmental Impact Report.....	2-4
2.7.1 The Document as a Whole .....	2-4
2.7.2 Environmental Analysis Sections (Section 5.1–5.21) .....	2-6
2.8 References .....	2-7
<b>3.0 Environmental Setting.....</b>	<b>3-1</b>
3.1 Physical Setting.....	3-1
3.1.1 Project Location and Surrounding Land Uses.....	3-1
3.1.2 Climate, Topographic, Geologic, and Visual Setting.....	3-2
3.1.3 Cultural and Historic Setting.....	3-3
3.1.4 Biological Setting .....	3-4

<b><u>Section</u></b>	<b><u>Page</u></b>
3.1.5 Hydrology and Drainage Characteristics.....	3-5
3.1.6 Water Quality Setting.....	3-6
3.1.7 Water Resources Setting .....	3-7
3.1.8 Air Resources.....	3-8
3.2 Existing Land Uses.....	3-9
3.2.1 Existing Operations.....	3-9
3.2.2 Existing Public Facilities and Infrastructure.....	3-9
3.3 Land Use Designations and Zoning .....	3-11
3.4 Regional Planning Context.....	3-12
3.4.1 Population and Housing.....	3-12
3.4.2 Employment.....	3-13
3.4.3 Jobs and Housing Balance .....	3-13
3.5 Constraints and Opportunities.....	3-13
3.5.1 Constraints.....	3-13
3.5.2 Opportunities .....	3-17
3.6 References.....	3-22
<b>4.0 Project Description.....</b>	<b>4-1</b>
4.1 Section Organization.....	4-1
4.2 Project Location.....	4-2
4.3 Project Objectives .....	4-3
4.3.1 Purpose .....	4-3
4.3.2 Objectives of the Project.....	4-4
4.4 Project Overview .....	4-5
4.4.3 Land Use Plans .....	4-7
4.4.4 Zoning.....	4-10
4.4.5 Centennial Specific Plan.....	4-12
4.5 Centennial Project Components .....	4-16
4.5.1 Project Design Features.....	4-16
4.5.2 Conceptual Land Use Plan.....	4-16
4.5.3 Vesting Tentative Parcel Map.....	4-17
4.5.4 Conceptual Land Use Plan and Development Standards.....	4-17
4.5.5 Mobility Plan.....	4-30
4.5.6 Parks/Recreation.....	4-42

<b><u>Section</u></b>	<b><u>Page</u></b>
4.5.7	Natural Resources/Open Space..... 4-43
4.5.8	Integrated Water Resources Management Approach..... 4-46
4.5.9	Water-Related Utilities and Infrastructure ..... 4-55
4.5.10	Dry Utilities ..... 4-63
4.5.11	Green Development Program..... 4-70
4.5.12	Public Services/Facilities ..... 4-75
4.5.13	Landscape, Fuel Modification, and Lighting..... 4-80
4.5.14	Solid Waste Management Plan..... 4-85
4.5.15	Communication Based Technology Plan ..... 4-88
4.5.16	Affordable Housing Program..... 4-89
4.5.17	Grading and Construction ..... 4-90
4.6	Phasing and Implementation ..... 4-91
4.6.1	Land Use Phasing..... 4-91
4.6.2	Fiscal Implementation..... 4-92
4.6.3	First Phase Of Development..... 4-92
4.7	Off-site Project Features..... 4-96
4.7.1	Roadway Improvements ..... 4-96
4.7.2	Aqueduct Crossings and Water Infrastructure..... 4-98
4.7.3	Connections to Existing Off-site Dry Utilities ..... 4-99
4.7.4	Mitigation Areas ..... 4-101
4.8	Intended Use of the EIR..... 4-102
4.8.1	County of Los Angeles..... 4-102
4.8.2	Responsible and Trustee Agencies..... 4-107
4.9	References ..... 4-110
<b>5.0</b>	<b>Regulatory and Environmental Setting, Impacts, and Mitigation..... 5-1</b>
5.0.1	Introduction ..... 5-1
5.0.2	Thresholds of Significance..... 5-1
5.0.3	Environmental Impacts and Mitigation ..... 5-1
5.0.4	References..... 5-3
5.1	Geotechnical ..... 5.1-1
5.1.1	Introduction ..... 5.1-1
5.1.2	Relevant Plans, Policies, and Regulations ..... 5.1-3
5.1.3	Environmental Setting..... 5.1-6

<b><u>Section</u></b>	<b><u>Page</u></b>
5.1.4	Project Design Features ..... 5.1-13
5.1.5	Threshold Criteria ..... 5.1-14
5.1.6	Environmental Impacts..... 5.1-15
5.1.7	Mitigation Measures ..... 5.1-26
5.1.8	Level of Significance after Mitigation..... 5.1-26
5.1.9	References..... 5.1-27
5.2	Hydrology and Flood ..... 5.2-1
5.2.1	Purpose ..... 5.2-1
5.2.2	Relevant Plans, Policies, and Regulations ..... 5.2-4
5.2.3	Environmental Setting..... 5.2-15
5.2.4	Project Design Features ..... 5.2-21
5.2.5	Threshold Criteria ..... 5.2-22
5.2.6	Environmental Impacts..... 5.2-23
5.2.7	Mitigation Measures ..... 5.2-49
5.2.8	Level of Significance After Mitigation ..... 5.2-50
5.2.9	References..... 5.2-50
5.3	Hazards and Fire Safety..... 5.3-1
5.3.1	Introduction ..... 5.3-1
5.3.2	Hazards and Hazardous Materials ..... 5.3-3
5.3.3	Fire Safety ..... 5.3-28
5.3.4	References..... 5.3-39
5.4	Water Quality..... 5.4-1
5.4.1	Introduction ..... 5.4-1
5.2.1	Relevant Plans, Policies, and Regulations ..... 5.4-3
5.2.2	Environmental Setting..... 5.4-18
5.2.3	Project Design Features ..... 5.4-29
5.2.4	Water Quality Assessment Methodology ..... 5.4-31
5.2.5	Threshold Criteria ..... 5.4-50
5.2.6	Environmental Impacts..... 5.4-52
5.2.7	Mitigation Measures ..... 5.4-90
5.2.8	Level of Significance After Mitigation ..... 5.4-91
5.2.9	References..... 5.4-91
5.5	Land Resources..... 5.5-1

<b><u>Section</u></b>	<b><u>Page</u></b>
5.5.1	Introduction ..... 5.5-1
5.5.2	Agricultural and Forest Resources..... 5.5-3
5.5.3	Mineral Resources..... 5.5-19
5.5.4	References..... 5.5-21
5.6	Cultural and Tribal Resources ..... 5.6-1
5.6.1	Introduction ..... 5.6-1
5.6.2	Relevant Plans, Policies and Regulations ..... 5.6-4
5.6.3	Environmental Setting..... 5.6-6
5.6.1	Project Design Features ..... 5.6-44
5.6.2	Threshold Criteria ..... 5.6-45
5.6.3	Environmental Impacts..... 5.6-46
5.6.4	Mitigation Measures ..... 5.6-54
5.6.4	Level of Significance After Mitigation ..... 5.6-61
5.6.5	References..... 5.6-61
5.7	Biological Resources ..... 5.7-1
5.7.1	Introduction ..... 5.7-1
5.7.2	Relevant Plans, Policies and Regulations ..... 5.7-3
5.7.3	Environmental Setting..... 5.7-10
5.7.4	Project Design Features ..... 5.7-135
5.7.5	Threshold Criteria ..... 5.7-140
5.7.6	Environmental Impacts..... 5.7-141
5.7.7	Mitigation Measures ..... 5.7-173
5.7.8	Level of Significance After Mitigation ..... 5.7-195
5.7.9	References..... 5.7-195
5.8	Land Use, Entitlements, and Planning..... 5.8-1
5.8.1	Introduction ..... 5.8-1
5.8.2	Relevant Plans, Policies, and Regulations ..... 5.8-4
5.8.3	Environmental Setting..... 5.8-13
5.8.4	Project Design Feature ..... 5.8-18
5.8.5	Threshold Criteria ..... 5.8-18
5.8.6	Environmental Impacts..... 5.8-18
5.8.7	Mitigation Measures ..... 5.8-78
5.8.8	Level of Significance After Mitigation ..... 5.8-79

5.8.9	References..... 5.8-79
5.9	Population, Housing, and Employment ..... 5.9-1
5.9.1	Introduction ..... 5.9-1
5.9.2	Relevant Plans, Policies, and Regulations ..... 5.9-4
5.9.3	Environmental Setting..... 5.9-7
5.9.4	Project Design Features ..... 5.9-22
5.9.5	Threshold Criteria ..... 5.9-23
5.9.6	Environmental Impacts..... 5.9-23
5.9.7	Mitigation Measures ..... 5.9-33
5.9.8	Level of Significance After Mitigation ..... 5.9-33
5.9.9	References..... 5.9-34
5.10	Traffic, Access, and Circulation ..... 5.10-1
5.10.1	Introduction ..... 5.10-1
5.10.2	Relevant Plans, Policies, and Regulations ..... 5.10-5
5.10.3	Environmental Setting..... 5.10-15
5.10.4	Project Design Features ..... 5.10-36
5.10.5	Threshold Criteria ..... 5.10-38
5.10.6	Environmental Impacts..... 5.10-48
5.10.7	Mitigation Measures ..... 5.10-144
5.10.8	Level of Significance After Mitigation ..... 5.10-157
5.10.9	References..... 5.10-157
5.11	Air Resources ..... 5.11-1
5.11.1	Introduction ..... 5.11-1
5.11.2	Relevant Plans, Policies, and Regulations ..... 5.11-11
5.11.3	Methodology ..... 5.11-18
5.11.4	Environmental Setting..... 5.11-22
5.11.5	Project Design Features ..... 5.11-30
5.11.6	Threshold Criteria ..... 5.11-36
5.11.7	Environmental Impacts..... 5.11-40
5.11.8	Mitigation Measures ..... 5.11-78
5.11.9	Level of Significance After Mitigation ..... 5.11-83
5.11.10	References..... 5.11-83

## TABLES

<b><u>Table</u></b>	<b><u>Page</u></b>
1-1	Centennial Specific Plan Impact Summary ..... 1-29
1-2	Centennial Specific Plan Mitigation Summary ..... 1-37
4-1	Centennial Project Overview ..... 4-7
4-2	Centennial Specific Plan Statistical Table..... 4-13
4-3	Summary of Residential Development ..... 4-21
4-4	Centennial Project Roadway Standards ..... 4-33
4-5	Centennial Substation Equipment Specifications ..... 4-66
5.1-1	Dominant Faults in the Vicinity of the Project Site (DSHA)..... 5.1-11
5.1-2	Probabilistic Seismic Hazard Parameters (EZ-FRISK)..... 5.1-12
5.1-3	Probabilistic Seismic Hazard Parameters (CGS) ..... 5.1-12
5.2-1	Existing Drainage Areas and Associated Tributary Systems Within the Project Site ..... 5.2-16
5.2-2	Existing Conditions Peak Discharge Rates and Volumes, 50-Year Storm Event, Existing Cross Sections Along Project Boundaries ..... 5.2-21
5.2-3	Receiving Channels of Concern for Hydromodification ..... 5.2-25
5.2-4	Summary of Regional Retention and Detention for Hydromodification Control ..... 5.2-29
5.2-5	Summary of Hydrology Data Sources ..... 5.2-35
5.2-6	Summary of Regional Retention and Detention Basins for Flood Control..... 5.2-38
5.2-7	Summary of Pre- And Post-Development Peak Discharge Rates for the 50- Year Storm Event ..... 5.2-39
5.2-8	Summary of Pre- And Post-Development Runoff Volumes for the 50-Year Storm Event ..... 5.2-40
5.3-1	Pesticides Used on the Centennial Project Site <sup>a</sup> ..... 5.3-13
5.4-1	Summary of Monitoring Data In Piru Creek..... 5.4-25
5.4-2	2007 Groundwater Monitoring Data for the Project Area ..... 5.4-27
5.4-3	2010 Groundwater Monitoring Data for the Project Area ..... 5.4-28
5.4-4	Low Impact Development Standards Manual Source Control Requirements and Project Best Management Practices ..... 5.4-41
5.4-5	Summary of Regional Retention and Detention for Water Quality Control ..... 5.4-48
5.4-6	Predicted Average Annual Pollutant Loads ..... 5.4-58
5.4-7	Predicted Average Annual Pollutant Concentrations..... 5.4-59
5.4-8	Comparison of Predicted Total Suspended Solids Concentrations With Water Quality Criteria for the Project..... 5.4-60
5.4-9	Comparison of Nutrient Concentrations With Water Quality Criteria for the Project..... 5.4-62
5.4-10	Comparison of Predicted Metals Concentrations With Water Quality Criteria for the Project..... 5.4-64
5.4-11	Comparison of Predicted Chloride Concentrations With Water Quality Criteria for the Project..... 5.4-65
5.4-12	Comparison of Nitrate-N and Chloride Concentrations With GroundWater Quality Objectives for the Project Site ..... 5.4-69
5.5-1	Los Angeles County Agricultural Acres Per Crop 1970–2013..... 5.5-8

<b><u>Table</u></b>	<b><u>Page</u></b>
5.5-2 Farmland Mapping and Monitoring Program Resources in Los Angeles County 2000–2014.....	5.5-9
5.5-3 Agricultural Lands Committed to Non-Agricultural Use in Los Angeles County 2002–2010.....	5.5-10
5.5-4 Farmland Mapping and Monitoring Program Designations and Acreages on the Centennial Project Site .....	5.5-11
5.6-1 Archaeological and Historic Resources Within the Project Site Boundaries ....	5.6-20
5.6-2 Geologic Formations and Paleontological Sensitivity Within the Project Site Boundaries .....	5.6-42
5.6-3 Mitigation Measures for Resources in Development Footprint.....	5.6-49
5.6-4 Mitigation Measures for Resources Within Open Space Areas .....	5.6-51
5.7-1 Soil Types and Their Hydrological Characteristics .....	5.7-12
5.7-2 Biological Surveys Conducted on the Project SITE (1999–2015).....	5.7-19
5.7-3 Vegetation Type Acreages.....	5.7-33
5.7-4 Summary of Results of 2003–2004 Grassland Study .....	5.7-43
5.7-5 Special Status Plant Species.....	5.7-68
5.7-6 Estimated Number of Oaks on the Project Site .....	5.7-87
5.7-7 Estimated Number of Oaks by Size Class on the Project Site.....	5.7-87
5.7-8 Special Status Wildlife Species .....	5.7-89
5.7-9 Other L.A. Audubon Sensitive Bird Species .....	5.7-100
5.7-10 Jurisdictional Wetlands and Waters Summary.....	5.7-134
5.7-11 Impacts to Vegetation Types.....	5.7-155
5.7-12 Primary Biological Resources Within the Impact Areas and the On-site and Off-site Preserve System .....	5.7-158
5.7-13 Impacts to Jurisdictional Wetlands and Waters .....	5.7-162
5.8-1 Antelope Valley Area Plan Consistency Analysis .....	5.8-24
5.9-1 SCAG Region Population Projections.....	5.9-7
5.9-2 Los Angeles County Population .....	5.9-8
5.9-3 Los Angeles County Population Projections.....	5.9-9
5.9-4 Population Projections for the Antelope Valley.....	5.9-10
5.9-5 Population Projections for TAZs .....	5.9-11
5.9-6 Kern County Population Projections .....	5.9-11
5.9-7 SCAG Region Household Projections .....	5.9-12
5.9-8 Los Angeles County Housing Stock .....	5.9-13
5.9-9 Los Angeles County Household Projections.....	5.9-13
5.9-10 Los Angeles County 2016 Housing Units by Type .....	5.9-14
5.9-11 Los Angeles County Income Limits (2016).....	5.9-15
5.9-12 Future Housing Needs: 2014–2021 .....	5.9-16
5.9-13 Antelope Valley Housing Stock .....	5.9-16
5.9-14 Household Projections for Traffic Analysis Zones.....	5.9-17
5.9-15 Kern County Housing Projections.....	5.9-17
5.9-16 Kern County Future Housing Need: 2013–2023 .....	5.9-18
5.9-17 SCAG Region Employment Projections.....	5.9-18
5.9-18 Los Angeles County Employment Base .....	5.9-19
5.9-19 Los Angeles County Employment Projections.....	5.9-20

<b><u>Table</u></b>	<b><u>Page</u></b>
5.9-20 Employment Projections for TAZs .....	5.9-21
5.9-21 Unemployment Rates .....	5.9-21
5.9-22 Kern County Employment Projections .....	5.9-22
5.10-1 RTP/SCS Performance Measures .....	5.10-7
5.10-2 Capacities for Freeways and Expressways – Existing Conditions .....	5.10-17
5.10-3 ICU and LOS Summary – Existing (2014 and 2015) Conditions.....	5.10-21
5.10-4 Existing (2014 and 2015) Freeway Peak Hour Volumes and V/C Summary – Northbound and Eastbound .....	5.10-24
5.10-5 Existing (2014 and 2015) Freeway Peak Hour Volumes and V/C Summary – Southbound and Westbound.....	5.10-28
5.10-6 Ramp Peak Hour Volumes and V/C Summary – Existing (2014 and 2015) Conditions .....	5.10-32
5.10-7 Level of Service Descriptions.....	5.10-39
5.10-8 Volume/Capacity Ratio Level of Service Ranges.....	5.10-41
5.10-9 Los Criteria For Basic Freeway Segments.....	5.10-42
5.10-10 Freeway Mainline Performance Criteria .....	5.10-43
5.10-11 Freeway Ramp Performance Criteria.....	5.10-44
5.10-12 Arterial Intersection Performance Criteria .....	5.10-45
5.10-13 LOS Criteria for Two-Lane Rural Highways .....	5.10-46
5.10-14 Two-Lane Rural State Highway Performance Criteria .....	5.10-46
5.10-15 LOS Criteria for Multiple Lane Rural Highways.....	5.10-47
5.10-16 Multiple Lane Rural Highway Performance Criteria .....	5.10-48
5.10-17 Project Area SCAG TAZ Socioeconomic Data Summary .....	5.10-49
5.10-18 Internal/External Tripends.....	5.10-50
5.10-19 Trip End and Trip Summary .....	5.10-50
5.10-20 SR-138 Two-Lane Highway Impact Summary – Existing Plus Project Conditions .....	5.10-54
5.10-21 Freeway/Expressway Volume and Capacity Summary – Existing (2014 and 2015) Plus Project with Existing Lanes.....	5.10-57
5.10-22 Ramp Peak Hour Volumes and V/C Summary – Existing (2014 and 2015) Plus Project.....	5.10-68
5.10-23 ICU and LOS Summary – Existing (2014 and 2015) Plus Project Conditions.	5.10-81
5.10-24 SR-138 Cumulative (2035) Conditions Two-Lane Highway Impact Analysis .....	5.10-89
5.10-25 Freeway Volume and Capacity Summary – Cumulative (2035 and 2040) Conditions With and Without the Project.....	5.10-93
5.10-26 Volume and Capacity Summary – 2035 and 2040 Freeway Conditions With Mitigation .....	5.10-105
5.10-27 Ramp Peak Hour Volumes and V/C Summary –Cumulative (2035 and 2040) Conditions.....	5.10-108
5.10-28 ICU and LOS Summary – Cumulative (2035) No Project and With Project Comparison.....	5.10-121
5.10-29 ICU and LOS Summary – Existing (2014 & 2015) Conditions and Cumulative (2035) With Project Comparison (Los Angeles County SR-138 Intersections).....	5.10-124

<b><u>Table</u></b>	<b><u>Page</u></b>
5.10-30 Cumulative Impact Summary for SR-138 With Improvements.....	5.10-128
5.10-31 Project Impact Summary with Mitigation .....	5.10-129
5.10-32 Project Impact Summary .....	5.10-131
5.10-33 Mitigation Summary .....	5.10-132
5.10-34 CMP Analysis Locations.....	5.10-136
5.10-35 Transit Trip Summary .....	5.10-137
5.11-1 California and National Ambient Air Quality Standards .....	5.11-4
5.11-2 Designations of Criteria Pollutants In The Antelope Valley Portion of The Mojave Desert Air Basin.....	5.11-24
5.11-3 Designations of Criteria Pollutants in the South Coast Air Basin.....	5.11-25
5.11-4 Air Quality Levels Measured at The Lancaster and Santa Clarita Monitoring Stations .....	5.11-26
5.11-5 Stationary Source Types, Size Limits, and Quantity Estimates .....	5.11-32
5.11-6 Antelope Valley Air Quality Management District Criteria Pollutant Significance Thresholds .....	5.11-38
5.11-7 South Coast Air Quality Management District Thresholds of Significance .....	5.11-39
5.11-8 Grading, Building, Paving, and Architectural Coating equipment for Average Year Emissions Estimates .....	5.11-41
5.11-9 Average Year Estimated Annual Construction Emissions (AVAQMD Thresholds) .....	5.11-44
5.11-10 Average Year Estimated Daily Construction Emissions (SCAQMD Thresholds) .....	5.11-45
5.11-11 Grading Equipment for Peak Grading Year.....	5.11-46
5.11-12 Estimated Annual Construction Emissions for the Peak Grading Year (Antelope Valley Air Quality Management District Thresholds).....	5.11-47
5.11-13 Estimated Daily Construction Emissions for the Peak Grading Year (South Coast Air Quality Management District Thresholds).....	5.11-47
5.11-14 Estimated Annual Construction Emissions With Implementation of Mitigation (Tier 4 Final Equipment, if Available) for the Average Year (AVAQMD Thresholds) .....	5.11-48
5.11-15 Estimated Daily Construction Emissions With Implementation of Mitigation (Tier 4 Final Equipment, if Available) for the Average Year (SCAQMD Thresholds).....	5.11-49
5.11-16 Estimated Annual Construction Emissions With Implementation of Mitigation (Tier 4 Final Equipment, if Available) for the Peak Grading Year (AVAQMD Thresholds) .....	5.11-50
5.11-17 Estimated Daily Construction Emissions With Implementation of Mitigation (Tier 4 Final Equipment, if Available) for the Peak Grading Year (SCAQMD Thresholds).....	5.11-50
5.11-18 Estimated Annual Operational Emissions (AVAQMD Thresholds).....	5.11-52
5.11-19 Estimated Maximum Daily Operational Emissions (SCAQMD Thresholds)....	5.11-53
5.11-20 Estimated Annual Combined Emissions (AVAQMD Thresholds) .....	5.11-55
5.11-21 Estimated Annual Mid-Project Combined Emissions (SCAQMD Units [lbs/day]) .....	5.11-56
5.11-22 Aggregate Emissions from Stationary Sources .....	5.11-58

<b><u>Table</u></b>	<b><u>Page</u></b>
5.11-23 Ambient Concentrations at Sensitive Receptors During Phase Two, Three, and Four Construction.....	5.11-59
5.11-24 Incremental Health Risks From Diesel Particulate Matter to Existing Residences.....	5.11-74
5.12-1 California Land Use Compatibility Guidelines.....	5.12-5
5.12-2 Los Angeles County Exterior Noise Standards for Stationary Noise Sources...	5.12-6
5.12-3 Los Angeles County Construction Noise Limits.....	5.12-8
5.12-4 Noise Levels for Common Activities.....	5.12-11
5.12-5 Existing Measured Noise Levels.....	5.12-15
5.12-6 Existing Traffic Noise Levels.....	5.12-16
5.12-7 Estimated Noise Levels From Community Use Area Activities.....	5.12-25
5.12-8 Typical Maximum Construction Noise Levels.....	5.12-31
5.12-9 Estimated Grading Construction Noise Levels.....	5.12-32
5.12-10 Vibration Levels for Construction Equipment.....	5.12-36
5.12-11 Existing Plus Project Traffic Noise Levels.....	5.12-38
5.12-12 2035 Traffic Noise Levels.....	5.12-42
5.14-1 Quimby Act/Parkland Dedication Ordinance Requirement for the Centennial Project.....	5.14-24
5.14-2 General Plan Parkland Standard for the Centennial Project.....	5.14-25
5.15-1 Gorman Joint School District Facilities, Enrollment, and Capacity.....	5.15-8
5.15-2 Westside Union Elementary District School Enrollment and Capacity.....	5.15-10
5.15-3 Antelope Valley Union High School District School Enrollment and Capacity.....	5.15-12
5.15-4 Centennial Buildout Demand for Gorman District Facilities Based on the School Facilities and Funding Agreement.....	5.15-15
5.15-5 Centennial Buildout Demand for WUSD Facilities Based on WUSD Rates.....	5.15-17
5.15-6 K-8 School Locations/Acres.....	5.15-18
5.15-7 Centennial Buildout Demand for High Schools Based on AVUHSD Rates.....	5.15-19
5.16-1 Closest County of Los Angeles Fire Stations.....	5.16-7
5.16-2 Closest Kern County Fire Stations.....	5.16-9
5.16-3 Fire History On and Near Centennial Project Site.....	5.16-10
5.17-1 Area Libraries.....	5.17-7
5.17-2 2015 Los Angeles County Solid Waste Disposal.....	5.17-21
5.17-3 Major Landfills in Los Angeles County Serving the Project Area.....	5.17-23
5.17-4 Area Learning Centers.....	5.17-24
5.17-5 Annual Solid Waste Generation.....	5.17-31
5.18-1 Antelope Valley Integrated Regional Water Management Plan Population Projections.....	5.18-31
5.18-2 Antelope Valley Integrated Regional Water Management Plan Projected Water Supply and Demand (acre-feet) Comparison for an Average Water Year.....	5.18-32
5.18-3 Antelope Valley Integrated Regional Water Management Plan Projected Water Supply and Demand (acre-feet) Comparison for a Single-Dry Water Year.....	5.18-33

<b><u>Table</u></b>	<b><u>Page</u></b>
5.18-4 Antelope Valley Integrated Regional Water Management Plan Projected Water Supply and Demand (acre-feet) Comparison for a Multiple-Dry Water Year .....	5.18-34
5.18-5 Antelope Valley Integrated Regional Water Management Plan Estimated 2010 Per Capita Urban Water Use in the Antelope Valley .....	5.18-35
5.18-6 Residential Indoor Water Use Rates in U.S. Environmental Protection Agency and California Department of Water Resources National and California Studies .....	5.18-43
5.18-7 Centennial Land Use and Water Demand at Project Buildout.....	5.18-45
5.18-8 Summary of Project Buildout Demand and Per Capita Water Use .....	5.18-49
5.18-9 Construction Water Demand by Phase and Year .....	5.18-51
5.18-10 Average Year Supplies and Demand, Years 1–20 to Project Buildout and Years 21–25 After Buildout .....	5.18-55
5.18-11 Water Supplies and Demand in a Single-Dry Year, Project Years 5, 10, 15, and 20 (Full Buildout).....	5.18-57
5.18-12 Water Supplies and Demand in a Multiple-Dry Year Period Starting in Year 3, Year 8, Year 13, and Year 18 to Full Buildout .....	5.18-58
5.20-1 SCE Estimate of Centennial Peak Electrical Demand .....	5.20-9
5.20-2 SoCalGas Estimate of Centennial’s Monthly Natural Gas Demand .....	5.20-19
5.21-1 Operational and Total GHG Emissions.....	5.21-2
5.21-2 Comparison of Worldwide GHG Emissions .....	5.21-38
5.21-3 Grading, Building, Paving, and Architectural Coating Equipment for Average Year Emissions Estimates .....	5.21-51
5.21-4 Vegetation Change Greenhouse Gas Emissions .....	5.21-54
5.21-5 Area Source Greenhouse Gas Emissions .....	5.21-56
5.21-6 Energy Use and Greenhouse Gas Emissions.....	5.21-57
5.21-7 Water Use and Greenhouse Gas Emissions.....	5.21-60
5.21-8 Solid Waste Generation and Greenhouse Gas Emissions .....	5.21-63
5.21-9 Mobile Source Vehicle Miles Traveled and Greenhouse Gas Emissions .....	5.21-64
5.21-10 Operational and Total GHG Emissions.....	5.21-70
5.21-11 Centennial Project Compliance With the Los Angeles County Community Climate Action Plan .....	5.21-73
7-1 North Los Angeles County and Kern County Growth Projections .....	7-4
7-2 Related Project Development Summary .....	7-6
7-3 Significant and Unavoidable Cumulative Impacts .....	7-31
8-1 Centennial Specific Plan Alternatives Comparison .....	8-15
8-2 Comparison of Alternatives’ Impacts to the Centennial Project.....	8-19
8-3 Ability of Each Alternative to Meet the Project Objectives .....	8-69

## EXHIBITS

<b><u>Exhibit</u></b>	<b><u>Follows Page</u></b>
3-1	Regional Location ..... 3-1
3-2	Project Vicinity Map..... 3-1
3-3	Aerial Photograph..... 3-2
3-4	Local Area Constraints..... 3-13
4-1	Centennial Specific Plan – Land Use Plan..... 4-5
4-2a	Antelope Valley Area Plan Land Use Designations..... 4-9
4-2b	Antelope Valley Area Plan Zoning ..... 4-11
4-3	Centennial Project – Villages and Core Areas ..... 4-16
4-4	Centennial Project – Vesting Tentative Parcel Map No. 060022..... 4-17
4-5	Centennial Project – Safety Zones..... 4-28
4-6	Centennial Project – Significant Ecological Area Zone ..... 4-29
4-7	Centennial Project – Circulation Plan..... 4-32
4-8	Centennial Project – Conceptual Bicycle Plan ..... 4-35
4-9	Centennial Project – Conceptual Transit Plan ..... 4-37
4-10a	Centennial Project – Recreation and Trails Plan..... 4-38
4-10b	Centennial Project – Greenway Trails..... 4-38
4-10c	Centennial Project – Typical Community Trail ..... 4-39
4-11	Centennial Project – On-Site Open Space/Mitigation Area..... 4-43
4-12	Centennial Project – Off-Site Mitigation Preserve ..... 4-44
4-13	Centennial Project – Conceptual Domestic Water System..... 4-55
4-14	Centennial Project – Conceptual Wastewater System ..... 4-59
4-15	Centennial Project – Conceptual Recycled Water System..... 4-61
4-16	Centennial Project – Conceptual Drainage and Flood Control System..... 4-62
4-17	Centennial Project – Dry Utilities Plan..... 4-63
4-18	Known Major Utilities in Project Area ..... 4-67
4-19a	Centennial Project – Slope Analysis..... 4-91
4-19b	Centennial Project – Conceptual Grading Plan..... 4-91
4-20	Centennial Project – Conceptual Phasing Plan..... 4-91
4-21	Centennial Project – Off-Site Project Components ..... 4-96
5.1-1	Regional Faults..... 5.1-9
5.1-2	Geologic Hazards..... 5.1-10
5.2-1	Regional Water Quality Control Board Boundaries ..... 5.2-15
5.2-2	Drainage Areas on the Project Site..... 5.2-16
5.2-3	Existing Watershed and Drainage Nodes ..... 5.2-16
5.2-4	Proposed Infiltration Basin Locations ..... 5.2-17
5.2-5	Receiving Channels of Concern and 100-Year Floodplain ..... 5.2-17
5.2-6	Location and Designation of Storm Water Runoff Discharge Cross Sections with Project ..... 5.2-39
5.3-1	Locations of Phase I Findings ..... 5.3-6
5.4-1	Groundwater Basins in the Project Area ..... 5.4-22
5.4-2	Low Impact Development (LID) Drainage Areas with Project..... 5.4-40
5.5-1	Important Farmland (FMMP Designations) ..... 5.5-11
5.5-2	Current On-site Agricultural Uses..... 5.5-11

<b><u>Exhibit</u></b>	<b><u>Follows Page</u></b>
5.6-1 Geological Formations .....	5.6-41
5.7-1 Grouped Vegetation Types.....	5.7-31
5.7-2 Grassland Field Sampling Point Selection .....	5.7-46
5.7-3 Grassland Category Map .....	5.7-46
5.7-4 Grassland Sampling Points .....	5.7-46
5.7-5 Points With Predicted Native Perennial Bunchgrass (NPBG) Cover .....	5.7-46
5.7-6 Regional Wildlife Movement.....	5.7-56
5.7-7 Special Status Species.....	5.7-74
5.7-8 Oak Trees within Study Area .....	5.7-86
5.7-7b Special Status Wildlife Species Observations .....	5.7-88
5.7-9 Jurisdictional Drainage Features.....	5.7-133
5.7-10 Mitigation Preserve.....	5.7-135
5.7-11a Special Status Plant Species Observation with Impact Boundary .....	5.7-142
5.7-11b Special Status Species Impacts.....	5.7-142
5.7-12 Vegetation Type Impacts .....	5.7-158
5.7-13 Jurisdictional Drainage Feature Impacts .....	5.7-162
5.7-14 Oak Tree Impacts .....	5.7-171
5.7-15 Significant Ecological Areas.....	5.7-172
5.7-16 Oak Tree/Oak Woodland Restoration/Creation Areas .....	5.7-183
5.7-17 Detailed Vegetation Map.....	5.7-195
5.9-1 Traffic Analysis Zones .....	5.9-10
5.10-1 Project Site Location and Vicinity .....	5.10-16
5.10-2 Study Area Highway System - Existing (2014 and 2015) Conditions.....	5.10-16
5.10-3 Average Daily Traffic Volumes – Existing Conditions .....	5.10-22
5.10-4 AM Peak Hour Intersection Volume Counts on SR-138 (Existing Conditions) .....	5.10-22
5.10-5 PM Peak Hour Intersection Volume Counts on SR-138 (Existing Conditions) .....	5.10-22
5.10-6 SCAG Traffic Analysis Zones.....	5.10-49
5.10-7 Project Trip Distribution at Buildout .....	5.10-51
5.10-8 On-site Average Daily Traffic Volumes.....	5.10-51
5.10-9 Average Daily Traffic Volumes - Project Only.....	5.10-53
5.10-10 Average Daily Traffic Volumes – Existing (2014 and 2015) Plus Project .....	5.10-53
5.10-11 Year 2035 Plus Project ADT Volumes .....	5.10-88
5.11-1 Air District Boundaries .....	5.11-13
5.12-1 Common CNEL Noise Exposure Levels at Various Locations .....	5.12-12
5.12-2 Noise Measurement Locations .....	5.12-14
5.12-3 On-Site Circulation System, Average Daily Traffic (ADT) Volumes, and Speeds .....	5.12-22
5.13-1 Viewpoint 1 – Cement Plant Road Realignment Simulation .....	5.13-9
5.13-2 Viewpoint 2 – Project Entrance Simulation.....	5.13-9
5.13-3 Viewpoint 3 – Town Center Entrance Simulation .....	5.13-9
5.13-4 Viewpoint 4 – Business Park Simulation .....	5.13-10
5.13-5 Viewpoint 5 – 300 <sup>th</sup> Street Simulation.....	5.13-10
5.14-1 Existing Open Space and Recreation Areas .....	5.14-8

<b><u>Exhibit</u></b>	<b><u>Follows Page</u></b>
5.14-2 Existing and Proposed Trails in the Project Vicinity .....	5.14-8
5.15-1 Local School Districts .....	5.15-6
5.16-1 Existing Fire Station Locations.....	5.16-7
5.16-2 Existing Law Enforcement Station Locations .....	5.16-18
5.18-1 Primary Features in the Antelope Valley Groundwater Basin .....	5.18-17
5.18-2 Groundwater Sub-basins in the Antelope Valley Groundwater Basin.....	5.18-18
5.18-3 Antelope Valley Adjudication Area.....	5.18-19
5.18-4 Project Site and Tejon Ranch Company Land Ownership within the Antelope Valley Adjudication Area.....	5.18-19
5.18-5 Location of Study Area, Tejon Ranch Company Land, and the Project Site .....	5.18-19
5.18-6 Project Site and Tejon Ranch Company Land Ownership within the AVEK Service Area.....	5.18-29
5.18-7 Preliminary Water Storage and Distribution System.....	5.18-52
5.19-1 Preliminary Wastewater Collection System.....	5.19-10
5.19-2 Treatment Methods at Project Wastewater Reclamation Facilities (WRF) ....	5.19-11
5.19-3 Preliminary Recycled Water, Storage, and Distribution System .....	5.19-11
5.20-1 Known Major Utilities in Project Area .....	5.20-7
5.20-2 Centennial Project – Dry Utility Improvements .....	5.20-7
7-1 Los Angeles County Cumulative Impact Area.....	7-3
8-1 Alternative B – Previously Proposed Project.....	8-9
8-2 Alternative Site Location Within Tejon Ranch .....	8-12
8-3 Public Input Alternative .....	8-13
8-4 Alternative C – Additional Drainage Avoidance .....	8-17
8-5 Alternative D – Infrastructure Relocation Alternative .....	8-17
8-6 Alternative E – Density Clustering/East of Aqueduct.....	8-18
8-7 Alternative F – Central Economic Opportunity Area Development.....	8-18

**LIST OF APPENDICES  
(On Accompanying CDs)**

**Appendix**

**2.0 Notice of Preparation, Initial Study and NOP Comment Letters**

2.0-A 2015 Notice of Preparation, Initial Study, and Comment Letters Received on the NOP.

2.0-B 2004 Notice of Preparation, Initial Study, and Comment Letters Received on the NOP.

2.0-C Mitigation Monitoring and Reporting Program

**4.0 Project Description**

4.0-A Centennial Specific Plan, prepared by Placeworks, May 2017.

**5.1 Geotechnical Reports**

5.1-A *Preliminary Geotechnical Summary Report; Centennial – Tejon Ranch, Los Angeles County, California*, prepared by Geocon, August 2015

**5.2 Hydrology, Flood, and Drainage Reports**

5.2-A *Centennial Master Plan Hydrology*, prepared by Psomas, April 2017

5.2-B *Centennial Project Hydromodification Technical Report*, prepared by Geosyntec, March 2016

**5.3 Environmental Safety and Man-Made Hazards**

## 1.0 EXECUTIVE SUMMARY

### 1.1 GENERAL INTRODUCTION

The environmental impact report (EIR) process, as defined by the California Environmental Quality Act (CEQA), requires the preparation of an objective, full-disclosure document. This EIR provides a comprehensive evaluation of the reasonably anticipated scope of the Project and evaluates the potential impacts of its construction and long-term operation. It is intended to serve as an informational document for public agency decision makers and the general public regarding (1) the objectives and components of the Project; (2) any potentially significant environmental impacts (individual and cumulative) that may be associated with the planning, construction, and operation of the Project; and (3) appropriate and feasible mitigation measures and alternatives that may be adopted to reduce or eliminate these significant impacts. The Project's Mitigation Monitoring and Reporting Program (MMRP) is provided in Appendix 2.0-C of this Draft EIR.

This EIR provides project-level detail pursuant to Section 15161 of the State CEQA Guidelines, including specific infrastructure components needed to implement the Project, which state that a project EIR "examines the environmental impacts of a specific development project. This type of EIR should focus primarily on the changes in the environment that would result from the development project. The EIR shall examine all phases of the project including planning, construction, and operation" (California Code of Regulations [CCR], Title 14, Section 15161).

### 1.2 PURPOSE AND SCOPE OF THIS ENVIRONMENTAL IMPACT REPORT

This EIR has been prepared to evaluate the potential environmental impacts associated with the construction and operation of the Centennial Project. This EIR has been prepared in conformance with the California Environmental Quality Act (CEQA; *California Public Resources Code* [PRC], Sections 21000 et seq.) and the State CEQA Guidelines (14 CCR Sections 15000 et seq.). This EIR addresses the potential environmental impacts associated with developing all of the land uses and implementing the associated actions identified in the Project's Conceptual Land Use Plan through buildout.

The scope of this EIR includes issues identified in consultation with the County during the Notice of Preparation (NOP) comment periods, as well as environmental issues raised by agencies and the general public in response to the scoping process and circulation of the NOP. The environmental topics to be addressed (with the respective EIR section numbers) include the following:

- Geotechnical (Section 5.1)
- Hydrology and Flood (Section 5.2)
- Hazards and Fire Safety (Section 5.3)
- Water Quality (Section 5.4)

- Land Resources (Agricultural, Forestry, and Mineral Resources) (Section 5.5)
- Cultural and Tribal Resources (Section 5.6)
- Biological Resources (Section 5.7)
- Land Use, Entitlements, and Planning (Section 5.8)
- Population, Housing, and Employment (Section 5.9)
- Traffic, Access, and Circulation (Section 5.10)
- Air Resources (Section 5.11)
- Noise (Section 5.12)
- Visual Resources (Section 5.13)
- Parks and Recreation (Section 5.14)
- Education (Section 5.15)
- Fire and Law Enforcement Services (Section 5.16)
- Other Public Services (Library, Solid Waste, and Other Public Facilities) (Section 5.17)
- Water Resources (Section 5.18)
- Wastewater Collection (Section 5.19)
- Dry Utilities (Electrical, Fossil Fuels [Natural Gas and Petroleum], Telephone, and Cable Service) (Section 5.20)
- Climate Change (Section 5.21)
- Growth-Inducing Impacts (Section 6.0)
- Cumulative Impacts (Section 7.0)
- Alternatives to the Proposed Project (Section 8.0)
- CEQA-Mandated Sections (Section 9.0)
- Document Preparers (Section 10.0)
- Acronyms (Section 11.0)
- Glossary (Section 12.0)

## 1.3 PROJECT SETTING

### 1.3.1 PROJECT LOCATION

The Project is proposed on approximately 12,323 acres (19.3 square miles) of land in the northwestern portion of the Antelope Valley in unincorporated Los Angeles County. The Project site is located approximately 35 miles north of the City of Santa Clarita in Los Angeles County; approximately 50 miles south of the City of Bakersfield in Kern County via State Route (SR) 99 and Interstate (I) 5; and approximately 36 and 43 miles west of the Cities of Lancaster and Palmdale, respectively, in Los Angeles County via SR-138. SR-138 runs through the southern portion of the Project site, which is located approximately one mile east of I-5, just south of the Kern County/Los Angeles County boundary in the vicinity of Quail Lake. The community of Gorman in Los Angeles County is adjacent to I-5 and is approximately four miles north of the I-5/SR-138 junction. The community of Neenach is located approximately 1.2 miles to the east of the Project boundary. The West Branch of the State Water Project's (SWP) California Aqueduct bisects the Project. The Project site's

physical setting is summarized below; refer to Section 3.0, Environmental Setting, for a detailed description of the Project site's existing setting.

### **1.3.2 PHYSICAL SETTING**

The Tehachapi Mountains border the northern and western perimeter of the Project site, and the San Gabriel Mountains are located to the south of the Project site. The Project site's topography is comprised largely of low rolling hills, with areas of steeper slopes and higher elevations in the western and northwestern portions of the site. Elevations range from approximately 2,975 feet above mean sea level (msl) to approximately 3,635 feet above msl. The Project site has been primarily used for livestock grazing for more than 150 years. In addition to cattle grazing, the Tejon Ranch Company owns and cultivates approximately 1,000 acres in the eastern portion of the Project site. Existing development is limited to a few paved access roads to the California Aqueduct and through the site to the National Cement Plant, which is located approximately one mile north of the Project site. There are also unpaved ranch roads, fencing, stock ponds, and a few electrical transmission lines. Further details of the physical setting are described below; please refer to the topical analyses in Section 5.0 for a complete discussion of the existing setting.

#### ***Air Resources***

The Project site is under the jurisdiction of two different air districts and lies within two different air basins. Approximately 91 percent of the site is within the boundaries of the Antelope Valley Air Quality Management District (AVAQMD), while approximately 9 percent of the southwest portion of the Project site is within the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The portion of the site under the jurisdiction of the AVAQMD lies within the Mojave Desert Air Basin (MDAB), while the portion of the Project site that is under the jurisdiction of the SCAQMD lies within the South Coast Air Basin (SoCAB).

#### ***Biological Resources***

There are a variety of vegetation types on the Project site; however, the site is dominated by grasslands. There are also riparian and wetland vegetation types on site occurring in association with drainages, springs, and seeps. Oak woodland vegetation types are dominant in the westernmost and the southern portions of the Project area as a whole. Scrub vegetation types (primarily chaparral) are generally found in the western portion of the Project site on somewhat eroded, steep slopes. In the Project site's lower elevations, rabbitbrush scrub is present. There are a number of wildlife species, including invertebrates, amphibians, reptiles, birds, and mammals, that have been identified or that would be expected to occur on the Project site. A total of 42 special status wildlife species are known to occur or potentially occur in the Project region (defined as the western Antelope Valley and its associated watersheds); of these, 33 have at least some potential to occur, albeit low in many cases, or were observed by Biologists during the course of various field surveys conducted on the Project site. The Project site is not located within any U.S. Fish and Wildlife Service-designated or proposed Critical Habitat for any of State- and/or federally listed Endangered, Threatened, or Candidate Species. In addition to the special status species

designated by the State and federal resource agencies, the Los Angeles Audubon maintains a list of Sensitive Bird Species that they consider to be at risk of decline or extirpation in Los Angeles County. These species were also analyzed for potential to occur on the Project site.

### ***Cultural and Tribal Resources***

The Tejon Ranch region, including the Project site, was a contact point between five separate ethnolinguistic groups immediately prior to the arrival of European Americans in California, and the Tejon Ranch area became a multi-ethnic, post-Mission Period refuge for many Native Americans. Two of the three rock formations identified on the Project site are considered to be sensitive for the presence of fossil resources: the marine Late Miocene Quail Lake Formation and the Late Miocene Oso Canyon Formation.

### ***Hydrology***

The Project site is located primarily within the limits of the Antelope Valley Watershed. The Santa Clara River Watershed is the adjacent watershed to the southwest. Approximately 90 percent of the Project site is located within the jurisdiction of the Lahontan Regional Water Quality Control Board (RWQCB), and approximately 10 percent is within the jurisdiction of the Los Angeles RWQCB. Local drainages on the Project site include Oso Canyon, Los Alamos Creek, Little Sycamore Canyon and Big Sycamore Canyon, Tentrock Canyon, Horsecamp Canyon, and Cow Spring Canyon.

## **1.4 PROJECT DESCRIPTION**

The Project involves the development of a new community with residential, commercial, business park, recreational/entertainment, and institutional/civic uses. The Project includes open space, parks, schools, utilities, and infrastructure to support the proposed land uses and future residents.

### **1.4.3 LAND USE OVERVIEW**

The Project site encompasses approximately 12,323 acres and would allow up to 19,333 dwelling units (du) on approximately 4,987 gross acres of land designated for residential uses. Other land uses include approximately 7,363,818 square feet (sf) of Business Park uses (office, research and development, and warehousing or light manufacturing uses) on approximately 597 gross acres and approximately 1,034,550 sf of Commercial uses on approximately 102 acres. Proposed Institutional/Civic land uses (such as schools for higher education, medical facilities, library, and other civic uses) encompass approximately 1,568,160 sf on approximately 110 acres. The primary entitlement action associated with the Project includes the adoption of the *Centennial Specific Plan* and, as described in Section 4.8, Intended Use of the EIR, additional entitlement actions include a Zone Change to Specific Plan; Amendment to the Highway Plan (Map 3.1 of the AVAP); Amendment to the Highway Plan Policy Map included in the General Plan; Development Agreement; Tentative Parcel Map; and a Conditional Use Permits (CUPs) for grading and for the approval of Project-related infrastructure. Project buildout would be implemented in

phases based on future market conditions over an approximate 20-year period through a series of future tract and parcel maps.

The Project includes the development of nine Villages that will each contain a mix of land uses that enable residents to live near schools, shopping, neighborhood businesses and services, civic buildings, medical facilities, and employment centers. The Project includes a mix of housing options within each Village, ranging from apartment homes close to Town Centers to single-family homes in lower-density areas. A full range of light industrial, business, and other commercial uses are planned that are intended to yield a broad range of employment opportunities, from retail services to large corporate employers. The opportunities for employment diversity increase the overall economic sustainability of the Project and the West EOA.

The Mixed-Use (MU) Overlay is an optional designation for uses within the Commercial areas. The MU Overlay is intended to allow for a combination of commercial, office and residential uses in either vertically or horizontally (uses side by side) integrated projects, as an optional land use in select commercial areas. The Project includes approximately 130,680 sf of Recreation/Entertainment Overlay uses (clubhouse, farmers market, childcare facilities, health clubs) on approximately 75 acres. Proposed sites for major Utility facilities that would serve the entire community (e.g., two wastewater reclamation facilities, water treatment facility, water bank, materials recovery facility) encompass approximately 191 acres. The School Overlay includes Kindergarten through 12<sup>th</sup> grade schools located on approximately 146 acres. Approximately 5,624 acres (approximately 45.6 percent) of the 12,323-acre Project site are proposed for Open Space for natural resource protection and greenways, and 163 acres are included in the Park Overlay for active and passive recreational use.

The Project also includes a vehicular and a non-vehicular circulation system. In support of the *Antelope Valley Area Plan's* (AVAP's) goal of reducing single-occupancy vehicle use, the Project includes alternatives to automobile travel (e.g., public transit, bicycle network, and pedestrian system) that would minimize traffic, pollution, and greenhouse gases. Efficient use of land and a balance of uses that result in a jobs/housing balance would reduce single-occupancy automobile travel and vehicle miles traveled. The Project provides for an integrated network of roadways and walking and biking trails to reduce automotive use and facilitate safe and efficient travel. An extensive network of sidewalks, greenway trails (approximately 13 miles), and community trails (approximately 60 miles) would link residential, schools, shopping, and employment areas.

The Project's Green Development Program encompasses a range of sustainable development practices that have been incorporated into the Project at all phases of site development (i.e., from land use planning to long-term resource conservation) and it encourages environmentally sustainable development in two ways. First, in addition to satisfying all mandatory measures of the California Green Building Standards (CALGreen) Code, all residential and non-residential development within the *Centennial Specific Plan* shall be required to satisfy the measures necessary to achieve CALGreen Tier 1 that are currently applicable at the time it is being developed. Second, this Green Development Program includes additional measures for Centennial that exceed applicable State, regional, and local requirements, including but not limited to exceeding 2016 CALGreen Tier 1 standards. With

this approach, Project development will meet and exceed the mandatory standards of the CALGreen Code, CALGreen Tier 1, and the requirements of the County's "Green Building Ordinances" that exist on the date of adoption of the *Centennial Specific Plan*.

In support of the AVAP's prioritization for the preservation of natural open space resources, development in areas of significant biological value would be minimized and there would be no disturbance or development within the designated Significant Ecological Area (SEA) on the Project site. Of the 12,323 acres within the Project site, approximately 5,624 acres would be included in the Open Space land use designation. Of the 5,624 acres of designated Open Space, approximately 5,116 acres (42 percent of the total Project site) are intended to (1) remain in their original natural condition; (2) be restored; and/or (3) be enhanced by weed abatement, fencing, and native species planting, among other means. Of this amount, approximately 3,865 acres are designated as SEA 17 to be preserved in perpetuity within the Project site boundaries. The preservation also protects local wildlife movement on and off-site because these areas are positioned contiguous to off-site open space areas, thereby providing a larger total area of continuous preserved open space for local wildlife to use as habitat and for movement. No Project development would occur within SEA 17.

#### **1.4.4 PUBLIC SERVICES AND INFRASTRUCTURE**

The Project includes conceptual site locations for up to four new fire stations in the Project area. The number of on-site fire stations and their general locations were determined through preliminary consultation with the Los Angeles County Fire Department (LACFD). The Project would provide for one on-site Sheriff's station. Prior to development of this permanent Sheriff's station, the Los Angeles County Sheriff's Department (LASD) would operate a temporary station (e.g., store front station) in the first phase of Project development. This store front Sheriff station would be developed and fully operational prior to issuance of the first certificate of occupancy. To accommodate the demand for educational facilities created by future Centennial residents, the Project reserves sites through a "Schools" land use designation for five Kindergarten (K) through 8<sup>th</sup> grade schools, one K-5 school, and one high school. A library will also be developed in the Town Center.

The Project's Green Development Program requires reduced potable water consumption through the use of drought-tolerant or native plants in greenways, transition areas, and rights-of-way; low-flow showerheads, faucets and toilets; intelligent irrigation devices; and recycled water use primarily for landscape irrigation in residential common areas. Additionally, the Project's water resource management infrastructure for wastewater treatment, recycled water, flood control/drainage, water quality, hydromodification control, and sediment management are integrated to create a cohesive infrastructure system that minimizes the Project's effects on the environment.

The Project includes two wastewater reclamation facilities for the tertiary treatment of all wastewater generated by Project uses. This recycled water will be delivered throughout the Project site for non-potable uses (e.g., irrigation), thereby reducing the Project's demand for imported water and groundwater resources. The Project will also use its underground aquifers to bank imported water supplies available but not needed during average and wet years to provide for Project uses in dry years. The Project's flood control/drainage and water

quality facilities have been designed in such a way that they can increase groundwater recharge, thereby increasing the amount of groundwater available for Project uses and decreasing the Project's need for imported water resources. As a result of this integrated approach, the Project will be able to rely on its groundwater and wastewater resources, as well as its Green Development Program requirements, to reduce the demand for imported water from the State Water Project (SWP) that the Project would otherwise create, and will be more protective of its natural drainages and sensitive habitats.

A portion of the National Cement Plant Road within the Project boundaries is planned to be realigned through the Project site to access the SR-138 from the western side of Quail Lake rather than from its current connection on the east side of Quail Lake. This realignment serves the purpose of providing a shorter route of access for the cement trucks to the I-5; eliminates concrete truck travel over the bridge that crosses the West Branch of the Aqueduct; and eliminates cement truck traffic from traversing through one of the entrances to the Project site. In addition to the existing National Cement Plant Road bridge, the Project includes the construction of one new bridge over the West Branch of the Aqueduct.

#### **1.4.5 OFF-SITE PROJECT FEATURES**

The Project would require the implementation of off-site features consisting of roadway improvements and connections and upgrades to existing off-site utility systems. The Project involves five intersections with the SR-138. Two of these intersections are considered "off site", as they are not surrounded on both sides by the Project site. These two off-site intersections include the proposed realignment of the National Cement Plant Road at the western edge of Quail Lake and the intersection of 290<sup>th</sup> Street West with the SR-138. The construction of acceleration and deceleration lanes, turn pockets, and signalized traffic lights at each intersection would be required for Project implementation. Additionally, two underpasses and one overpass bridge crossing over SR-138 would be constructed to facilitate both pedestrian and bike access to employment centers.

Off-site groundwater wells are expected to be required within the existing Tejon Ranch Company (TRC) Water Bank in Kern County as a result of the Project; this water would require conveyance through the construction of new water pipelines from Kern County to the Project site. Connecting the TRC Water Bank wells to the Project site would require trenching for water pipelines to connect the wellheads to the "untreated wellhead pipelines" to be installed along 300<sup>th</sup> Street West and a crossing of the California Aqueduct. The Project would require four crossings of the California Aqueduct, including the wellhead pipeline that crosses the East Branch of the Aqueduct.

Project implementation would require the extension of off-site utilities to connections with on-site utilities. Electrical and telephone extensions would be constructed on the north side of SR-138 in the vicinity of Quail Lake. The new telephone extension would involve retrofitting and replacing the current overhead system that extends from the Frazier Park area to Gorman, and then to the site. Additionally, development of the Project could also impact off-site fiber-optic connections to the Litespan 2000 cabinet and require an upgrade of the existing Central Office facility to expand the Central Office's service capacity. However, AT&T's implementation of necessary expansion and upgrades would occur within existing

facility structures. A utility corridor would also be required within the 300<sup>th</sup> Street West right-of-way as it traverses both on and off the site. This would likely contain both wet and dry utilities, including but not limited to sewer, recycled, water, storm drain, electricity, cable television, and telephone.

Regarding electrical service, through coordination with Southern California Edison (SCE), two options were developed for bringing the additional capacity to service the western portion of the Project site: (1) reconfiguration of the existing Bailey Substation located off site along the property's western boundary and (2) upgrading the Gorman Substation and reconstructing the existing overhead transmission lines to handle the higher load. In either event, the improvements would occur entirely on lands owned by SCE, not on the Project site. No existing off-site facilities other than these would require upgrades or retrofitting to provide adequate electrical service to the Project site. At this time, upgrade of the Bailey Substation is considered the more likely solution; however, both options will continue to remain viable until later stages of the site development process subsequent to the CEQA process. If the Bailey Substation is upgraded, no upgrades to the Gorman Substation or other off-site facilities will be necessary to serve the first phase of Project implementation.

The initial natural gas facilities for the first phase of Project implementation would be provided by tapping into the existing high pressure gas main along Gorman Post Road west of the Project site. It would be necessary to construct a gas regulator station at this location for distributing pressure and/or extending a high pressure line to and within the Project site for the placement of a series of future regulator stations.

## 1.5 PROJECT OBJECTIVES

The Project demonstrates consistency with the *Antelope Valley Area Plan (AVAP)* through the Project Objectives, which have been identified for the Project.

1. Implement the Antelope Valley Area Plan (AVAP) by creating an environmentally and economically sustainable master-planned community on the Project site to help accommodate planned regional population and economic growth.
2. Design the Project to maximize efficient utilization of regional infrastructure while preserving hundreds of thousands of acres of contiguous natural open space and important biological resources.
3. Size the Project to include a broad range of employment, residential, institutional, and recreational land uses to encourage walkability and wellness, while reducing off-site employment-related commuter trips.
4. Ensure that all Project site infrastructure and public services are funded by the Project to avoid creating any financial obligations on existing residents and other taxpayers.
5. Integrate a multi-modal transportation network, renewable energy, water conservation, community wellness, and other green development features into the Project's design, build out, and ongoing operations.

## 1.6 SUMMARY OF THE ENVIRONMENTAL ANALYSIS

### 1.6.1 GEOTECHNICAL

With implementation of Project Design Feature (PDF) 1-1, the Project would not expose people or structures to potential substantial adverse effects (including the risk of injury or death) involving strong seismic ground shaking, seismic-related ground failure (e.g., liquefaction, settlement, lateral spreading), or location on an unstable geologic unit (e.g., collapse, expansive soils). The Project has been designed with a Geologic Safety Zone so that areas with potential geologic and seismic constraints are not developed with habitable structures and are planned so that buildings near faults have a minimum 100-foot setback in either direction from the fault line (PDF 1-1). Therefore, the Project would not expose people or structures to potential adverse effects (including the risk of injury or death) from surface rupture of a known earthquake fault with implementation of PDF 1-1. Additionally, in accordance with California Department of Education's Title 5 and current building codes, no sensitive uses (i.e., schools, hospitals, or public assembly sites) would be located on sites presenting a significant geotechnical hazard, as determined by the site-specific geological and soils engineering study. Therefore, there would be less than significant impacts related to fault rupture, seismic ground shaking, and ground failure with implementation of PDF 1-1.

Development of the Project may require localized blasting associated with excavation on site, and this would have the potential to result in geotechnical instability. However, with implementation of MM 12-7 from Section 5.12, Noise, potential impacts would be reduced to a less than significant level.

There would be less than significant impacts associated with off-site Project features since no off-site features would include habitable structures and since all off-site features would be required to comply with County and State geotechnical review and building code requirements as applied to the Project.

Development of the Project would result in less than significant impacts related to erosion or loss of topsoil with compliance with County subdivision specifications; County building code requirements; the Project's Hillside Grading Guidelines, and existing and future tract map-level geotechnical recommendations for the Project.

### 1.6.2 HYDROLOGY AND FLOOD

The proposed Project has been designed to meet or exceed County MS4 Permit, LID Standards Manual and LID requirements hydromodification and hydrology (flood control) requirements for new development. The Project incorporates MMs 2-1 and 2-2 that require Project compliance with hydromodification and flood-control performance standards be confirmed in a Drainage System Engineering and Planning Report submitted to the County during the review and approval of each Project tract map. Project runoff will not exceed the planned storm drain capacity and will not require construction of additional drainage facilities not considered in this EIR and that could have significant environmental effects.

As required by MM 2-3, portions of the Project site along the northern and eastern site boundaries located within a 100-year floodplain will be subject to a Specific Plan Floodplain Safety Overlay that precludes habitable residential, commercial, school and institutional structures in the floodplain. All applications for Project tract maps that would locate any structures not precluded by the Floodplain Safety Overlay in the floodplain must include a Drainage System Engineering and Planning Report that provides a detailed description of the floodplain boundaries and a description of applicable flood protection measures. This report must demonstrate that, after construction, structure designs and floodplain flows will comply with all applicable FEMA and County of Los Angeles floodplain flood flow and development standards. If required, a conditional letter of map revision (CLOMR) from FEMA will be obtained prior to any construction within a mapped 100-year floodplain. There will be no housing development in on-site floodplains, and no significant impacts will occur from placing structures within a floodplain.

Potential mudflow impacts will be reduced to less than significant levels by capturing debris flows in on-site basins and engineered and natural stream channels and by minimizing disturbance in on-site locations with slopes in excess of 25 percent that could generate mudflows. Storm water basins will be managed to avoid potential mosquito-borne health vectors by implementing California Department of Public Health (CDPH) recommendations and fully discharging captured storm water within 96 hours. An integrated pest management program must be developed and confirmed during the County review and approval process for Project tract maps (see MM 4-2). The Project site is not subject to tsunamis, seiches or dam and levee failure inundation.

### **1.6.3 HAZARDS AND FIRE SAFETY**

#### ***Hazards and Hazardous Materials***

There would be less than significant impacts related to Valley Fever with implementation of MM 3-1 related to dust control during construction; MM 3-2 related to aiding the prevention of Valley Fever among construction workers; with PDF 3-1 related to resident notice of temporary Valley Fever risk during construction and other earth-moving activities; and implementation of Rule 403 dust-control measures.

There would be less than significant impacts related to environmental hazards, including hazardous materials from current or historic land uses with implementation of MM 3-4 related to historic dry well re-abandonment and MM 3-5 related to permanent closure of the abandoned mine/tunnel.

Operations at the Quail Lake Skypark Airport would not have a significant impact for any portion of the Project site. The Project would result in less than significant impacts related to impairment or interference with an emergency response or evacuation plan with implementation of MM 3-7, requiring preparation of an emergency response plan for the Project.

## **Fire Safety**

With adherence to requirements for fuel modification zone management (MM 3-9) and emergency access (MM 3-7), the Project's potential impact related to wildfires would be less than significant. MM 3-9 requires property owner notification of their responsibilities for maintaining the fuel modification zone(s) on their property. The Project would not result in significant impacts related to proximity of a land use representing a potential fire hazard.

## **1.6.4 WATER QUALITY**

The Project will implement site-design, source-control, Low Impact Development (LID), and hydromodification-control Best Management Practices (BMP) requirements. The Project's water quality performance standard is consistent with County requirements for new development and is incorporated in MM 4-1. With mitigation, the Project would not have a significant impact on surface water or groundwater quality. Developed area runoff constituent concentrations would be below all water quality objectives and criteria. Qualitatively assessed constituents in post-development runoff would not occur at levels that would exceed water quality standards or adversely affect beneficial uses of receiving surface or ground waters. Implementation of the planned BMPs in compliance with the Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit, LID Ordinance, and LID Standards Manual would meet or exceed the requirements of the federal, State, and County standards for water quality. The two proposed wastewater reclamation facilities (WRFs) will produce recycled water treated to unrestricted reuse standards under Title 22 of the *California Code of Regulations*. The WRFs will be issued Waste Discharge Requirements (WDRs) by the Lahontan Regional Water Quality Control Board (RWQCB) and will be operated in accordance with the WDRs to protect surface and groundwater quality and designated beneficial uses. MM 19-5 in Section 5.19, Wastewater Collection, requires that WRF compliance with Title 22 and WDR requirements be confirmed in documentation submitted to the County prior to the issuance of building permits for Project development.

## **1.6.5 LAND RESOURCES**

The Project will result in the conversion of approximately 642 acres of on-site Prime Farmland. The Project site is identified as being within the West Economic Opportunity Area (EOA), one of three EOAs established by the AVAP. The EIR for the AVAP considered the impacts of converting a total of 6,169 acres of Important Farmland and concluded that the conversion would be a significant and unavoidable impact (DRP 2014). Although the Project is consistent with the AVAP's land use policy, the Project would not result in any new impacts to agricultural lands, and the Project would allow for continued grazing activity and small-scale agriculture and agriculture-related uses (PDF 5-1), because the Project is directly facilitating the conversion of 642 acres of Prime Farmland to non-agricultural uses, it is considered a significant impact of the Project. For the same reasons as described in the AVAP EIR, there is no feasible mitigation to reduce this impact to a less than significant level and, therefore would be a significant unavoidable impact of the Project.

The adoption of the Project will require a discretionary zone change to be made by the County that is consistent with, and would help implement, the AVAP—specifically the Rural

Preservation Strategy and associated Policy LU 1.1—as it applies to the Project site. Also, there are no Williamson Act contracts on site, or within Los Angeles County (outside of Catalina Island). Therefore, there would be no conflict with applicable agricultural land use policies if the County adopts the Project.

The only agricultural zoning on the Project site is the A-1-2, Light Agriculture, zone located on the lands to the east of 300<sup>th</sup> Street West. This zoning allows tree crops as a permitted use. Although the remainder of the Project site is not zoned for agricultural uses under the AVAP, an approximate 13-acre area in the northwestern corner of the site is identified as containing montane hardwood resources, and approximately 883 acres in the southwestern and southeastern portions of the site are identified as containing primarily mixed chaparral (approximately 553 acres) as well as blue oak woodland, blue oak–foothill pine, juniper, and pinyon–juniper resources (approximately 330 acres) on maps prepared by the California Department of Fire and Forestry Protection’s Fire and Resource Assessment Program (FRAP 2006). It is noted that the statewide mapping of forest and timber resources as part of the FRAP is separate from the vegetation mapping performed for the Project site, and is used herein solely for the determination of potential forest and timber resources. Finally, no part of the Project site is zoned as a Timberland Production Zone.

The Project site does not contain any trees listed as a “commercial species” for the applicable Southern Forest District as defined in the applicable regulations. Project implementation would not conflict with zoning for forest land or timberland as the Project site is not used for forest land or timberland resources and is not considered forest land or timberland by the County or the State. The Project will not conflict with zoning for timberland or a Timberland Production Zone, as the site has not been designated as such. There would be no impact to forest land and no mitigation is required.

Project implementation would not result in impacts related to the loss of known mineral resources because there are no known mineral resources on the Project site or in the areas where the off-site Project features would occur.

### **1.6.6 CULTURAL AND TRIBAL RESOURCES**

California Register of Historical Resources (CRHR) cultural resources eligibility evaluations were completed in 2012 and 2015 for sites in areas where impacts associated with development were anticipated. Also, the County of Los Angeles, as Lead Agency, completed Native American consultation under Assembly Bill (AB) 52. The Fernandeano Tataviam Band of Mission Indians (Tataviam Tribe) and the Tejon Indian Tribe (Tejon Tribe) were contacted, consultation was initiated, and mitigation measures were agreed upon by all parties involved.

CRHR-eligible resources in the development area (CA-LAN-3201, CA-LAN-3240 and CA-LAN-3242) were defined and MMs were developed to be implemented either prior to the issuance of grading permits (MMs 6-1, 6-2, and 6-3 which describe monitoring of grading, protection of CRHR-eligible sites, and data recovery/avoidance strategies respectively) or prior to the completion of construction activities (MM 6-4, which details an archaeological site protection program to be implemented during and after construction). Excavated finds shall

be offered to the County of Los Angeles and/or its designee (i.e., the Tejon Tribe) on a first refusal basis (MM 6-1 and 6-3); the Tejon Tribe can then make a determination whether the find is a significant tribal cultural resource and opt to accept the resource for curation in its facility). There are a total of 30 prehistoric archaeological sites within open space areas (i.e., areas outside the grading footprint). Of these, the CRHR eligibility of 18 of the 30 total sites has been determined, and 1 site (CA-LAN-3206) has been determined eligible and 17 sites have been determine ineligible. For the 12 remaining sites, it is assumed that the sites are historically significant until, and unless, evaluation proves otherwise. Long-term operation of the Project would result in potential indirect impacts to the 12 sites with unknown eligibility and the 1 site located in the open space areas that is known to be eligible (CA-LAN-3206). Therefore, MM 6-4 requires preparation of an Archaeological Resources Site-Protection Program aimed to protect and preserve identified archaeological resources that may be vulnerable to disturbance. With implementation of MMs 6-1 through 6-4, impacts to archaeological and tribal cultural resources would be reduced to a less than significant level.

The Paleo Environmental Associates report (2009) has classified rock units on the Project site according to their likelihood of containing resources of paleontological importance, and geologic evidence from adjacent areas with similar sedimentary formations indicates a high likelihood of encountering such resources during Project development. Impacts, should they occur, would be reduced to a level considered less than significant through the application of MMs 6-5 through 6-9.

There is no evidence for the presence of Native American burial sites and associated human remains within the Project area because none of the sites recorded and evaluated on the Project area were found to contain human remains, nor were there any data to suggest they were present. However, the presence of known cultural resources sites increases the likelihood that they may be present. MM 6-10 is provided to address these potential occurrences, should they be realized.

### **1.6.7 BIOLOGICAL RESOURCES**

Development and implementation of the Project would result in significant direct and indirect impacts to special status plants; special status wildlife; nesting birds; native grasslands, wildflower fields, and other special status vegetation types; jurisdictional drainages, wetlands, and riparian vegetation; wildlife movement and wildlife habitat; and regulated oak trees. Some, but not all, of these impacts would be reduced to less than significant levels with implementation of the Project's MMs and Mitigation Monitoring and Reporting Program (MMRP).

Significant impacts to special status plants, special status wildlife, and nesting birds that would result from implementing the Project would be reduced to a level considered less than significant through implementation of MMs 7-1 through 7-9.

Significant impacts to native grasslands and wildflower fields and other special status vegetation types that would result from implementing the Project would be reduced to less than significant levels with implementation of MMs 7-10 and 7-11.

Significant impacts to jurisdictional drainages, wetlands, and riparian vegetation that would result from implementing the Project would be reduced to less than significant levels with implementation of MM 7-12, which states that all lost functional values shall be replaced; appropriate regulatory agency permits and/or agreements shall be obtained; and the mitigation measures stipulated in those permits/agreements shall be implemented.

Significant impacts to wildlife movement and general wildlife habitat that would result from implementing the Project would be reduced to less than significant levels with implementation of MM 7-13 through MM 7-18.

Significant impacts to oak tree resources that would result from implementing the Project would be reduced to less than significant levels with implementation of MM 7-11 and MMs 7-19 through 7-20, in accordance with the County of Los Angeles Oak Tree Ordinance and in compliance with the Los Angeles County Oak Woodlands Conservation Management Plan. For the impacts to oak woodlands, mitigation is proposed in accordance with these County documents and California State law by creating, enhancing, and/or restoring oak habitats and by preserving existing oak woodlands.

There would be no development within (including roads and fuel modification zones), and therefore no direct impacts on, Significant Ecological Areas (SEAs) or on any lands for which a habitat conservation plan (HCP) or a natural community conservation plan (NCCP) has been adopted as there are no HCPs or NCCPs for the Project site or off-site impact areas. To further ensure SEA impact avoidance, MM 7-21 is included, which prohibits fuel modification zones from encroaching on the adjacent SEA. The Project's designation of open space in the northwest portion of the site is consistent with the Tehachapi Upland Multiple Species Habitat Conservation Plan (TU MSHCP) located immediately adjacent to the north.

### **1.6.8 LAND USE, ENTITLEMENTS, AND PLANNING**

The Project site is largely undeveloped, and there are no residential communities on or near the site, except for scattered residences to the east of the site, north of SR-138 and east of 290<sup>th</sup> Street West. The Project would not divide an established community.

The Project is consistent with the Los Angeles County General Plan 2035 and the AVAP (a component of the General Plan and the applicable Area Plan for the site). The Project would require a General Plan Amendment to incorporate the planned internal roadways into the AVAP Highway Plan. The AVAP designates the Project site as within the West Economic Opportunity Area (EOA); AVAP also requires approval of a Specific Plan for a new master planned community in this EOA. Further, the Land Use Map includes an SP overlay designation over the site. In compliance with applicable Specific Plan County requirements and state law, the Project Specific Plan includes the location of the project's internal circulation network of roadways. Some of these internal roadways that meet the criteria for being included in the Antelope Valley Area Plan Highway Plan (Map 3.1 of the Antelope Valley Area Plan, which includes major highways, secondary highways, limited secondary highways, parkways, and expressways). Amending Map 3.1 of the Antelope Valley Area Plan and the Highway Plan Policy Map included in the General Plan (Figure 7.3, Highway Plan Policy Map), require AVAP and General Plan amendments to fill in the required roadway

details within the Project site. This is consistent with AVAP's requirement for a Specific Plan for a new master planned community in this EOA. The Project remains consistent with the AVAP, which is part of the General Plan, and no text amendments to the AVAP or County General Plan are proposed.

The Project site would also require a zone change to Specific Plan, in accordance with the County's Zoning Ordinance (Title 22 of the County Code), to conform to the General Plan designation as well as the AVAP requirement that a Specific Plan be completed for development in the West EOA. Since a Specific Plan would be adopted for the site, the Project would be consistent with the County's Hillside Management Areas (HMA) Ordinance and since the Specific Plan includes measures to protect sensitive hillside areas as described in Section 3.3, Conceptual Grading Plan, and Appendix 1-B, Hillside Design Guidelines in the Specific Plan. However, proposed grading on the site would exceed 100,000 cubic yards and a CUP would be needed pursuant to Section 22.56.217 of the Los Angeles County Code. The Project also requires a CUP for approval of Project-related infrastructure.

The increase in housing and employment that would occur with Project implementation is consistent with the projections for the Project site included in the traffic analysis zones (TAZs)<sup>1</sup> and corresponding figures in the Southern California Association of Governments' (SCAG) 2012-2035 and 2016-2040 Regional Transportation Plan/Sustainable Communities Plan (RTP/SCS). The resident population of the Project at buildout is 82.46 percent of the projected resident population of traffic analysis zone (TAZ) 20280000 and TAZ 20281000 by 2035, but exceeds the Southern California Association of Governments (SCAG) projections for 2040. The 2016 Regional Transportation Plan/Sustainable Communities Plan (RTP/SCS) states that TAZ level data or any data at a geography smaller than the jurisdictional level is included in the draft growth forecasts for regional modeling purpose only, and is advisory and non-binding. As such, the exceedance of population growth projections at the Project site on a TAZ level is not considered a significant adverse impact. Land use impacts relative to the SCAG RTP/SCS would be less than significant and no mitigation is required.

The AVAP has been challenged in court, but no injunction against implementation of the plan has been sought or granted. The County's General Plan was adopted in October 2015, and was not challenged and is in effect. Consistent with land use law and CEQA requirements, these land use plans are being implemented and the EIRs prepared for each plan have been considered as part of this project EIR and each is incorporated by reference. This EIR does not tier from, nor is it legally reliant upon, the EIRs for either the AVAP or the General Plan. Should the approval and adoption of the AVAP or its accompanying EIR be invalidated pending further environmental and policy review, a possible judicial remedy could effectively revive the now-superseded former *Antelope Valley Areawide General Plan* (AVAGP), the earlier Area Plan for this area of Los Angeles County. In that case, the Project would require an AVAGP amendment in addition to a zone change to Specific Plan and other entitlements, including a Conditional Use Permit for development within a SEA. Upon approval of these AVAGP plan amendments, zone change, and other associated entitlements, the Project would have less than significant land use impacts.

---

<sup>1</sup> SCAG divides the entire region into traffic analysis zones (TAZs) as a basic geographic unit for its growth projections.

## 1.6.9 POPULATION, HOUSING, AND EMPLOYMENT

Implementation of the Project would result in (1) the introduction of a maximum of 19,333 housing units; (2) the creation of an estimated 23,675 permanent jobs; and (3) a maximum resident population of approximately 57,150 persons at Project buildout, which is estimated to occur in 2035. As detailed below, the estimate of a buildout population of approximately 57,150 persons serves as a conservative estimate used for impact analysis, since the number of dwelling units constructed in each planning area are not likely to be at maximum densities but would vary within the density range. Similarly, household sizes may differ from the averages used and the resulting resident population would likely be less than 57,150 persons.

Under the *Centennial Specific Plan*, reconfiguring an existing single-family home to create a Living Suite is permissible and does not create a new dwelling unit. Without regard to whether a State density bonus is ever used on the Project site, the total number of dwelling units, inclusive of all product types, cannot exceed the number of dwelling units identified in Section 4.0, Project Description, and considered in this EIR absent further CEQA review.

While the Project would increase the resident population in the Antelope Valley, it would be located in an area designated for future development as an EOA, as discussed in the 2015 AVAP. The site is part of the West EOA, which is located along SR-138, near I-5, east and west of the California Aqueduct. Most of the land in the vicinity of the Project site is designated as Open Space in the AVAP and is expected to remain undeveloped. Development on approximately 4,109 acres in the immediate Project area designated for potential development (e.g., areas with Rural Land, Rural Commercial, and Rural Mixed Use designations) within this EOA may also occur, although no applications are pending. The land immediately to the west (Gorman Post Ranch) currently has a development application pending with the County of Los Angeles for future residential development, although it is not consistent with the 2015 AVAP.

As stated in Policies LU 1.1 and LU 1.2 of the AVAP, future development in the Antelope Valley shall be directed into rural town center areas and EOAs, while limiting development in rural preserve areas. Consistent with the AVAP and the intent of EOAs, the Project would accommodate growth in the Antelope Valley through new residential, commercial, and light industrial developments, while preserving the rural character and ecological resources of the surrounding areas. The site is also identified as a Future Rural Town Area, which would serve as a transition between rural town centers and rural preserve areas and where future development is anticipated. Thus, population growth associated with the Project is consistent with anticipated population increases under the AVAP.

SCAG projects that Los Angeles County will experience substantial growth between 2012 and 2040 (SCAG 2016c). The Project site is also located in traffic analysis zones (TAZs)<sup>2</sup> where future growth is expected (SCAG 2012c). Future growth in the County is expected to occur as infill development in urban centers, as well as new development on vacant lands. The Project would lead to growth in employment, housing, and population on largely vacant land.

---

<sup>2</sup> SCAG divides the entire region into traffic analysis zones (TAZs) as a basic geographic unit for its growth projections.

The proposed Project is consistent with the household and employment projections for the area that includes the Project site in the SCAG's 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (SCAG 2012e) and 2016 RTP/SCS (SCAG 2016a), and the proposed Project is consistent with the demographic projections in the AVAP.

As discussed in Section 5.8, Land Use, Entitlement and Planning, and above in Section 1.6.8, the Project would promote sustainability consistent with regional goals. The Project would also contribute to meeting the State-mandated Regional Housing Needs Assessment (RHNA) housing production goals for the unincorporated areas of the County.

The AVAP intends to provide a jobs/housing ratio of 1.3 jobs per dwelling unit in the unincorporated area of the Antelope Valley within designated EOAs. The AVAP's Economic Development Element sets a strategy of designating areas for light and heavy industrial uses near major transportation corridors and/or a concentration of skilled labor force in EOAs. The Project would implement this strategy, and would provide an estimated jobs/housing ratio of 1.22, through the development of commercial and business park uses on the site, for use by high-tech manufacturing, transportation, and logistics companies. The Project would also include residential development to create a mixed use community within the West EOA, consistent with the AVAP's Land Use Policy Map.

In summary, implementation of the Project is considered growth accommodating rather than growth inducing at a regional level based on SCAG projections. Therefore, would be less than significant in relation to planned population, housing, and employment growth in the region. However, because the Project would substantially increase growth relative to the existing Project site conditions, this increase in population and housing on the Project site is considered significant. However, no mitigation would be appropriate since the Project is consistent with approved growth plans in the region. This represents a significant and unavoidable impact.

There would be less than significant impacts related to the potential displacement of people or housing units as a result of the Project since the majority of the Project site is undeveloped. An existing residence of a Tejon employee is located near the northern boundary of the Project site. This residence would be left in place until development occurs near this area, at which time a notice would be provided and displacement would be voluntary. The residence would then be demolished or relocated.

### **1.6.10 TRAFFIC, ACCESS, AND CIRCULATION**

This section of the EIR analyzes traffic conditions with and without the Project in the near-term (under Existing conditions) and long-term cumulative (under 2035 conditions for Los Angeles County, and 2040 conditions for Kern County).

Potential traffic increases associated with Project implementation would affect traffic operations and levels of service at roadways internal to the site and at roadways and freeways serving the site. These impacts would be addressed by a range of on-site and off-site Project improvements and the implementation of PDFs and MMs. The PDFs and MMs

include new internal roads, improved intersection configurations, and the addition of traffic signals that have been incorporated into the Project and payment of fair share fees for needed freeway and expressway improvements, as identified below. With the incorporation of PDFs and the recommended MMs, Project impacts to traffic on SR-138, streets intersecting SR-138 in the Project vicinity, freeway mainline segments, freeway interchange ramps, and arterial roadway intersections will be less than significant.

The Project Applicant intends to implement and fund State transportation facility mitigation measures through a proposed Centennial Transportation Improvement Program (CTIP) agreement with the California Department of Transportation (Caltrans). The CTIP would provide funding contributions, phasing, guarantees of payments, and collection of third-party contributions for MM implementation. Alternatively, the Project will pay a fair share contribution towards the construction of transportation facilities that will mitigate for potential Project impacts. With these traffic mitigation measures, there will not be a significant Project or cumulative impact from Project traffic. The Project will also be in compliance with the Los Angeles County and Kern County Congestion Management Programs (CMPs). The Project will incorporate PDFs to reduce vehicle use and promote alternative transportation, including transit use, in compliance with applicable transportation plans, policies, and regulations. However, if Caltrans does not implement planned and required improvements on State facilities, the Project would contribute to significant unavoidable impacts since the County (as the Lead Agency) lacks jurisdiction and control over State highway facilities, and cannot mandate the construction of improvements to these facilities.

### **1.6.11 AIR RESOURCES**

This section analyzes the temporary/construction-related and long-term/operational-related regional air quality emissions, local pollutant concentrations, and exposure of sensitive receptors to pollutants resulting from implementation of the Project. Analyses of health risks to sensitive receptors from toxic air contaminant emissions generated by stationary sources, minor sources, and by vehicles on SR-138 are provided. Odor impacts and consistency with air quality management plans are also analyzed.

The northern 91 percent of the Project site lies within the boundaries of the AVAQMD, while the remaining 9 percent lies within the SCAQMD.

The Project's construction emissions would exceed AVAQMD annual mass emissions thresholds for nitrogen oxides (NOx) and SCAQMD daily mass emissions thresholds for volatile organic compounds (VOCs) and NOx.

Implementation of MMs 11-2 and 11-3 would substantially reduce construction-related NOx and would also reduce VOC emissions, but the impact would remain significant and unavoidable after mitigation. Construction mass emissions of PM10, PM2.5, CO, and sulfur oxides (SOx) would be less than significant. During later phases of construction, concentrations of PM10 and PM2.5 from construction activities could exceed ambient air quality standards and potentially expose sensitive receptors in the completed area of the

development to substantial pollutant concentrations. This impact would be significant and unavoidable.

At buildout of the Project, in 2035, long-term operational emissions of VOC, NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub> would exceed AVAQMD and SCAQMD CEQA significance thresholds. The primary source of long-term emissions would be from vehicle operations. MMs 11-4, 11-5, and 11-6 would be implemented to reduce operational emissions; however, the impact would remain significant and unavoidable. It should be noted that the Project's proposed residential and non-residential uses have been planned for a balance between the number of jobs available and the number of on-site housing units in an effort to encourage local trip making. The Centennial Traffic Study located in Appendix 5.10-A of this EIR forecasts that around 48 percent of the daily trip generation will be internal to the Project site, while 52 percent will be external trips. The Project would require the establishment of a Transportation Management Association (TMA) that develops strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize transit efficiencies and services. The TMA would reduce dependence on the automobile and provide for a more efficient use of transportation resources among Project occupants, thereby reducing pollutant emissions.

The Project's stationary sources (natural gas-fired boilers, emergency generators, broilers, and small source particulate matter generators) would be limited in size and number by MM 11-1, which requires implementation of PDF 11-1. With these limits, stationary source emissions would not exceed ambient air quality standards or health risk (cancer and non-carcinogenic) standards, and the impacts would be less than significant.

The Project would not contribute to off-site traffic conditions that would violate ambient CO standards and would be less than significant.

MM 11-10 requires the implementation of PDF 11-6, which specifies that residences or other sensitive land uses shall not be built within 150 feet of SR-138. The analysis demonstrates that the incremental cancer risk and chronic non-cancer health risk to sensitive receptors beyond the 150-foot buffer would be less than significant. The analysis also indicates that health risks to existing residents adjacent to SR-138 in the Project vicinity would be less than significant with incorporation of MM 11-10.

There would be less than significant impacts related to potential offensive odors generated by the wastewater reclamation facilities (WRF) and, if built, a Materials Recovery Facility Solid Waste Transfer Facility (MRF/SWTF).

The Project would not conflict with AVAQMD and SCAQMD air quality management plans (AQMP) because the land uses, population, and vehicle travel elements of the Project are anticipated in SCAG's 2012–2035 RTP/SCS and 2016–2040 RTP/SCS, which are the basis for AQMP development. The impact would be less than significant.

## 1.6.12 NOISE

The Project would generate an estimated 75,908 external daily trips at buildout; these vehicles would primarily use SR-138, I-5, SR-14, and SR-99. The addition of Project traffic to existing traffic would increase the traffic volumes on these roadways and, therefore, the traffic noise at adjacent receptors. Traffic noise increases would exceed the 3 A-weighted decibels (dBA) Community Noise Equivalent Level (CNEL) criterion at identified receptors on SR-138, between Gorman Post Road and Old Ridge Route Road, resulting in a significant impact. The impact would be considered significant and unavoidable because feasible mitigation to reduce these impacts is not within County jurisdiction.

Project-generated traffic would potentially expose people at proposed residential, hotel, school, and religious facilities on the Project site to noise levels in excess of the applicable State and County standards. The impact would be less than significant with implementation of MM 12-1, which would require the completion of an acoustical analysis that address each proposed residential, hotel, school, and place of worship that may be significantly affected by traffic noise to verify that the facilities include the appropriate noise-reduction features to meet interior and exterior noise standards.

The Project would include a number of land uses where installed equipment or activities may generate noise levels that could result in a significant impact at areas adjacent to or within the Project site. Maximum noise levels for these noise sources are prescribed by the County Code (i.e., the Noise Ordinance). The impact would be less than significant with implementation of MM 12-2, which would require the completion of an acoustical analysis for each proposed business park use, school, community use area, park and recreation area, transportation center, animal control facility, utility, commercial development, and manufacturing/industrial development to verify the facility has been properly designed to comply with the noise ordinance.

Construction of the Project and off-site Project features would increase the ambient noise levels in the Project vicinity above levels that exist without the Project. Noise from mobile equipment would be loudest during site preparation and grading activities. Because of the large size of the Project site and distance between grading activities and sensitive receptors, mobile equipment noise levels would not exceed County standards and would be less than significant. There is a potential for stationary construction equipment to generate noise exceeding the noise ordinance limit. MM 12-3 would be incorporated into the Project and would require stationary equipment to operate at a distance that is greater than 450 feet or to provide an enclosure or similar noise attenuation device to limit the average hourly daytime noise level to 60 dBA or less. With the incorporation of MM 12-3, the temporary increase in ambient noise levels due to on-site construction stationary sources would be less than significant. Blasting may be required in portions of the Project site during the construction period, but the noise impact would be less than significant with implementation of MM 12-7.

No pile driving is currently anticipated for the Project. However, if pile driving is required, there would be a potential significant impact. MM 12-4 would require a vibration analysis prior to any pile-driving activities to ensure that vibration impacts would not exceed County

standards and would be less than significant. The County vibration standard could also be exceeded if vibratory rollers, scrapers, and bulldozers operate near occupied residences. MM 12-5 restricts the use of this equipment and impacts would be less than significant with mitigation.

The Project would not expose persons to significant noise impacts from aviation activities from public airports, military overflights, Quail Lake Skypark, or the Fire Station 77 heliport.

### **1.6.13 VISUAL RESOURCES**

The Project would result in significant and unavoidable impacts related to a change in visual character of the Project site, as experienced by viewers at public vantage points (primarily existing transportation thoroughfares including SR-138 and 300<sup>th</sup> Street West). The Project proposes to preserve many existing features to minimize the visual alteration of the site, as listed in PDFs 13-1 through 13-6, as required for implementation through MMs 7-12 (from Section 5.7, Biological Resources) and 13-1 through 13-3. These include retention of rock outcroppings visible from off-site areas; use of landform/contour grading; use of landscaping designs that are similar to the natural topography; preservation of open space; use of native and regionally appropriate plant species in public landscape areas; provision of development setbacks from natural areas; and inclusion of aesthetically pleasing and consistent Project signage and monumentation both internally and externally. However, even with these features, the overall change to the site resulting from grading and development of the Project would be a substantial visual impact that may be perceived by some as an impact for which no additional feasible mitigation exists, and would therefore remain significant and unavoidable.

Views from existing public regional trails and bikeways would be limited due to both the distance and the intervening topography between these routes and the Project site, and would result in a less than significant impact. It is anticipated that any structures that are proposed along the Pacific Crest Trail (PCT) realignment would be screened by a wall along the rear of the residences (see MM 13-4); additionally, a wide, thickly landscaped setback containing the conceptual PCT realignment would ensure that the urban uses in the foreground would have limited visibility and would therefore result in a less than significant impact with implementation of MM 13-4.

There are no State-designated scenic highways within 20 miles of the Project boundaries; SR-138 is not a State scenic highway, nor is it eligible for listing (Caltrans 2011). Thus, while there are features on and around the Project site that would be considered scenic by many, because these components of the overall visual character are not within the viewshed of a State-designated scenic highway, the proposed changes to the Project site would not result in impacts related to damaging scenic resources along a scenic highway.

The *Los Angeles County General Plan* does not identify any scenic highway near the site (DRP 2015c); however, the AVAP identifies Scenic Drives. I-5, Gorman Post Road, SR-138, Old Ridge Road (Highway N-2), and Three Points Road are designated in the AVAP as Scenic Drives on and near the site. However, the site is also within the West EOA and a Future Rural Town Area (DRP 2015a).

The Project would introduce new light sources as part of future development. The Project would include preparation of an Exterior Lighting (photometric) Plan, also referred to as “the Dark Sky Plan”, to require outdoor lighting that minimizes glare and prevents light spillover beyond the Project site boundaries by using various techniques—which may include hooded street lights, directing light downward, and timers or sensors on lights—while maintaining consistency with County lighting and safety standards (MM 13-6 ). However, due to the existing low nighttime ambient light levels in the area, implementation of the Project would result in a significant and unavoidable impact by contributing a substantial new source of nighttime light and glare. In addition, because the Project site is currently undeveloped, new sources of daytime glare would be introduced and potential glare impacts would be greater than existing conditions; this would be considered a significant and unavoidable impact.

#### **1.6.14 PARKS AND RECREATION**

The Project would provide abundant and varied on-site recreational amenities in an area that currently has little local parkland, including public (i.e., State or federal owned or County-dedicated and maintained) and private (i.e., Homeowners Association or other privately maintained) parks and other recreation amenities. The Project would include approximately 163 acres of Park Overlay, which includes neighborhood parks, community parks, and community regional parks that would be dedicated to the County of Los Angeles in a developed condition.

Regarding County parkland requirements, based on consultation with the County Department of Parks and Recreation (DPR), the types and amounts of recreation amenities proposed on the Project site would meet and exceed the preliminary Parkland Dedication Ordinance/Quimby Act requirement of approximately 147 acres and the preliminary General Plan standard of approximately 195 acres. Specifically, in compliance with the Parkland Dedication Ordinance, (1) the quantity of public parks shall be provided consistent with the conditions of approval defined by the County for each tract map and (2) parkland would be dedicated to the County in a developed condition (see MM 14-3), providing for acreage equivalency credit. In compliance with the General Plan, the Project shall provide public and private recreation amenities that meet the General Plan parkland standard’s acreage requirements, and each tract map submitted for the County DPR’s review and clearance shall have a table with a breakdown of acreage per lot for the categories of parkland to be credited against both the Parkland Dedication Ordinance/Quimby Act requirement and the General Plan standard (see MMs 14-4 and 14-5). There would be less than significant impacts related to provision of parkland pursuant to State and County standards.

Although the Project would be expected to increase visitation to off-site federal, State, and County recreational facilities and trails in the Project area, it is not expected that increased visitation at any single facility would result in substantial physical deterioration or necessitate the construction or expansion of off-site recreational facilities. The Project would result in less than significant impacts related to recreational facilities built as part of the Project, and no construction or expansion of off-site federal, State, or County recreational facilities and trails are anticipated that would result in physical environmental impacts.

Finally, the Project would not interfere with, but would facilitate regional open space connectivity.

### **1.6.15 EDUCATION**

The Project would increase the resident population of the area and would therefore result in the generation of new students. These new students would be served by one of the three respective school districts that encompass the Project site. The Project includes locations for one Kindergarten through 5<sup>th</sup> grade (K-5) school; five K-8 schools (MM 15-1); and one high school (MM 15-3). The designation of school sites allows the respective school districts to plan for the provision of school facilities to serve the Project as needed. In addition, the Project Applicant/Developer shall finalize and sign agreements with the school districts for a contribution to facilitate the financing, construction, and operation of new school facilities in the Project area, as an alternative to the payment of school impact fees and as allowed under Section 65996(b) of the *California Government Code*. The Project Applicant/Developer shall demonstrate to the County of Los Angeles Department of Regional Planning that they have complied with all applicable School Facilities and Funding Agreements with the school districts (MM 15-2). In addition, compliance with California Department of Education Title 5 requirements for school site selection and school design and construction would reduce impacts to public schools to a less than significant level.

Because school facilities would be centrally located within the planning areas on the Project site, a majority of the Project site would not require busing. It is anticipated that the first K-8 school (initially a K-12 facility) would be opened by the Gorman Joint School District at occupancy of the first residential units. The planned approach is to initially construct a K-12 campus in order to provide public school accommodations at all education levels at Project opening. As Project buildout occurs, this school would revert to a K-8 school when the high school is constructed. There would be no impacts related to school transportation and no mitigation would be required.

There would be no impacts to education services associated with the proposed off-site access roads, and utilities would not result in any uses or activities that would generate additional students or otherwise create an increased demand for schools.

### **1.6.16 FIRE AND LAW ENFORCEMENT SERVICES**

The Project would result in the development of a maximum of 19,333 residential units, generating approximately 57,150 residents, and over 10.0 million square feet of non-residential development that would create approximately 23,675 jobs. This anticipated Project-related growth in population and employment would result in an increase in demand for fire and law enforcement services on the Project site.

#### ***Fire Services***

Fire services and emergency response for fire incidents during the initial development phases of the Project would be provided from Fire Station 77, located at 46833 Peace Valley Road in Gorman, which is currently staffed with a three-person engine company. This station

would serve the Project until such time that the 1,000<sup>th</sup> dwelling unit is built on the site (at which time the first on-site fire station would be operational) (see MM 16-3).

The Project includes conceptual site locations for up to four new fire stations on the Project site. These new fire stations are projected to provide an average five-minute response time for the first arriving unit for fire and eight minutes for the advanced life support (paramedic) unit on the site at Project buildout. This is consistent with the County of Los Angeles Fire Department's (LACFD's) goals for response times in urban areas. Ultimately, the LACFD would approve the final station site locations, and the Project Applicant/Developer would construct and equip the fire stations (MM 16-3). The LACFD has indicated that the proposed fire stations on the site would provide adequate fire service to the Project.

The Project Applicant/Developer would provide funding for the construction of fire protection facilities in accordance with the approved Project, in lieu of paying established developer fees at the time building permits are issued (MMs 16-1 through 16-3). Implementation of MMs 16-1 through 16-3 would provide for fire station sites and funding for fire protection services to serve the Project. Therefore, impacts on fire services would be reduced to a less than significant level.

#### ***Law Enforcement Services***

The Project would also result in an increase in the demand for law enforcement services, including those provided by the Los Angeles County Sheriff's Department (Sheriff's Department or LASD) and the California Highway Patrol (CHP). The Project includes the construction of a Sheriff's station on the Project site (in the Business Park area north of SR-138). Prior to development of this permanent Sheriff's station, the LASD would operate out of a "store front" sub-station until the permanent station is required to be developed. This LASD "store front" sub-station would be properly outfitted in accordance with applicable occupancy requirements of the LASD for this type of facility, and would be fully operational prior to the issuance of the first occupancy permit (MMs 16-2 and 16-4) to ensure that response times to the site for emergency and non-emergency calls would be within the County guidelines.

The addition of the "store front" and permanent Sheriff's stations, payment of developer fees by the Project Applicant/Developer, if applicable (refer to MM 16-4) and revenues from taxes generated (for LASD) and vehicle registration fees (for CHP) would offset increased demands on the LASD and the CHP. Therefore, impacts on law enforcement services would be reduced to a less than significant level.

### **1.6.17 OTHER PUBLIC SERVICES**

#### ***Library Services***

The Project would create less than significant impacts to the existing County of Los Angeles Public Library ("County Library") facilities with the implementation of the recommended mitigation measures (MMs 17-1 through 17-8). The sizing, design and programming of the Permanent Facility, including the influence of technology on library services, will be agreed upon by representatives from County Library and the Project Applicant/Developer. Also, as

discussed in PDF 17-1, the Project would include internet and intranet infrastructure, to provide access to all readily available library resources.

### ***Solid Waste Services***

Implementation of the Project would generate solid wastes (including hazardous wastes) during construction and operation. Adopted plans and regulations to manage solid waste disposal and recycling efforts generally mandate actions by the State, County, and/or local municipality rather than individual project applicants. For the Project, the County of Los Angeles is the agency responsible for providing solid waste disposal facilities. As such, the significance of the Project's solid waste generation would be determined by the degree to which the Project's solid waste generation and management features affect the County's disposal facilities and programs designed to meet its goals and comply with waste management regulations.

While the Project incorporates a Solid Waste Management Plan (PDF 17-3, MM 17-10) to achieve a goal of diverting at least 75 percent of operational solid waste, permitted Class III landfill capacity cannot be guaranteed at the time of Project buildout and through the life of the Project, which are both beyond the LACDPW's 15-year planning horizon for solid waste disposal. Therefore, while the County is committed to handling all solid wastes generated in the County now and in the future, to be conservative, this EIR concludes that the Project buildout would result in a significant impact on the County's anticipated Class III landfill capacity. PDFs 17-2 and 17-3 and MMs 17-9 (construction waste) and 17-10 (operational waste) reflect all feasible measures to reduce and divert the Project's municipal solid waste generation. Therefore, the Project would result in significant and unavoidable impact related to municipal solid wastes during long-term operation of the Project.

### ***Other Public Facilities***

Implementation of the Project would require County services for the maintenance of on-site public roadways, parks, and other public infrastructure. In order to facilitate the maintenance of County-owned facilities that would be developed as part of the Project, land would be provided to the County for the development of two on-site maintenance yards for County of Los Angeles Departments of Public Works and Parks and Recreation. The County may also construct, equip, and operate a permanent new animal control facility adjacent to the maintenance yards, if such a permanent facility is needed in the Project area. Impacts on other public facilities would be less than significant.

## **1.6.18 WATER RESOURCES**

A Water Supply Assessment (WSA) for the Project was approved by the Golden Valley Municipal Water District (GVMWD) in May 2011. The EIR's water supply analysis updates the information in the 2011 WSA to implement the recommendations in the peer review of the Project's water supply and demand assessment and to include the AVAP and General Plan updates and related CEQA water supply analyses; the Antelope Valley Integrated Regional Water Management Plan; the approved Judgment and Physical Solution for the Antelope Valley groundwater basin; the Antelope Valley – East Kern Water Agency 2015 Urban Water

Management Plan; the DCR; and State drought emergency and proposed permanent water conservation measures.

At buildout the Project is estimated to require 11,365 acre-feet per year (afy) of water for residential, commercial, landscaping and other purposes, of which 6,788 afy would be treated for potable use, and 4,577 afy would consist of recycled water treated in on-site WRFs to State standards under Title 22 of the CCR for unrestricted reuse. The Project's water supplies will sustainably meet buildout potable and recycled water demands and will maintain an average annual reserve supply of more than 79,000 af, or more than 11 years of full-buildout potable water demand. MM 18-1 and MM 18-2 ensure that Project's water efficiency will be achieved and that water supplies will be confirmed in reports that utilize on-site metering data after approximately 25 percent and 50 percent of the proposed Project has been built. If required, the Project Water Purveyor must identify and implement response measures that will ensure that available supplies will meet future demand. No subsequent development may occur until the County is satisfied that water supplies are sufficient to meet future demand.

### **1.6.19 WASTEWATER COLLECTION**

The Project will include wastewater treatment and recycled water distribution facilities to minimize potable water demand. Two WRFs would be constructed to provide solids handling, biogas reuse, and recycled water treated to unrestricted reuse standards under Title 22 of the CCR. One WRF would be located west of the West Branch of the California Aqueduct (WRF West) and one would be located east of the Aqueduct (WRF East). Recycled water will be used for outdoor irrigation and indoor wastewater and cooling in the proposed business park. At full buildout, recycled water will meet approximately 40 percent of total Project's water demand.

Section 3.5 of the *Centennial Specific Plan* includes a Wastewater Management Plan (see also PDFs 19-1 through 19-3). The Wastewater Management Plan requirements and PDFs 19-1 through 19-3 have been incorporated in MMs 19-1, 19-2 and 19-3. These measures ensure that potential impacts related to wastewater treatment requirements and wastewater capacity will be less than significant.

### **1.6.20 DRY UTILITIES**

The Project will result in the development of a maximum of 19,333 residential units. The new residential units will result in an increase in demand for dry utility services and facilities, including electricity (Southern California Edison [SCE]), fossil fuels (natural gas and petroleum), telephone (AT&T), and cable television (CATV)(CalNeva Broadband or other provider yet to be determined).

Direct and indirect impacts to dry utility services and facilities will be less than significant. Each affected utility has been consulted to determine whether there will be adequate energy supplies, communication services, and the infrastructure to serve the Project. In the case of cable television, since there is currently no provider, one local Cable Television company is willing and able to provide services to the Project site. With implementation of the planned

energy efficiency features and with upgrades to utility infrastructure near and within the Project site (as determined by each provider), there will be adequate energy and communication services for the Project in addition to the existing demand for these services.

There will be less than significant impacts associated with off-site features related to installation of infrastructure for electricity, natural gas, petroleum, telephone, cable television, and internet services. Any necessary off-site utility upgrades will occur within lands (easements) already owned by these respective utilities.

### **1.6.21 CLIMATE CHANGE**

The quantification of greenhouse gas (GHG) emissions, as calculated through the California Emissions Estimator Model (CalEEMod) Version 2016.3.1, estimates that the Project at buildout in 2035 would have GHG emissions of approximately 244,379 metric tons of carbon dioxide equivalent (MTCO<sub>2e</sub>) per year. This total includes amortized emissions from the construction period, the loss of carbon-sequestering vegetation, and the planting of carbon-sequestering trees.

For informational purposes only, Project GHG emissions would substantially exceed the AVAQMD's 100,000 MTCO<sub>2e</sub> per year project-level threshold. The Project's service population is estimated at 57,150 residents and 23,675 employees for a service population total of 80,825 at Project buildout. For informational purposes only, the Project's GHG efficiency would be 3.02, which would not exceed the SCAQMD-staff-proposed "plan-level" 4.1 GHG efficiency threshold, but would exceed the SCAQMD-staff-proposed "project-level" 3.0 GHG efficiency threshold.

The Project would be consistent with the *Los Angeles County Community Climate Action Plan 2020* (CCAP), SCAG's 2012–2035 and 2016–2040 RTP/SCS, and regulatory measures designed to reduce GHG emissions. Additionally, the Project is consistent with the SCAQMD's proposed draft efficiency threshold and the AVAP.

Based on the Project's consistency with the CCAP, SCAG's 2012–2035 and 2016–2040 RTP/SCS, and based on its compliance with applicable GHG-reducing regulatory measures, the Project could be found to have a less than significant impact on GHG. However, climate change is a global phenomenon and the significance of GHG emissions is more appropriately considered on a cumulative level. The Project's GHG emissions would contribute to the global inventory of GHGs. To date, the vast majority of other States and nations have not followed California's lead in mandating GHG emission reductions across a broad spectrum of economic sectors and have not enacted regulations similar to those adopted in California, which already has nearly the lowest level of GHG per capita of any state. The County of Los Angeles has no jurisdictional control or responsibility for GHG reductions in other parts of California, and certainly not in the context of global action. Moreover, due to the County's limited jurisdiction over many GHG reduction measures required in both the CCAP and the RTP/SCS, and with respect to the many GHG-reducing regulatory programs implemented at the State level, the County lacks the requisite level of jurisdiction and control to ensure that all such measures and programs will be fully implemented as planned by third party agencies and private parties. Therefore, because of the global context of GHG emissions which are

outside the County's jurisdiction and control, and because the of Project's forecasted GHG emission rate, the project's incremental contribution to the cumulative environmental impact related to GHG emissions is conservatively determined to be cumulatively considerable and this significant cumulative impact would be significant and unavoidable.

## 1.7 GROWTH-INDUCING IMPACTS

The Project is proposed in response to anticipated growth in the Northern Los Angeles County/Antelope Valley area, and Project development is consistent with the growth projections that have been adopted by SCAG for the Project area, the Antelope Valley, the North Los Angeles County Subregion, the County, and the region.

The Project is also consistent with the AVAP and proposes development in the West EOA, where the AVAP anticipates future development. The EIR (SCH No. 2014061043) for the AVAP fully evaluated the growth-inducing impacts of buildout of the unincorporated areas of the Antelope Valley, as allowed by the AVAP (LACDRP 2014). No changes to the AVAP are proposed by the Project that would affect population generation or otherwise lead to additional indirect growth, and no changes to the circumstances under which development would occur have occurred since the EIR for the AVAP was certified in June 2015. The only amendment to the AVAP proposed by the Project is the inclusion of the internal roadway network into the AVAP Highway Plan. The portion of the Project site that is located east of 300<sup>th</sup> Street West is designated as RL2 (1 DU/ 2 ac) in the AVAP; the Specific Plan designates this land as LDR (0-7 du / ac), but the AVAP allows for flexibility in land use adjustments.

Because the Project is consistent with the allowable land uses and development densities/intensities in the AVAP and since the EIR for the AVAP adequately analyzed the growth-inducing impacts of the AVAP, the Project would not have any growth-inducing impacts that were not previously analyzed in that certified EIR. As such, the Project would not be considered growth-inducing related to planned growth in the region. However, the existence of the Project makes it reasonably foreseeable that future unplanned development may occur along the eastern fringes of the Project site, where physical constraints to development are less than to the north and south, which could result in a significant impact on the environment on lands outside the West EOA. This would be considered a significant adverse indirect growth-inducing impact.

## 1.8 CUMULATIVE IMPACTS

The proposed Project's cumulative impact analysis includes the consideration of both regional growth projections (i.e., the "projection" approach) and proposed and approved development in the AVAP area, Santa Clarita Valley (SCV), southern Kern County (approximately south of Interstate [I] 5 and State Route [SR] 99) as well as the cities of Lancaster, Palmdale, and Santa Clarita (i.e., the "list" approach). Although there is expansive undeveloped land in the area surrounding the Project site, there is limited land proximate to the Project site that is available for future development. The majority of surrounding lands are subject to development constraints, such as permanent conservation, limited infrastructure, public ownership, and/or topography. This serves to minimize cumulative

impacts that are associated with proximity to other ongoing projects. Significant and unavoidable cumulative impacts were identified for biological resources (regional wildlife movement, loss of native perennial grasslands); land resources (in the form of a loss of Prime Farmland); traffic (mitigation measures are outside the control of the lead agency); air resources (emissions of O<sub>3</sub> and PM<sub>10</sub>); noise (traffic noise along segments of SR-138); visual resources (in the form of resulting in a significant change to long range views from public land, and light pollution or “sky glow”); solid waste (contribution to municipal solid waste disposal); water resources (water supplies); population, housing, and employment (substantial relative to existing conditions); and climate change (GHG-reduction measures outside the County beyond the control of the lead agency).

## 1.9 SUMMARY OF IMPACTS

Table 1-1, Centennial Specific Plan Impact Summary, below provides the significance finding, after implementation of PDFs and MMs, for each environmental topic, and associated significance thresholds, addressed in Section 5.0 of this EIR. Table 1-2, Centennial Specific Plan Mitigation Summary, following Table 1-1 provides the MMs recommended for the Centennial Project and reflects the Mitigation Monitoring and Reporting Program (MMRP) provided in Appendix 2.0-C of this EIR.

**TABLE 1-1  
CENTENNIAL SPECIFIC PLAN IMPACT SUMMARY**

<b>Topic</b>	<b>Significance Finding</b>
<b>Geotechnical</b>	
Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault	Less Than Significant
Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic groundshaking	Less Than Significant
Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction and lateral spreading	Less Than Significant
Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides	Less Than Significant
Result in substantial soil erosion or the loss of topsoil	Less Than Significant
Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse	Impact Mitigated to Less Than Significant
Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property	Impact Mitigated to Less Than Significant
Have soils incapable of adequately supporting the use of onsite wastewater treatment systems where sewers are not available for the disposal of wastewater	Impact Mitigated to Less Than Significant
Conflict with Hillside Management Area Ordinance or hillside design standards in the County General Plan Conservation and Open Space Element	Less Than Significant
<b>Hydrology and Flood</b>	

**TABLE 1-1  
CENTENNIAL SPECIFIC PLAN IMPACT SUMMARY**

<b>Topic</b>	<b>Significance Finding</b>
Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off- site	Impact Mitigated to Less Than Significant
Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site	Impact Mitigated to Less Than Significant
Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff	Impact Mitigated to Less Than Significant
Conflict with the Los Angeles County Low Impact Development Ordinance	Impact Mitigated to Less Than Significant
Create drainage system capacity problems, or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects	Less Than Significant
Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map, or within a floodway or floodplain	Impact Mitigated to Less Than Significant
Place structures, which would impede or redirect flood flows, within a 100-year flood hazard area, floodway, or floodplain	Impact Mitigated to Less Than Significant
Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam	Impact Mitigated to Less Than Significant
Place structures in areas subject to inundation by seiche, tsunami, or mudflow	Impact Mitigated to Less Than Significant
Add water features or create conditions in which standing water can accumulate that could increase habitat for mosquitoes and other vectors that transmit diseases such as the West Nile virus and result in increased pesticide use	Impact Mitigated to Less Than Significant
<b>Hazards and Fire Safety (Hazards and Hazardous Materials and Fire Safety)</b>	
<i>Hazards and Hazardous Materials</i>	
Create a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials	Impact Mitigated to Less Than Significant
Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment	Impact Mitigated to Less Than Significant
Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter-mile of sensitive land uses	Impact Mitigated to Less Than Significant
Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment	Impact Mitigated to Less Than Significant
Result in a safety hazard for people residing or working in the project area for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport	Less Than Significant
Result in a safety hazard for people residing or working in the project area for a project within the vicinity of a private airstrip	Less Than Significant
Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan	Impact Mitigated to Less Than Significant
<i>Fire Safety</i>	

**TABLE 1-1  
CENTENNIAL SPECIFIC PLAN IMPACT SUMMARY**

<b>Topic</b>	<b>Significance Finding</b>
Expose people or structures to a significant risk of loss, injury, or death involving fires due to be located in Very High Fire Hazard Severity Zone; in a high fire hazard area with inadequate access; in an area with inadequate water and pressure to meet fire flow standards; in proximity to land uses that have the potential for dangerous fire hazard	Impact Mitigated to Less Than Significant
<b>Water Quality</b>	
Violate any (surface water) water quality standards or waste discharge requirements	Impact Mitigated to Less Than Significant
Generate construction or post-construction runoff that would violate applicable stormwater NPDES permits or otherwise significantly affect surface water or groundwater quality	Impact Mitigated to Less Than Significant
Result in point or nonpoint source pollutant discharges into State Water Resources Control Board-designated Areas of Special Biological Significance	No Impact
Use onsite wastewater treatment systems in areas with known geological limitations (e.g. high groundwater) or in close proximity to surface water (including, but not limited to, streams, lakes, and drainage course)	Impact Mitigated to Less Than Significant
Otherwise substantially degrade water quality	Impact Mitigated to Less Than Significant
<b>Land Resources (Agricultural, Forest and Mineral Resources)</b>	
<i>Agriculture and Forest Resources</i>	
Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to non-agricultural use	Significant and Unavoidable Impact
Conflict with existing zoning for agricultural use, with a designated Agricultural Opportunity Area, or with a Williamson Act contract	Less Than Significant
Conflict with existing zoning for, or cause rezoning of forest land, timberland, or timberland zoned Timberland Production	No Impact
Result in the loss of forest land or conversion of forest land to non-forest use	No Impact
Involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest land use	No Impact
<i>Mineral Resources</i>	
Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.	No Impact
Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	No Impact
<b>Cultural and Tribal Resources</b>	
Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5 of the CEQA Guidelines	Impact Mitigated to Less Than Significant
Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5 of the CEQA Guidelines	Impact Mitigated to Less Than Significant
Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, or contain rock formations indicating potential paleontological resources	Impact Mitigated to Less Than Significant
Disturb any human remains, including those interred outside of formal cemeteries	Impact Mitigated to Less Than Significant
Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural	Impact Mitigated to Less Than Significant

**TABLE 1-1  
CENTENNIAL SPECIFIC PLAN IMPACT SUMMARY**

<b>Topic</b>	<b>Significance Finding</b>
value to a California Native American tribe, and that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k).	
Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	Impact Mitigated to Less Than Significant
<b>Biological Resources</b>	
Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS	Impact Mitigated to Less Than Significant
Have a substantial adverse effect on any sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS	Impact Mitigated to Less Than Significant
Have a substantial adverse effect on federally or state protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, and drainages) or waters of the United States, as defined by §404 of the federal Clean Water Act or California Fish and Game code §1600 et seq. through direct removal, filling, hydrological interruption, or other means	Impact Mitigated to Less Than Significant
Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites	Impact Mitigated to Less Than Significant
Convert oak woodlands or otherwise contain oak or other unique native trees	Impact Mitigated to Less Than Significant
Conflict with any local policies or ordinances protecting biological resources, including Wildflower Reserve Areas, the Los Angeles County Oak Tree Ordinance, the Significant Ecological Areas (SEAs), and Sensitive Environmental Resource Areas (SERAs)	Impact Mitigated to Less Than Significant
Conflict with the provisions of an adopted state, regional, or local habitat conservation plan	No Impact
<b>Land Use, Entitlements, and Planning</b>	
Physically divide an established community	No Impact
Be inconsistent with the applicable County plans for the subject property including, but not limited to, the General Plan, specific plans, local coastal plans, area plans, and community/neighborhood plans	Less Than Significant
Be inconsistent with the County zoning ordinance as applicable to the subject property	Less Than Significant
Conflict with Hillside Management criteria, Significant Ecological Areas conformance criteria, or other applicable land use criteria	Less Than Significant
<b>Population, Housing, and Employment</b>	

**TABLE 1-1  
CENTENNIAL SPECIFIC PLAN IMPACT SUMMARY**

<b>Topic</b>	<b>Significance Finding</b>
Induce substantial population growth in an area, either directly or indirectly	Significant and Unavoidable
Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere	Less than significant
Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere	Less Than Significant
Cumulatively exceed official regional or local population projections	Significant and Unavoidable
<b>Traffic, Access, and Circulation</b>	
Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system	Impact Mitigated to Less Than Significant/ Some Mitigation Outside Authority of Lead Agency
Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways	Impact Mitigated to Less Than Significant/ Some Mitigation Outside Authority of Lead Agency
Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks	Less Than Significant
Substantially increase hazards due to a design feature or incompatible uses	Impact Mitigated to Less Than Significant
Result in inadequate emergency access	Impact Mitigated to Less Than Significant
Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities	No Impact
<b>Air Resources</b>	
Violate any air quality standard or contribute substantially to an existing or projected air quality violation	Significant and Unavoidable
Expose sensitive receptors to substantial pollutant concentrations	Significant and Unavoidable
Conflict with or obstruct implementation of applicable air quality plans of either the South Coast AQMD (SCAQMD) or the Antelope Valley AQMD (AVAQMD)	Less Than Significant
Create objectionable odors affecting a substantial number of people	Less Than Significant
Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard	Significant and Unavoidable
<b>Noise</b>	
Result in exposure of persons to, or generation of, noise in excess of standards established in the County General Plan or noise ordinance, or applicable standards of other agencies	Impact Mitigated to Less Than Significant
Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels	Impact Mitigated to Less Than Significant
Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project, including noise from parking areas	Significant and Unavoidable
Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project, including noise from amplified sound systems	Impact Mitigated to Less Than Significant
For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels	No Impact

**TABLE 1-1  
CENTENNIAL SPECIFIC PLAN IMPACT SUMMARY**

<b>Topic</b>	<b>Significance Finding</b>
For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels	Less Than Significant
<b>Visual Resources</b>	
Have a substantial adverse effect on a scenic vista	Significant and Unavoidable
Be visible from or will obstruct views from a regional riding or hiking trail	Less Than Significant
Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway	Less Than Significant
Substantially degrade the existing visual character or quality of the site and its surroundings because of height, bulk, pattern, scale, character, or other features	Significant and Unavoidable
Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area	Significant and Unavoidable
<b>Parks and Recreation</b>	
Increase the use of the existing neighborhood and regional parks or other recreational facilities such that a substantial physical deterioration of the facilities would occur or be accelerated	Less Than Significant
Include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment	Less Than Significant
Interfere with regional open space connectivity	Less Than Significant
Create capacity or service level problems, or result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, in order to maintain acceptable service ratios, response times or other performance objectives for parks	Impact Mitigated to Less Than Significant
<b>Education</b>	
Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable performance objectives for any of the public services: schools	Impact Mitigated to Less Than Significant
<b>Fire and Law Enforcement</b>	
<i>Fire Services</i>	
Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need of new or physical altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services: fire protection	Impact Mitigated to Less Than Significant
<i>Law Enforcement Services</i>	
Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need of new or physical altered governmental facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: sheriff protection	Impact Mitigated to Less Than Significant
<b>Other Public Services</b>	
<i>Library</i>	
Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or	Impact Mitigated to Less Than Significant

**TABLE 1-1  
CENTENNIAL SPECIFIC PLAN IMPACT SUMMARY**

<b>Topic</b>	<b>Significance Finding</b>
physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: libraries	
<b>Solid Waste Management</b>	
Be served by a landfill with insufficient permitted capacity to accommodate the project's solid waste disposal needs	Significant and Unavoidable
Not comply with federal, state, and local statutes and regulations related to solid waste	Significant and Unavoidable
<b>Other Public Facilities</b>	
Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: other public facilities	Less Than Significant
<b>Water Resources</b>	
Have insufficient reliable water supplies available to serve the project demands from existing entitlements and resources, considering existing and projected water demands from other land uses	Impact Mitigated to Less Than Significant
Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level	Less Than Significant
<b>Wastewater</b>	
Exceed wastewater treatment requirements of either the Los Angeles or Lahontan RWQCBs	Impact Mitigated to Less Than Significant
Create water or wastewater system capacity problems, or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects	Less Than Significant
<b>Dry Utilities</b>	
Create electrical system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects	Impact Mitigated to Less Than Significant
Create energy utility (natural gas and petroleum) system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects	Impact Mitigated to Less Than Significant
Create telephone service system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects	Impact Mitigated to Less Than Significant
Create cable services system capacity problems, or result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects	Impact Mitigated to Less Than Significant
<b>Climate Change</b>	
Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment	Significant and Unavoidable
Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases	Significant and Unavoidable

**TABLE 1-1  
CENTENNIAL SPECIFIC PLAN IMPACT SUMMARY**

Topic	Significance Finding
<b>Growth-Inducing Impacts</b>	
<p>The Project would not be considered growth-inducing related to planned growth in the region. However, the existence of the Project makes it reasonably foreseeable that future unplanned development may occur along the eastern fringes of the Project site, where physical constraints to development are less than to the north and south, which could result in a significant impact on the environment on lands outside the West EOA. This would be considered a significant adverse indirect growth-inducing impact.</p>	
<b>Cumulative Impacts</b>	
<p>The following environmental factors would result in cumulatively significant and unavoidable impacts:</p> <ul style="list-style-type: none"> <li>• Land Resources (loss of Prime Farmland)</li> <li>• Biological Resources (regional wildlife movement, loss of native grasslands)</li> <li>• Population, Housing, and Employment (substantial relative to existing conditions)</li> <li>• Traffic, Access, and Circulation (without pending improvements by Caltrans)</li> <li>• Air Resources (construction and operational emissions in the AVAQMD and the SCAQMD)</li> <li>• Noise (traffic noise along segments of SR-138)</li> <li>• Visual Resources (change to long range views from public land and nighttime light and glare)</li> <li>• Solid Waste (contribution to municipal solid waste disposal)</li> <li>• Water Resources (water supplies)</li> <li>• Climate Change (greenhouse gas emissions)</li> </ul>	
<p>NPDES: National Pollutant Discharge Elimination System; CEQA: California Environmental Quality Act; CDFW: California Department of Fish and Wildlife; USFWS: U.S. Fish and Wildlife Service; SEAs: Significant Ecological Areas; SERAs: Sensitive Environmental Resource Areas; SCAQMD: South Coast Air Quality Management District; AVAQMD: Antelope Valley Air Quality Management District; RWQCB: Regional Water Quality Control Board; CATV: cable television; Caltrans: California Department of Transportation; SR: State Route</p>	

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.2	<b>Hydrology and Flood</b>	<b>MM 2-1</b> The Project shall implement hydromodification control Best Management Practices (BMPs) that will meet the requirements of Section 8 – Hydromodification Impacts of the County LID Standards Manual, as confirmed by the County based on a Drainage System Engineering and Planning Report to be submitted with each Project tract map application. This Drainage System Engineering and Planning Report shall describe applicable hydromodification control BMPs and utilize approved Los Angeles County methods to demonstrate compliance with the County LID Standards Manual.
5.2	<b>Hydrology and Flood</b>	<p><b>MM 2-2</b> The Project shall implement hydrology and flood-control BMPs that will achieve the following hydrology and flood performance standards:</p> <p><i>All project water conveyance facilities must be designed to provide capital flood protection. BMPs must be implemented to ensure that, for the capital storm event, there is no increase in peak discharge rates and no increase in runoff volume offsite compared with peak discharge rates and runoff volumes under existing, pre-development conditions. Compliance with the hydrology and flood performance standard shall be demonstrated by using a methodology approved Los Angeles County Department of Public Works for comparing project site pre- and post-development peak discharge rates and runoff volumes.</i></p> <p>Compliance with the hydrology and flood performance standards shall be further confirmed by the County, based on a Drainage System Engineering and Planning Report submitted with each Project tract map application. The Drainage System Engineering and Planning Report shall describe applicable hydrology and flood-control BMPs and utilize approved Los Angeles County methodologies to demonstrate compliance with the hydrology and flood performance standards.</p>
5.2	<b>Hydrology and Flood</b>	<b>MM 2-3</b> Each Tentative Map shall depict the 100-year floodplain mapped by the Federal Emergency Management Agency (FEMA). The placement of habitable residential, commercial, school and institutional buildings shall be precluded within any mapped 100-year floodplain. All applications for Project tract maps that would locate any structures within a mapped 100-year floodplain must include an engineering report that provides a detailed description of the floodplain boundaries and demonstrates that as-built conditions comply with all applicable FEMA requirements. If required, a conditional letter of map revision (CLOMR) shall be obtained from FEMA prior to construction within a mapped 100-year floodplain.
5.3	<b>Hazards and Fire Safety</b>	<b>MM 3-1</b> The Project Applicant/Developer shall employ a Dust-Control Supervisor who will be on the site within 30 minutes of the start of work taking place each morning; will have the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Antelope Valley Air Quality Management District (AVAQMD) Rule 403 and South Coast Air Quality Management District (SCAQMD) Rule 403 requirements; and will have completed the SCAQMD Fugitive Dust Control Class and has been issued a valid Certificate of Completion for the class. Contact information for the Project's Dust Control Supervisor shall be posted on-site to ensure that the public has a means of providing complaints regarding fugitive dust. The Dust Control Supervisor shall be responsible for tracking complaints, conducting corrective action, as necessary, and for maintaining an up-to-date log of complaints and responses for periodic County review.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.3	Hazards and Fire Safety	<b>MM 3-3</b> The Project Applicant/Developer shall provide to each prospective property purchaser or tenant a notice and statement of acknowledgment that shall be executed (i.e., read and signed) by the prospective purchaser, lessee, or tenant that the property within Centennial may present a risk of exposure to Valley Fever spores during construction or other earth-moving activities. The form shall include strategies to reduce potential exposure to Valley Fever spores. The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the County.
5.3	Hazards and Fire Safety	<b>MM 3-4</b> The Project Applicant/Developer shall coordinate with the California Department of Conservation, Division of Oil, Gas and Geological Resources (DOGGR) to facilitate re-abandonment of the two on-site historic dry oil wells in accordance with current DOGGR specifications. The Project Applicant/Developer shall present documentation to the County that it has complied with the DOGGR requirements for re-abandonment of the two on-site wells.
5.3	Hazards and Fire Safety	<b>MM 3-5</b> The Project Applicant/Developer shall provide documentation to the County that the abandoned mine shaft is permanently closed in accordance with applicable regulations, as directed by the California Department of Conservation Office of Mine Reclamation, to prevent future access and potential ground instability issues.
5.3	Hazards and Fire Safety	<b>MM 3-6</b> If unanticipated hazardous materials or waste is encountered during construction, all work in the immediate vicinity of the suspect hazardous material shall be halted and the applicable oversight agency(ies) shall be notified. The applicable agency(ies) are determined based on the type and extent of the material encountered, and may include the California Department of Toxic Substances Control (DTSC), the State Water Quality Control Board, and/or local agencies, such as the County of Los Angeles Fire Department. The Project Applicant/Developer shall coordinate with appropriate agency(ies) on the appropriate means to address the suspect hazardous material/waste. All environmental investigation and/or remediation shall be conducted under a Workplan approved by the primary oversight agency(ies) and construction in the affected area shall not proceed until clearance has been issued by the applicable agency(ies).
5.3	Hazards and Fire Safety	<b>MM 3-7</b> The Project Applicant/Developer shall prepare an Emergency Response Plan for the Project, which shall be updated as needed for each Tentative Map, and shall be submitted to the County for review and approval. The Project Applicant/Developer shall be responsible for distributing the current Emergency Response Plan to each purchaser or tenant of each property within Centennial, and shall distribute the Plan to all landowners through the Transportation Management Agency (TMA).
5.3	Hazards and Fire Safety	<b>MM 3-8</b> The Project Applicant/Developer shall prepare a Traffic Control Plan in accordance with the California Manual on Uniform Traffic Control Devices (MUTCD). The Traffic Control Plan shall be reviewed and approved by the California Department of Transportation (Caltrans), and all construction activities in the public right-of-way shall comply with the approved Traffic Control Plan to the satisfaction of Caltrans. Documentation of Caltrans approval shall be provided to the County for any Tentative Map involving construction within State Route 138 right-of-way.
5.3	Hazards and Fire Safety	<b>MM 3-9</b> The Project Applicant/Developer shall prepare a Fuel Modification Plan demonstrating compliance with the County Fire Code Title 32 and shall provide all new residents and business owners with recorded Covenants, Conditions, and Restrictions (CC&Rs) or disclosure statements that identify the responsibilities for maintaining the fuel modification zone(s) on their property, as defined in the approved Fuel Modification Plan. The CC&Rs or disclosure statements

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>prepared by the Project Applicant/Developer shall be submitted to the County to confirm that new property owners will be informed of their responsibilities for maintaining the fuel modification zone(s) on their property.</p>
5.4	Water Quality	<p><b>MM 4-1</b> The Project shall implement Low Impact Development (LID) and water quality control Best Management Practices (BMPs) that will achieve the following LID performance standard:</p> <p><i>LID BMPs shall be selected and sized to retain the volume of storm water runoff produced from the higher of the 85th percentile or ¾ inch, 24-hour storm depth as determined from the Los Angeles County 85th Percentile 24-hr Rainfall Isohyetal Map (February 2004) (LID design volume). When it has been demonstrated that 100 percent of the LID design volume cannot be feasibly infiltrated within the Project, then the volume shall be harvested and reused. If that volume cannot be harvested and reused within 96 hours, then biofiltration shall be provided for 1.5 times the portion of the LID design volume that is not retained. Runoff from roadways shall be retained or biofiltered in retention or biofiltration BMPs sized to capture the design storm volume or flow, per the guidance in the U.S. Environmental Protection Agency's (USEPA's) Managing Wet Weather with Green Infrastructure: Green Streets. LID BMPs may be parcel-based or regional facilities.</i></p> <p>Compliance with the LID performance standards shall be confirmed by the County based on a Drainage System Engineering and Planning Report to be submitted with each Tentative Map application. The Report shall describe applicable water quality control and LID BMPs and shall utilize approved Los Angeles County methodologies to demonstrate compliance with the LID performance standards. To the extent feasible, incorporate permeable pavement, groundcovers, and/or other measures to increase infiltration.</p>
5.4	Water Quality	<p><b>MM 4-2</b> The Project shall implement integrated pest management (IPM) and landscaping best management practices (BMPs) consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. The IPM and landscaping BMPs shall be confirmed in a Landscaping Plan submitted to the County during the review and approval process for each tract map application. The BMPs shall include a Planting Plan that is consistent with the plant water use requirements of Section 3.3 of the <i>Centennial Specific Plan</i>; with procedures for removing non-native vegetation and planting native vegetation; with fertilizer guidelines; and with the IPM approach for preventing or suppressing pest problems (i.e., insects and diseases). This shall be done through a combination of techniques including using pest-resistant plants; using biological controls; incorporating cultural practices; including habitat modification; and judiciously using pesticides. The IPM and landscaping BMPs shall address the following:</p> <ul style="list-style-type: none"> <li>• Pest identification.</li> <li>• Practices to prevent pest incidence and to reduce pest buildup.</li> <li>• Monitoring to examine vegetation and surrounding areas for pests to evaluate trends and to identify when controls are needed.</li> <li>• Establishment of action thresholds that trigger control actions.</li> <li>• Pest-control methods (cultural, mechanical, environmental, biological, and appropriate pesticides).</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<ul style="list-style-type: none"> <li>• Pesticide management, which includes safety requirements (e.g., Material Safety Data Sheets, precautionary statements, protective equipment); regulatory requirements; spill mitigation measures; groundwater and surface water protection measures associated with pesticide use; and pesticide applicator certifications, licenses, and training (i.e., all pesticide applicators must be certified by the California Department of Pesticide Regulation).</li> </ul>
5.6	<b>Cultural and Tribal Resources</b>	<p><b>MM 6-1</b> The Project Applicant/Developer shall retain a qualified Archaeologist who shall oversee archaeological monitoring of topsoil grading and removals (including clearing, grubbing, and trenching) in the immediate vicinity of the following 25 archaeological sites that are within the grading footprint and 1 site in the open space area that is immediately adjacent to the development impact area: CA-LAN-3201, CA-LAN-3202H, CA-LAN-3219H, CA-LAN-3227, CA-LAN-3230, CA-LAN-3232, CA-LAN-3233, CA-LAN-3234, CA-LAN-3236, CA-LAN-3237, CA-LAN-3238, CA-LAN-3239, CA-LAN-3240, CA-LAN-3241, CA-LAN-3242, CA-LAN-3243, CA-LAN-3244, CA-LAN-3245, CA-LAN-3246, CA-LAN-3247, CA-LAN-3248, CA-LAN-3250, CA-LAN-3251, CA-LAN-3252, CA-LAN-3253, and CA-LAN-3985H. CA-LAN-3227 is the site immediately adjacent to the grading footprint. Additionally, a Native American monitor representing the Tejon Indian Tribe shall be present during topsoil grading and removals in the vicinity of the 26 above-listed archaeological sites.</p> <p>The Project Applicant/Developer shall provide written evidence to the County that a qualified Archaeologist has been retained; shall be present at the pre-grading meeting; shall establish procedures for archaeological resource surveillance, including coordination with representatives of the Tejon Indian Tribe on the location and schedule of Native American monitoring; and shall establish (in cooperation with the Project Applicant/Developer and/or County, as well as the Tejon Indian Tribe) procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of any artifacts found, as appropriate.</p> <p>The qualified Archaeologist shall develop and submit an Archaeological Resource Monitoring Plan to the County for sites in development areas. The qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe shall be retained to attend pre-grade meetings and to monitor earth-moving activities, including clearing, grubbing and trenching, in the vicinity (i.e., the area of a site reasonably expected to contain archaeological resources plus a buffer of at least 10 meters [33 feet]) of any and/or all cultural resource sites. The Archaeologist and Native American monitor shall carefully inspect these areas to assess the potential for significant prehistoric or historic remains. If potentially significant archaeological resources are uncovered, a subsurface test and/or evaluation shall be performed to assess the discovery. Further subsurface investigation or data recovery shall be undertaken if the resource is determined unique or historically significant (i.e., important for its prehistoric or historic information) and therefore eligible for the California Register of Historical Resources (CRHR).</p> <p>The archaeological procedures shall be incorporated as a note on the Grading Plan cover sheet. If additional or unexpected archaeological features are discovered, the qualified Archaeologist shall report such findings in writing to the County and/or the Tejon Indian Tribe. If archaeological resources are found to be of possible significance, the qualified Archaeologist shall determine appropriate actions, in cooperation with the County and the Tejon Indian Tribe, for further exploration and/or salvage.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>The Archaeologist shall submit a Follow-up Report to the County. The Follow-up Report shall include the period of inspection; an analysis of any artifacts found; and the present repository of the artifacts. Recovered finds shall be offered to the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts. These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the County.</p> <p>The Project Applicant/Developer shall retain a certified Archaeologist who will perform a Phase II subsurface test-level investigation and surface collection for archaeological resource sites of undetermined CRHR eligibility discovered during monitoring. A Phase II Test-level Report shall be completed that evaluates the sites; includes a discussion of the sites' significance (depth, nature, condition, and extent of the resources); and contains recommendations for final mitigation and cost estimates (if required) to fully mitigate significant impacts. Should the Phase II subsurface test-level investigation and surface collection determine the potential presence of significant subsurface resources, the site shall be mitigated to a less than significant level through the implementation of one of the mitigation options discussed below:</p> <ol style="list-style-type: none"> <li>a. Relocation of grading boundaries and fuel modification zones to completely avoid disturbance to the site(s). Should boundary relocation be infeasible, a qualified Archaeologist shall be present in the vicinity of archaeological resources during grading and fuel modification brush clearance. <b>(NOTE: confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the South Central Coastal Information Center (SCCIC) at California State, Fullerton. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.)</b> Fencing shall be erected outside the sites to visually depict the areas to be avoided during construction.</li> <li>b. If it is determined that avoidance and/or preservation are not feasible, then prior to grading in the vicinity of archaeological resources, Phase III data recovery (salvage excavations) shall be conducted for these archaeological sites or any other sites within the potential impact area of development that cannot be avoided. <b>(NOTE: confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.)</b> The Phase III work shall provide sufficient scientific information to fully mitigate the impacts of development on these sites to a level considered less than significant and shall be performed in accordance with the standards of the State Historic Preservation Office (SHPO).</li> </ol> <p>Excavated assemblages shall be offered to the County and/or the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts. Final mitigation</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		shall be carried out based upon the recommendations in the Phase II Test Level Report, and the County shall make a determination as to the site's disposition based on the recommendations of the qualified Archaeologist. Possible determinations include, but are not limited to, preservation, salvage, partial salvage, or no mitigation necessary.
5.6	<b>Cultural and Tribal Resources</b>	<b>MM 6-2</b> Archaeological sites CA-LAN-3201, CA-LAN-3206, CA-LAN-3227, CA-LAN-3240, and CA-LAN-3242 shall be surrounded with high visibility construction fencing with a buffer of approximately 50 feet around each site to ensure that the archaeological sites are completely avoided during construction-related activities. A qualified Archaeologist shall work with surveying teams and the Construction Supervisor to fence the area to be avoided prior to the commencement of grading.
5.6	<b>Cultural and Tribal Resources</b>	<p><b>MM 6-3</b> The Project Applicant/Developer shall retain a qualified Archaeologist to mitigate impacts to eligible archaeological sites within the development impact area. Additionally, and a Native American monitor representing the Tejon Indian Tribe shall be present during ground-disturbing activities (i.e. topsoil grading and removals) in the vicinity of the three below-listed archaeological sites. Impacts to these eligible sites (CA-LAN-3201, CA-LAN-3240, and CA-LAN-3242) shall be mitigated to a less than significant level through the implementation of one of the mitigation options described below.</p> <ul style="list-style-type: none"> <li>a. Relocation of grading boundaries and fuel modification zones to completely avoid disturbance to the site(s). Should boundary relocation be infeasible, a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe shall be present in the vicinity of archaeological resources during grading and fuel modification brush clearance to monitor all activities and ensure that archaeological resources are not impacted. (<b>NOTE:</b> confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) Fencing shall be erected outside the sites to visually depict the areas to be avoided during construction. Any temporary fencing materials (i.e., plastic web, chain link, etc.) placed during construction should not become permanent. Any permanent fencing erected to protect the sites should be visually pleasing and consistent with the overall aesthetic experience of the community of Centennial.</li> <li>b. If avoidance and/or preservation are not feasible, then prior to grading in the vicinity of archaeological resources, Phase III data recovery (salvage excavations) shall be conducted for these archaeological sites or any other sites within the potential impact area of development that cannot be avoided. (<b>NOTE:</b> confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) The Phase III work shall provide sufficient scientific information to fully mitigate the impacts of development on these sites and shall be performed in accordance with the standards of the SHPO.</li> </ul> <p>Excavated finds shall be offered to the County and/or the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		Final mitigation shall be carried out based upon the recommendations in the Phase II Test-Level Report, and the County shall make a determination as to the site's disposition based on the recommendations of the qualified Archaeologist and the Native American monitor representing the Tejon Indian Tribe. Possible determinations include, but are not limited to, preservation, salvage, partial salvage, or no mitigation necessary.
5.6	<b>Cultural and Tribal Resources</b>	<p><b>MM 6-4</b> The Project Applicant/Developer shall develop and implement an Archaeological Resources Site-Protection Program aimed to protect and preserve identified archaeological resources vulnerable to disturbance. This program shall be prepared by the qualified Monitoring Archaeologist familiar with the resources present within the Project boundaries and approved by the County and shall include implementation of one or more of the following:</p> <ul style="list-style-type: none"> <li>a. Fencing and/or other access-restriction methods shall be placed around the archaeologically sensitive areas of the Project site to inhibit human access. This is especially applicable to site CA-LAN-3227.</li> <li>b. Non-invasive plant species with thorns (e.g., prickly pear cactus [<i>Opuntia</i> spp.]) or other deterrent characteristics shall be planted in areas close to known resources in order to discourage human presence; this is generally applicable to the majority of sites to be preserved in areas of native vegetation.</li> <li>c. Known resources shall be capped with a layer of chemically inactive soil/sediment, in consultation with a qualified Archaeologist. This is especially applicable to sites CA-LAN-3201, CA-LAN-3206, CA-LAN-3240, and CA-LAN-3242.</li> </ul> <p>The above-mentioned mitigation shall be implemented prior to the completion of construction activities and shall be overseen by the County and/or the Tejon Indian Tribe. The qualified Archaeologist shall prepare a written statement documenting appropriate site-protection measures. Additionally, a Native American monitor representing the Tejon Indian Tribe shall be present during all initial surface grubbing, initial ground surface grading, and any excavation greater than one-half foot in depth. For implementation of each tract map, if no subsurface Native American or archaeological remains are identified during that initial grading, continuous monitoring will no longer be required but the Native American monitor shall spot-check all additional subsurface excavations at least once a week for the duration of grading and excavation activities or until monitor deems site clear. The Project Archaeologist shall be responsible for coordinating the location and schedule of Native American monitors.</p>
5.6	<b>Cultural and Tribal Resources</b>	<p><b>MM 6-5</b> For the exposed paleontological resources discovered during the Paleo Environmental Associates (PEA) 2009 study (as detailed in the document entitled <i>Paleontologic Resource Inventory and Impact Assessment Technical Report prepared in support of Centennial Specific Plan, western Antelope Valley, northern Los Angeles County, California</i>) and any paleontological resources uncovered during grading or excavation activities in or out of the presence of a Monitor, grading activities will be stopped and diverted to a part of the site reasonably away from the find (highly dependent on the size and complexity of the resource), and a qualified Paleontologist shall (1) ascertain the significance of the resources; (2) establish protocol with the Project Applicant/Developer to protect (or mitigate impacts to) such resources; (3) ascertain the presence of additional resources; and (4) provide additional monitoring of the site, if the Monitor deems it appropriate.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.6	<b>Cultural and Tribal Resources</b>	<b>MM 6-6</b> A Paleontological Treatment and Monitoring Plan (PTMP) shall be developed by a qualified Paleontologist retained by the Project Applicant/Developer. The PTMP shall be reviewed and approved by the County. This plan shall include a protocol for examining, evaluating, and (if necessary) salvaging known fossil localities identified during the PEA (2009) study (as detailed in the document entitled <i>Paleontologic Resource Inventory and Impact Assessment Technical Report prepared in support of Centennial Specific Plan, western Antelope Valley, northern Los Angeles County, California</i> ); a grading observation schedule shall be maintained when grading occurs within sedimentary rock units so that the Paleontologist may identify and evaluate fossil resources within the Project site. This qualified Paleontologist shall be retained to attend pre-grade meetings and to monitor deep earth-moving activities (including grading, cutting, and trenching) at the site. Paleontological monitoring shall be conducted by a qualified Paleontologist during grading and other excavation work. Recommended hours for monitoring activities shall be established by the qualified Paleontologist and shall be outlined in the PTMP. It shall be the responsibility of the qualified Paleontologist to demonstrate, to the satisfaction of the County, the appropriate level of monitoring necessary based on the tentative map-level grading plans. The qualified Paleontologist shall carefully inspect PTMP-identified areas in order to assess the potential for significant fossil remains. If potential paleontological resources are uncovered, a subsurface evaluation will be performed to assess the discovery. Further subsurface investigation will be undertaken if the resource is determined unique or important for its paleontological information. Because of the potential for producing small fragments of vertebrate microfossils, the Paleontologist shall conduct reasonable, periodic screening of sands from cuts in these units. Such material may be removed in bulk and screened off site for further analysis.
5.6	<b>Cultural and Tribal Resources</b>	<b>MM 6-7</b> The qualified Paleontologist retained by the Project Applicant/Developer shall coordinate with appropriate construction contractor personnel to provide information concerning the protection of paleontological resources. Contractor personnel shall be informed that unauthorized fossil collecting is prohibited. The contractor's heavy equipment operators shall be briefed on procedures to be followed in the event that fossil remains and a fossil site are encountered during earth-moving activities (grading or blasting). The briefing shall be presented to new contractor personnel as necessary. Names and telephone numbers of the Monitor and other appropriate mitigation program personnel shall be provided to appropriate contractor personnel and to the County.
5.6	<b>Cultural and Tribal Resources</b>	<b>MM 6-8</b> The qualified Paleontologist shall initiate and coordinate recovery operations with the Project Applicant/Developer, and the County of Los Angeles for any significant fossil localities identified in the Paleo Environmental Associates 2009 document entitled <i>Paleontologic Resource Inventory and Impact Assessment Technical Report prepared in support of Centennial Specific Plan, western Antelope Valley, northern Los Angeles County, California</i> as well as if significant fossils are exposed during any Project-related grading pursuant to the PTMP. To initiate recovery operations, the Paleontologist shall be allowed to divert or direct grading in the area of exposure to facilitate evaluation and, if identified as potentially significant, to recover significant fossils. The qualified Paleontologist shall notify the Construction Foreman of the discovery of fossil resources and shall discuss recovery methods and the timeline needed to evaluate the find. If a fossil discovery occurs during grading operations when the Paleontologist is not present, grading shall be diverted a reasonable distance away from the area until the qualified Paleontologist can survey the area, conduct recovery operations, and make an assessment on the significance of the find.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.6	<b>Cultural and Tribal Resources</b>	<b>MM 6-9</b> A formal museum storage agreement shall be developed between the Project Paleontologist and an accredited institution. Any fossils and their contextual stratigraphic data that are collected during development shall be prepared and identified by a qualified Paleontologist. Excavated significant fossil finds shall be donated with funding for stabilization, identification, and curation on a first right-of-refusal basis to an appropriate, accredited institution that has a retrievable collection system and an educational and research interest in the materials (e.g., the Natural History Museum of Los Angeles County). A final report prepared by the qualified Paleontologist that details the discovery, recovery, laboratory analysis, and findings and disposition of specimens shall be submitted to the County.
5.6	<b>Cultural and Tribal Resources</b>	<b>MM 6-10</b> In accordance with <i>California Code of Regulations</i> (Title 14, Section 15064.5[e]), in the event of the accidental discovery or recognition of any human remains in any location other than a dedicated cemetery, the Los Angeles County Coroner must be notified of the discovery ( <i>California Health and Safety Code</i> , Section 7050.5) and all activities in the immediate area of the find or in any nearby area reasonably suspected to overlie adjacent human remains must cease until appropriate and lawful measures have been implemented. If the Coroner determines that the remains are not recent, but rather of Native American origin, the Coroner shall notify the Native American Heritage Commission (NAHC) in Sacramento within 24 hours to permit the NAHC to determine the Most Likely Descendent (MLD) of the deceased Native American. The designated MLD may make recommendations to the Project Applicant/Developer or the person responsible for the excavation work, for means of treating or reassignment of the human remains and any associated grave goods with appropriate dignity, as provided in <i>California Public Resources Code</i> , Section 5097.98. If any of the following occurs, the Project Applicant/Developer shall rebury the Native American remains and the associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance: (1) the NAHC is unable to identify an MLD; (2) the MLD fails to make a recommendation within 48 hours of being notified of the discovery; or (3) the Project Applicant/Developer rejects the recommendation of the MLD and mediation by the NAHC fails to provide acceptable measures.
5.7	<b>Biological Resources</b>	<b>MM 7-1</b> Prior to issuance of grading permits in areas of the Project site that may disturb California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, or adobe yampah populations, focused surveys of mitigation lands shall have been completed to confirm compliance with the 2:1 mitigation ratio for the California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah. Surveys will be conducted in accordance with current California Native Plant Society (CNPS) protocol and will occur during the appropriate time of year. The Survey Report shall be submitted to the County and the California Department of Fish and Wildlife (CDFW) for their review. In addition to rare plant species populations that have previously been found in the Mitigation Preserve, newly detected populations will be preserved and managed for long-term preservation. These populations will provide baseline information for management efforts described below and will provide information to help determine habitat suitability in areas where propagation of rare plants may be considered.  The Project Applicant shall prepare and implement a Special Status Plant Species Restoration Plan covering the California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah that shall specify the following: (1) procedures for the collection and temporary storage of seed (all available seed from every impacted occurrence shall be collected); (2) planting procedures, including soil preparation and irrigation; (3) a schedule and action plan to maintain and monitor enhanced, restored, and/or created populations; (4) methods to control plant densities (of competing plants) to promote the establishment of California androsace, crownscale, round-

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah; and (5) a list of County-approved success criteria (e.g., germination rates, growth, plant cover) to compare to the density of existing populations. The Project Applicant shall develop the Special Status Plant Species Restoration Plan and the County shall approve it prior to any vegetation clearing or grading on the site. Adoption of this plan shall be used as the performance standard. An overview of the plan objectives is provided in the Biological Resource Mitigation Program to be submitted and approved by the County prior to issuance of grading permits.</p> <p>Prior to the commencement of vegetation clearing and/or grading activities, the Project Applicant shall contract a qualified firm to harvest California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah seeds from the impacted populations on the Project site. The seeds shall be collected in the manner and time described in the Special Status Plant Species Restoration Plan. The harvested seed shall be used for the enhancement, restoration, or creation of these species' populations to be preserved in open space areas on the Project site. Additionally, prior to implementation of the Plan, a focused survey for the special status species impacted (listed above) shall occur in the preserve areas to document existing populations.</p> <p>The previously documented populations of California androsace, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah occurring in the designated on-site mitigation areas (north of State Route [SR] 138 and south of SR-138), and Mitigation Areas 1, 2, 3 shall be preserved in perpetuity. These existing areas shall be enhanced, expanded, or restored or new areas shall be created in suitable habitat in order to compensate at a 2:1 ratio for the thousands of individual special status plants that will be lost due to the Project.</p> <p>Those portions of the crownscale and Mojave spineflower populations that are located within and along the western edge of the open space polygon located approximately 500 feet east of Cement Plant Road and approximately 650 feet north of the SR-138 shall be protected. No temporary or permanent disturbance (including fuel modification) shall occur in the identified occurrence points or polygons; these occurrence points or polygons shall be flagged by a qualified Biologist prior to the start of Project activities in the area. In addition, the post-construction hydrology that supports these protected populations shall be consistent with the pre-Project hydrologic condition. The supporting area consists of the adjacent slope, which drains to the protected plant populations and consists of approximately 300 feet to the north and north northwest.</p> <p>Planting of California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah shall be performed in accordance with the specifications in the Special Status Plant Species Restoration Plan, which will also indicate the target densities for each of these species so that the new populations will support at least as many individuals of each species as were impacted.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-2</b> A pre-construction/grading survey of all areas proposed for construction/grading activities that contain potentially suitable habitat for silvery legless lizard, coast horned lizard, two-striped garter snake, and American badger shall be conducted by a qualified Biologist. Surveys will consist of 1 pass-through by a qualified Wildlife Biologist walking 50-meter belt transects across areas to be impacted while visually searching for the species listed above. Surveys will be conducted no more than three days prior to the disturbance of the surveyed area. If any of these species or other wildlife species that can be easily moved are observed within the construction/grading zone, the Biologist (who must have a valid California Scientific Collecting Permit) shall relocate them to a suitable area outside the construction zone. Suitable areas would include appropriate habitats within the proposed open space areas in the northwestern portion</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>of the Project site and would be identified in a Wildlife Relocation Plan (described below) prior to surveys but before construction begins.</p> <p>Areas adjacent to Quail Lake and on the Project site potentially supporting western pond turtle breeding habitat shall not be disturbed during the breeding season for the turtles (April through August). No Project activities shall occur within 300 feet from the edge of Quail Lake, due to potential for nesting in those areas.</p> <p>Pre-construction burrowing owl and Swainson's hawk surveys shall be conducted in all potentially suitable habitat areas prior to initial site preparation. Methods employed shall be consistent with standard and appropriate protocols for both species within the appropriate season of the year prior to construction. Burrowing owl pre-construction surveys shall be conducted prior to the start of construction/ground-breaking activities. Surveys will be conducted following the California Department of Fish and Wildlife's (CDFW's) 2012 burrowing owl survey protocol. These surveys shall be conducted weekly beginning 30 days prior to the start of construction with the final survey occurring 1 day prior to construction.</p> <p>If pre-construction surveys locate an active Swainson's hawk nest on the Project site, then no construction activities will occur within ½ mile of the nest between March 1 and September 15. Furthermore, a Swainson's hawk Monitoring and Mitigation Plan shall be prepared within 90 days after locating an active Swainson's hawk nest in consultation with the County and the CDFW.</p> <p>The Wildlife Relocation Plan shall describe: (1) all areas potentially suitable for receiving relocated animals and (2) methods that shall be used in the relocation process. Methods shall include appropriate species-specific handling techniques and appropriate hygienic methods to prevent the spread of pathogens. The Plan shall also identify thresholds for the number of individuals of each species that shall be allowed to be placed in any particular area. The Wildlife Relocation Plan shall be prepared by the Project Applicant/Developer and submitted to the CDFW prior to Project implementation. County and CDFW approval of the Plan shall indicate that the performance standards have been met. Although, implementation of the mitigation plan may have some impact on wildlife, it is expected to be negligible relative to the project as a whole and expected to have a net positive effect as required.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-3</b> For all grading and construction activities, the Project Applicant/Developer shall retain a qualified Biologist (with selection reviewed by the County) to ensure that incidental construction impacts on special status wildlife species are avoided or minimized. The Biologist shall relocate silvery legless lizard, coast horned lizard, two-striped garter snake, American badger, and any other special status wildlife species that can be moved which would otherwise be destroyed or adversely affected by construction and/or site-preparation activities. Responsibilities of the Construction Biological Monitor shall include:</p> <ol style="list-style-type: none"> <li>a. Attendance at the pre-construction meeting to ensure that timing and location of construction activities do not conflict with other mitigation requirements (e.g., seasonal surveys for nesting birds). The meeting shall be conducted with the Contractor and other key construction personnel to describe the importance of restricting work to designated areas.</li> <li>b. Discussion with the Contractor of procedures to minimize harm/harassment of wildlife that may be encountered during construction.</li> </ol>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>c. Review/designation of the construction area with the Contractor in accordance with the Final Grading Plan. Haul roads, access roads, and on-site staging and storage areas shall be sited in grading areas to minimize degradation of habitat adjacent to these areas. If activities outside these limits are necessary, they shall be evaluated by the Biologist to ensure no special status species or habitats will be affected.</p> <p>d. A field review that is conducted to stake designated construction limits (to be set by the Surveyor). Any construction activity areas immediately adjacent to riparian areas or other special status resources (such as large trees or bird nests) may be flagged or temporarily fenced by the Monitor at his/her discretion.</p> <p>e. Periodic visits to the site during construction to coordinate and monitor compliance with the above provisions.</p> <p>f. Submittal of a brief report to the County and CDFW discussing any conflicts or errors resulting in impacts to special status resources within 48 hours of the incident. At the conclusion of construction of each planning area, submittal of a Final Report discussing the results of the activities and any recommendations for improving the process. Submission of this report shall be the performance standard.</p> <p>In addition, a Biological Monitor will be on site during all initial vegetation removal and will employ salvage methods to minimize direct impacts to common wildlife species. Where feasible, the biological monitor will attempt to ensure wildlife are out of potential direct impact. If a wildlife species is in harm's way and has not moved on its own, the Biologist will attempt to scare them away from the area. If wildlife does not move, and where feasible, the wildlife species will be relocated to suitable habitat.</p>
5.7	<b>Biological Resources</b>	<b>MM 7-4</b> All open space preservation areas adjacent to active construction sites shall be denoted with fencing installed and maintained during construction to ensure that construction activities remain within the development footprint. Construction area temporary signage shall not have holes (or holes shall be covered or filled within the top four inches) to prevent raptor talon entanglement. Construction fencing and signage will be overseen by the Project Biologist.
5.7	<b>Biological Resources</b>	<b>MM 7-5</b> Within the year prior to, and within the appropriate season, focused surveys for the following special status species shall be repeated: arroyo toad, Tehachapi slender salamander, California red-legged frog (concurrent with two-striped garter snake and western pond turtle focused surveys), western spadefoot, mountain plover, southwestern willow flycatcher, and least Bell's vireo. Surveys shall be conducted in accordance with the approved CDFW or U.S. Fish and Wildlife Species (USFWS) protocol for that species.
5.7	<b>Biological Resources</b>	<b>MM 7-6</b> The Project Applicant/Developer shall retain a qualified Biologist with knowledge of California condors to monitor construction activities in the Project area. The resumes of the proposed Biologist(s) will be provided to the CDFW for concurrence. This Biologist(s) will be referred to as the "Authorized Biologist" hereinafter. During clearing and grubbing of construction areas, the Authorized Biologist shall be present at all times. During mass grading, construction sites shall be monitored on a daily basis, and the Authorized Biologist will have the authority to stop all activities until appropriate corrective measures have been completed. If condors are observed landing in the Project area, the Applicant shall avoid further construction within 500 feet of the sighting until the animals have left the area, or as otherwise authorized by CDFW and USFWS. All condor sightings in the Project area will be reported to CDFW and USFWS within 24 hours of the sighting.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>To further protect California condors potentially foraging in the Project area over the long term from negative interactions with humans and/or artificial structures, the Project Applicant/Developer shall remove dead cattle that are found or reported within 1,000 feet of the boundary of a residential or commercial development. Dead cattle shall be relocated to a predetermined location. The locations where carcasses shall be placed shall be a minimum of 1,000 feet from a development area boundary. Appropriate locations for transfer of carcasses include open grasslands and oak/grassland areas where condors can readily detect carcasses and easily land and take off without encountering physical obstacles such as powerlines and other utility structures. The proposed locations would be selected and approved by the CDFW and USFWS. Pursuant to this measure, a telephone number for reporting dead cattle shall be provided and actively maintained. Any cattle carcasses transferred to the relocation areas shall be reported to the USFWS Condor Group.</p> <p>All surfaces on new antennae and phone/utility towers shall be designed and operated with anti-perching devices in conformance with Avian Power Line Interaction Committee standards to deter California condors and other raptors from perching. During construction, the area shall be kept clean of debris (e.g., cable, trash, and construction materials). The Project Applicant/Developer shall collect all microtrash and litter (i.e., anything shiny, such as broken glass), vehicle fluids, and food waste from the Project area on a daily basis. Workers shall be trained on the issue of microtrash: what constitutes microtrash, its potential effects on California condors, and how to avoid the deposition of microtrash.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-7</b> The Project shall incorporate avoidance and additional open space buffer features for this tri-colored blackbird nesting area. Permanent impacts will be restricted to a distance of 400 feet from the nesting area. The nesting area will be delineated by a qualified Ornithologist based on all available data (three years of site-specific data shall be used). Temporary impacts (i.e., construction noise) within 400 feet shall be restricted to the non-breeding season. The breeding season for this species shall be considered April 1 through July 1.</p> <p>The Project shall include enhancement, restoration, and/or preservation of potentially suitable tricolored blackbird breeding and foraging habitat. Potentially suitable areas for enhancement and preservation include lower Oso Canyon in close proximity to Cement Plant Road, as well as any other created water bodies as part of the Project Drainage Plan, where feasible. Enhancement factors shall include the creation of bulrush marsh habitat or other substrate known to support breeding tricolored blackbirds; a persistent nearby standing water during the breeding season; and available adjacent foraging habitat with an appropriate food source.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-8</b> Project construction activities (including, but not limited to, staging and disturbances to native and nonnative vegetation, structures, and substrates) shall occur outside of the avian breeding season, if feasible, which generally runs from February 1–August 31 (as early as January 1 for some raptors) to avoid take of birds or their eggs. “Take” means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture or kill (California Fish and Game Code, Section 86), and includes take of eggs or young resulting from disturbances that cause abandonment of active nests. Depending on the avian species present, a qualified Biologist may determine that a change in the breeding season dates is warranted.</p> <p>If avoidance of the avian breeding season is not feasible, a qualified Biologist with experience in conducting breeding bird surveys shall conduct weekly bird surveys beginning 30 days prior to the initiation of Project activities, to detect protected native birds occurring in suitable nesting habitat that is to be disturbed and (as access to adjacent areas</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>allows) any other such habitat within 500 feet of the disturbance area. The surveys shall continue on a weekly basis with the last survey being conducted no more than three days prior to the initiation of Project activities. If a protected native bird is found, the Project Applicant/Developer shall delay all Project activities within 300 feet of on- and off-site suitable nesting habitat (within 500 feet for suitable raptor nesting habitat) until August 31. Alternatively, the qualified Biologist could continue the surveys in order to locate any nests. If an active nest is located, Project activities within 300 feet of the nest (within 500 feet for raptor nests) or as determined by a qualified Biological Monitor, must be postponed until the nest is vacated; the juveniles have fledged; and there is no evidence of a second attempt at nesting. Flagging, stakes, or construction fencing shall be used to demarcate the inside boundary of the buffer of 300 feet (or 500 feet) between the Project activities and the nest. Project personnel, including all contractors working on site, shall be instructed on the sensitivity of the area. The Project Applicant/Developer shall provide the Department of Regional Planning with the results of the recommended protective measures described above to document compliance with applicable State and federal laws pertaining to the protection of native birds.</p> <p>If the Biological Monitor determines that a narrower buffer between the Project activities and observed active nests is warranted, he/she shall submit a written explanation as to why (e.g., species-specific information; ambient conditions and birds' habituation to them; and the terrain, vegetation, and birds' lines of sight between the Project activities and the nest and foraging areas) to the Department of Regional Planning and, upon request, the CDFW. Based on the submitted information, the Department of Regional Planning (and the CDFW, if the CDFW requests) will determine whether to allow a narrower buffer.</p> <p>The Biological Monitor shall be present on site during all grubbing and clearing of vegetation to ensure that these activities remain within the Project footprint (i.e., outside the demarcated buffer); to ensure that the flagging/stakes/fencing is being maintained; and to minimize the likelihood that active nests are abandoned or fail due to Project activities. The Biological Monitor shall send weekly monitoring reports to the Department of Regional Planning during the grubbing and clearing of vegetation, and shall notify the Department of Regional Planning immediately if Project activities damage active avian nests.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-9</b> A qualified Biologist (retained by the Project Applicant/Developer with selection reviewed by the County) shall conduct a field survey no earlier than 20 days prior to any grading activity that would occur during the breeding season (i.e., April 1 through August 31) of native bat species that potentially utilize the site. This should be done to determine if active roosts of special status bats (such as pallid bat) are present in the applicable habitats on the site (e.g., woodlands). If active roosts are found, construction within 200 feet shall be postponed or halted until the roost is vacated and juveniles are self-sufficient, as determined by the Biologist.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation																																										
5.7	Biological Resources	<p><b>MM 7-10</b> The Project Applicant/Developer shall preserve grasslands, including native perennial grassland and associated wildflower field vegetation types, at a minimum 2:1 ratio within the approximate 27,408-acre mitigation preserve (see Table A). The Project would impact 6,416 acres of grasslands; therefore, a total of 12,832 acres of grassland mitigation acreage is required to bring impacts to a less than significant level.</p> <p style="text-align: center;"><b>TABLE A GRASSLAND MITIGATION ACREAGES</b></p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Mitigation Area</th> <th>Grasslands</th> <th>Total Acreage</th> </tr> </thead> <tbody> <tr> <td colspan="3"><b>On-site Unimpacted/SEA</b></td> </tr> <tr> <td>On-site Unimpacted/SEA</td> <td style="text-align: center;">1,989</td> <td style="text-align: center;">3,861</td> </tr> <tr> <td style="text-align: right;"><i>Subtotal</i> <i>(Total On-Site Mitigation Area)</i></td> <td style="text-align: center;"><i>1,989</i></td> <td style="text-align: center;"><i>3,861</i></td> </tr> <tr> <td colspan="3"><b>Off-Site Open Space</b></td> </tr> <tr> <td>Area 1</td> <td style="text-align: center;">1,641</td> <td style="text-align: center;">6,417</td> </tr> <tr> <td>Area 2</td> <td style="text-align: center;">1,602</td> <td style="text-align: center;">2,556</td> </tr> <tr> <td>Area 3</td> <td style="text-align: center;">3,059</td> <td style="text-align: center;">4,183</td> </tr> <tr> <td>Area 4</td> <td style="text-align: center;">4,429</td> <td style="text-align: center;">7,319</td> </tr> <tr> <td>Area 5</td> <td style="text-align: center;">643</td> <td style="text-align: center;">643</td> </tr> <tr> <td>Area 6</td> <td style="text-align: center;">1,012</td> <td style="text-align: center;">2,429</td> </tr> <tr> <td style="text-align: right;"><i>Subtotal</i> <i>(Total Off-site Mitigation Area)</i></td> <td style="text-align: center;"><i>12,386</i></td> <td style="text-align: center;"><i>23,547</i></td> </tr> <tr> <td style="text-align: center;"><b>Total Mitigation Area</b></td> <td style="text-align: center;"><b>14,375**</b></td> <td style="text-align: center;"><b>27,408</b></td> </tr> <tr> <td colspan="2">SEA: Significant Ecological Area</td> <td>**Goal for 2:1 Grassland Mitigation is 12,832 Acres</td> </tr> </tbody> </table> <p>Mitigation for loss of those areas modeled as native perennial grassland will provide similar habitat quality as that which was lost. The result shall be native perennial grassland and wildflower field values that are equal to or greater than the overall ecological functions and values of those lost as a result of Project implementation. Preservation shall include dedication and long-term management working towards the goal of a self-sustaining system. Long-term management will include focused major problematic non-native species eradication (e.g., feral pigs) where feasible. Preservation will occur on open space lands on the Project site and on other lands within Tejon Ranch.</p>	Mitigation Area	Grasslands	Total Acreage	<b>On-site Unimpacted/SEA</b>			On-site Unimpacted/SEA	1,989	3,861	<i>Subtotal</i> <i>(Total On-Site Mitigation Area)</i>	<i>1,989</i>	<i>3,861</i>	<b>Off-Site Open Space</b>			Area 1	1,641	6,417	Area 2	1,602	2,556	Area 3	3,059	4,183	Area 4	4,429	7,319	Area 5	643	643	Area 6	1,012	2,429	<i>Subtotal</i> <i>(Total Off-site Mitigation Area)</i>	<i>12,386</i>	<i>23,547</i>	<b>Total Mitigation Area</b>	<b>14,375**</b>	<b>27,408</b>	SEA: Significant Ecological Area		**Goal for 2:1 Grassland Mitigation is 12,832 Acres

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>As outlined in Table A above, the 14,375 acres of grassland preservation will occur in open space areas on site and in the six other areas. A full description of these areas is in PDF 7-2. Many of these grassland areas have been part of the expansive grassland studies conducted for the Project over the course of several years. Detailed plot analysis and modeling show the high level of similarity between these preserved grasslands and the grasslands within the Project impact area. In addition, the grasslands are contiguous with other preserved open space in the region and support other important biological functions (e.g., drainages and local wildlife movement pathways). As a result, the preserved grassland is part of a more watershed-level preservation allowing for long-term sustainment and a total value that is greater than the sum of its parts.</p> <p>The preservation phasing through conservation easements shall be based on the percentage of total area of impact per phase of development, regardless of specific resource impacts. The specific location of the acreage to be dedicated within a particular phase will be chosen to maximize the replacement of resource values lost during that phase of construction while maintaining as much contiguous acreage as possible. In order to preserve an adequate quantity of grassland, lands outside the County of Los Angeles, within the County of Kern, would be used for mitigation. As each phase is proposed, a percentage of the mitigation preserve (which is equivalent to the percentage of that phase's impacts) shall be dedicated concurrent with the entitlement approval of that phase.</p> <p>The open space preserve, including the grasslands within it, shall be preserved in perpetuity to offset Project impacts on native grasslands and wildflower fields prior to issuance of a grading permit for the Project site. The phasing of mitigation has been previously described. The Native Perennial Grassland and Wildflower Field Mitigation Plan will sufficiently offset and fully mitigate the impacts on native grasslands and wildflower fields associated with the Project.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-11</b> This measure prescribes mitigation for other special status vegetation types including mixed oak woodland, oak trees, and other riparian and wetland vegetation types. Each of these three vegetation types is discussed separately (native grassland and wildflower fields are addressed in MM 7-10).</p> <p><i>Mixed Oak Woodlands</i></p> <p>The Project Applicant/Developer shall create mixed oak woodlands to achieve resulting vegetation/habitat values. Since there would be approximately 6.2 acres of oak woodland impacts, mitigation will result in the preservation of a minimum of 6.2 acres of mixed oak woodland and creation of a minimum of 6.2 acres of mixed oak woodland, which will include the establishment<sup>3</sup> of 322 oak trees completed as part of oak tree replacement in accordance with the County of Los Angeles oak tree permit requirements (see Oak Trees Section below). Oak trees established in created oak woodlands will be credited towards both oak woodland and oak tree mitigation requirements. If Project impacts are reduced through a reduction in Project disturbance limits in oak woodland areas, required mitigation acreage will be reduced accordingly.</p> <p>In accordance with mitigation options outlined in Section 21083.4 of the <i>California Public Resources Code</i> (PRC), replacement of oak woodlands shall consist of no greater than ½ of the oak woodland mitigation requirement. Therefore, half of the 6.2 oak woodland impact acreage will be mitigated via the alternate option of preservation. The</p>

3 In Biology, “establish”, in this sense, refers to vegetation (including seeds) that has been planted and is becoming a healthy, surviving plant with as much chance to survive as plants that have existed for a long period of time.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>combined acreage of oak woodland preserved both on site (unimpacted/Significant Ecological Area [SEA]) and within the off-site mitigation areas is 3,102 acres and is expected to substantially exceed the required 50 percent of mitigation as preservation.</p> <p>Mitigation through creation is typically implemented on lands with minimal habitat value (e.g., ruderal vegetation, graded slopes) rather than in areas with a substantial component of existing native vegetation. However, evidence of lack of naturally occurring recruitment on site indicates that the existing woodlands are likely to be eventually replaced by non-woodland vegetation. Based on the lack of naturally occurring replacement trees, it is anticipated that oak woodland planting is necessary to sustain the oak woodlands. Therefore, the goal of oak resource mitigation efforts will be to create and enhance oak woodlands. To maximize potential for success, oak woodlands will be created within and adjacent to the same areas where oak woodlands currently exist. This method will create future generations of oak trees and oak woodland on the site in these areas. Details of the oak woodland mitigation program are described below in items 1-10.</p> <ol style="list-style-type: none"> <li>1. To mitigate for impacts to oak woodland and oak trees, site-specific native acorns will be collected. Acorns will be collected within the watershed area of the Project site to ensure that acorns collected are of a similar genetic stock to those existing on the site. Some acorns will be planted and maintained in containers, and others will be stored and planted directly on site within the Oak Mitigation Areas.</li> <li>2. To maximize oak woodland biological values and the potential for long-term success, some locally collected oak acorns will be planted directly into the ground. These acorns will be planted in appropriate locations in the Oak Mitigation Areas. The locations identified for acorn planting will be reviewed by the County Forester.</li> <li>3. Container plants will be propagated and maintained from locally collected acorns. In this way, more established container plants will be available for mitigation efforts, and they will contain the most suitable genetic variability appropriate for the region to increase mitigation success. The preferred method of propagation will include the establishment of a temporary nursery on the Project site. The nursery will include partial shade areas to reduce water loss and a constant water supply to supplement planted trees. Using the acorns collected from within the watershed area of the Project site, container plantings will be cultivated at this location. Development of trees on site will ensure that they are acclimated to the typical weather conditions at their eventual permanent location. If necessary, and in consultation with the County Forester, acorns collected from the site may be stored or propagated and maintained under contract with a reputable native plant nursery off site.</li> <li>4. To provide overstory, midstory, and understory tree/plant coverage, some container plants and oak trees, grown from locally collected acorns, will be installed in addition to the application of native seed mixes. Since studies indicate that the younger the planting is, the more likely the chance is for successful establishment and long term viability<sup>4</sup> locally collected acorns as well as locally collected, nursery-cultivated young oak trees (one-gallon or five-gallon containers of oaks) would be planted on site.</li> <li>5. The Project Applicant/Developer will provide an annual report to the County that will include an accounting of each of the following in the mitigation areas: (a) the number of acorns planted; (b) the number of germinated acorns</li> </ol>

4 Young and Evans 2000

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>(whether planted or natural) protected; (c) the number of new oak trees planted in mitigation areas, including the species of each tree planted; (d) the caliper of each new tree planted and/or protected; (e) the acreage of woodlands created and/or conserved in the mitigation areas.</p> <p>6. Creation of structurally diverse oak woodland habitat within and contiguous to existing oak woodlands will be accomplished by planting locally collected oak acorns, plus yearly sowings of additional locally collected acorns, as well as, temporary irrigation, weed abatement, pest deterrence, and/or other maintenance tasks as needed to facilitate oak seedling germination and survival.</p> <p>7. Prior to Project grading, locally collected acorns will be planted and grown. Once trees reach a diameter of one inch just above ground surface (i.e., basal height) within the Oak Tree/Oak Woodland Mitigation Areas, they will be appropriated as “mitigation trees” to be used for oak woodland and oak tree permit mitigation purposes with approval from the County Forester as part of the oak woodland and oak tree permit mitigation process and will be credited as a mitigation tree if the tree is determined to be healthy by the Los Angeles County Forester at the end of the monitoring period.</p> <p>8. The required 12.4 acres of mixed oak woodland creation will occur within 473 acres of existing oak woodland (primary area) and 716 acres of adjacent low quality non-native grassland (secondary area, if needed) on the western portion of the Project site. Additional suitable areas may also be identified within reduced grading footprints following final detailed tract map production to the satisfaction of the County Forester. Mitigation planting areas will be refined within the proposed mitigation areas through a multi-variable query of existing Geographical Information System (GIS) data sets, and intensive field analysis to precisely identify suitable planting locations (e.g., localized soil types, microtopography). Created oak woodlands will have an approximate average density of 80 appropriately sized oak trees per acre at the end of the monitoring period (or other density as directed by the County Forester), while staying within the mitigation areas. The contiguity of the created woodland habitat within or adjacent to existing oak woodlands will be ecologically beneficial, and will also improve the logistics of restoration installation, maintenance, and monitoring, compared to a fragmented habitat creation program. These methods will help to ensure the success of created oak woodlands to replace the existing woodlands over time.</p> <p>9. In order to implement the creation of habitat on the site and to ensure the persistence of the overall biological functions and values over time, the Project Applicant/Developer shall submit an Oak Woodland Habitat Mitigation Plan to the County for approval prior to the issuance of a grading permit for each tract map or combination of tract maps. The mitigation approach described in the Plan shall comply with Section 21083.4 of the <i>California Public Resources Code</i> (PRC), which was enacted by California Senate Bill (SB) 1334. County approval of the Plan shall be required prior to the initiation of any clearing or grading on the site that affects any oak woodland vegetation. The Oak Woodland Habitat Mitigation Plan shall be developed by a qualified Restoration Specialist, to be retained by the Project Applicant/Developer, and shall be subject to County approval. The objective of the Oak Woodland Habitat Mitigation Plan will be to preserve 6.2 acres of existing oak woodland and to create 6.2 acres of oak woodland. The Oak Woodland Habitat Mitigation Plan serves the purpose of satisfying the conditions of Section 21083.4 of the <i>California Public Resources Code</i>.</p> <p>10. Implementation of the Oak Woodland Mitigation Plan will be the responsibility of the Project Applicant/Developer or its designated party; the Plan shall specify, the following:</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>a. <b>Personnel:</b> The responsibilities and qualifications of personnel required to implement and supervise the plan will be specified. The responsibilities of the Landowner, County staff, Specialists, and Maintenance Personnel that will supervise and implement the plan will also be included.</p> <p>b. <b>Site Selection:</b> The mitigation site(s) will be determined in coordination with the Project Applicant/Developer and the County. The site(s) will be located in open space areas that will be managed in perpetuity through a conservation easement, open space dedication, performance bond, management at the Tejon Ranch Conservancy, or other method approved by the County.</p> <p>c. <b>Native Species Seed Collection, Site Preparation, and Planting Implementation:</b> Under the supervision of the County Forester, site preparation will include (i) protection of existing native species; (ii) trash and weed removal; (iii) native species salvage and reuse (i.e., duff); (iv) soil treatments (i.e., imprinting, and/or decompacting); (v) erosion-control measures (i.e., rice or willow wattles); (vi) native seed mix application; and (vii) procedures for native seed collection from the site, including acorns of native oak species.</p> <p>d. <b>Schedule:</b> Restoration/revegetation sites will be established between October 1 and January 30. Seeding and planting of container plants will take place immediately after preparation of the mitigation sites and will take place under the supervision of the County Forester.</p> <p>e. <b>Maintenance Plan and Guidelines:</b> The Maintenance Plan, to be approved by the County, will include (i) weed control; (ii) herbivory control (e.g., feral pigs); (iii) trash removal; (iv) irrigation system maintenance; (v) maintenance training; (vi) replacement planting; and (vii) a vehicle washing program to capture invasive propagules. The Maintenance Plan will also indicate who is responsible for each of these listed tasks.</p> <p>f. <b>Monitoring Plan:</b> The monitoring plan, to be approved by the County, will include (i) qualitative monitoring (i.e., photographs and general observations); (ii) yearly quantitative monitoring (i.e., randomly placed transects to assess vegetation type coverage and systematically assess all mitigation oak trees); (iii) performance criteria as approved by the County; and (iv) annual reports that will be submitted to the County for five consecutive years after initial planting (or longer if the County requires) and following plan approval.</p> <p>g. <b>Long-Term Preservation:</b> Long-term preservation of the mitigation site(s) will be outlined in the Restoration Plan to ensure that they are not impacted by future development. An open space dedication, conservation easement, performance bond, management by the Tejon Ranch Conservancy, or other County-approved method will be used to ensure long-term preservation.</p> <p>h. <b>Growth/Vegetation Standards:</b> Growth/vegetation standards will be developed by a qualified Biologist in accordance with County and regulatory agency requirements.</p> <p><i>Oak Trees</i></p> <p>The mitigation approach for replacing lost oak trees shall comply with the County of Los Angeles Oak Tree Ordinance (CLAOTO) requirements. The goal of this program is to replace impacted oak trees at a ratio of 3:1 for non-heritage oaks and 10:1 for heritage oaks in accordance with the County's oak tree permit requirements. This would result in the</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>establishment of 322 oak trees. However, if Project impacts are reduced through a reduction in Project disturbance limits within oak woodland areas, required tree numbers will be reduced accordingly.</p> <p>Mitigation trees are typically planted on lands with minimal habitat value (e.g., ruderal vegetation, graded slopes) rather than in areas with a substantial component of existing native vegetation. To maximize potential for success, oak trees will be planted in the same areas where oak woodlands currently exist. This method will create future generations of oak trees and oak woodland on the site in these areas and will be done as described in Numbers 1-10 under the "Mixed Oak Woodlands" portion above. Additionally, quantitative tree monitoring data for all mitigation trees (whether for County of Los Angeles Oak Tree Ordinance [CLAOTO] mitigation or oak woodland mitigation) will be submitted to the County Forester yearly and, for convenience, will be included as an appendix to the annual report required in 10(f)(ii) above.</p> <p><i>Other Riparian and Wetland</i></p> <p>In addition, the Project Applicant/Developer shall create, enhance, and/or restore all impacted riparian and wetland vegetation types that are not considered jurisdictional by permitting resource agencies (i.e., those not mitigated through regulatory permit conditions) at a 1:1 ratio. This applies to areas mapped as alluvial scrub; riparian herb; rush riparian grassland; southern arroyo willow riparian; southern willow scrub; unvegetated wash; willow riparian forest; willow riparian woodland; alkali meadow; Baltic rush; and seeps and ephemeral ponds. These areas shall be included in the Streambed and Wetland Habitat Creation and Enhancement Plan discussed in MM 7-12, which shall be approved by the County prior to issuance of grading permits.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-12</b> Prior to any fill of or alteration to drainage tributaries, wetlands, and/or riparian vegetation on the Project site, the Project Applicant/Developer shall obtain the appropriate regulatory agency permits and/or agreements from the U.S. Army Corps of Engineers (USACE), the California Department of Fish and Wildlife (CDFW), and the applicable Regional Water Quality Control Board (RWQCB). The Project Applicant/Developer shall comply with all mitigation measures specified in the regulatory agency permits and/or agreements. Pursuant to the permit requirements, the Project Applicant/Developer will develop a Storm Water Pollution Prevention Plan (SWPPP) that incorporates Best Management Practices (BMPs) for reducing or eliminating construction-related pollutants in the site runoff.</p> <p>The Project is subject to the following Mitigation Performance Standards: As anticipated to be required by USACE, CDFW, and Regional Water Quality Control Board (RWQCB) regulatory permits, the Project Applicant/Developer shall create, enhance, and/or restore acreage to ensure that net habitat values are at least equal to those lost from Project implementation. Mitigation ratios are typically specified in the regulatory permits. However, if mitigation is conducted prior to impacts taking place, mitigation ratios can be pro-rated; this type of mitigation pro-rating allows time to evaluate if created, enhanced, and/or restored habitat values are at least equal to those that will eventually be lost from Project implementation. Under this scenario, it can be verified that the restoration/creation goals have been accomplished or are proceeding satisfactorily.</p> <p>The extent of drainages and wetlands that would be preserved under the Project will provide opportunities to expand and enhance the drainages, wetlands, and riparian vegetation on the Project site.</p> <p>As discussed previously, a wetland functional assessment of the drainages and other aquatic features in the Project site was conducted by Glenn Lukos Associates in 2006 and 2009 in order to characterize and evaluate the functions of the</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>site’s drainages and riparian habitats (GLA 2009a). An update to that functional assessment was conducted in 2015 (BonTerra Psomas 2015a). Overall, aquatic resources on the site were evaluated in terms of Functional Capacity Units (FCU), which indicate more specifically the mitigation level necessary to restore riparian functions after Project implementation by providing a measure of the ability of a wetland area to perform typical wetland functions.</p> <p>The purpose of the mitigation is to replace lost habitat value, as measured in FCU rather than based on a standard acreage ratio. Mitigation will include a combination of on-site and off-site preservation of jurisdictional resources; on-site and off-site enhancement/restoration of preserved jurisdictional resources in order to increase overall functional capacity; and the creation (expansion) of riparian/wetland habitats along degraded drainages, including Oso Creek and two of its tributaries in addition to the three other drainages (including the main drainage located along and immediately north of State Route [SR] 138).</p> <p>The direct and indirect loss in on-site functional units will be mitigated through passive enhancement of open space areas, active enhancement of 6.5 acres of wetland, and creation of approximately 78.4 acres of wetland/riparian habitat (GLA 2009a). Following implementation of mitigation, the Project provides approximately 4,748.5 FCUs. Therefore, the proposed mitigation will result in a functional gain of 327.5 FCUs, thereby ensuring a net increase in functionality in the post-Project condition (GLA 2009a). In summary, implementation of the proposed jurisdictional resource mitigation will actually result in a net gain in the measurable functional capacity and therefore, the habitat values, of the on-site and off-site drainages and other aquatic features.<sup>5</sup></p> <p>To implement the creation/restoration/enhancement of streambed/wetland habitats on the site, the Project Applicant/Developer shall develop a Streambed and Wetland Habitat Creation and Enhancement Plan commensurate with regulatory agency permits and/or agreements. The purpose of this plan is to demonstrate the feasibility of creating the required mitigation acreage and to ensure that the overall biological functions and values are increased. The plan shall be developed by a qualified Restoration Specialist and shall be submitted to the County for approval. The Streambed and Wetland Habitat Creation and Enhancement Plan shall specify the following:</p> <ol style="list-style-type: none"> <li>a. <b>Personnel:</b> Responsibilities and qualifications of the personnel required to implement and supervise the plan will be specified. The responsibilities of the Landowner, Specialists, and Maintenance Personnel that will supervise and implement the plan will also be included.</li> <li>b. <b>Site Selection:</b> The sites for mitigation will be determined through coordination between the Project Applicant/Developer, the USACE, the CDFW, the applicable RWQCB, and the County.</li> <li>c. <b>Site Preparation and Planting Implementation:</b> Site preparation will include: (1) protection of existing native species; (2) trash and weed removal; (3) native species salvage and reuse (i.e., duff); (4) soil treatments (i.e., imprinting and/or decompacting); (5) erosion-control measures (i.e., rice or willow wattles); (6) seed mix application and quantities; and (7) procedures for seed collection from existing habitat on the site.</li> <li>d. <b>Schedule:</b> Establishment of restoration/revegetation sites will be conducted between October 1 and January 30. Seeding and planting of container plants will take place immediately after preparation of the restoration sites.</li> </ol>

5 For information about the functional values of the impacted jurisdictional resources and proposed mitigation areas, see GLA 2009b in Appendix 5.7-B.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>e. <b>Maintenance Plan/Guidelines:</b> The maintenance plan will include (1) weed control; (2) herbivory control; (3) trash removal; (4) irrigation system maintenance; (5) maintenance training; (6) replacement planting; and (7) vehicle washing program to capture invasive propagules.</p> <p>f. <b>Monitoring Plan:</b> The monitoring plan will include (1) qualitative monitoring (i.e., photographs and general observations); (2) quantitative monitoring (i.e., randomly placed transects); (3) performance criteria, as approved by the USACE, the CDFW, and the applicable RWQCB; (4) biannual reports (i.e., two reports the first year) for the first year will be submitted to the USACE, the CDFW, the applicable RWQCB; and (5) annual reports, which will be submitted to all three agencies and the County for an additional four years after initial planting. The monitoring is planned for five years, but may be shorter or longer depending upon the performance of the mitigation sites.</p> <p>g. <b>Long-Term Preservation:</b> Long-term preservation of the mitigation sites will be outlined in the mitigation plan to ensure that they are not impacted by future development. An open space dedication, conservation easement, performance bond, management by the Tejon Ranch Conservancy, or other County-approved method will be used to ensure long-term preservation.</p> <p>h. <b>Performance Standards:</b> These will be developed by conducting a biological functions and values assessment (using an accepted method such as Hydrogeomorphic Modeling [HGM]) to establish a baseline for the overall biological value of the affected streambeds and riparian areas on the site. Revegetation will be considered successful at five years if the percent cover and species diversity of the restored and/or created habitat areas are similar to percent cover and species diversity of adjacent existing habitats, as determined by quantitative testing of existing, restored, and created habitat areas. Contingency measures shall also be described in the event that mitigation efforts are not successful.</p> <p>i. <b>Cattle Exclusion Methods:</b> Measures to exclude cattle from habitat creation areas and enhancement areas (where applicable) shall be identified and described.</p> <p>j. <b>Funding:</b> The funding source(s) for all proposed mitigation actions shall be identified.</p> <p>The Streambed and Wetland Habitat Creation and Enhancement Plan shall be subject to approval by the County, the USACE, the CDFW, and the applicable RWQCB for impacts within the respective jurisdictional areas of these agencies. If pro-rated mitigation ratios are used, it shall be demonstrated that the mitigation performance standards have been accomplished. The accomplishment shall be verified by the USACE, the CDFW, and the applicable RWQCB based on the performance standards established above prior to the County's issuance of a grading permit. Implementation of these mitigation measures may serve the dual purpose of satisfying the conditions (or a portion of the conditions) of the agreements/permits of the USACE, the CDFW, and the applicable RWQCB.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-13</b> The Project Applicant/Developer shall develop a Landscaping Plan for review and approval by the County Biologist, which includes a plant palette composed of non-invasive species that are adapted to the conditions found on the Project site and do not require high irrigation rates. The Landscaping Plan will also include a list of invasive plant species prohibited from being planted on the Project site. In addition, retail sales of these invasive plant species will be prohibited at any businesses (nurseries) located within the Project site. Landscape plans shall encourage planting of local natives typical of native vegetation within ten miles of the Project site.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>The Homeowners Association shall supply future residents of the Project site with the list of invasive plant species from the Landscaping Plan that will be prohibited from being planted on the Project site and educational materials that emphasize the importance of adhering to the list. A list of local native plants shall be provided to homeowners.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-14</b> The designated SR-138 underpass shall be located where the highway crosses the Project's western border near the current intersection with Cement Plant Road. The width of the underpass shall be 100 feet and shall flare out on both sides of the highway to a 150-foot width in the Project open space adjacent to the highway. These specifications are expected to allow some local wildlife to safely pass between open space areas on opposite sides of the highway.</p> <p>In addition, a 50-foot open space buffer will be incorporated on the eastern and western sides of Cement Plant Road; this buffer shall be from the southern side of the bridge that spans the California Aqueduct to the nearest open space polygon that meets the property edge. The undeveloped 50-foot buffer shall run parallel with the Aqueduct along its southern bank. This buffer may be temporarily disturbed during construction, but shall be retained as greenspace to increase connectivity for local wildlife between open space areas and potential Aqueduct crossing locations.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-15</b> Waste and recycling receptacles that discourage foraging by wildlife species adapted to urban environments shall be installed by the Project Applicant/Developer in common areas (i.e., any area where public trash receptacles would be placed, such as parks, sidewalks, community centers, and walking trails) throughout the Project site. Documentation of the completion of this measure shall be submitted to the County prior to occupation of housing units.</p> <p>The Homeowners Association shall supply an educational pamphlet to future residents of the Project site regarding: the importance of not feeding wildlife; information stating that trash (containing food) and microtrash that could potentially attract condors should not be accessible to wildlife; the necessity of keeping the ground free of fallen fruit from trees; and instructions about not leaving pet food outside.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-16</b> All landscaping materials (including organic mulches) for common/public areas (i.e., parks and intervening unpaved areas which are not a part of any homeowner's parcel) shall be inspected and certified by landscape suppliers as being "free" of Argentine ants prior to planting. Additionally, container plants and other landscaping materials to be installed within common/public areas within 200 feet of the open space areas shall be inspected by a qualified restoration specialist for the presence of Argentine ants. Plants or other materials with Argentine ants shall be rejected.</p> <p>Upon initiating landscaping within a development area, quarterly monitoring shall be initiated for Argentine ants along the development/construction-open space interface at sentinel locations where invasions could occur (e.g., where moist microhabitats that attract Argentine ants may be created). A qualified biologist shall determine the monitoring locations. Ant pitfall traps will be placed in these sentinel locations and operated on a quarterly basis to detect invasion by Argentine ants. If Argentine ants are detected during monitoring, direct control measures will be implemented immediately to help prevent the invasion from worsening.</p> <p>These direct controls may include but are not limited to nest/mound insecticide treatment, or available natural control methods being developed. A general reconnaissance of the infested area would also be conducted to identify and correct the possible source of the invasion, such as uncontrolled urban runoff, leaking pipes, or collected water. Each site visit shall be followed up with a summary monitoring report sent electronically to Applicant indicating the status of the site. Monthly monitoring reports, as needed, shall be submitted to CDFG and the County of Los Angeles).</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>Monitoring reports shall include remedial recommendations and issue resolution discussions when necessary. Monitoring and control of Argentine ants would occur for a 5-year period. After the first 5 years, the Homeowners Association or other entity will be responsible for controlling Argentine ants. Additionally, to further guard against Argentine ants, the Homeowners Association shall discourage irrigated landscape planting through distribution of educational information and other feasible methods to reduce the potential for importing Argentine ants.</p> <p>To preclude the invasion of Argentine ants into preserved populations of round leaved filaree and crownscale and their associated buffers, controls will be implemented using an integrated pest management (IPM) approach. The controls include (1) Providing "dry zones" between development and round leaved filaree and crownscale populations, where typical soil moistures are maintained at levels below about 10% soil saturation, which will deter the establishment of nesting colonies of ants; and providing dry zone buffers of sufficient width to reduce the potential for Argentine ant activity within core habitat areas; (2) Where feasible, and/or appropriate, dry areas such as parking lots and roadways shall be built adjacent to the boundaries of these populations; (3) designing adjacent areas to slope away from the preserved populations to avoid runoff entering the area; (4) Pedestrian pathways placed next to preserve populations shall consist of decomposed granite or other gravel to minimize the holding of moisture, thereby preventing establishment of suitable habitat for Argentine ant colonies; (5) Ensuring that landscape container plants installed within 200 feet of preserved populations are ant free prior to installation to reduce the chance of colonies establishing in areas close to the preserved populations; (6) Maintaining natural hydrological conditions in the preserved populations areas, including the buffers, through project design features for roadways, French drains, irrigation systems, underground utilities, drainage pipes and fencing, storm drains, and any other BMP measures that apply to surface water entering the preserved populations areas; (7) Using drought resistant plants in fuel modification zones and minimizing irrigation to the extent feasible.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-17</b> The Project Applicant/Developer shall implement a public awareness program (prior to the first occupancy permit) in an effort to restrict public access to the riparian and open space areas on the Project site to designated trails and to prevent unleashed domestic animals from entering these areas. This program shall include signs that identify the boundaries of ecologically sensitive areas; the use of temporary fencing around sensitive areas that appear to be receiving a high level of disturbance until the disturbance is reversed; and promotion of public education and awareness of such areas. The Project Applicant/Developer shall be responsible for the initial development of the public awareness program and installation of interpretive signs and fencing. The Homeowners Association, the Project Applicant/Developer, or an acceptable Land Manager/Agency (as approved by the County) shall be responsible for maintaining this program, including signs and fencing.</p> <p>Only passive recreational activities shall be permitted within the designated natural open space areas and shall be restricted to trails. Some areas may allow slightly greater impacts if designated as picnic and/or camping areas.</p> <p>All dogs shall be required to be leashed while in the designated natural open space areas. In addition, all dogs and cats shall be required to be neutered or spayed; all dogs shall be required to have a microchip; and potential owners shall show evidence prior to entry into the Centennial Development, as required by Los Angeles County Code (Section 10.20.350).</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.7	<b>Biological Resources</b>	<p><b>MM 7-18</b> Common area landscaping and restoration methods shall follow protocols to reduce the potential for the introduction of pathogens and pests into the Project site and to reduce the spread of pathogens and pests outside the Project site (should they inadvertently be introduced). Protocols for reducing the potential for introduction of pathogens and pests into the site via plant foliage/soil from nurseries supplying the material shall include the following anti-contamination procedures: sanitizing all containers, tools, and footwear (boots, pots, clippers, soil scoops, shovels) in soil potting areas; sanitizing all transplanting and prep tables; sanitizing plant storage locations (e.g., benches); sanitizing plant transportation devices (e.g., carts); sanitizing floor surfaces where plants are stored on a regular basis; and using anti-splash watering methods for particularly susceptible plant species. Field installation crews shall sanitize all tools and footwear during landscaping and restoration activities prior to using them or entering the site and shall install plants in a way that minimizes conditions that support pathogens and pests (e.g., minimizing standing water). All plant materials brought onto the site will be inspected by landscape/restoration personnel familiar with signs of pathogen and pest infestation. Should pathogens or pests be detected, the infected material shall be bagged, secured, and disposed of off-site to a contained location. Long-term control methods shall include monitoring to examine vegetation and surrounding areas for pests to evaluate trends and to identify when controls are needed; establishing action thresholds that trigger control actions; and implementing pest control methods—cultural, mechanical, environmental, and biological—and appropriate pesticides.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-19</b> Prior to vegetation clearing or grading, additional surveys shall be performed to confirm that all oak trees within the impact and buffer areas are recorded. The Project Applicant/Developer will be required to comply with all mitigation measures stipulated in the County-issued Oak Tree Permit pursuant to the County of Los Angeles Oak Tree Ordinance (CLAOTO) and the <i>County of Los Angeles Oak Woodlands Conservation Management Plan</i> (OWCMP). Trees would be planted pursuant to the Oak Woodland Restoration Plan discussed in MM 7-11.</p>
5.7	<b>Biological Resources</b>	<p><b>MM 7-20</b> All oak tree driplines within 50 feet of land clearing (including brush clearing) or areas to be graded shall be enclosed with temporary fencing for the duration of the clearing or grading activities. Fencing shall extend to the root protection zone (RPZ) (that area at least 15 feet from the trunk or half again as large as the distance from the trunk to the dripline, whichever is greater). No parking or storage of equipment, solvents, or chemicals that could adversely affect the trees shall be allowed within 25 feet of the trunk at any time. Fence removal shall occur only after the Project Biologist confirms the health of preserved trees.</p> <p>All upslope grading and drainage shall be engineered to minimize resultant erosion, soil compaction, or drainage into preserved oak tree areas. Whenever possible, utilities shall be designed to avoid crossing under the canopies of preserved trees unless the utilities are installed by drilling under the root zones (where feasible) in order to avoid impacts associated with cutting roots. Feasibility of drilling under trees will be based on soil conditions. Utilities will be clustered whenever possible to lessen impacts to oak RPZs.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.7	<b>Biological Resources</b>	<b>MM 7-21</b> In order to ensure that no direct impacts to Significant Ecological Area (SEA) 17 occur, brush clearance zones shall be contained within the current Project impact boundary and no overlap with the adjacent SEA 17 shall occur. Vegetation management for fire abatement purposes is not authorized in SEA areas. An Implementation Plan, including fire risk abatement measures (including but not limited to vegetation management) required to comply with State and County fire prevention and response legal requirements, shall be submitted as part of the tentative tract map for portions of the Project site that border an SEA or mitigation preserve area. The Plan shall include this prohibition on vegetation clearance within these biologically sensitive areas.
5.7	<b>Biological Resources</b>	<b>MM 7-22</b> If a golf course is developed as part of Project implementation, the Project Applicant/Developer shall prepare a Golf Course Management Plan that requires any golf course developed on the site to be built and managed in accordance with the Audubon Cooperative Sanctuary Program for Golf Courses (or equivalent), which is a cooperative effort between the United States Golf Association and Audubon International that is designed to promote ecologically sound land management and to conserve natural resources.
5.10	<b>Traffic, Access and Circulation</b>	<b>MM 10-1</b> The Project shall provide internet infrastructure and a community intranet with access for homeowners associations; interest groups; local event scheduling; schools, library, carpool and transit services; and other on-site entertainment and amenities for residential land uses. The internet and intranet will reduce the need for people to use automobile travel to obtain the information that is provided by both. The intranet shall also provide education about greenhouse gas (GHG) emissions; GHG reduction opportunities; energy and water conservation opportunities; financial incentives (e.g., rebates and low-interest loans) for energy-efficiency improvements; and energy-efficiency technology systems, including those suitable for large commercial and industrial users.
5.10	<b>Traffic, Access and Circulation</b>	<b>MM 10-2</b> The Project Applicant/Developer shall submit a traffic study that addresses site access and local circulation in accordance with the County of Los Angeles Department of Public Works Traffic Impact Analysis Report Guidelines. The Project Applicant/Developer shall retain a Traffic Engineer or Civil Engineer licensed in the State of California to perform the traffic study to the satisfaction of the County.
5.10	<b>Traffic, Access and Circulation</b>	<b>MM 10-3</b> The Project Applicant/Developer shall seek to enter into a Centennial Transportation Improvement Program (CTIP) for Land Development Impacts to California State Transportation Facilities with Caltrans and shall comply with the terms the CTIP agreement if approved and implemented. Compliance with the CTIP shall constitute compliance with the mitigation measures for the Project's traffic impacts on the State highway system. Any required improvements that result from direct Project impacts (i.e. not from cumulative impacts), and are required on Caltrans-owned facilities, shall be implemented through a CTIP. Any required improvements that result from cumulative traffic impacts may be implemented through payment of fair share fees.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.10	Traffic, Access and Circulation	<p><b>MM 10-4</b> The Project Applicant/Developer will work with the County and/or Caltrans to establish a Traffic Mitigation Fee Program or an assessment district (an example of such is the Bridge and Thoroughfare District pursuant to <i>California Government Code</i>, Sections 66484 et seq.) or other equivalent program. Such a program or assessment district will mitigate vehicular trips related to new development accessing the SR-138 corridor between I-5 and SR-14 by establishing a fair share contribution from such new development to ensure the SR-138 needed improvements are fully funded. These fees shall be used for the needed improvements and may include the cost of engineering, soils analysis, right-of-way acquisition, demolition, relocation, construction, inspection, and other related expenses.</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-5</b> The Project Applicant/Developer shall submit Traffic Management Plans to the County for review and approval. The Traffic Management Plans shall describe traffic-control measures that shall be implemented to maintain traffic flow in all directions, including where utilities and other improvements are being implemented in existing roadways. The Traffic Management Plans shall identify the following: construction haul routes; duration and location of lane closures; location of parking for the public and construction workers during construction phases; use of flag persons; and any pedestrian-related impacts to sidewalks and intersection crossings. The Traffic Management Plan shall be implemented during all stages of Project construction that generate traffic impacts.</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-6</b> (<i>Traffic Study MM-1</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP to improve SR-138 to a four lane expressway from I-5 to 190th Street West, with right-of-way reserved for a six-lane expressway between I-5 and 300th Street West, or comparable improvements consistent with the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-7</b> (<i>Traffic Study MM-2</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at Specific Plan Westerly Access and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from westerly project entrance to 290<sup>th</sup> Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.</li> <li>• Construct intersection to include: two NB left-turn lanes, three NB through lanes and one NB right-turn lane.</li> <li>• In the SB direction, construct two left turn lanes, three through lanes and one free-flow right-turn lane.</li> <li>• In the EB direction, construct three left-turn lanes and one right-turn lane.</li> <li>• In the WB direction, construct two left-turn lanes and a free-flow right-turn lane.</li> <li>• Install traffic signal.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.10	Traffic, Access and Circulation	<p><b>MM 10-8</b> (<i>Traffic Study MM-3</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at Specific Plan Central Access and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from westerly project entrance to 290<sup>th</sup> Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.</li> <li>• In the NB and SB directions, construct two left-turn lanes, three through lanes and one right-turn lane.</li> <li>• In the EB direction, construct two left-turn lanes and one right-turn lane.</li> <li>• In the WB direction, construct two left-turn lanes and a free-flow right-turn lane.</li> <li>• Install traffic signal and include SB and NB right-turn overlap phasing.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-9</b> (<i>Traffic Study MM-4</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 300<sup>th</sup> Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from westerly project entrance to 290<sup>th</sup> Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.</li> <li>• Construct two left-turn lanes and one right-turn lane in the EB direction and two left-turn lanes and dual right-turn lanes in the WB direction.</li> <li>• In the NB direction, construct two left-turn lanes, three through lanes, and one right-turn lane.</li> <li>• In the SB direction, construct two left turn lanes, three through lanes and one free-flow right-turn lane.</li> <li>• Install traffic signal and include WB right-turn overlap phasing.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-10</b> (<i>Traffic Study MM-5</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 290<sup>th</sup> Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from westerly project entrance to 290<sup>th</sup> Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.</li> <li>• Additional intersection improvements include: two EB left turn lanes, one WB right-turn lane, two SB left turn and two SB right-turn lanes.</li> <li>• Install traffic signal.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.10	Traffic, Access and Circulation	<p><b>MM 10-11</b> (<i>Traffic Study MM-6</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at Margalo Drive and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from 290<sup>th</sup> Street West to 190<sup>th</sup> Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.</li> <li>• Additional intersection improvements include: one EB left turn lane and one WB right-turn lane.</li> <li>• Install traffic signal.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-12</b> (<i>Traffic Study MM-7</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at Three Points and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from 290<sup>th</sup> Street West to 190<sup>th</sup> Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.</li> <li>• Additional improvements include adding one NB left-turn lane and one SB left turn lane.</li> </ul> <p>Or contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-13</b> (<i>Traffic Study MM-8</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 245<sup>th</sup> Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from 290<sup>th</sup> Street West to 190<sup>th</sup> Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.</li> <li>• Additional improvements include adding one NB left-turn lane and one SB left turn lane and one dedicated EB right-turn lane.</li> <li>• Install traffic signal.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-14</b> (<i>Traffic Study MM-9</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 230<sup>th</sup> Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from 290<sup>th</sup> Street West to 190<sup>th</sup> Street West.</li> <li>• Additional improvements include one SB left-turn lane, one SB right-turn lane and one EB left-turn lane.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.10	Traffic, Access and Circulation	<p><b>MM 10-15</b> (<i>Traffic Study MM-10</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 190<sup>th</sup> Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Widen SR-138 to a four-lane highway from 290<sup>th</sup> Street West to 190<sup>th</sup> Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.</li> <li>• Additional improvements include adding one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left turn lane and one dedicated EB right-turn lane.</li> <li>• Install traffic signal.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-16</b> (<i>Traffic Study MM-11</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 170<sup>th</sup> Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.</li> <li>• Additional improvements include one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-17</b> (<i>Traffic Study MM-12</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 110<sup>th</sup> Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.</li> <li>• Additional improvements include: one EB left-turn lane, one WB left-turn lane, two NB left-turn lanes, one SB left-turn lane and two SB right-turn lanes.</li> <li>• Install traffic signal.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-18</b> (<i>Traffic Study MM-13</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 90<sup>th</sup> Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.</li> <li>• Additional improvements include: one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane.</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-19</b> (<i>Traffic Study MM-14</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 60th Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.</li> <li>• Additional improvements include: one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane.</li> <li>• Install traffic signal.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-20</b> (<i>Traffic Study MM-15</i>) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 30th Street West and SR-138:</p> <ul style="list-style-type: none"> <li>• Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.</li> <li>• Additional improvements include adding one EB left-turn lane and one WB left-turn lane.</li> </ul> <p>Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-21</b> (<i>Traffic Study MM-16</i>) To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:</p> <ul style="list-style-type: none"> <li>• Addition of one auxiliary lane at the connector ramp from westbound SR-138 to southbound I-5 for existing plus Project conditions.</li> </ul>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-22</b> (<i>Traffic Study MM-17 and MM-34</i>) To provide adequate capacity at The Old Road at I-5 SB Ramps/Sedona intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the addition of a second southbound left-turn lane from The Old Road to the I-5 Southbound On-Ramp.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.10	Traffic, Access and Circulation	<p><b>MM 10-23</b> (<i>Traffic Study MM-18</i>) To mitigate the increase of side-street delay for the existing adjacent off-site areas and for planned on-site side streets along SR-138, the Project Applicant/Developer shall either (1) comply with the terms of the Centennial Transportation Improvement Program (CTIP) or (2) dedicate right-of-way within the project site at each site access location to accommodate the ultimate intersection or interchange configuration to be determined by the Northwest Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative) at the following SR-138 intersections:</p> <ul style="list-style-type: none"> <li>• Westerly Access</li> <li>• Central Access</li> <li>• 300<sup>th</sup> Street West</li> <li>• 290<sup>th</sup> Street West</li> </ul>
5.10	Traffic, Access and Circulation	<p><b>MM 10-24</b> (<i>Traffic Study MM-19</i>) To provide adequate on- and off-site capacity, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the widening of SR-138, including:</p> <ul style="list-style-type: none"> <li>• Addition of an auxiliary lane in each direction (six lanes total) from I-5 to 300<sup>th</sup> Street West</li> </ul>
5.10	Traffic, Access and Circulation	<p><b>MM 10-25</b> (<i>Traffic Study MM-20</i>) To provide adequate on- and off-site capacity, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the widening of SR-138, including:</p> <ul style="list-style-type: none"> <li>• Addition of an auxiliary lane in each direction (six lanes total) from 300<sup>th</sup> Street West to 245<sup>th</sup> Street West</li> </ul>
5.10	Traffic, Access and Circulation	<p><b>MM 10-26</b> (<i>Traffic Study MM-21 and MM-26</i>) To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding towards RTP/SCS improvement projects on SR-58 between I-5 in Kern County and I-15 in San Bernardino County, as verified by the County in consultation with the Kern COG and Caltrans. Improvements could include development of a high capacity goods movement facility along the SR-58 and/or E-220 corridors.</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-27</b> (<i>Traffic Study MM-22</i>) To provide adequate capacity on SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for the SR-138 improvements to a limited access facility with grade-separated interchanges, consistent with the County's analysis of the AVAP, or fair share participation and/or contribution to the SR-138 improvements (freeway/expressway or expressway/limited access conventional highway) being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).</p>
5.10	Traffic, Access and Circulation	<p><b>MM 10-28</b> (<i>Traffic Study MM-23</i>) To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding towards the following planned improvements to I-5:</p> <ul style="list-style-type: none"> <li>• I-5 between Fort Tejon and Grapevine Road and between SR-138 and Lake Hughes Road interchanges: Strengthening and widening the inside and outside shoulders of I-5.</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-29</b> (<i>Traffic Study MM-24</i>) The Project Applicant/Developer shall implement the Mobility Plan, included as Section 3.2 of the Specific Plan, which provides an extensive system of sidewalks, greenway trails, community trails, and two transit hubs to serve as alternative means of transportation on the Project site. The Mobility Plan also requires creation and ongoing operation of a Transportation Management Association (TMA) to implement ongoing transportation improvements and programs.</p> <p>The Project Applicant/Developer, through the required implementation of the Mobility Plan, shall:</p> <ul style="list-style-type: none"> <li>• Reinforce and serve the Land Use Plan;</li> <li>• Provide residents and employees with multiple modes of accessibility for internal and external trips by future residents and visitors;</li> <li>• Provide options to reduce vehicle trips and emissions by linking effective travel demand management with transportation systems and parking policies;</li> <li>• Provide residents and employees on the Project site with multiple modes of transportation;</li> <li>• Provides for 80 percent on average, but no less than 50 percent of residential units to be located within one-half mile of a Village center that includes retail and service uses;</li> <li>• Provide parks within a 5-minute walk (0.25 mile) of 80 percent of all residential units;</li> <li>• Require TMA implementation of combination of transit and transportation measures to reduce on-site single-occupancy automobile use by 30 percent in relation to standard ITE-generation rates for the overall Project; and</li> <li>• Require TMA implementation of a combination of measures to reduce off-site peak hour commutes to and from the Project site in single-occupancy automobiles by 20 percent.</li> <li>• Require TMA implementation of a program to coordinate with automotive dealers on the Project site to promote CNG, electric, and hybrid electric vehicles.</li> <li>• Require TMA oversight of requirement for service fleet vehicles for agencies or businesses located on-site to be alternative fuel vehicles to the maximum extent feasible, as determine by the Project Applicant/Developer.</li> </ul> <p>The Circulation Plan sets forth requirements for roadway classifications; intersection controls; and traffic calming measures. Where approved by the California Department of Transportation (Caltrans) and the County and where maintenance and durability costs are comparable to traditional materials, use "cool" pavement materials, which reduce heat island effect.</p>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-30</b> (<i>Traffic Study MM-24</i>) Each component of the Mobility Plan incorporates Transportation Demand Management (TDM) features to reduce dependence on the automobile, provide for a more efficient use of transportation resources among Project occupants, and thereby reduce pollutant emissions. Related to this is the creation and ongoing operation of a Transportation Management Association (TMA) to fund and manage the operation of ongoing transportation programs, including but not limited to transit and on-demand services. The key TDM elements that are inherent in the overall Mobility Plan are:</p> <ul style="list-style-type: none"> <li>• Sidewalks, greenway trails, and community trails that link residential, schools, shopping, and employment</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>areas;</p> <ul style="list-style-type: none"> <li>• Small- to medium-sized streets and blocks that allow for shorter walking distances to retail, parks, schools, and other destinations;</li> <li>• Pedestrian environments incorporated with public streets;</li> <li>• Parking behind buildings to encourage walking in retail areas along street frontage; and</li> <li>• Parks within 0.25 mile of 80 percent of all residential units</li> </ul>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-31</b> (<i>Traffic Study MM-25</i>) To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding towards the following planned improvements to I-5:</p> <ul style="list-style-type: none"> <li>• I-5 between Lake Hughes and Parker: Addition of one auxiliary lane in each direction.</li> <li>• I-5 between Parker Road and SR-14: Addition of one HOV or HOT lane in each direction.</li> </ul>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-32</b> (<i>Traffic Study MM-27</i>) To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:</p> <ul style="list-style-type: none"> <li>• Addition of two auxiliary lanes at the connector ramp from westbound SR-138 to southbound I-5 for Year 2035 cumulative buildout conditions.</li> </ul>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-33</b> (<i>Traffic Study MM-28</i>) To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:</p> <ul style="list-style-type: none"> <li>• Addition of two auxiliary lanes at the connector ramp mainline before the northbound I-5 to eastbound SR-138 connector ramp</li> </ul>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-34</b> (<i>Traffic Study MM-29</i>) To provide adequate capacity at the SR-14/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at SR-14/SR-138:</p> <ul style="list-style-type: none"> <li>• Construction of one auxiliary lane and a second off-ramp lane for the SR-14 northbound off ramp to SR-138.</li> </ul>
5.10	<b>Traffic, Access and Circulation</b>	<p><b>MM 10-35</b> (<i>Traffic Study MM-30</i>) To provide adequate capacity at the SR-14/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at SR-14/SR-138:</p> <ul style="list-style-type: none"> <li>• Construction of a second lane on the SR-14 southbound on-ramp from SR-138.</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.10	Traffic, Access and Circulation	<b>MM 10-36</b> (Traffic Study MM-31) To provide adequate capacity at the SR-14 SB Ramps and SR-138 interchange, the Project Applicant/Developer shall (1) comply with the terms of the CTIP for the reconfiguration of the interchange to include two eastbound through lanes and three westbound through lanes. In the southbound direction, add a second right-turn lane and install a traffic signal and include right-turn overlap phasing or (2) contribute fair share funding for intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).
5.10	Traffic, Access and Circulation	<b>MM 10-37</b> (Traffic Study MM-32) To provide adequate capacity at SR-14 NB Ramps and SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP for the reconfiguration of the interchange to include two eastbound through lanes and two westbound through lanes and, in the northbound direction, add two left-turn lanes and a traffic signal or (2) contribute fair share funding for intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).
5.10	Traffic, Access and Circulation	<b>MM 10-38</b> (Traffic Study MM-33) To provide adequate capacity at Lake Hughes Road at I-5 NB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the CTIP or (2) contribute fair share funding towards planned improvements to I-5 for the addition of one lane to the northbound off-ramp and restripe the configuration to include one left-turn, one shared left/right-turn lane, and one dedicated right-turn lane.
5.10	Traffic, Access and Circulation	<b>MM 10-39</b> (Traffic Study MM-35) To provide adequate capacity at the Magic Mountain Parkway at I-5 SB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the CTIP or (2) contribute fair share funding towards planned improvements to I-5 for the restriping of the southbound off-ramp to provide two left-turn lanes, one shared left-turn/through lane, and one right-turn lane.
5.10	Traffic, Access and Circulation	<b>MM 10-40</b> (Traffic Study MM-36) To provide adequate capacity at the Magic Mountain Parkway at I-5 NB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the CTIP or (2) contribute fair share funding towards planned improvements to I-5 for the conversion of the northbound shared through/right-turn lane to a shared left/through/right turn lane.
5.10	Traffic, Access and Circulation	<b>MM 10-41</b> (Traffic Study MM-37) To provide adequate capacity at the Valencia Boulevard at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the striping of a third westbound through lane.
5.10	Traffic, Access and Circulation	<b>MM 10-42</b> (Traffic Study MM-38) To provide adequate capacity at the Valencia Boulevard at I-5 NB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the traffic signal modification to add a northbound right-turn overlap phase.
5.10	Traffic, Access and Circulation	<b>MM 10-43</b> (Traffic Study MM-39) To provide adequate capacity at the McBean Parkway at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the restriping of the dedicated westbound right-turn lane to a shared through/right-turn lane.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.10	Traffic, Access and Circulation	<b>MM 10-44</b> ( <i>Traffic Study MM-40</i> ) To provide adequate capacity at the Calgrove Boulevard at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward adding a second eastbound through lane and a de-facto right-turn lane and a second through lane in the westbound direction.
5.10	Traffic, Access and Circulation	<b>MM 10-45</b> ( <i>Traffic Study MM-41</i> ) To provide adequate capacity at the Calgrove Boulevard at I-5 NB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward restriping to add a westbound de facto right-turn lane.
5.11	Air Resources	<b>MM 11-1</b> The Project's plans and specifications shall require stationary sources to comply with the parameters stated in Stationary Source Types, Size Limits, and Quantity Estimates, which is included as Attachment A to the Project's Mitigation Monitoring and Reporting Program. Should there be a need for a stationary source exceeding the prescribed limits, the Project Applicant/Developer shall apply for source-specific permit from the Antelope Valley Air Quality Management District (AVAQMD) or South Coast Air Quality Management District (SCAQMD), as applicable.
5.11	Air Resources	<p><b>MM 11-2</b> The Project's plans and specifications shall include the following measures to minimize nitrogen oxide (NOx) and volatile organic compound (VOC) emissions during construction:</p> <ul style="list-style-type: none"> <li>• All off-road diesel-powered construction equipment greater than 50 horsepower shall meet U.S. Environmental Protection Agency (USEPA) Tier 4 Final emission standards to the extent that the equipment is available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by the California Air Resources Board (CARB). Any emissions-control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. If Tier 4 Final equipment is not available, the Project Applicant/Developer shall provide the County with documentation showing the reasons for non-availability.</li> <li>• Alternatively, construction equipment may be selected according to the Green Construction Policy used by the Los Angeles County Metropolitan Transportation Authority or the ports of Los Angeles/Long Beach. These policies include provisions to 'step down' from Tier 4 equipment to Tier 3 or Tier 2 if specified criteria are met.</li> <li>• Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export). If the Project Applicant/Developer determines that 2010 model year or newer diesel trucks cannot be obtained, trucks that meet USEPA 2007 model year NOx emissions requirements shall be required. If 2010 model year or</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>newer diesel trucks are not available, the Project Applicant/Developer shall provide the County with documentation showing the reasons for non-availability.</p> <ul style="list-style-type: none"> <li>• A copy of each unit's certified tier specification, BACT documentation, and CARB or District operating permit shall be provided to the County at the first occurrence of mobilization of each applicable unit of equipment.</li> <li>• Construction contractors shall ensure construction equipment is properly serviced and maintained to the manufacturer's standards.</li> <li>• Construction contractors shall limit non-essential idling of construction equipment to no more than five consecutive minutes.</li> </ul>
5.11	Air Resources	<p><b>MM 11-3</b> The Project's plans and specifications shall prohibit wood-burning fireplaces as required by SCAQMD Rule 445 in single-family residences throughout the entire Project site, including at residences that are 3,000 or more feet above mean sea level at which the SCAQMD prohibition would otherwise not apply. Natural gas fireplaces shall be limited to a total of 13,954.</p>
5.11	Air Resources	<p><b>MM 11-4</b> The Project's plans and specifications for non-residential buildings shall demonstrate that the following features have been incorporated into the building designs. Proof of compliance shall be provided to the County prior to the issuance of occupancy permits.</p> <ul style="list-style-type: none"> <li>• For buildings with over 10 tenant-occupants, changing/shower facilities shall be provided as specified in Section A5.106.4.3, Nonresidential Voluntary Measures, of the CALGreen Code as follows: for 11 to 100 tenant-occupants, one unisex shower; for 101 to 200 tenant-occupants, one shower per gender; and for over 200 tenant-occupants, one shower per gender for each 200 additional tenant-occupants.</li> <li>• Preferential parking for low-emitting, fuel-efficient, and carpool/van vehicles shall be provided as specified in Section A5.106.5.1, Nonresidential Voluntary Measures, of the CALGreen Code as follows: two for 10 to 15 spaces; four for 26 to 50 spaces; six for 51 to 75 spaces; nine for 76 to 100 spaces; eleven for 101 to 150 spaces; 18 for 151 to 200 spaces; and at least 10 percent of total for 201 and more spaces.</li> <li>• Facilities shall be installed to support future electric vehicle charging at each non-residential building with 30 or more parking spaces. Installation shall be consistent with Section A5.106.5.3, Nonresidential Voluntary Measures (Tier 1), of the CALGreen Code. The facilities shall meet Section 406.9 (Electric Vehicle) of the <i>California Building Code</i> and as follows: <p><b>Single charging space requirements.</b> When only a single charging space is required, install a listed raceway capable of accommodating a dedicated branch circuit. The raceway shall not be less than trade size 1. The raceway shall be securely fastened at the main service or subpanel and shall terminate in close proximity to the proposed location of the charging system into a listed cabinet, box or enclosure.</p> <p><b>Multiple charging spaces required.</b> When multiple charging spaces are required, plans shall include the location(s) and type of electrical vehicle supply equipment (EVSE), raceway method(s), wiring schematics and electrical calculations to verify that the electrical system has sufficient capacity to charge simultaneously all the electric vehicles (EV) at all designated EV charging spaces at their full rated amperage. Plan design shall be based on Level 2 EVSE at</p> </li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		its maximum operating ampacity. Provide raceways from the electrical service panel to the designated parking areas which are required to be installed at the time of construction.
5.11	Air Resources	<p><b>MM 11-5</b> The Project's plans and specifications for residential buildings shall demonstrate that the following features have been incorporated.</p> <ul style="list-style-type: none"> <li>• Visitor parking shall include preferentially located parking spaces for alternative-fueled vehicles.</li> <li>• Exterior electrical receptacles and natural gas or propane hookups.</li> <li>• Bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code, as follows:</li> </ul> <p><b>Short-term bicycle parking.</b> Provide permanently anchored bicycle racks within 100 feet of the visitor's entrance, readily visible to passers-by, for five percent of visitor motorized vehicle parking capacity within a minimum of one two-bike capacity rack.</p> <p><b>Long-term bicycle parking for multifamily buildings.</b> Provide on-site bicycle parking for at least one bicycle per every two dwelling units. Acceptable parking facilities shall be conveniently reached from the street and may include, but not limited to:</p> <ol style="list-style-type: none"> <li>1. Covered, lockable enclosures with permanently anchored racks for bicycles.</li> <li>2. Lockable bicycle rooms with permanently anchored racks.</li> <li>3. Lockable, permanently anchored bicycle lockers.</li> </ol> <p><b>Long-term bicycle parking for hotel and motel buildings.</b> Provide one on-site bicycle parking space for every 25,000 square feet, but not less than two. Acceptable parking facilities shall be conveniently reached from the street and may include, but not be limited to:</p> <ol style="list-style-type: none"> <li>1. Covered, lockable enclosures with permanently anchored racks for bicycles.</li> <li>2. Lockable bicycle rooms with permanently anchored racks.</li> <li>3. Lockable, permanently anchored bicycle lockers.</li> </ol>
5.11	Air Resources	<p><b>MM 11-6</b> The Project's plans and specifications for parking structures and parking lots with 20 or more parking spaces shall demonstrate that the following features have been incorporated into the parking facility.</p> <ul style="list-style-type: none"> <li>• The parking facility shall include a minimum of five percent preferentially located parking spaces for alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles.</li> <li>• The parking facility shall include at least one electric vehicle charging station. Electrical lines shall be designed and sized to add additional charging stations for up to three percent of the total parking spaces when a demand is demonstrated. The design and installation shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, of the CALGreen Code as follows:</li> </ul> <p><b>Single charging space requirements.</b> When only a single charging space is required, install a listed raceway capable of accommodating a dedicated branch circuit. The raceway shall not be less than trade size 1 (nominal 1-inch inside</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>diameter). The raceway shall be securely fastened at the main service or subpanel and shall terminate in close proximity to the proposed location of the charging system into a listed cabinet, box or enclosure.</p> <p><b>Multiple charging spaces required.</b> When multiple charging spaces are required, plans shall include the location(s) and type of electrical vehicle supply equipment (EVSE), raceway method(s), wiring schematics and electrical calculations to verify that the electrical system has sufficient capacity to charge simultaneously all the electric vehicles at all designated EV charging spaces at their full rated amperage. Plan design shall be based on Level 2 EVSE at its maximum operating ampacity. Only underground raceways and related underground equipment are required to be installed at the time of construction.</p> <ul style="list-style-type: none"> <li>For residential parking facilities, bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code.</li> </ul>
5.11	Air Resources	<p><b>MM 11-7</b> The Project's plans and specifications for business park or water reclamation facility land uses shall demonstrate that buffer areas adjacent to proposed business parks in compliance with the Air Quality Analysis for Stationary Sources Allowed by the Centennial Specific Plan, (see Appendix 5.11-B of this EIR) have been incorporated into the design plans. The buffer areas shall prohibit uses that are potential sources of toxic air contaminants and shall prohibit uses that include sensitive receptors, except as allowed through written evidence that the sensitive use would not be exposed to Toxic Air Contaminants with pollutant concentrations resulting in a cancer risk greater than or equal to 10 in 1 million for health risks and 1.0 for non-cancer chronic and acute hazard indices (HIs).</p>
5.11	Air Resources	<p><b>MM 11-8</b> Prior to approval of any tract map that includes an air quality sensitive use (e.g., residence, school, hospital, daycare center) within a designated business park, the Project Applicant/Developer shall provide written evidence to the County that the sensitive use would not be exposed to Toxic Air Contaminants with pollutant concentrations resulting in a cancer risk greater than or equal to 10 in 1 million for health risks and 1.0 for non-cancer chronic and acute hazard indices (HIs).</p>
5.11	Air Resources	<p><b>MM 11-9</b> The Project's plans and specifications shall demonstrate that all distribution centers are within the business park areas south of State Route (SR) 138 and are located at least 1,000 feet from existing sensitive receptors and lands designated for sensitive land uses. Distribution centers shall not be allowed in other areas within the Project site.</p>
5.11	Air Resources	<p><b>MM 11-10</b> The Project's plans and specifications shall demonstrate that any land uses involving the public congregation of sensitive receptors (e.g. residential, schools, hospital, daycare center) are not within 150 feet of the near edge of the SR-138 traffic lanes.</p>
5.11	Air Resources	<p><b>MM 11-11</b> Prior to the approval of any tract map that includes an air quality sensitive receptor (e.g. residential, day care, schools, hospital) located within 500 feet of the SR-138, the Project Applicant/Developer shall provide a dispersion analysis to calculate the health risks from vehicle emissions from SR-138. If the study concludes that health risks would be significant at the location of a proposed sensitive receptor, then effective design measures must be implemented into the structures to mitigate for interior air quality, such as ventilation systems that include MERV13 filters or equivalent protections against TACs from vehicle emissions. Confirmation of compliance shall be provided to the County prior to occupancy that include sensitive receptors within 500 feet of the SR-138.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.12	Noise	<p><b>MM 12-1</b> For residences, hotels and motels, schools, and places of worship adjacent to a collector road with a buildout forecast of 10,000 average daily trips (ADT) or greater or any higher classification road, the Project Applicant/Developer shall submit to the County an Acoustical Study prepared in accordance with Section 1207.12 of the County Building Code. The Acoustical Study shall demonstrate that exterior noise levels at areas where residents would reasonably be expected to spend more than one hour (e.g., backyards) would not exceed 65 A-weighted decibels (dBA) Community Noise Level Equivalent Level (CNEL). The Acoustical Study shall also verify, before Certificate of Occupancy (CofO) issuance, that the buildings have been properly designed to comply with a CNEL requirement of 45 dBA for habitable interior living areas, classrooms, and rooms used for patient care and worship. The design features required to achieve the noise standard shall include one or more of the following elements, as verified by the Acoustical Study: building setbacks from the roadway; noise barriers; building orientation relative to the roadway; interior living space (bedroom, common area) orientation; sound-rated windows; upgraded exterior wall and/or roof construction; insulation batts; and forced air ventilation.</p>
5.12	Noise	<p><b>MM 12-2</b> For each business park use, school, community use area, park and recreation area, animal control facility, utility, County maintenance facility, commercial development, or manufacturing/industrial development, the Project Applicant/Developer shall submit an Acoustical Study to verify that the Project has been properly designed to comply with the County of Los Angeles's Noise Ordinance standards at the nearby sensitive properties (both on and off site). The design features required to achieve the noise standard shall include one or more of the following elements, as verified by the Acoustical Study: building setbacks from the sensitive receptors; noise barriers; building orientation relative to the sensitive receptor; sound-rated windows; and upgraded exterior wall and/or roof construction.</p>
5.12	Noise	<p><b>MM 12-3</b> To ensure that construction noise is minimized, in addition to meeting all requirements of Section 12.08 of the <i>County of Los Angeles Code</i>, the following measures shall be implemented during construction:</p> <ul style="list-style-type: none"> <li>• All construction equipment, including internal combustion engines and stationary equipment (used for construction purposes) shall be equipped with noise-reducing features such as, but not limited to, improved mufflers, intake silencers, ducts, engine enclosures, and acoustical shields or shrouds.</li> <li>• Stationary equipment (e.g., generators, air compressors, concrete pumps) located within 450 feet of residences or schools shall have noise abatement (e.g., engine enclosures or equipment placed behind barriers,) to limit the noise level at the sensitive receptor to an average sound level (<math>L_{eq}</math>) of 60 dBA or less.</li> <li>• Equipment and material staging areas and equipment maintenance areas shall be located at least 500 feet from sensitive noise receivers, if feasible.</li> </ul>
5.12	Noise	<p><b>MM 12-4</b> The Project Applicant/Developer shall submit a vibration analysis to the County demonstrating that the pile installation has been designed to limit vibrations to 0.01 peak particle velocity (ppv) inch per second (in/sec) or less at occupied buildings. Design features may include alternate methods of installation that result in reduced vibrations such as pile driving cushions or jetting instead of drilling.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.12	Noise	<p><b>MM 12-5</b> For the Project site areas adjacent to 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue, the Project Applicant/Developer shall provide information to County demonstrating that plans and specifications require that (1) vibratory rollers shall not be used within 300 feet of occupied residences or that vibratory rollers used within 300 feet of occupied residences shall be operated in the static mode and (2) large bulldozers and scrapers shall not be operated within 150 feet of occupied residences. Alternatively, the Project Applicant/Developer shall provide information to County demonstrating that plans and specifications require that vibratory rollers, large bulldozers, large scrapers, and similar heavy equipment shall be operated to comply with the requirements of Section 12.08.560 of the County Code and that vibrations at residential properties would not exceed 0.01 inch per second (in/sec).</p>
5.12	Noise	<p><b>MM 12-6</b> The Project Applicant/Developer shall provide to each prospective purchaser or tenant with a notice and statement of acknowledgment that shall be executed by the prospective purchaser, lessee, or tenant that the Centennial property will be undergoing continuing development and, depending on relative location, noise from construction activities may be heard. The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the County. Subsequent to Project buildout, this mitigation measure would no longer apply.</p>
5.12	Noise	<p><b>MM 12-7</b> In the event that blasting is necessary in order to fracture non-rippable rock, the Project Applicant/Developer shall prepare a Blasting Plan to be submitted and approved by the County of Los Angeles Fire Department in order to obtain a blasting permit; evidence of this approval shall be submitted to the County of Los Angeles Department of Regional Planning in order to obtain an Explosives Permit. The Blasting Plan shall be prepared in accordance with the United States Department of Interior, Office of Surface Mining (USOSM) standards and shall include, but not be limited to, the following:</p> <ol style="list-style-type: none"> <li>a. A pre-blast survey.</li> <li>b. The site and location of planned blasting and hours of operation (blasting to be conducted during the daylight hours only).</li> <li>c. Notification of blasting activities to all property owners within one-half mile of the blasting area. This notification shall describe the expected period and frequency that the blasting shall occur and give a contact phone number for any questions or complaints. All complaints shall be responded to in a method deemed satisfactory to the County of Los Angeles Department of Regional Planning.</li> <li>d. The types and amounts of explosives.</li> <li>e. Warning system information.</li> <li>f. Methods of transportation and handling of explosives.</li> <li>g. Minimum acceptable weather conditions.</li> <li>h. Procedures for handling, setting, wiring, and firing explosives.</li> <li>i. Procedures for clearing and controlling access to blast danger.</li> <li>j. Procedures for handling misfires and other unusual occurrences.</li> <li>k. An Emergency Action Plan.</li> </ol>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<ul style="list-style-type: none"> <li>l. Material safety data sheet for all explosives or other hazardous materials expected to be used.</li> <li>m. Procedures to ensure compliance with local, State and federal laws.</li> <li>n. Requirements and procedures for vibration monitoring near existing structures during blasting events.</li> </ul>
5.13	Visual Resources	<p><b>MM 13-1</b> The Project's plans and specifications shall demonstrate the implementation of measures to preserve existing rock outcroppings that are visible from off-site locations along the SR-138. In addition, the County shall review all final development plans (e.g., landscape, lighting, architectural plans)—as provided by the Project Applicant/Developer—to ensure that the development standards for each land use have been implemented to minimize the visual alteration of the site and to create an aesthetically pleasing development.</p>
5.13	Visual Resources	<p><b>MM 13-2</b> The Project shall implement the following components of the Green Development Program to minimize potentially adverse visual impacts:</p> <ul style="list-style-type: none"> <li>• Site the highest density residential uses in areas adjacent to commercial centers and permit residential uses in commercial centers through the Mixed Use Overlay to place larger populations within key centers, encouraging pedestrian activity and a reduction in vehicle trips.</li> <li>• Preserve oak woodlands, savannahs, and other sensitive habitat areas near Oso Canyon and at the foot of the San Gabriel Mountains southerly of SR-138.</li> <li>• Exterior lighting shall not cause unacceptable light trespass and shall be fully shielded.</li> <li>• Outdoor lighting shall be turned off using automatic control devices or systems between the hours of 10:00 PM and sunrise of the following day in commercial, business park, and mixed use areas, unless required by the County Building Code. If the property operates beyond 10:00 PM, then outdoor lighting shall be turned off 1 hour after the operation ends for the day.</li> <li>• Outdoor lighting for safety and security reasons is allowed after 10:00 PM only if fully shielded motion sensors are used to turn off lighting after 10:00 PM and the sensors turn the lighting off automatically no more than 10 minutes after the area is vacated or at least 50 percent of the total lumen levels are reduced or 50 percent of the total outdoor light fixtures are turned off between 10:00 PM and sunrise.</li> <li>• Outdoor lighting in residential and open space areas that are over 15 feet in height shall have an output no greater than 400 lumens.</li> <li>• The maximum height of outdoor lighting fixtures shall be: <ul style="list-style-type: none"> <li>○ 20 feet in Residential and Open Space areas</li> <li>○ 30 feet in Commercial, Mixed Use, and Public areas</li> <li>○ 35 feet in Business Park areas</li> </ul> </li> <li>• Prohibit the use of outdoor lighting that includes drop-down lenses, mercury vapor lights, ultraviolet lights, search lights, laser lights and any outdoor lighting that flashes, blinks, alternates or moves unless mandated for health and safety reasons by a public agency.</li> <li>• Outdoor light fixtures in outdoor recreational areas shall be mounted, aimed, and fully shielded so that light</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>beams fall onto activity areas and no unacceptable light trespass occurs on surrounding areas or properties. Outdoor lighting shall only provide the minimum necessary to illuminate recreational activities areas and shall be no more than 75 feet high. Preferably, these fixtures shall also use high pressure sodium or metal halide lamps.</p> <ul style="list-style-type: none"> <li>• Outdoor advertising signs, business signs and roof and freestanding signs that are lighted shall be fully shielded. Externally mounted light fixtures shall be mounted on the top of the sign and shall be oriented downward. Externally mounted bulbs or lighting tubes for signs shall not be visible from adjoining properties or public rights-of-way, unless such bulbs or tubes are filled with neon, argon, krypton or other self-illuminating substance.</li> </ul>
5.13	<b>Visual Resources</b>	<b>MM 13-3</b> The existing off-site 66 kV electric lines that extend from SR-138 beginning at approximately the Old Ridge Route to 290th Street West, shall be relocated south of the Business Park area or may be placed underground,.
5.13	<b>Visual Resources</b>	<b>MM 13-4</b> Structures proposed along the Pacific Crest National Scenic Trail (PCT) shall be screened by a block wall along the rear of the structures abutting the trail and a 34-foot-wide landscaped setback shall be provided that would contain the conceptual PCT realignment.
5.13	<b>Visual Resources</b>	<b>MM 13-5</b> Security lighting used for construction areas, equipment, and building materials staging areas shall be directed away from SR-138, 300 <sup>th</sup> Street West, 290 <sup>th</sup> Street West, and existing residences east of 300 <sup>th</sup> Street West and east of 290 <sup>th</sup> Street West and Malinda Avenue. Screening of construction security lighting at construction staging areas shall be implemented, as feasible. Construction equipment and materials staging areas shall be located as far as feasible from surrounding adjacent residences and lights shall be directed away from adjacent on-site residences that are occupied, as each development phase is built.
5.13	<b>Visual Resources</b>	<p><b>MM 13-6</b> An Exterior Lighting Plan shall be prepared in coordination with a qualified Biologist, be reviewed by an Electrical Engineer who is registered in the State of California, and then approved by the County prior to the submittal of each building permit. The Lighting Plan shall apply to all proposed structures and for development areas that border natural open space resources.</p> <p>The Lighting Plan shall be consistent with County Rural Outdoor Lighting District requirements for the Antelope Valley and shall provide guidelines for the outdoor lighting to be used throughout the Project site. Final lighting orientation and design shall be approved by the County.</p> <p>The Lighting Plan shall include, but not be limited to, the following:</p> <ol style="list-style-type: none"> <li>a. All lighting within 300 feet of natural open space areas shall only be implemented where needed for safety and shall be directed away from these areas and shielded so that light is not directed into open space and riparian areas. Where possible, these safety lights shall be motion sensor activated with infrared light sensors to prevent daytime lighting.</li> <li>b. Mercury vapor and halide lighting shall not be used on the perimeter of the developed areas or adjacent to designated open space.</li> </ol>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<ul style="list-style-type: none"> <li>c. Illumination levels should be compatible with the character and use of surrounding development as determined by national lighting organizations. The Illuminating Engineering Society of North America publishes recommendations for the lighting industry that include illumination levels for outdoor lighting.</li> <li>d. Low-pressure sodium lighting fixtures or flashing lights shall not be used except in emergency situations.</li> <li>e. Exterior lighting standards and fixtures shall be located and designed to minimize direct glare beyond the site boundaries. Lighting shall be fully shielded and directed downwards to confine light spread solely within necessary locations. Illumination or glare from the exterior lighting system onto adjacent properties or streets should be minimized.</li> <li>f. Security lighting fixtures shall not project above the roof line of the building on which they are mounted.</li> <li>g. Where applicable, time-control devices shall be utilized on exterior lighting sources.</li> <li>h. Street, parking lot, and structural lighting fixtures shall provide adequate illumination for safety and comfort of vehicular and pedestrian traffic while minimizing light spillover.</li> </ul>
5.14	Parks and Recreation	<p><b>MM 14-1</b> The Project shall implement the following components of the Green Development Program to provide healthy outdoor parks and recreational resources on the Project site:</p> <ul style="list-style-type: none"> <li>• Provide a functional system of community trails, greenway trails, and natural corridors to serve as recreational opportunities and as alternative means of transportation to reduce vehicular traffic.</li> <li>• Provide “complete streets” throughout the community to provide alternative modes of transport (walking, biking, low-speed vehicles (LSVs) such as neighborhood electric scooters, bikes and other low-speed electric vehicles (NEVs).</li> <li>• Incorporate sidewalks (separated by a parkway from streets) and trees to be the main street elements to create a walking environment, promoting pedestrian activity.</li> <li>• Provide Class I – IV bike lanes throughout the Project to ensure a variety of alternative transportation options.</li> <li>• Provide permanently anchored bicycle racks within 200 feet of visitors’ entrance of nonresidential buildings, readily visible to passers-by, for 5 percent of new visitor motorized vehicle parking spaces being added, with a minimum of two-bike capacity rack.</li> <li>• For new nonresidential buildings with over 10 tenant-occupants or for additions or alterations that add 10 or more tenant vehicular parking spaces, provide secure bicycle parking spaces at a rate of 5 percent of tenant parking being added, with a minimum of one space.</li> <li>• For residential buildings, provide permanently anchored bicycle racks within 100 feet of the visitor’s entrance, readily visible to passers-by, for 5 percent of visitor motorized vehicle parking capacity with a minimum of one two-bike capacity rack.</li> <li>• Nonresidential buildings within the Business Park and Commercial areas with 75,000 or more square feet of gross floor area shall provide locker rooms and shower facilities.</li> <li>• For multifamily buildings, provide on-site bicycle parking for at least one bicycle per every two dwelling units</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<ul style="list-style-type: none"> <li>• Include planned green space, which are integrated pockets of open space (including greenways, tree stands, hillsides, and community parks) with minimal developed amenities. Planned green space reduces evapotranspiration; allows natural percolation of runoff from adjacent lands; reduces the heat island effect; and adds aesthetic value to a site. Planned green space can provide habitat as well as linkages to other habitat areas.</li> </ul>
5.14	Parks and Recreation	<b>MM 14-2</b> The Project Applicant/Developer shall implement the Parks and Recreation Plan as set forth in Chapter 3.12 of the <i>Centennial Specific Plan</i> to provide visually appropriate parks and recreational amenities to the Project site.
5.14	Parks and Recreation	<b>MM 14-3</b> The Project Applicant/Developer shall construct 163 acres of parks consistent with the Park Overlay requirements of the Centennial Specific Plan, which includes acreage to meet the County's Parkland Dedication Ordinance requirements. In addition, the Project Applicant/Developer will fund the cost of constructing and equipping the public parks within the Project, pursuant to a park Development Agreement, a statutory Development Agreement pursuant to Section 65864 et seq. of the <i>California Government Code</i> , or other condition of approval.  For purposes of this measure, and as applied to all future Tentative Maps, the County shall deem all parks that are 3.0 acres or more in size as public parks, so long as each park site meets County standards for site suitability. The Project shall provide public parks to be developed in accordance with the schematic designs approved by the County.  Neighborhood and community parks shall contain various types of improvements that may include, but not be limited to, parking lot, walkways, plazas and other forms of hardscape, shade trellis, security lighting, trash enclosures, locking gates, fencing, open turf sports fields, basketball courts, multi-purpose ballfields, tennis courts, children's play areas, picnic areas (picnic tables with pads), shade structures/pavilions, restrooms with drinking fountains, recreation building, office and storage space/service yards, trees, landscaping (including plant material, grading, drainage, and irrigation), and park entry monuments.
5.14	Parks and Recreation	<b>MM 14-4</b> The Project shall provide public parkland in compliance with the County of Los Angeles Parkland Dedication Ordinance/Quimby Act, with all acreage figures stated as "net" (three percent slope, maximum). Additionally, public parks shall be dedicated to the County in a developed condition, in accordance with the schematic designs recommended by the County and/or as approved by the Regional Planning Commission and/or the County Board of Supervisors as part of approval of each tract map as each phase of development occurs throughout the Project site with amenities consistent with County-approved plans. Developed public parks shall also be credited with an equivalency acreage correlating with the current Representative Land Value for the applicable Park Planning Area (currently Park Planning Area 48). All public parks must comply with County's Park Design Guidelines and Standards, Public Parks.
5.14	Parks and Recreation	<b>MM 14-5</b> The Project shall provide public and private recreation amenities that equate to the acreage requirements of the County of Los Angeles General Plan local parkland standard (4 acres for every 1,000 persons in the unincorporated County). For purposes of monitoring compliance with the General Plan standard, whenever either a Tentative Map or a Final Map is submitted for the County's review and clearance, those maps shall have a table that provides a breakdown of acreage per lot for the following categories: (1) Public Park acreage (maximum slope 3 percent or less), ; (2) Public Park Acreage Equivalency (which shall be based upon estimated Public Park Improvement Values derived from Total Project Cost Estimates required at the time of map clearance and the Parkland Dedication Ordinance/Quimby Ordinance in effect at the time the map is submitted); (3) Private Park acreage, including pocket

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		parks; (4) Greenway and County multi-use (hiking, equestrian, and mountain biking) trail acreage; (5) Community Recreation Facility acreage; and (6) Private Recreation Facility acreage.
5.15	<b>Education</b>	<b>MM 15-1</b> The Project Applicant/Developer shall designate one K-5 and five K-8 school sites in the Project area in accordance with the conceptual land use plan or alternate location(s) that shall be agreed upon by the authorized school districts.
5.15	<b>Education</b>	<b>MM 15-2</b> The Project Applicant/Developer shall demonstrate to the County that they have an executed agreement with all school districts that operate within the boundaries of the Project site.
5.15	<b>Education</b>	<b>MM 15-3</b> The Project Applicant/Developer shall designate one high school site in the Project area in accordance with the conceptual land use plan or alternate location(s) that shall be agreed upon by the authorized school district.
5.16	<b>Fire and Law Enforcement Services</b>	<b>MM 16-1</b> At buildout, the Los Angeles County Fire Department (LACFD) fire stations shall be located such that response times to the Project site shall be 5 minutes or less for fire service responses and 8 minutes or less for the advanced life support (paramedic) unit responses within the Project site.
5.16	<b>Fire and Law Enforcement Services</b>	<b>MM 16-2</b> The Project Applicant/Developer shall pay developer fees in effect at the time of construction permit approval, in accordance with the LACFD Developer Fee Program until such time the Project Applicant/Developer has conveyed an approved, operational fire station to the LACFD. As an alternative to fee payment, the Developer Fee Program allows the LACFD and the Project Applicant/Developer to agree on a program whereby the Project Applicant/Developer would provide land and would construct and equip the fire stations required for the Project in exchange for a credit towards the Project's fee payments.
5.16	<b>Fire and Law Enforcement Services</b>	<b>MM 16-3</b> The Project Applicant/Developer shall provide land, convey title, and shall construct and equip, to the specifications and requirements of the LACFD, for up to four new Fire Stations to the LACFD. The approved final plans and specifications for the Project shall identify locations of the fire stations. The LACFD shall have final approval over the fire station site locations. The timing for the construction of the on-site fire stations shall be established by the LACFD dependent upon the phasing of development, with the first on-site fire station operational no later than the time the 1,000 <sup>th</sup> dwelling unit is built on site.
5.16	<b>Fire and Law Enforcement Services</b>	<b>MM 16-4</b> The Project Applicant/Developer shall pay Law Enforcement Facilities Mitigation Fee (LEFMF) to the Los Angeles County Sheriff's Department (LASD) pursuant to the requirements established in County Ordinance No. 2008-0033. The amount of fees to be paid will be determined based on the established fee in Section 22.74.030 of the County Code. The Project incorporates a temporary "store front" sub-station, followed by construction of a permanent LASD Station included on the Project site, in lieu of a portion of the LEFMF, as allowed under Section 22.74.090 (Consideration in Lieu of Fee) of the County Code. Costs associated with the construction of the temporary "store front" sub-station and permanent LASD Station would be credited against the LEFMF.  Prior to completion of the permanent LASD Station, the "store front" sub-station may be located on site in Village 1 on the north side of the SR-138. This temporary sub-station shall be properly outfitted in accordance with applicable occupancy requirements of the LASD for such "store front" facilities and shall be operational prior to the approval of the first certificate of occupancy for the first phase of Project development.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>The Centennial Land Use Plan identifies a conceptual location for one LASD Station in the Business Park area on the Project site north of the SR-138. The permanent LASD Station shall be constructed immediately following completion of the first phase of development. The LASD shall have final approval over the temporary sub-station and permanent LASD Station site locations.</p>
5.17	Other Public Services	<p><b>MM 17-1</b> The <i>Los Angeles County Code</i> (Chapter 22.72 of Title 22) (“Library Ordinance”) imposes a Library Facilities Mitigation Fee on new residential development projects in the unincorporated areas of the County of Los Angeles served by the County Library (the “Library Facilities Mitigation Fee”). The Library Facilities Mitigation Fee that is in effect for the designated County Library planning area is charged upon approval of each residential building permit and is based on the estimated reasonable cost of providing the projected library facility needs in the applicable library planning area. The Project is located within Planning Area 2: Antelope Valley and, as of the date of this EIR, the Library Facilities Mitigation Fee is \$844.00 per residential building permit (based upon the County Library’s mitigation fee per building permit amount established on October 27, 1998, and last updated on July 1, 2015). The Project provides for the development of a maximum of 19,333 residential dwelling units. Based on the current fee, the total Library Facilities Mitigation Fee that would be due from the Project Applicant/Developer (or its successors in interest) is \$16,317,052. Consistent with the Library Ordinance, the amount of the Library Facilities Mitigation Fee that shall apply to the Project shall be the fee payable on the date the County issues each building permit for a residential dwelling unit. The amount of the Library Facilities Mitigation Fee may be increased from time to time pursuant to Section 22.72.040 of the County Code and State law; provided, however, the Library Facilities Mitigation Fee applicable to residential dwellings within the Project shall be no more than the amount of the Library Facilities Mitigation Fee applicable to residential dwellings outside of the Project but within Planning Area 2. The aggregate Library Facilities Mitigation Fees payable for all of the residential dwelling units within the Project for which building permits have been issued shall be referred to herein as the “Project-Wide Fee Total.” The ordinance allows that in lieu of the payment of Library Facilities Mitigation Fees, the Project Applicant/Developer shall fulfill the obligations required by the mitigation measures in this EIR, to satisfy the requirements of the Library Ordinance.</p>
5.17	Other Public Services	<p><b>MM 17-2</b> Section 22.72.090 of the Library Ordinance permits the County Librarian to accept substitute consideration in lieu of the Library Facilities Mitigation Fee if the proposed substitute consideration (such as land, facility construction, and/or materials) (i) has a value that is equal to or greater than the applicable Library Facilities Mitigation Fee that is otherwise due; (ii) is in the form acceptable to the County Librarian; and (iii) is within the scope of the applicable library facilities project. Because the Library Facilities Mitigation Fee only allows for an incremental accumulation of funds for future library facilities as building permits are issued and fees are collected pursuant to Section 22.72.060 of the County of Los Angeles Code, the County Library will implement a strategy that will better serve the residents of Centennial by ensuring that the timing and scope of public library facilities will meet the demands of the community. Centennial desires to cooperate with the County Library in meeting its goals and also seeks certainty with respect to the amount and timing of the Project’s financial commitment to the County Library. Therefore, the parties’ objectives will be satisfied if, in lieu of the Project Applicant/Developer’s payment of Library Facilities Mitigation Fees at the time residential building permits are pulled in accordance with Section 22.72.060 of the County Code, the Project Applicant/Developer will instead set aside the land and contribute the funds required to build and equip a turnkey Permanent Facility, all in accordance with the terms and conditions of the Development Agreement. As discussed in</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		MM 17-1, the Project Applicant/Developer's provision of such land and funding will, in accordance with the required mitigation measures, be credited against Library Facilities Mitigation Fees that would otherwise be due.
5.17	<b>Other Public Services</b>	<b>MM 17-3</b> The Project Applicant/Developer shall dedicate to the County Library up to 2.62 acres within Village 3 of the Project (the "Dedicated Land") for public library purposes or other location for the permanent facility mutually agreed upon by the County Librarian and the Project Applicant/Developer. The Project Applicant/Developer shall receive a credit against unpaid Library Facilities Mitigation Fees in an amount equal to the fair market value of all Dedicated Land as of the date of the dedication to the County of Los Angeles for County Library purposes. The Dedicated Land shall be conveyed to the County concurrently with the filing and recordation of the final map within which the Dedicated Land is located. If the County Library desires to increase the size of the Dedicated Land, it shall make such request of the Project Applicant/Developer no later than the date that the County approves the tentative map for the proposed subdivision in which the Dedicated Land is located. the Project Applicant/Developer agrees to increase the size of the Dedicated Land upon the County's request provided: (i) the County cooperates with the Project Applicant/Developer in any related land use boundary changes, transfers or conversions necessary to accommodate the larger library site, subject to the requirements of CEQA and (ii) the County either pays the fair market value for such land with either (A) U.S. funds or (B) a dollar-for-dollar credit against unpaid Library Facilities Mitigation Fees, so long as the Project-Wide Fee Total has not already been offset pursuant to MM 17-4 through MM 17-7. "Fair market value" for the land described in this paragraph shall be determined based on the value of such land had it been entitled for institutional office purposes and the property had a maximum floor area ratio (FAR) of 0.25. If the County Library at any time changes the use of the Dedicated Land from that of a County-owned public library facility, then the Dedicated Land will revert back to Centennial.
5.17	<b>Other Public Services</b>	<b>MM 17-4</b> The Project Applicant/Developer shall provide plans and specifications with a one or two-story, turn-key public library building (the "Permanent Facility") on the Dedicated Lands. The Permanent Facility may be constructed in phases. The size and scope of the Permanent Facility will be determined by the County Librarian in consultation with the Project Applicant/Developer provided, however, that the Project Applicant/Developer's maximum financial contribution shall not exceed the Project-Wide Fee Total, less any offsets pursuant to Mitigation Measures 17-4, 17-6, and 17-7 in this EIR. The sizing, design and programming of the Permanent Facility, including the influence of technology on library services, will be agreed upon by representatives from County Library and the Project Applicant/Developer. A report shall be prepared by an independent library consultant selected by the County Library that will solicit input from the community with respect to the types of library services desired at the Permanent Library Facility. The consultant's report shall be paid for by the Project Applicant/Developer and the Project Applicant/Developer shall receive a credit against the Project-Wide Fee Total for the Project Applicant/Developer's payment of such costs. The Permanent Facility and Permanent Library furniture, fixture, and equipment (FF&E, as defined below) will be substantially similar in quality and materials to the Quartz Hill branch of the County Library on November 2016. The design of the Permanent Library will be performed by an architect mutually selected by the Project Applicant/Developer and the County Librarian. The Permanent Facility must comply with all requirements of the County Library's Low Voltage Specifications in effect on the date the design contract for the Permanent Facility is fully executed. The County Library shall be responsible for all costs of design and construction of the Permanent Library in excess of the Project Applicant/Developer's Library Facilities Mitigation Fee obligations hereunder. If, after application of the fee credits

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
		<p>against Library Facilities Mitigation Fees to which the Project Applicant/Developer is entitled, there is insufficient funds to construct the Permanent Facility and purchase the Permanent Library FF&amp;E, the Project Applicant/Developer shall not be required to fund construction of the Permanent Facility until additional and sufficient funds are authorized by the County to construct the Permanent Facility and to procure the Permanent Library FF&amp;E. The Permanent Facility will be completed and operational on a date agreed to between the County Librarian and the Project Applicant, subject to force majeure and events within the control of the County (such as, for example, the County's failure to pay any funding shortfalls if credits against the Project-Wide Fee Total are exhausted). The size of the Permanent Facility will be proportionately reduced in size and materials if the County approves less than the 19,333 residential units proposed for the Centennial Project.</p>
5.17	Other Public Services	<p><b>MM 17-5</b> The Project Applicant/Developer agrees to install furniture, fixtures and equipment ("Permanent Library FF&amp;E") and purchase library materials in connection with the Permanent Facility, provided that the Project Applicant/Developer's financial contribution toward the cost of the Permanent Library FF&amp;E and library materials shall not exceed the Project-Wide Fee Total when taken together with all other Project Applicant/Developer expenses then credited against the Project-Wide Fee Total. The County Library shall be responsible for all costs of Permanent Library FF&amp;E and library materials in excess of the Project-Wide Fee Total. The Permanent Library FF&amp;E specifications will be provided by the County Library. Any FF&amp;E purchased shall remain the property of the County Library.</p>
5.17	Other Public Services	<p><b>MM 17-6</b> The Project Applicant/Developer shall provide plans and specifications that demonstrate on-site parking for library patrons at a ratio of 4 parking spaces per 1,000 gross square feet of library space. The parking lot shall also include two spaces adjacent to the staff entrance of the library for County library service vehicles. Parking may be shared with adjacent uses with the consent of the County Library.</p>
5.17	Other Public Services	<p><b>MM 17-7</b> If the Project Applicant/Developer has satisfied its obligations in Mitigation Measures 17-1 through 17-6, above, and the Project Applicant/Developer continues to pull building permits within the Project, then the Project Applicant/Developer (or its successors in interest) shall pay any Library Facilities Mitigation Fees still owing as construction permits are issued, which shall be expended by the County Library for the benefit of the Permanent Facility on library materials, FF&amp;E, facility enhancements or library programs as determined by the County Librarian.</p>
5.17	Other Public Services	<p><b>MM 17-8</b> No later than December 1 and July 1 of each calendar year, the Project Applicant/Developer shall deliver to the County Library a report in writing providing the number of residential building permits actually issued to date. Within 30 days from the date the report is received, the County Library will deliver, or cause to deliver, to the Project Applicant/Developer a report on the revised Project-Wide Fee Total.</p>
5.17	Other Public Services	<p><b>MM 17-9</b> The Project Applicant/Developer shall be responsible for implementing the following construction waste reduction requirements to ensure that 100 percent of soil is diverted during grading activities, and that at least 70 percent of nonhazardous construction and demolition waste is diverted from landfill disposal. During all construction phases, wastes would be managed with the use of recycling bins for various debris materials which would be sent to existing recycling and/or processing facilities in accordance with all provisions of the County Construction and Demolition Debris Ordinance. This would include submitting and implementing a Recycling and Reuse Plan to Public Works in connection with obtaining a building or grading permit.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.17	Other Public Services	<p><b>MM 17-10</b> The Project shall incorporate the Solid Waste Management Plan (Section 3.7 of the Centennial Specific Plan) and the Property Owner/Developer shall be responsible for implementation of the following operational waste reduction requirements to ensure that at least 75 percent of operational waste is diverted from landfill disposal:</p> <ul style="list-style-type: none"> <li>• The Property Owner/Developer shall process an on-site contract with a waste management company and/or recyclers, and/or self-haul to waste and recycling facilities to properly recycle, divert, and dispose of solid waste generated on-site. Throughout the Project's operation, the waste hauler shall be required by contract to maintain records showing the diversion of not less than 75 percent of the operational waste generated by the Project.</li> <li>• The waste management contract will establish dedicated cans for green waste and a Green Waste Recycling Plan that must be adhered to by landscape maintenance companies as part of the CC&amp;Rs. The CC&amp;Rs will require the use of mulching mowers or mowers with mulching blades for common lawn area, use of California Air Resources Board- (CARB) approved or electric maintenance equipment; placing three to five inches of mulch in common areas' planting beds each year as part of the Landscape Maintenance Plan for all non-residential and multi-family buildings; and diverting organic wastes to a mulching and composting facility or anaerobic digestion facility.</li> <li>• The CC&amp;Rs will require the Property Owner to recycle and divert from the waste bin, solids such as metal, glass, paper, plastic, cardboard, food and yard waste; and divert from the waste bin hazardous waste, electronic waste, and universal waste. Information on items prohibited from landfill disposal and on recycling and composting will be provided to Property Owners.</li> <li>• Household hazardous wastes and less commonly disposed materials (such as electronics and appliances) shall have seasonal pickup (at least two times a year) and residents would be notified of upcoming events.</li> <li>• Semi-annual "exchange days" shall be organized, publicized, and paid for by the Master Homeowners Association (HOA).</li> <li>• The Project Applicant/Master Developer shall set aside a minimum of 5 acres for a future Materials Recovery Facility/Transfer Station (MRF/TS) that includes a household hazardous waste permanent collection and reuse center and allows for mulching/composting operations. The site shall be located in a suitable location with the capacity to manage the nonhazardous solid waste and household hazardous waste generated by the Centennial Development Project at buildout. The Project Applicant/Master Developer shall prepare and grade the site, and install basic mainline infrastructure fronting the property prior to the issuance of any occupancy permits associated with the first phase of project implementation. The Master Developer shall continually encourage a waste management company to build these facilities on this build ready site. The CC&amp;R for the future MRF/TS site shall require the land to be set aside for the MRF/TS in perpetuity.</li> <li>• The Smart Gardening Learning Center specifications will be provided by County Public Works.</li> <li>• Parking for the Learning Center and the MRF/TS may be shared with adjacent uses with the consent of the property owners and County Public Works.</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.18	Water Resources	<p><b>MM 18-1</b> In addition to complying with the water efficiency and conservation set forth in Divisions 4.3 and 5.3 of the California Green Building Standards (CALGreen) Code or the County Green Building Standards Code, whichever are more stringent, the Project Applicant/Developer shall implement the measures listed below.</p> <p><b>Meter Water Use.</b> Install, maintain, and monitor all non-construction potable and non-potable water use using appropriate metering equipment throughout the site.</p> <p><b>Reduce Potable Water Use with On-Site Recycled Water.</b> Install, maintain, and operate on-site wastewater treatment and conveyance facilities that provide recycled water treated to California Title 22 unrestricted reuse standards from on-site wastewater. Recycled water shall be used to meet (i) 100 percent of commercial, business park, institutional, school, hotel, park, and slope irrigation demand and (ii) outdoor irrigation demand in 50 percent of the total very low and low density residential lot landscaped area.</p> <p><b>Water Efficient Appliances.</b> Require installation of water-efficient major appliances (washers, dryers, dishwashers) in compliance with the California Appliance Efficiency Regulations, Energy Star®, or other applicable standards.</p> <p><b>Water Efficient Irrigation.</b> Require the installation of irrigation equipment with a minimum 0.80 irrigation efficiency for all public and private park, recreation and entertainment land use, arterial roadway, and slope irrigation uses. Water Smart/Evapotranspiration-based controllers shall be used. Low water use plants and shrubs shall be used in all irrigated slope areas with an average plant factor of 0.2, as defined in the State Model Water Efficient Landscape Ordinance.</p> <p><b>Water Budget Based Water Rates.</b> Require that the Project Water Purveyor implement water budget based rates in compliance with all applicable legal requirements and in a manner consistent with the use of such rates by other water districts in California (e.g., Irvine Ranch Water District). The water budget based rates shall incorporate and be designed to ensure that Project potable water use meets or exceeds the following standards and adjusted as may be required to meet more stringent standards that may be adopted by the State or Los Angeles County:</p> <ol style="list-style-type: none"> <li>1. Indoor Water Use Standards <ol style="list-style-type: none"> <li>(a) Residential indoor water use – 55 gallons per capita per day</li> <li>(b) Commercial indoor water use – 200 gallons per day per thousand square feet</li> <li>(c) Business Park indoor water use – 65 gallons per day per thousand square feet, including recycled water for commercial wastewater and cooling use except where prohibited by applicable law for particular types of areas or uses (e.g., employee cafeterias)</li> <li>(d) Institutional indoor water use – 50 gallons per day per thousand square feet</li> <li>(e) Hotel indoor water use – 125 gallons per day per room.</li> </ol> </li> <li>2. Outdoor Water Use Standards <ol style="list-style-type: none"> <li>(a) Residential outdoor water use – 55 percent of the reference evapotranspiration rate for the Project site</li> <li>(b) Commercial, industrial, and institutional outdoor use – 45 percent of the reference evapotranspiration rate for the Project site</li> </ol> </li> </ol>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.18	Water Resources	<b>MM 18-2</b> The Project Applicant/Developer shall submit to the County Water Use Reports prepared by a qualified specialist to the satisfaction of the County to verify that projected water use efficiencies are being achieved (1) at the end of the 5 <sup>th</sup> year following first occupancy or occupancy of the 4,000 <sup>th</sup> dwelling unit, whichever occurs later and (2) at the end of the 10 <sup>th</sup> year following first occupancy or occupancy of the 10,000 <sup>th</sup> dwelling unit, whichever occurs later. In the event that a Water Use Report indicates that consumption exceeds projected levels, response measures must be implemented to ensure that available supplies will be sufficient to meet future demand. No further development will be approved until additional measures are implemented to achieve the required efficiencies and/or provide additional water supplies, as confirmed by the Project Water Purveyor. No subsequent Tentative Maps shall be approved until the Project Water Purveyor has demonstrated to the satisfaction of the County that the implementation of specific water demand and supply response measures will ensure that available supplies will meet future Project demand.
5.19	Wastewater Collection	<b>MM 19-1</b> The Project Applicant/Developer shall provide documentation to the County that it has completed all required procedures and has paid all applicable fees associated with establishing the Project Water Purveyor, or an alternate qualified public utility district, as the operator of the WRFs.
5.19	Wastewater Collection	<b>MM 19-2</b> The Project Applicant/Developer shall demonstrate that the Project has either been annexed into an existing qualified public utility district (e.g. Golden Valley Municipal Water District) or that a new public utility district (e.g. Project Water Purveyor) has been created to serve the Project. The Project Water Purveyor or alternate qualified public utility district shall be responsible for the design, construction, and operation of the wastewater facilities, and shall ensure compliance with all applicable standards and regulations, including all Lahontan RWQCB and Title 22 requirements of the California Code of Regulations.
5.19	Wastewater Collection	<b>MM 19-3</b> The Project shall incorporate the Wastewater Management Plan ( <i>Centennial Specific Plan</i> , Section 3.5), and the Project Applicant/Developer shall prepare a Facilities Report, a Pump Station Feasibility Report, and a Sewer Area Study consistent with County Policies and Requirements. .
5.19	Wastewater Collection	<b>MM 19-4</b> The Project Applicant/Developer shall provide the County with plans and specifications that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utility district requirements and standards that demonstrate that the WRF West shall serve the Project site west of the West Branch of the California Aqueduct. The facility shall be located on an approximate 3-acre site and shall treat an average flow of approximately 0.34 million gallon per day. Biosolids shall be hauled to a suitable landfill or used for conversion into fertilizer products.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.19	Wastewater Collection	<b>MM 19-5</b> The Project Applicant/Developer shall provide the County with plans and specifications that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utility district requirements and standards that demonstrate that the WRF East shall serve the Project site east of the West Branch of the California Aqueduct. WRF East will be located near the northeasterly corner of the Project and shall treat an average flow of 4.28 million gallons per day. Biosolids shall be hauled to a suitable landfill or used for conversion into fertilizer products. Lined seasonal recycled water storage ponds shall be implemented as required to temporarily store recycled water during times of low demand. The ponds shall implement feasible and applicable wastewater treatment facility best management practices for mosquito and health vector recommended in the California Department of Public Health's 2012 <i>Best Management Practices for Mosquito Control in California: Recommendations of the California Department of Public Health and the Mosquito and Vector Control Association of California</i> .
5.20	Dry Utilities	<b>MM 20.2-1</b> The Project Applicant/Developer shall coordinate with Southern California Edison (SCE) to ensure that there are no prolonged disruptions to the existing transmission lines that extend through the Project study area and to coordinate in the design and implementation of future electrical service and facilities (e.g., transmission lines, access road) in the Project study area. This will ensure that: (1) no prolonged service disruptions during the extension and upgrading of these services would arise; (2) the nature, design, and timing of electrical system improvements are in accordance with all SCE requirements; and (3) the improvements are adequate to serve the proposed land uses and are available for the first occupied land uses.
5.20	Dry Utilities	<b>MM 20.2-2</b> The Project Applicant/Developer shall provide the County with plans and specifications that demonstrate a future substation shall be constructed in the eastern half of the Project site to serve Project development in the easterly portion of the Project site. To provide adequate capacity for electrical services for the Project, SCE would select one of the following two options to implement: (1) reconfigure the Bailey Substation or (2) upgrade the Gorman Substation and retrofit the existing overhead power lines. An electrical generation and distribution system shall be constructed as part of the main utility corridors for dry utilities. The timing of construction, as well as specific facility location and sizing, shall be coordinated with SCE.
5.20	Dry Utilities	<b>MM 20.3-1</b> The Project Applicant/Developer shall coordinate with the Southern California Gas Company (SoCalGas) in the design and implementation of future natural gas service and facilities in the Project study area to ensure that (1) no prolonged service disruptions during the extension and upgrade of these services would arise; (2) the nature, design, and timing of natural gas system improvements are in accordance with SoCalGas requirements; and (3) the improvements are adequate to serve the Project, to be in place for the first occupied land uses.
5.20	Dry Utilities	<b>MM 20.3-2</b> The Project Applicant/Developer shall install, bond for, or otherwise provide on-site natural gas facilities in coordination with SoCalGas.
5.20	Dry Utilities	<b>MM 20.3-3</b> An additional regulator station shall be constructed by SoCalGas to loop the distribution system for increased reliability. The timing for development of this station shall be determined by SoCalGas through an assessment of the system's operational needs. The timing for construction of this facility, as well as the specific location and sizing, shall be coordinated with SoCalGas.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.20	Dry Utilities	<b>MM 20.4-1</b> The Project Applicant/Developer shall coordinate with AT&T in the design and implementation of future telecommunications service and facilities within the Project study area to ensure that: (1) no prolonged service disruptions during the extension and upgrading of these services would arise; (2) the nature, design, and timing of telecommunications system improvements are in accordance with AT&T requirements; and (3) the improvements are adequate to serve the proposed land uses.
5.20	Dry Utilities	<b>MM 20.5-1</b> The Project Applicant/Developer shall coordinate with the Cable Television Service Provider in the design and implementation of future communication service and facilities within the Project study area to ensure that (1) no prolonged service disruptions during the extension and upgrading of these services would arise; (2) the nature, design, and timing of cable system improvements are in accordance with the Cable Service Provider's requirements; and (3) the improvements are adequate to serve the proposed land uses. The cable service connections shall be available at the property lines.
5.21	Climate Change	<b>MM 21-1</b> The Project Applicant/Developer shall provide the County with plans and specifications that demonstrate 50 percent of the Project's anticipated electrical energy demand at buildout shall be satisfied from on-site renewable energy generation. "Anticipated electrical energy demand" shall be determined on the basis of the anticipated loads for each building as shown in the reports submitted at the time of building permit application pursuant to the Building Energy Efficiency Standards of Title 24. "On-site renewable energy generation" includes, but is not limited to, solar, wind, geothermal, biofuel and hydroelectric systems. These systems shall be installed in connection with the development of one or more of the following: residential units, nonresidential buildings, public buildings, or Specific Plan utility facilities located either within the Specific Plan area or within its immediate vicinity.
5.21	Climate Change	<b>MM 21-2</b> The Project's plans and specifications shall demonstrate compliance with California Green Building Standards (CALGreen) Code voluntary measure A4.203.1.2.1 Tier 1 for newly-constructed low-rise residential buildings. Therefore, the energy efficiency of these buildings would exceed 2016 Title 24 requirements by 15 percent. Low rise buildings are three stories or less. The Project shall incorporate the Green Development Program ( <i>Centennial Specific Plan</i> , Appendix 2A), and the Project Applicant/Developer shall be responsible for the implementation of this requirement, which may include energy reduction measures such as use of high performance glazing, radiant heat roof barriers, insulation of all pipes, programmable thermostats, fluorescent and LED bulbs, solar access, sealed ducts, strategic placement of trees and other shading devices. All single-family homebuyers shall have the option to include a photovoltaic array system.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.21	Climate Change	<p><b>MM 21-3</b> The Project's plans and specifications shall demonstrate compliance with CALGreen voluntary measure A5.203.1.2.1 Tier 1 for nonresidential buildings (e.g. hotel, high-rise residential), thereby exceeding the 2016 Title 24 energy efficiency requirements for these buildings by 10 percent. The Project shall incorporate the Green Development Program (Centennial Specific Plan, Appendix 2A), and the Project Applicant/Developer shall be responsible for the implementation of this requirement, which may include energy reduction measures such as high performance glazing, radiant heat roof barriers, high-efficient HVAC with hot-gas reheat, insulation of all pipes, programmable thermostats, fluorescent and LED bulbs, solar access, sealed ducts, zero use of CFC refrigerants in commercial buildings, strategic placement of trees, and other shading devices. Commercial structures shall include passive solar design techniques, such as a north-south panel orientation on buildings, and shall install operable windows designed to maximize natural ventilation by opening into prevailing west winds at inlets and away outlets, thereby reducing use of interior climate controls.</p>
5.21	Climate Change	<p><b>MM 21-4</b> The-Project Applicant/Developer shall require in contract specifications, that contractors limit construction equipment idling to 3 minutes and include a program to ensure that equipment operators comply with the 3-minute limit.</p>
5.21	Climate Change	<p><b>MM 21-5</b> The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that a minimum of 70 percent of public and community pools and spas shall be equipped with active solar heating systems where heating is necessary or desired. The Project Applicant/Developer shall provide the proposed plan for compliance with this provision prior to obtaining a permit for the pool.</p>
5.21	Climate Change	<p><b>MM 21-6</b> Deeds, CC&amp;Rs or similar legal documents shall contain the following requirement: The owners of all single-family and multi-family residential units shall be required, upon resale, to present to the buyer a written energy audit checklist prepared by a qualified third party at the time the seller provides the buyer with the Real Estate Transfer Disclosure Statement required by California Civil Code, Section 1102 et seq. The energy audit checklist shall certify that all HVAC systems, thermostats, appliances, windows and swimming pools (if applicable) are the same as those originally installed or, if changed, otherwise comply with Centennial's Green Development Program. All residential pool covers shall be removable, and shall not be automatic retractable covers.</p> <p>The CC&amp;Rs of the master homeowners association or other applicable association shall require compliance with the provisions of this measure and shall provide notice to individual owners of the resale energy audit checklist requirement. The master homeowners association or other applicable association shall monitor compliance and provide the County with an annual report of compliance with this measure.</p>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.21	Climate Change	<b>MM 21-7</b> Deeds, CC&Rs, or similar legal documents shall contain the following requirement: For nonresidential buildings, within ninety (90) days after the end of the first full calendar year following the issuance of the certificate of occupancy and within ninety (90) days after each five year period thereafter, the owner or tenant in possession thereof shall submit to the master commercial owners association or other applicable association a report prepared by the owner or a qualified, independent third party that evaluates whether all major building systems such as heat furnace, air conditioner, and other mechanical fixtures are working within the design standards established for each system. The master commercial owners association or other applicable association shall monitor compliance and provide the County with an annual report of compliance with this measure.
5.21	Climate Change	<b>MM 21-8</b> Energy efficient major appliances and HVAC systems that meet the more stringent of applicable California Energy Commission (CEC) requirements or ENERGY STAR requirements, or equivalent, shall be exclusively offered by residential builders. Major appliances subject to this requirement include dishwashers, clothes washers, refrigerators, and room air conditioners.
5.21	Climate Change	<b>MM 21-9</b> The Project Applicant/Developer shall provide plans and specifications to the County that have been prepared in accordance with the Project Water Purveyor or alternate qualified public utility district requirements and standards, demonstrating that the Project's wastewater reclamation facilities (WRFs) shall include equipment to capture and reuse biogas for energy production.
5.21	Climate Change	<b>MM 21-10</b> The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that nonresidential or multi-family buildings shall be constructed with recycled water infrastructure to serve common areas for these facilities, except where prohibited by law. To the extent recycled water is produced within the Project and available, recycled water shall be used for landscape irrigation within those common areas. Compliance with these measures shall be established prior to the of a construction permits for nonresidential and multi-family facilities and at the time of County approval of final landscaping plans submitted by the Project Applicant/Developer after final map recordation for homeowners association common areas. Covenants, conditions and restrictions (CC&Rs) shall require the owners of such common areas to maintain, repair and replace irrigation systems and plantings in accordance with County approved plans.
5.21	Climate Change	<b>MM 21-11</b> The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that nonresidential building shall be constructed with indoor plumbing fixtures and fixture fittings that would reduce the overall use of potable water within the building by 12 percent, consistent with 2016 CALGreen Tier 1 nonresidential voluntary measures as prescribed in Section A5.303.2.3.1 of the code.
5.21	Climate Change	<b>MM 21-12</b> The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that single or multi-family residential buildings shall be constructed with kitchen faucets and appliances that comply with 2016 CALGreen code residential voluntary measures specified in Sections A4.303.1 and A4.303.3 of the code.
5.21	Climate Change	<b>MM 21-13</b> The outdoor residential (single-family and multi-family) water budget for water budget based ratemaking shall be based on having no more than 25 percent turf grass allowed in landscaped areas of single-family detached residential front yards and multi-family residential common areas.

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.21	Climate Change	<b>MM 21-14</b> Ten percent of all homes in Centennial communities that permit housing, with the exception of the lowest density area (Community 8-2) will be affordable, in conformance with the Affordable Housing Implementation Plan (see Appendix 3-H of the Centennial Specific Plan).
5.21	Climate Change	<b>MM 21-15</b> The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that one 208/240 VAC receptacle that may be used for charging electric vehicles, shall be installed in each detached and attached single-family residence. The installation shall comply with requirements of the 2016 CALGreen Code Section 4.106.4.1, or the most applicable code at the time of construction.
5.21	Climate Change	<p><b>MM 21-16</b> The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that “alternative energy fueling stations” shall be installed as follows. An “alternative energy vehicle fueling station” is a 208/240 VAC electrical vehicle charging station or a station providing another new or improved technology (e.g. compressed natural gas (CNG) and hydrogen fuel cell) that provides refueling for vehicles that do not use fossil fuel. An electric charging station shall allow for simultaneous charging of two electric vehicles.</p> <ul style="list-style-type: none"> <li>• Business Park and Institutional land use designations shall provide a minimum of one alternative energy vehicle fueling station on site for the first 50,000 square feet of usable floor space and additional alternative energy vehicle fueling stations for each additional 50,000 square feet of usable floor space thereafter.</li> <li>• Multi-family residential buildings of at least 20 residential units shall provide a minimum of one alternative energy vehicle fueling station for the first twenty (20) residential units and an additional alternative energy vehicle fueling station for each additional twenty (20) residential units thereafter.</li> <li>• The Town Center and each Village Center shall provide a minimum of one alternative energy vehicle charging station.</li> <li>• Designated Transit Hubs shall provide a minimum of one alternative energy vehicle charging station.</li> </ul>
5.21	Climate Change	<p><b>MM 21-17</b> The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the building designs for non-residential buildings:</p> <ul style="list-style-type: none"> <li>• Bicycle parking spaces at a rate of 5 percent of minimum required vehicle parking spaces for nonresidential land uses.</li> <li>• Preferential parking for low-emitting, fuel-efficient, and carpool/van vehicles shall be provided as specified in Section A5.106.5.1, Nonresidential Voluntary Measures, of the CALGreen Code.</li> </ul>
5.21	Climate Change	<p><b>MM 21-18</b> The Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the building designs or specifications for multi-family residential buildings:</p> <ul style="list-style-type: none"> <li>• Visitor parking shall include preferentially located parking spaces for alternative-fueled vehicles.</li> <li>• Bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code or as required by County Code Section 22.52.1225B, whichever is more stringent.</li> </ul>

**TABLE 1-2  
CENTENNIAL SPECIFIC PLAN MITIGATION SUMMARY**

#	Environmental Factor	Mitigation
5.21	Climate Change	<p><b>MM 21-19</b> For parking structures and parking lots with 20 or more parking spaces, the Project Applicant/Developer shall provide plans and specifications to the County demonstrating that the following features have been incorporated into the parking facility:</p> <ul style="list-style-type: none"> <li>• The parking facility shall include a minimum of five percent preferentially located parking spaces for alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles.</li> <li>• The parking facility shall include at least one electric vehicle charging station. Electrical lines shall be designed and sized to add additional charging stations for up to three percent of the total parking spaces when a demand is demonstrated. The design and installation shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, of the CALGreen Code.</li> <li>• For residential parking facilities, bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen code or as required by County Code Section 22.52.1225B, whichever is more stringent.</li> </ul>
5.21	Climate Change	<p><b>MM 21-20</b> The Project Applicant/Developer shall ensure that the implementation of the Green Development Program takes into account compliance with the following regulations.</p> <ol style="list-style-type: none"> <li>1) Regulations that are quantified inputs into the CalEEMod analysis, resulting in GHG Reductions: <ol style="list-style-type: none"> <li>a) Pavley Motor Vehicle Standards (AB 1493)</li> <li>b) Low Carbon Fuel Standard (California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 7, Section 95480 et seq.)</li> <li>c) Title 24 (part 6 [Energy Code] and part 11 [CALGreen Code]) of the California Code of Regulations</li> <li>d) Renewable Portfolio Standard (SB X1 2 and SB 350)</li> <li>e) Solid Waste Diversion (AB 341)</li> <li>f) Statewide reduction in potable urban water usage of 25 percent relative to water use in 2013 (Executive Order B-29-15)</li> <li>g) Model Water Efficient Landscape Ordinance (MWEL0) (California Code of Regulations, Title 23, Division 2, Chapter 2.7)</li> <li>h) Los Angeles Tree Planting Ordinance (Los Angeles County Code, Title 22, Division 1, Chapter 22, Part 20, Sections 22.52.2100 et seq.)</li> <li>i) Los Angeles County Green Building Standards Code (Los Angeles County Code, Title 31, Chapter 1, Sections 100 et seq.)</li> <li>j) California Water Code (California Code of Regulations, Division 6, Part 2.10, Sections 10910–10915)</li> <li>k) Los Angeles County Community Climate Action Plan</li> </ol> </li> <li>2) Regulations that are not quantified inputs into the CalEEMod analysis, but should be considered for incorporation as appropriate:</li> </ol>

## 1.10 ALTERNATIVES

The Alternatives Section (Section 8.0) discusses the potential impacts of alternatives that have been created as alternate approaches to the proposed Project. Six of eight possible alternatives are discussed; they are: Alternative A, No Project Alternative; Alternative B, Previously Proposed Project Alternative; Alternative C, Additional Drainage Avoidance Alternative; Alternative D, Infrastructure Relocation Alternative; Alternative E, Density Clustering/East of Aqueduct Alternative; and Alternative F, Central EOA Development Alternative. Each Alternative has a description and a summary of the impacts of each. The Environmentally Superior Alternative, as determined in accordance with CEQA, is Alternative E, Density Clustering/East of Aqueduct Alternative.

## 1.11 AREAS OF CONTROVERSY

CEQA requires that areas of controversy and unresolved issues be identified up front as part of the EIR. As discussed previously, the scope of this EIR includes issues identified by agencies and the public in response to circulation of the NOP. The following are the primary issues that are unresolved or that involve an element of potential controversy:

- The scoping process identified the public's concern over availability of water supplies. The sources of water and the sufficiency of water supplies to serve the Project are discussed in Section 5.18 (Water Resources).
- Comments have been received during the scoping process indicating concern regarding creation of nighttime light pollution with Project implementation. Section 5.13 (Visual Resources), particularly the analysis of Threshold 13-5, addresses impacts related to daytime and nighttime light and glare sources associated with the Project.
- The scoping process identified the public's concern over preservation of open space. As a means of addressing this issue, the Project provides 12,323 acres in open space. In order to analyze potential impacts, land resource impacts are discussed in Section 5.5 (Land Resources), land use and planning impacts are discussed in Section 5.8 (Land Use, Entitlements and Planning), and aesthetic impacts are discussed in Section 5.13 (Visual Resources), among other sections.
- Comments have been received during the scoping process indicating that the proposed Project should not be approved because it impacts California condor habitat. EIR Section 5.7 (Biological Resources) analyzes this issue and demonstrates that the Project area is outside the designated critical habitat for the California condor.
- The Project proposes the development of 19,333 housing units on the Project site. The appropriateness of this amount of development in the proposed location has been questioned. EIR Section 5.9 analyzes the population, housing, and employment impacts that would result from the implementation of the proposed Project. Further, EIR Section 5.10 (Traffic, Access and Circulation), Section 5.11 (Air Resources), Section 5.17 (Other Public Services), and Section 5.18 (Water Resources), among others, analyze the infrastructure needed for the Project and impacts associated with developing the Project at the Project site. Section 5.7 (Biological Resources) analyzes the direct and

indirect impacts to local and regional biological resources and issues, including wildlife movement, with implementation of the Project.

- The *Centennial Specific Plan* proposes development adjacent to the San Andreas Significant Ecological Areas (SEA) designated by the County of Los Angeles, but would not impact the SEA. EIR Section 5.7 (Biological Resources), particularly the analysis of Threshold 7-5, addresses impacts to biological resources.
- SR-138 and I-5 are the main travel routes projected to be used by residents and employees within the Project. They are facilities under the control of Caltrans; therefore, the County does not have the authority to modify access to these highways. There is a concern that the additional traffic would impact the facilities in a manner that will affect existing and future travelers on the facilities. The Project includes a comprehensive mitigation program—including an agreement between the Project proponents, the County, and Caltrans—to mitigate the additional trips to a less than significant level. This issue is addressed in Section 5.10 (Traffic, Access, and Circulation).

## 1.12 REFERENCED DOCUMENTS AND AVAILABILITY OF STUDIES AND REPORTS

Copies of this Draft EIR, the technical appendices, and all cited or referenced studies or reports are available for review at the County of Los Angeles Department of Regional Planning located at 320 West Temple Street, Los Angeles, California. The EIR and technical appendices are also available for review on the Los Angeles County Department of Regional Planning website ([www.planning.lacounty.gov](http://www.planning.lacounty.gov)) and as CDs in the following libraries:<sup>6</sup>

## 2.0 INTRODUCTION

### 2.1 PURPOSE OF THE ENVIRONMENTAL IMPACT REPORT

This Environmental Impact Report (EIR) has been prepared to evaluate the potential environmental impacts associated with the construction and operation of the Centennial Project (Project). This EIR has been prepared in conformance with the California Environmental Quality Act (CEQA; *California Public Resources Code* [PRC], Sections 21000 et seq.) and the State CEQA Guidelines (Title 14, *California Code of Regulations* [CCR], Sections 15000 et seq.). This EIR addresses the potential environmental impacts associated with developing all of the land uses and implementing the associated actions identified in the Project's Conceptual Land Use Plan through buildout.

The County of Los Angeles (County) is the “public agency which has the principal responsibility for carrying out or approving the project” and, as such, is the “Lead Agency” for this Project under CEQA (14 CCR 15367). CEQA requires the Lead Agency to consider the information contained in the EIR prior to taking any discretionary action. The County, as the Lead Agency, will review and consider this EIR in its decision to approve, revise, or deny the Project.

Under CEQA, “[t]he purpose of the environmental impact report is to identify the significant effects on the environment of a project, to identify alternatives to the proposed project, and to indicate the manner in which significant environmental effects can be mitigated or avoided” (PRC 21002.1[a]). An EIR is the most comprehensive form of environmental documentation identified in CEQA and the State CEQA Guidelines and is intended to provide an objective, factually supported, full-disclosure analysis of the environmental consequences associated with a proposed project that have the potential to result in significant, adverse environmental impacts.

### 2.2 TYPE OF ENVIRONMENTAL IMPACT REPORT

This EIR analyzes the environmental impacts related to implementation of the master planned community that is detailed in Section 4.0, Project Description. More information related to the structure of each topical EIR section and the levels of analysis is provided in Section 5.0, Regulatory and Environmental Setting, Impacts, and Mitigation.

Since approval and implementation of the Project has the potential to cause physical changes in the environment, it is considered a “Project” (as defined by Section 21065 of CEQA and Section 15378 of the State CEQA Guidelines) and thus is subject to the mandates of CEQA. In accordance with Section 15051 of the State CEQA Guidelines, the Lead Agency is the public agency with the greatest responsibility for carrying out or approving the Project as a whole. The County of Los Angeles has the primary responsibility for the approval, construction, and operation of the Project.

This EIR provides a comprehensive evaluation of the reasonably anticipated scope of the Project and evaluates the potential impacts of its construction and long-term operation. It is intended to serve as an informational document for public agency decision makers and the general public regarding (1) the objectives and components of the Project; (2) any potentially significant environmental impacts (individual and cumulative) that may be associated with the planning, construction, and operation of the Project; and (3) appropriate and feasible mitigation measures and alternatives that may be adopted to reduce or eliminate these significant impacts.

This EIR is further intended to serve as the primary environmental document for all entitlements associated with the Project, including all discretionary approvals requested or required in order to implement the Project. Subsequent actions will be reviewed as required by CEQA (Section 21166) and the State CEQA Guidelines (14 CCR 15162).

This EIR provides project-level detail pursuant to the State CEQA Guidelines, including specific infrastructure components needed to implement the Project, which state that a project EIR “examines the environmental impacts of a specific development project. This type of EIR should focus primarily on the changes in the environment that would result from the development project. The EIR shall examine all phases of the project including planning, construction, and operation” (14 CCR 15161).

This EIR analyzes Project-level impacts with the most current information provided at the time. In the case that the Project changes to add significant environmental impacts not analyzed in this EIR, additional CEQA may be required.

### **2.2.1 STANDARDS OF ADEQUACY FOR ENVIRONMENTAL IMPACT REPORTS UNDER THE CALIFORNIA ENVIRONMENTAL QUALITY ACT**

Given the role of the EIR in informing both the public and decision makers, it is critical that the information presented in this document be both accurate and adequate. The State CEQA Guidelines do not contain specific, detailed, quantified standards for the content of environmental documents. However, Section 15151 of the State CEQA Guidelines states the following:

An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.

## 2.2.2 REVIEW OF AN ENVIRONMENTAL IMPACT REPORT

The County of Los Angeles, which has the principal responsibility for processing and approving the Project and other public agencies with direct interest in the Project (e.g., responsible and trustee agencies) that may use this EIR in their decision-making or permitting processes will consider the information in this EIR along with other information that may be presented during the CEQA process. In addition, this EIR is the primary reference document in the formulation and implementation of a Mitigation Monitoring and Reporting Program (MMRP) for the Project.

In accordance with CEQA, public agencies are required to make appropriate findings for each potential environmental impact identified in the EIR that cannot be mitigated to a less than significant level. If the Lead Agency (and responsible agencies using this CEQA document for associated permits or approvals) decides that the benefits of the Project outweigh any identified significant environmental effects that cannot be mitigated to below a threshold of significance, it (the Lead Agency) is required to adopt a Statement of Overriding Considerations, which states the reasons that support its actions.

The actions involved in the implementation of the Project are described in Section 4.8, Intended Use of the EIR. Other agencies that may have discretionary approval over the Project, or components thereof, including responsible and trustee agencies, are also described in Section 4.8, Intended Use of the EIR.

## 2.3 SCOPE OF THE ENVIRONMENTAL IMPACT REPORT

### 2.3.1 2004 NOTICE OF PREPARATION AND SCOPING PROCESS

The County has complied with the State CEQA Guidelines by providing opportunities for public participation in the environmental review process. Specifically, the Notice of Preparation (NOP) was distributed on March 15, 2004, to federal, State, regional, and local government agencies and interested parties to solicit comments and to inform agencies and the public of the Project during a 30-day public review period that extended from March 15 to April 14, 2004.

Copies of the NOP were also made available at the following libraries:

Quartz Hill Library  
42018 North 50<sup>th</sup> Street West  
Quartz Hill, California 93536<sup>1</sup>

Lancaster Regional Library  
601 West Lancaster Boulevard  
Lancaster, California 93534

Valencia County Library  
23743 West Valencia Boulevard  
Santa Clarita, California 91355

Newhall County Library  
22704 West 9<sup>th</sup> Street  
Santa Clarita, California 91321

<sup>1</sup> Quartz Hill Library address prior to November 19, 2016.

San Fernando Library  
217 North Maclay Avenue  
San Fernando, California 91340

The Project, as it was envisioned in 2004, was described in the NOP; potential environmental effects associated with Project approval and implementation were identified; and agencies and the public were invited to review and comment on the Initial Study, NOP, and NOP mailing list. Three scoping meetings (two on March 30, 2004, and one on March 31, 2004) were conducted during this review period to solicit additional suggestions from the public on the content of the EIR. Attendees were provided an opportunity to identify verbally or in writing the issues they felt should be addressed.

### **2.3.2 2015 NOTICE OF PREPARATION AND SCOPING PROCESS**

Since the issuance of the 2004 NOP, two land use policy document updates have been approved by the County Board of Supervisors (BOS), including the County of Los Angeles 2035 General Plan (General Plan 2035) on March 24, 2015 and the Antelope Valley Area Plan (AVAP) Update on June 16, 2015. These updates included information and data provided by the Southern California Association of Governments (SCAG) 2012-2035 Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) adopted on April 4, 2012. These updated documents take into account the development proposed within the Project site, and the Project is consistent with and implements the requirements of the AVAP.

The 2004 NOP set forth a Project boundary that included approximately 11,680 acres. The original proposal requested approval of a three Vesting Tentative Tract Maps (VTTM) and required a General Plan amendment and zone change, among other entitlement actions. Since the issuance of the 2004 NOP, certain modifications to the Project have been made, and the County of Los Angeles subsequently confirmed that the preparation of an EIR is required. The revised Project Description includes 12,323 acres, which includes new property to the east of 300th Street, north of the SR-138. The Project includes a balance of land uses and economic development consistent with the intent and the land use designations set forth within the AVAP's West Economic Opportunity Area (EOA), which includes the Project site. As such, many of the land use entitlement actions previously requested in the 2004 NOP are no longer applicable.

A revised NOP, which included the 2004 NOP and Initial Study as attachments, was prepared and issued in October 2015 to federal, State, regional, and local government agencies and interested parties to solicit comments and to inform agencies and the public of the Project during a 30-day public review period that extended from October 5 to November 4, 2015. Comments on the NOP were received from 21 agencies and individuals, which are also provided in Appendix 2.0-A.

The County conducted a public scoping meeting for the purpose of soliciting oral and written comments from interested parties as to the appropriate scope and content of the EIR. All interested parties were invited to attend the scoping meeting to assist in identifying issues to be addressed in the EIR. The scoping meeting included a brief presentation of the Project to be addressed in the EIR and provided an opportunity for attendees to give input to the

scope of the EIR. The Scoping Meeting was held on October 21, 2015 from 6:30 PM to 8:00 PM at the Gorman Elementary School (49847 Gorman School Rd, Lebec, CA 93243 ).

The NOP was made available for public review during regular business hours at the Los Angeles County Department of Regional Planning website (<http://planning.lacounty.gov/case>) and the address listed above as well as the following library locations:

Lancaster Regional Library  
601 West Lancaster Boulevard  
Lancaster, California 93534

### **2.3.3 SCOPE OF THIS ENVIRONMENTAL IMPACT REPORT**

The scope of this EIR includes issues identified in consultation with the County during the NOP comment period, as well as environmental issues raised by agencies and the general public in response to the scoping process and circulation of the NOP. The environmental topics to be addressed (with the respective EIR section numbers) include the following:

- Geotechnical (Section 5.1)
- Hydrology and Flood (Section 5.2)
- Hazards and Fire Safety (Section 5.3)
- Water Quality (Section 5.4)
- Land Resources (Agricultural, Forestry, and Mineral Resources) (Section 5.5)
- Cultural and Tribal Resources (Section 5.6)
- Biological Resources (Section 5.7)
- Land Use, Entitlements, and Planning (Section 5.8)

---

<sup>2</sup> Quartz Hill Library address prior to November 19, 2016.

- Population, Housing, and Employment (Section 5.9)
- Traffic, Access, and Circulation (Section 5.10)
- Air Resources (Section 5.11)
- Noise (Section 5.12)
- Visual Resources (Section 5.13)
- Parks and Recreation (Section 5.14)
- Education (Section 5.15)
- Fire and Law Enforcement Services (Section 5.16)
- Other Public Services (Library, Solid Waste, and Other Public Facilities) (Section 5.17)
- Water Resources (Section 5.18)
- Wastewater Collection (Section 5.19)
- Dry Utilities (Electrical, Fossil Fuels [Natural Gas and Petroleum], Telephone, and Cable Service) (Section 5.20)
- Climate Change (Section 5.21)
- Growth-Inducing Impacts (Section 6.0)
- Cumulative Impacts (Section 7.0)
- Alternatives to the Proposed Project (Section 8.0)
- CEQA-Mandated Sections (Section 9.0)
- Document Preparation (Section 10.0)
- Acronyms (Section 11.0)
- Glossary (Section 12.0)

## 2.4 PLANNING CONTEXT

### 2.4.1 COUNTY GENERAL PLAN

As previously mentioned, the BOS voted to approve the *County of Los Angeles General Plan 2035* on March 24, 2015. The General Plan was subsequently adopted on October 6, 2015, and became effective on November 5, 2015. The General Plan 2035 serves as the land use policy for the unincorporated areas of Los Angeles County and was developed in accordance with five guiding principles: smart growth; sufficient community services and infrastructure; strong and diverse economy; excellent environmental resource management; and healthy, livable, and equitable communities. The Elements of the General Plan discuss issues affecting the County and outline goals, policies, and implementation programs that address the needs of the County and achieve its long range vision for growth and development. The General Plan 2035 discusses the Antelope Valley Planning Area and its Economic Opportunity Areas, consisting of rural town centers and areas with opportunities for economic growth and development (DRP 2014). The Project is subject to the requirements of the General Plan 2035.

## 2.4.2 ANTELOPE VALLEY AREA PLAN

The AVAP is a component of the County of Los Angeles General Plan that provides a coordinate statement of public policy relating to the future of the Antelope Valley. It provides more specific goals and policies for unincorporated County land in the Antelope Valley area than the County General Plan (DRP 2014). The AVAP first went to the County of Los Angeles Board of Supervisors for approval on November 12, 2014, where the Board unanimously indicated its intent to approve the AVAP and certify its Final EIR (DRP 2015c). The Los Angeles County BOS adopted the AVAP on June 16, 2015, which includes the AVAP, associated zone changes, and amendments to the Zoning Code (Title 22) (DRP 2015b).

Both the General Plan 2035 and the AVAP updates include information and data provided in SCAG's 2012–2035 RTP/SCS adopted on April 4, 2012. On April 7, 2016, SCAG's Regional Council adopted the 2016-2040 RTP/SCS. This EIR addresses the Project's consistency with the adopted AVAP in Section 5.8, Land Use, Entitlements, and Planning.

## 2.5 PROJECT SPONSORS AND CONTACT PERSONS

The County of Los Angeles is the Lead Agency for preparation of this EIR. Inquiries regarding the EIR should be directed to the County. The Applicant for the Project is Centennial Founders, LLC. Key contact persons are as follows:

Lead Agency: County of Los Angeles  
 Department of Regional Planning  
 320 West Temple Street  
 Los Angeles, California 90012  
 Contact: Mr. Jodie Sackett  
 Email: specialprojects@planning.lacounty.gov

Project Applicant: Centennial Founders, LLC  
 28480 Avenue Stanford, Suite 210  
 Santa Clarita, California 91355

## 2.6 ENVIRONMENTAL IMPACT REPORT REVIEW

This EIR has been distributed to Responsible and Trustee Agencies, other affected agencies, surrounding jurisdictions, interested parties, and other parties who requested a copy of the EIR in accordance with Section 21092 of the *California Public Resources Code*. The Notice of Completion for the EIR was also distributed as required by CEQA. Typically, reviewers of the EIR are given a 45-day review period to prepare written comments on the document. Due to the comprehensive nature of this Project and the volume of technical materials to review, a 15-day extension (for a total 60-day review period) has been established for an initial review period prior to the first public hearing. During the public review period, this EIR (including the technical appendices) is available for review at the County of Los Angeles Department of

Regional Planning located at 320 West Temple Street, Los Angeles, California.<sup>3</sup> Additionally, copies of the EIR and technical appendices (on CD) are available at the reference desk of the same libraries listed above for the 2015 NOP, with the exception of the Quartz Hill Library (formerly located at 42018 50<sup>th</sup> Street West, Quartz Hill). The EIR is available at: Lancaster Regional Library, Castaic Library, Valencia Public Library, Old Town Newhall Library, Frazier Park Library, Canyon County JoAnne Darcy Library, San Fernando Library, Bakersfield Library–Southwest Branch, Stevenson Ranch Library, and the new Quartz Hill Library, located at 5040 West Avenue M2, Quartz Hill, California.

Written comments to the EIR should be addressed to Mr. Jodie Sackett at the address provided above under Section 2.5. Upon completion of the 60-day public review period, written responses to all significant environmental issues that were raised in written and oral comments on the EIR will be prepared and provided to all agencies and interested organizations prior to final action on the Project. These environmental comments and their responses will be included as part of the environmental record for the decision makers to consider.

## 2.7 ORGANIZATION OF THE ENVIRONMENTAL IMPACT REPORT

### 2.7.1 THE DOCUMENT AS A WHOLE

This EIR has been divided into sections and is bound in one volume. It is available both in hard copy and on DVD. This EIR contains 12 sections, as listed below, and technical appendices. For ease of use, the references have been listed at the end of each section instead of the end of the document in a separate section.

***Section 1.0: Executive Summary.*** This section presents an overview of the Project objectives, and Project setting and description; a summary of each topical analysis in the EIR, growth-inducing impacts, cumulative impacts, and alternatives analysis; a description of Project alternatives; areas of known controversy; and a summary table listing the significance finding for each threshold addressed in Section 5.0.

***Section 2.0: Introduction.*** This section provides an introduction to the EIR, the EIR process, and the public involvement process.

***Section 3.0: Environmental Setting.*** This section describes the physical setting and current land uses on the site. It also discusses the current land use designations as defined by the *County of Los Angeles 2035 General Plan* and

<sup>3</sup> Individuals or groups who would like a printed copy of the document can order directly from ARC at their own (nonrefundable) expense. Copies can be ordered from Robbie Watson by phone at (949) 660-1150 ext. 154 or by email at Robbie.Watson@e-arc.com.

*Antelope Valley Area Plan*, the current zoning, regional planning context, and summarizes possible development constraints and opportunities.

***Section 4.0: Project Description.***

This section provides a description of the Project, as illustrated by the Project's Conceptual Land Use Plan. This includes discussions of the Project's objectives, its design, implementation, and the entitlements required, among other issues.

***Section 5.0: Regulatory and Environmental Setting, Impacts, and Mitigation.***

This contains a brief overview of how each Section 5 analysis section is organized and explains the difference between a Project Design Feature (PDF) and a Mitigation Measure (MM).

***Sections 5.1–5.21.***

These sections present the regulatory and environmental settings, threshold criteria, direct and indirect environmental impacts, mitigation measures if needed, and level of significance after mitigation, including identification of any unavoidable significant impacts for the environmental topics itemized above in Section 2.3.3.

***Section 6.0: Growth-inducing Impacts.***

This section presents the analysis of possible indirect impacts due to growth wholly or partially induced by Project implementation.

***Section 7.0: Cumulative Impacts.***

This section presents the analysis of the Project's impacts in combination with anticipated impacts related to regional growth and local projects.

***Section 8.0: Alternatives to the Proposed Project.***

This section analyzes feasible alternatives to the Project that could reduce the potentially significant adverse impacts on the Project site. It also discusses how well these alternatives meet the Project objectives.

***Section 9.0: CEQA-Mandated Sections.***

This section summarizes the irreversible changes due to the Project and the Project's impacts, and discusses mitigation outside the authority of the Lead Agency.

***Section 10.0: Document Preparation.***

This section lists those persons who assisted in preparing this document.

***Section 11.0: Acronyms.***

This section lists the acronyms that have been used throughout this EIR.

**Section 12.0: Glossary.**

This section includes a glossary of terms that were frequently used in this EIR.

The technical appendices mentioned throughout this document that provide the technical support for the EIR have not been printed, except for the hard copies provided for the public at the County of Los Angeles offices. However, the technical appendices have been included in their entirety on DVDs that are included inside the front cover of all hard copies of this EIR. These appendices include the 2015 Notice of Preparation (and attachments) and responses to it; the *Centennial Specific Plan*; the technical studies prepared for the Project; and other subject-specific reports, documentation, guides, and information deemed important to the analysis. The appendix numbering corresponds to the section number (e.g., Appendix 5.1-A is used in Section 5.1, Geotechnical).

**2.7.2 ENVIRONMENTAL ANALYSIS SECTIONS (SECTION 5.1–5.21)**

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with Article 9 (Contents of Environmental Impact Reports) of the State CEQA Guidelines, each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce the significant impacts; level of significance after mitigation; and references. This information is presented in the following format:

- 5.X.1 Introduction** – Describes the purpose, focus, and format of the subsequent topical analysis; provides a summary of the analysis presented in that section; and lists the primary technical references used in that section.
- 5.X.2 Relevant Plans, Policies, and Regulations** – Lists and describes the plans, policies, laws, and regulations relevant to that topic in descending order of jurisdiction, from federal to local.
- 5.X.3 Environmental Setting** – Describes the existing physical condition of the Project site and surrounding area at the time the NOP of the EIR was distributed (in accordance with 14 CCR 15125), as it is germane to that topic. If the analysis requires an evaluation of a baseline environmental condition other than described at the time of the issuance of the NOP, the justification and method for assuming a different baseline is discussed.
- 5.X.4 Project Design Features**– Lists the numbered PDFs germane to that topic (these elements are explained in more detail in Section 5.0). PDFs are design elements that have been incorporated into the Project to avoid or minimize environmental effects. Because PDFs have been incorporated into the Project, they do not constitute mitigation measures as defined by CEQA. However, if the PDFs have mitigation value to reduce a potentially significant impact, then a corresponding mitigation measure (MM) has been prepared to ensure the implementation of the measure through the Mitigation Monitoring and Reporting Program (MMRP).

- 5.X.5 Threshold Criteria** – Lists the numbered thresholds of significance for that topic, derived from the County of Los Angeles Environmental Checklist.
- 5.X.6 Environmental Impacts** – Includes the analysis of environmental impacts under each threshold criterion identified for that topic (listed in bold italics). If the subject matter is sufficiently related, threshold criteria may be grouped together to streamline the analysis. The analysis includes a description of the Project-related impacts on the environment, which is determined by comparing the effect of the Project on the baseline environmental condition. At the conclusion of the analysis for each threshold, an “impact summary” is provided that summarizes the level of significance for that threshold after consideration of PDFs and MMs.
- 5.X.7 Mitigation Measures** – Lists numbered mitigation measures for all significant impacts identified in the analysis.
- 5.X.8 Level of Significance After Mitigation** – Summarizes the overall level of significance for that topic as a whole, after all recommended mitigation measures have been implemented.
- 5.X.9 References** – Includes an alphabetical listing of all references used in that section. The technical reports used for the topical analyses are referenced as well.

## 3.0 ENVIRONMENTAL SETTING

Section 15125 of the Guidelines adopted pursuant to the California Environmental Quality Act (CEQA) states that “an EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published”. Also, Section 21060.5 of CEQA defines “environment” as “the physical conditions that exist within the area which will be affected by a proposed project, including land, air, water, minerals, flora, fauna, noise, or objects of historic or aesthetic significance”. This section summarizes the environmental setting for the Project and its vicinity as it existed when the Notice of Preparation (NOP) was filed in 2015. This section also (1) includes the current land uses on the property and the County zoning and general plan designations for the Project site; (2) discusses the Project site in its regional planning context; and (3) includes an overview of the constraints and opportunities of developing the Project.

### 3.1 PHYSICAL SETTING

The following provides an overview of the general environmental setting and the Project site’s relationship to the surrounding area. For more detailed information on the overview summary provided in this section, please refer to the appropriate environmental topic in Sections 5.1 through 5.21 of this EIR.

#### 3.1.1 PROJECT LOCATION AND SURROUNDING LAND USES

The Project is proposed on approximately 12,323 acres (19.3 square miles) of land in the northwestern portion of the Antelope Valley in unincorporated Los Angeles County. Exhibit 3-1, Regional Location, depicts the Project site boundary in the context of the larger privately owned Tejon Ranch, which is actively used for grazing; farming; hunting; mineral, oil, and, gas extraction. Tejon Ranch is located mainly north of the Project site, primarily in Kern County.

The Project site is located approximately 35 miles north of the City of Santa Clarita in Los Angeles County; approximately 50 miles south of the City of Bakersfield in Kern County via State Route (SR) 99 and Interstate (I) 5; and approximately 36 and 43 miles west of the Cities of Lancaster and Palmdale, respectively, in Los Angeles County via SR-138. As shown on Exhibit 3-2, Project Vicinity Map, the Project site is bisected by SR-138 and is located approximately one mile east of I-5, just south of the Kern County/Los Angeles County boundary in the vicinity of Quail Lake. The community of Gorman in Los Angeles County is adjacent to I-5 and is approximately four miles north of the I-5/SR-138 junction. The community of Neenach is located approximately 1.2 miles to the east of the Project boundary. The West Branch of the State Water Project’s (SWP) California Aqueduct bisects the Project. Additional Project location information is provided in Section 3.2.

To the north of the Project site in Kern County is the National Cement Plant, which is served by a private paved road: Wayne Hands Road (also known as “National Cement Plant Road”, which is the name this document uses), which runs through the Project site and ends at the National Cement Plant. This road is proposed to be realigned on the Project site as a part of

D:\Projects\3CEN\Centennial\MXD\EIR\Ex\_regional\_location\_20150903.mxd

## Regional Location

## Exhibit 3-1

Centennial Project

D:\Projects\3CEN\Centennial\MXD\IER\EX\_vicinity\_aerial\_20150831.mxd

**Project Vicinity Map**

**Exhibit 3-2**

Centennial Project

the Project. The off-site National Cement Plant manufactures Portland cement from limestone deposits on its site, which is leased from Tejon Ranch.

To the east of the Project site are scattered residential and agricultural uses and the small community of Neenach. The High Desert Hunt Club is located southeast of the Project site and includes approximately 7,530 acres of land located on Tejon Ranch and 6,383 acres south of the Project site along SR-138 that is used for upland bird hunting (see Exhibit 3-2, Project Vicinity Map).

To the west of the Project site is the community of Gorman, located along I-5 approximately four miles from the Project site (as measured from the area just east of Quail Lake). The Hungry Valley State Vehicular Recreation Area (SVRA) is immediately west of I-5 at the Gorman exit, west of the Project area. The Hungry Valley SVRA contains over 19,000 acres, including campgrounds and trails for motorcycles, all-terrain vehicles (ATVs), dune buggies, and four-wheel-drive vehicles. Farther to the west is the 1.75-million-acre Los Padres National Forest located approximately 5 miles from the Project site in Ventura County.

To the south of the Project site is Quail Lake and SR-138, which also runs through the Project site. Residences are scattered throughout the foothills that lead up to the 693,000-acre Angeles National Forest (ANF), located approximately 1 to 3 miles from the Project site's southerly boundary (see Exhibit 3-2, Project Vicinity Map). The ANF extends for approximately 20 miles south to the Santa Clarita Valley.

### **3.1.2 CLIMATE, TOPOGRAPHIC, GEOLOGIC, AND VISUAL SETTING**

Temperatures in the area rarely exceed 100 degrees Fahrenheit (°F) in the summer or drop below 20°F in the winter. The average annual temperature measured on Tejon Ranch from 2012 through 2014 was 67°F (WRCC 2015a). Average annual precipitation measured on the Tejon Ranch from 2012 through 2014 was 8.05 inches; however, 2013 and 2014 were drought years and in 2012, a relatively wet year, total annual precipitation was 11.53 inches (WRCC 2015b).

The Project site is situated in the western portion of the Antelope Valley and in the foothills of the Tehachapi Mountains. As shown on Exhibit 3-3, Aerial Photograph and Project Boundary, the Project site is generally bisected by the West Branch of the California Aqueduct. The western portion of the site (i.e., west of the Aqueduct) is characterized by moderate to steep hills and canyons with oak woodlands and riparian areas, and the eastern portion of the site (i.e., east of the Aqueduct) is characterized by open, gently sloping mesa grasslands dissected by a network of arroyos. Elevations range from approximately 3,000 feet above mean sea level (msl) on the Antelope Valley floor in the northeastern portion of the site to approximately 4,250 feet above msl in the southwestern portion of the property.

The Project site, as with Southern California in its entirety, lies in a seismically active region and experiences moderate to strong ground shaking from earthquakes generated on one or more active earthquake faults on or near the site and in the region. The nearest known active fault is the San Andreas Fault, a portion of which transects the southwestern corner of the Project site. In addition, recent site-specific geotechnical studies identified two previously

D:\Projects\3CEN\Centennial\MXD\EX\_Site\_Plan\_20150831.mxd

# Aerial Photograph and Project Boundary

# Exhibit 3-3

Centennial Project

unknown active faults that traverse portions of the site (see Exhibit 5.1-2, Geologic Hazards). Please refer to Section 5.1, Geotechnical, for more information on the geologic setting of the Project site.

The Project site is at a lower elevation than much of the surrounding landforms. The Project site is comprised largely of low rolling hills, with areas of steeper slopes and higher elevations in the western and northwestern portions of the site. The Tehachapi Mountains border the northern and western perimeter of the Project site, and the San Gabriel Mountains are located to the south of the Project site. Therefore, public views of the Project site from the north, west, and portions of the south are blocked by topography. The Project site is primarily visible from public roadways adjacent to the southern and eastern portions of the site, including SR-138, 300<sup>th</sup> Street West, and 290<sup>th</sup> Street West. From the eastern bank of Quail Lake to the western site perimeter, the majority of the Project site eastward and to the north of SR-138 is obscured from view by the local hillsides surrounding Quail Lake. Please refer to Section 5.13, Visual Resources, for further discussion of site visibility and the existing and proposed visual character of the Project site.

### **3.1.3 CULTURAL AND HISTORIC SETTING**

Please refer to Section 5.6, Cultural and Tribal Resources, for further discussion of these topics.

#### **Archaeological and Tribal Cultural**

The Tejon Ranch region, including the Project site, was a contact point between five separate ethnolinguistic groups immediately prior to the arrival of Euro Americans in California. The general Tejon region was inhabited by the Kitanemuk, Interior Chumash, Tataviam, Southern Valley Yokuts, and Kawaiisu. The first three of these groups are likely to have lived in and/or used the lands comprising the Project site. The Tejon Ranch area became a multi-ethnic, post-Mission Period refuge for many Native Americans. Substantial Native American use of the Tejon Ranch region continued into the American Period, likely due to the relative remoteness of the region from most Euro-American activities.

#### **Paleontological**

The literature review completed for the Project reveals that two of the three rock formations identified on the Project site are considered to be sensitive for the presence of fossil resources. They include (1) the marine Late Miocene Quail Lake Formation, which is exposed in the elevated parts of the southwestern portion of the Project site (north of SR-138), northwest of Quail Lake, and in part of the elevated areas of the southeastern portion of the Project site, south of SR-138 and (2) the Late Miocene Oso Canyon Formation, which grades into the Quail Lake Formation. The Neenach Volcanic Formation, exposed in the southeastern portion of the Project area on the west side of Tentrock Canyon and northeast of La Liebre Ranch, will likely lack fossils. Older Quaternary terrace deposits occurring around the exposures of the Oso Canyon Formation may contain significant fossils, probably similar to those from the famous Rancho La Brea asphalt deposits (i.e., the La Brea Tar Pits)

in Los Angeles. Younger Quaternary alluvium, which is located in drainages in the lower-lying areas, is unlikely to contain any fossil deposits.

## Historic

Four large Mexican Period land grants in this region occurred during the 1840s that would eventually be united as Tejon Ranch. Because of its remote location from the coast, the Tejon Ranch/Tehachapi Mountains area saw little Euro-American development until about the 1850s. In 1854, Edward Fitzgerald Beale was appointed by President Millard Fillmore to establish an Indian reservation in the southern San Joaquin Valley that eventually moved to Tejon Canyon on the El Tejon Land Grant. The United States established a military post and Indian reservation at the top of Grapevine Canyon in 1854 and named it Fort Tejon. The Fort was a major stopping place for stagecoaches and mule-drawn wagon trains going by an inland route between the cities in Southern California and those in the Central Valley region and San Francisco.

Beale began purchasing large Mexican land grants that had come under ownership of the United States as an outcome of the Mexican War. One of the large grants was the 36,800-acre La Liebre Rancho that had been owned by Jose Mario Florez. Beale secured ownership of this grant, along with the El Tejon grant, and would eventually create the Tejon Ranchos comprising over 276,000 acres of land. The current Project site is located in the extreme southern end of the Tejon Ranchos area.

### 3.1.4 BIOLOGICAL SETTING

#### Vegetation

Most of the land on the Project site is currently used for livestock grazing, which is how it has been used for more than 150 years. An approximate 1,000-acre area in the eastern portion of the property is under agricultural cultivation. There are a variety of vegetation types on the Project site; however, the site is dominated by grasslands. There is considerable variation in species composition within these grasslands based on soil type, grazing pressure, slope and aspect, available groundwater, and disturbance history. As is typical in California, both native and non-native species occur within the mosaic of grassland types, producing a mix of patches of non-native grassland and native grassland. Wildflower fields are a component within portions of the grasslands and are expected to occur throughout most of the Project site.

There are also riparian and wetland vegetation types on site occurring in association with drainages, springs, and seeps. Oak woodland vegetation types are dominant in the westernmost and the southern portions of the Project area as a whole, and consist of dense stands of both deciduous and evergreen oak species. Scrub vegetation types (primarily chaparral) are generally found in the western portion of the Project site on somewhat eroded, steep slopes. In the lower elevations of the Project site, a rabbitbrush scrub vegetation type is present. Please refer to Section 5.7, Biological Resources, for a complete description of these resources.

## Wildlife

There are a number of wildlife species that have been identified or that would be expected to occur on the Project site. Invertebrate species identified on the site include numerous butterfly species as well as fairy shrimp, an aquatic invertebrate. Fish habitat is extremely limited, and only the most ubiquitous and tolerant species, such as the non-native mosquitofish, are expected to occur. Several common amphibian species are expected to occur or have been found, including the western toad, Pacific treefrog, and several species of slender salamanders. Common reptile species observed or expected to occur on the Project site include the western fence lizard, side-blotched lizard, western whiptail, gopher snake, red coachwhip, and western rattlesnake.

A variety of bird species, including raptors, are expected to reside on the Project site throughout the year, while other species are present only during certain seasons. For example, grassland vegetation types on the site support breeding residents, including the mourning dove, Say's phoebe, horned lark, lark sparrow, and western meadowlark. Migratory birds expected to use this vegetation on the site, either during the summer or winter, include species such as western kingbird and American pipit. Rodents and other small mammals are expected to be among the most diverse and widespread mammals on the Project site. Mammal species include mice, squirrels, skunks, bats, desert cottontail, coyote, gray fox, mule deer, pronghorn antelope, black bear, mountain lion, and bobcat. Please refer to Section 5.7, Biological Resources, for a complete listing of these resources.

### 3.1.5 HYDROLOGY AND DRAINAGE CHARACTERISTICS

The Project site is located primarily within the limits of the Antelope Valley Watershed, as defined by the County of Los Angeles Department of Public Works. The Antelope Valley Watershed straddles the Los Angeles County-Kern County border and primarily encompasses the valley bottom, receiving flows from nearby streams that originate from the surrounding mountains. The Santa Clara River Watershed is the adjacent watershed to the southwest and is under the jurisdiction of the Los Angeles Regional Water Quality Control Board (Los Angeles RWQCB), which has been designated "Region 4" by the California Water Resources Control Board (SWRCB). Approximately ten percent of the Project site is within Region 4. However, 90 percent of the Project site is located within the jurisdiction of the Lahontan Regional Water Quality Control Board (Lahontan RWQCB), which has been designated "Region 6" by the SWRCB (see Exhibit 5.2-1, Regional Water Quality Control Board Boundaries). The Project site is also contained within the Antelope Hydrologic Unit, as identified in the Lahontan RWQCB's Water Quality Control Plan (Lahontan RWQCB 1994).

Local drainages within the Project site include Oso Canyon; Los Alamos Creek; Tentrock Canyon; Horsecamp Canyon; and Cow Springs Canyon (see Exhibit 5.2-3, Existing Watershed and Drainage Nodes). As indicated above, the West Branch of the California Aqueduct bisects the Project site from the northeast to the southwest (see Exhibit 3-2, Project Vicinity Map). The Project site falls within an approximate 37,500-acre watershed with four distinct drainage basins: the East Drainage Area (in the northeastern portion of the Project site); the Quail Lake Drainage Area; the Gorman Creek Tributary; and the Oso Canyon Drainage Area (see Exhibit 5.2-2, Drainage Areas on the Project Site).

Surface flows on the site generally flow eastward. Most of the water in the on-site drainages infiltrates into the alluvial sandy plain in the eastern portion of the site. The dominant water sources for the site are runoff from the mountains to the west and south, and surface water runoff. Another water source is groundwater discharge (e.g., seeps, springs).

A few small channels (less than 0.1 mile in length) on the western side of the Aqueduct flow into, or toward, Quail Lake. No surface waters from the site enter the lined portions of the California Aqueduct. Culverts under the Aqueduct facilitate eastward-flowing drainage courses. Several small areas of impounded water or depressions generally associated with springs or flats are present on the site. Most, if not all these ponds, were created to provide water for livestock. Project site drainage characteristics are detailed in Section 5.2, Hydrology and Flood.

### **3.1.6 WATER QUALITY SETTING**

Surface and groundwater quality data for the Project site are limited. The U.S. Geological Survey (USGS) and the California Department of Water Resources (DWR) regularly monitor water quality in the California Aqueduct, but existing water quality data in and around the Project site for Oso Canyon Creek (located west of the Aqueduct), the East Drainage Area (located east of the Aqueduct), the Gorman Creek Tributary (located east of Quail Lake), and the Quail Lake Drainage Area (located north of Quail Lake) are not available. Groundwater monitoring has been conducted at several shallow and deep wells in the Project vicinity, and two USGS groundwater wells with limited water quality data are located within five miles of the eastern Project boundary.

Oso Canyon includes several creeks that flow easterly and terminate in the Antelope Valley floor to the northeast of the Project site boundary. Similarly, the East Drainage Area consists of several drainages that originate in the mountains and foothills to the south of the Project site and that flow northward across the valley floor and eventually pond in the dry lakes adjacent to the Kern County line. During large rainfall events, these drainages are likely to carry a high sediment load indicated by elevated total suspended solids (TSS) and turbidity due to the dirt roads, steep slopes, gullied land, and exposed silty and sandy soils in the watershed.

The existing water quality of Quail Lake is likely very similar to that of the State Water Project's (SWP's) water supply in the California Aqueduct directly upstream of the Project boundary. As part of the SWP, the DWR maintains a monitoring station at the Tehachapi Afterbay (Check 41), which is located immediately upstream of Quail Lake. Water quality in Quail Lake is representative of the quality of the SWP's water supply (which discharges into Quail Lake).

Groundwater in the Antelope Valley is generally high in dissolved salts because evapotranspiration increases the concentrations of minerals. Please refer to Section 5.4, Water Quality, for more detailed water quality information.

### 3.1.7 WATER RESOURCES SETTING

The Project would provide water supplies from multiple sources, including local groundwater, recycled water, Antelope Valley – East Kern Water Agency (AVEK) water, banked water, return flows, and other purchased water supplies from outside the AVEK service area in order to increase water supply reliability in normal (or average rainfall years), in single-dry year, and in multiple-dry year conditions. Each of these sources is described briefly below.

The West Antelope and Finger Buttes sub-basins of the Antelope Valley Groundwater Basin (AVGB) underlie the Project site; these sub-basins are, as a practical matter, hydrologically independent of other AVGB sub-basins, which are located further to the east of the Project site. There are three discrete aquifer systems that underlie the Project site: the western aquifer, southern aquifer, and the deep aquifer. The deep aquifer, which underlies the West Antelope sub-basin (located in the northeastern portion of the Project site), would be the principal groundwater source for the Project.

The West Branch of the California Aqueduct, a component of the SWP operated by the DWR, traverses the site in a north to south direction; Quail Lake, which is also part of the SWP, is located off site to the south of the Project site and just north of SR-138. At the present time, these facilities do not provide water supplies to the Project site. The Project would use some SWP water previously purchased from AVEK as well as from suppliers outside the AVEK service area.

Other non-SWP potable water supplies are also available for use by the Project. These supplies include 8,393 acre-feet (af) of water purchased by the Tejon Ranch Company (TRC) from the Nickel Family, LLC in 2008 and an additional 6,893 af of “Nickel Water” purchased in 2009. Under a separate exchange agreement with AVEK, these supplies would be available to the Project in the future at a ratio of 1.5 times the Nickel Water supplied to AVEK in 2008 and 2009. This agreement will provide a total of 22,180 af of future water to the Project.

Banked water is also available to the Project from the Tejon Ranch Company (TRC) Water Bank located in Kern County (see Exhibit 4-13, Centennial Project - Conceptual Domestic Water System). As of December 2015, approximately 17,287 af of water in the TRC Water Bank is stored for Project use; water banking of approximately 2,362 af of potable water supplies obtained from the SWP in years when surplus water is available (i.e., “Call Water”) can also be used to supply the Project. Centennial has entered into an agreement with Tejon Ranch for the rights to use Tejon Ranch’s water supplies. For informational purposes, there is an additional existing groundwater well in the Project vicinity; however, this well is used solely by the Cement Plant and would not be connected to the Project’s groundwater well system at any time.

Additionally, the Project proposes to use recycled water to help ensure that the Project’s potable water demands are met. Recycled water used for irrigation of landscaping will total approximately 40 percent of the community’s water demand, freeing up potable water for drinking, cooking, and other uses that require water to meet potable standards.

Please refer to Section 5.18, Water Resources, for more detailed existing setting information.

### **3.1.8 AIR RESOURCES**

The Project site is under the jurisdiction of two different air districts and lies within two different air basins. Approximately 85 percent of the site is within the boundaries of the Antelope Valley Air Quality Management District (AVAQMD), while approximately 15 percent of the southwest portion of the Project site is within the jurisdiction of South Coast Air Quality Management District (SCAQMD) (see Exhibit 5.11-1, Air District and Basin Boundaries). The portion of the site under the jurisdiction of the AVAQMD lies within the Mojave Desert Air Basin (MDAB). The portion of the Project site that is under the jurisdiction of the SCAQMD lies within the South Coast Air Basin (SoCAB).

The U.S. Environmental Protection Agency (USEPA) has designated the AVAQMD portion of the MDAB, which includes the majority of the Project site, as being a Severe-15 nonattainment area for ambient ozone (O<sub>3</sub>) concentrations; all other criteria pollutants are classified as being in attainment or unclassified. The State of California designates the MDAB as a nonattainment area for O<sub>3</sub> and for respirable particulate matter with a diameter of 10 microns or less (PM<sub>10</sub>) and in attainment or unclassified for all other criteria pollutants. Generally, State standards are more restrictive than federal standards.

The USEPA has designated the SoCAB, which includes a portion of the Project site, as being as an extreme nonattainment area for O<sub>3</sub>; in nonattainment for fine particulate matter with a diameter of 2.5 microns or less (PM<sub>2.5</sub>); and in attainment/maintenance for PM<sub>10</sub>, carbon monoxide (CO), and nitrogen dioxide (NO<sub>2</sub>). The State has designated the SoCAB as being in nonattainment for O<sub>3</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> and in attainment for CO, NO<sub>2</sub>, sulfur dioxide (SO<sub>2</sub>), and lead.

Air quality data representative of the Project site is collected at the Santa Clarita and Lancaster Monitoring Stations. The Santa Clarita Monitoring Station is approximately 29 miles southeast of the Project site. The Lancaster Monitoring Station is approximately 33 miles east of the Project site. The Santa Clarita and Lancaster monitoring data show that O<sub>3</sub> and PM<sub>10</sub> are the air pollutants of primary concern in the Project area, as related State and federal standards have been exceeded in recent years. Federal standards were exceeded for PM<sub>2.5</sub> at the Lancaster Monitoring Station and State standards were exceeded for PM<sub>2.5</sub> at the Santa Clarita Monitoring Station. Data collected at the aforementioned monitoring stations and included in Section 5.11, Air Resources, indicates a trend towards lower maximum levels and number of days exceeding the State and federal O<sub>3</sub> standards between 2012 and 2014; however, the data also indicates a trend toward increasing days of exceedances and maximum levels for PM<sub>10</sub> during this timeframe.

Please refer to Section 5.11, Air Resources, for more detailed environmental setting information.

## 3.2 EXISTING LAND USES

### 3.2.1 EXISTING OPERATIONS

The Project site consists of undeveloped land that has been primarily used for livestock grazing for more than 150 years. The Tejon Ranch Company currently leases most of the Project site to an independent company for grazing. Of the 12,323 acres of land comprising the Project site, approximately 10,950 acres (89 percent) are currently used for cattle grazing. The grazing area is spread almost entirely across the site, and grazing occurs in the spring. The total area of cattle grazing acreage on the Project site represents approximately 5 percent of the 235,829 acres of grazing land in Los Angeles County in the year 2012 (DOC 2015). In addition to cattle grazing, the Tejon Ranch Company owns and cultivates approximately 1,000 acres in the eastern portion of the Project site as 5 separate pivot fields that correlate with the approximate 642 acres of Prime Farmland on the site. The pivot fields are managed for the production of either alfalfa or a three-way forage mix (e.g., barley, oats, sedan grass). The total 1,000-acre area has been cultivated by the Tejon Ranch Company since 1998. Prior to 1998, the land was used primarily for grazing.

The High Desert Hunt Club includes approximately 7,530 acres of land located on Tejon Ranch and 6,383 acres south of the Project site along SR-138 that is used for bird hunting (see Exhibit 3-2, Project Vicinity Map). Additionally, near the northern edge of the Project site, there is an existing residential dwelling unit used to support the grazing and caretaking operations. There are two Not a Part (NAP) areas shown within the southwestern portion of the Project area. These parcels are shown on Exhibit 3-3, Aerial Photograph and Project Boundary, and are not part of the Project site, nor are they owned by the Project Applicant. Both NAPs are owned by Southern California Edison (SCE).

### 3.2.2 EXISTING PUBLIC FACILITIES AND INFRASTRUCTURE

#### Open Space and Recreation Areas

There are no existing parks or other recreational features within the Project boundaries, as the site is privately owned. However, a variety of jurisdictions own and/or maintain open space areas, parks, trails, and other recreational facilities in the vicinity of the Project site (see Exhibit 5.14-1, Existing Open Space and Recreational Areas). Section 5.14, Parks and Recreation, provides detailed descriptions of recreational opportunities in the Project vicinity, including the Angeles National Forest, the Los Padres National Forest, the Castaic Lake State Recreation Area, the Hungry Valley SVRA, Quail Lake, and Pyramid Lake. The Pacific Crest National Scenic Trail (PCT), which is administered by the U.S. Department of Agriculture (USDA) Forest Service and Pacific Crest Trail Association (PCTA), is the nearest existing trail in the Project area. It is anticipated that the PCT will be realigned to pass through the Project site adjacent to 300<sup>th</sup> Street West.

#### Schools and Libraries

There are no existing schools, libraries, or other educational facilities on the Project site. As described in Section 5.15, Education, and as depicted on Exhibit 5.15-1, Local School

Districts, the Project site is within the jurisdiction of three school districts: Gorman Joint School District, providing public elementary and junior high/middle school education (grades Kindergarten through 8<sup>th</sup> [K-8]); Westside Union Elementary School District, also providing K-8 education; and the Antelope Valley Union High School District, providing high school education (grades 9-12).

As described in Section 5.17, Other Public Services, the Antelope Valley Bookmobile, based at the Lancaster Library, currently serves the surrounding communities, including the communities of Gorman, Lake Hughes, Leona Valley, Lake Elizabeth, Holiday Valley, Antelope Acres, and Green Valley.

## **Fire Protection**

As described in Section 5.16, Fire and Law Enforcement Services, fire protection service is provided to the Project area by the Consolidated Fire Protection District of Los Angeles County, commonly known as the Los Angeles County Fire Department. Fire Station 77 at 46833 Peace Valley Road in Gorman is the nearest and the jurisdictional Los Angeles County Fire Station for the site. Several other Los Angeles County Fire Stations also provide fire services to the Project area. In addition, the Kern County Fire Department also responds to fires and other emergencies on the Project site and in the surrounding areas under an automatic mutual aid agreement with the Los Angeles County Fire Department.

Portions of the Project site are located in an area designated by the County Fire Department as a Very High Fire Hazard Severity Zone (VHFHSZ). All development within a VHFHSZ is required to meet the building construction and fuel modification requirements specified in the County Building and Safety Code for VHFHSZ areas.

## **Law Enforcement**

As described in Section 5.16, Fire and Law Enforcement Services, the Santa Clarita Valley Station of the County of Los Angeles Sheriff's Department is located near the intersection of Magic Mountain Parkway and Valencia Boulevard at 23740 Magic Mountain Parkway in Valencia, approximately 28 miles south of the Project site, as shown on Exhibit 5.16-2, Existing Law Enforcement Station Locations. This station is responsible for providing general law enforcement to the Project area. The California Highway Patrol (CHP) provides traffic control services to the Project site through its Newhall Area Station, which is located at 28648 The Old Road in Valencia, near the interchange of I-5 and SR-126, although the nearest CHP station to the Project site is the Fort Tejon Area CHP Station, located at 1033 Lebec Road in Lebec.

## **Circulation**

The Project site is located east of I-5 and adjacent to SR-138. The northern boundary of the Project site extends to the Los Angeles County/Kern County line, and the southern boundary extends just south of SR-138. The western boundary is approximately one mile east of I-5, and the eastern boundary is approximately 1.5 miles east of 300<sup>th</sup> Street West. Project-

related traffic is anticipated to utilize the major regional roadways across a broad geographic area (see Exhibit 3-2, Project Vicinity Map).

Existing roads on the Project site with public access include, as stated previously, (1) 300<sup>th</sup> Street West; (2) the National Cement Plant Road, which runs north-south through the Project site, crossing the Aqueduct's West Branch; and (3) a small portion of Gorman Post Road in the southwestern-most part of the site where it connects to SR-138. Additionally, there is a network of unpaved roadways that traverse the Project site for ranch activities, including through the areas that are to be preserved on site.

The major highway in the area is SR-138, which runs through the southern portion of the Project site and is currently built as a two-lane rural highway. The primary regional access road is via I-5, an eight-lane portion of the highway that connects with SR-138 approximately one mile west of the Project site's westernmost boundary. Major access to the Antelope Valley is via SR-14, which connects with I-5 southeast of the Project site in the Santa Clarita Valley; SR-14 then moves northeast and becomes the major north-south access into Lancaster and Palmdale. Just north of Lancaster, SR-14 connects with SR-138 east of the Project area (see Exhibit 3-1, Regional Location).

Section 5.10 (Traffic, Access, and Circulation) summarizes the existing capacities of these regional highways. No transit services currently exist in the Project area.

### 3.3 LAND USE DESIGNATIONS AND ZONING

The Project site is located within the boundaries of the Antelope Valley Area Plan (AVAP), a component of the County of Los Angeles 2035 General Plan that provides a coordinated statement of public policy relating to the future of the Antelope Valley. The Land Use Policy Map of the AVAP designates the Project site as having the following land-use designations: H5: Residential 5 (0-5 dwelling units [du]/net acre); OS-C: Open Space Conservation; CR: Rural Commercial; RL1: Rural Land 1 (1 du/1 gross acre); IL: Light Industrial; RL2: Rural Land 2 (1 du/2 gross acres). The Project site is designated on the AVAP land use map as within the West Economic Opportunity Area (DRP 2015a).

The existing zoning of the Project site includes: OS: Open Space; A-1-2: Light Agriculture; RPD: Residential Planned Development; CPD-DP: Commercial Planned Development; and MPD-DP: Manufacturing industrial planned development (DRP 2015a). The adoption of the Centennial Project would not require any amendments to the County of Los Angeles General Plan or the AVAP. A detailed discussion of land use and the related planning programs is provided in Section 5.8, Land Use, Entitlements, and Planning.

## **3.4 REGIONAL PLANNING CONTEXT**

### **3.4.1 POPULATION AND HOUSING**

As discussed in Section 5.9, Population, Housing, and Employment, there is an existing residential dwelling unit occupied by a Tejon Ranch employee at the northern-central end of the site.

Los Angeles County had a resident population of 10,241,335 in January 2016 (DOF 2016). This represented an increase in population of approximately 422,730 people (4.31 percent) between 2010 and 2016. The Southern California Association of Governments' (SCAG's) 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) projects the County's population to increase to 10.40 million people by the year 2020 and to 11.35 million by 2035 (SCAG 2012a). The recently adopted 2016-2040 RTP/SCS projects the County's population to increase to 10.33 million by 2020; to 11.15 million by 2035; and to 11.51 million by 2040 (SCAG 2016a).

The North Los Angeles County Subregion, as defined by SCAG, encompasses unincorporated County land and the Cities of Santa Clarita, Palmdale, and Lancaster. North Los Angeles County also includes the unincorporated Towns of Gorman, Neenach, Lake Hughes, Acton, and Castaic. The unincorporated Towns of Lebec and Frazier Park are within the regional vicinity of the Project site and are located in Kern County (see Exhibit 3-2, Project Vicinity Map).

The North Los Angeles County Subregion, which includes the Project site, had a population of approximately 658,755 people in 2010 (SCAG 2016b), which was 6.71 percent of the total County population of 9,818,605 persons (DOF 2016). From 2020 through 2040, the population is anticipated to grow considerably in the Cities of Santa Clarita, Lancaster, and Palmdale and in unincorporated areas of North Los Angeles County. The population of the North Los Angeles County Subregion is projected to increase by 32.97 percent between 2020 and 2040. Additionally, this subregion is projected to house approximately 8.56 percent of the County's entire population by 2040 (SCAG 2016b). This is up from 6.63 percent in 2012.

The North Los Angeles County Subregion had approximately 200,990 households in 2012. This is projected to grow to 245,473 households by 2020 and to 331,399 households by 2040. In turn, the County's estimated 2012 total of over 3.26 million households will increase to 3.49 million households by 2020 and to 3.95 million households by 2040 (SCAG 2016b). In order to meet future housing demand in the County, approximately 30,145 new housing units will be required in the unincorporated areas of Los Angeles County between 2014 and 2021 (DRP 2015a). The Project would aid in providing housing to North Los Angeles County, a subregion of the County that is projected to have an increased in demand for housing units over the next decades.

### **3.4.2 EMPLOYMENT**

Employment in Los Angeles County is estimated at over 4.24 million jobs in 2012 and is expected to increase by 415,900 jobs between 2012 and 2020 and by 563,300 jobs between 2020 and 2040 (SCAG 2016a). The North Los Angeles County Subregion had a 2012 job base of approximately 181,089 jobs, which is projected to increase to 211,300 jobs in 2020 and to 280,447 jobs by 2040 (SCAG 2016b). Additional information on employment growth and forecasts is provided in Section 5.9, Population, Housing, and Employment.

### **3.4.3 JOBS AND HOUSING BALANCE**

Jobs and housing are considered in balance when a subregion has enough employment opportunities for most people who live in the area and enough housing opportunities for most people who work in the area. A balanced condition would ultimately benefit the community by reducing the number of workers commuting to jobs outside the area and decreasing commuting times and distances for workers who do commute. This balance would minimize impacts to the regional transportation network and the quantity of related air emissions and would enhance the quality of life for Centennial residents.

No State, regional, County, or local requirements for a specific jobs/housing balance exist at the present time. The Economic Development Element of the AVAP states that the AVAP provides for a jobs/housing ratio of 1.3 jobs per dwelling unit in the unincorporated area of the Antelope Valley.

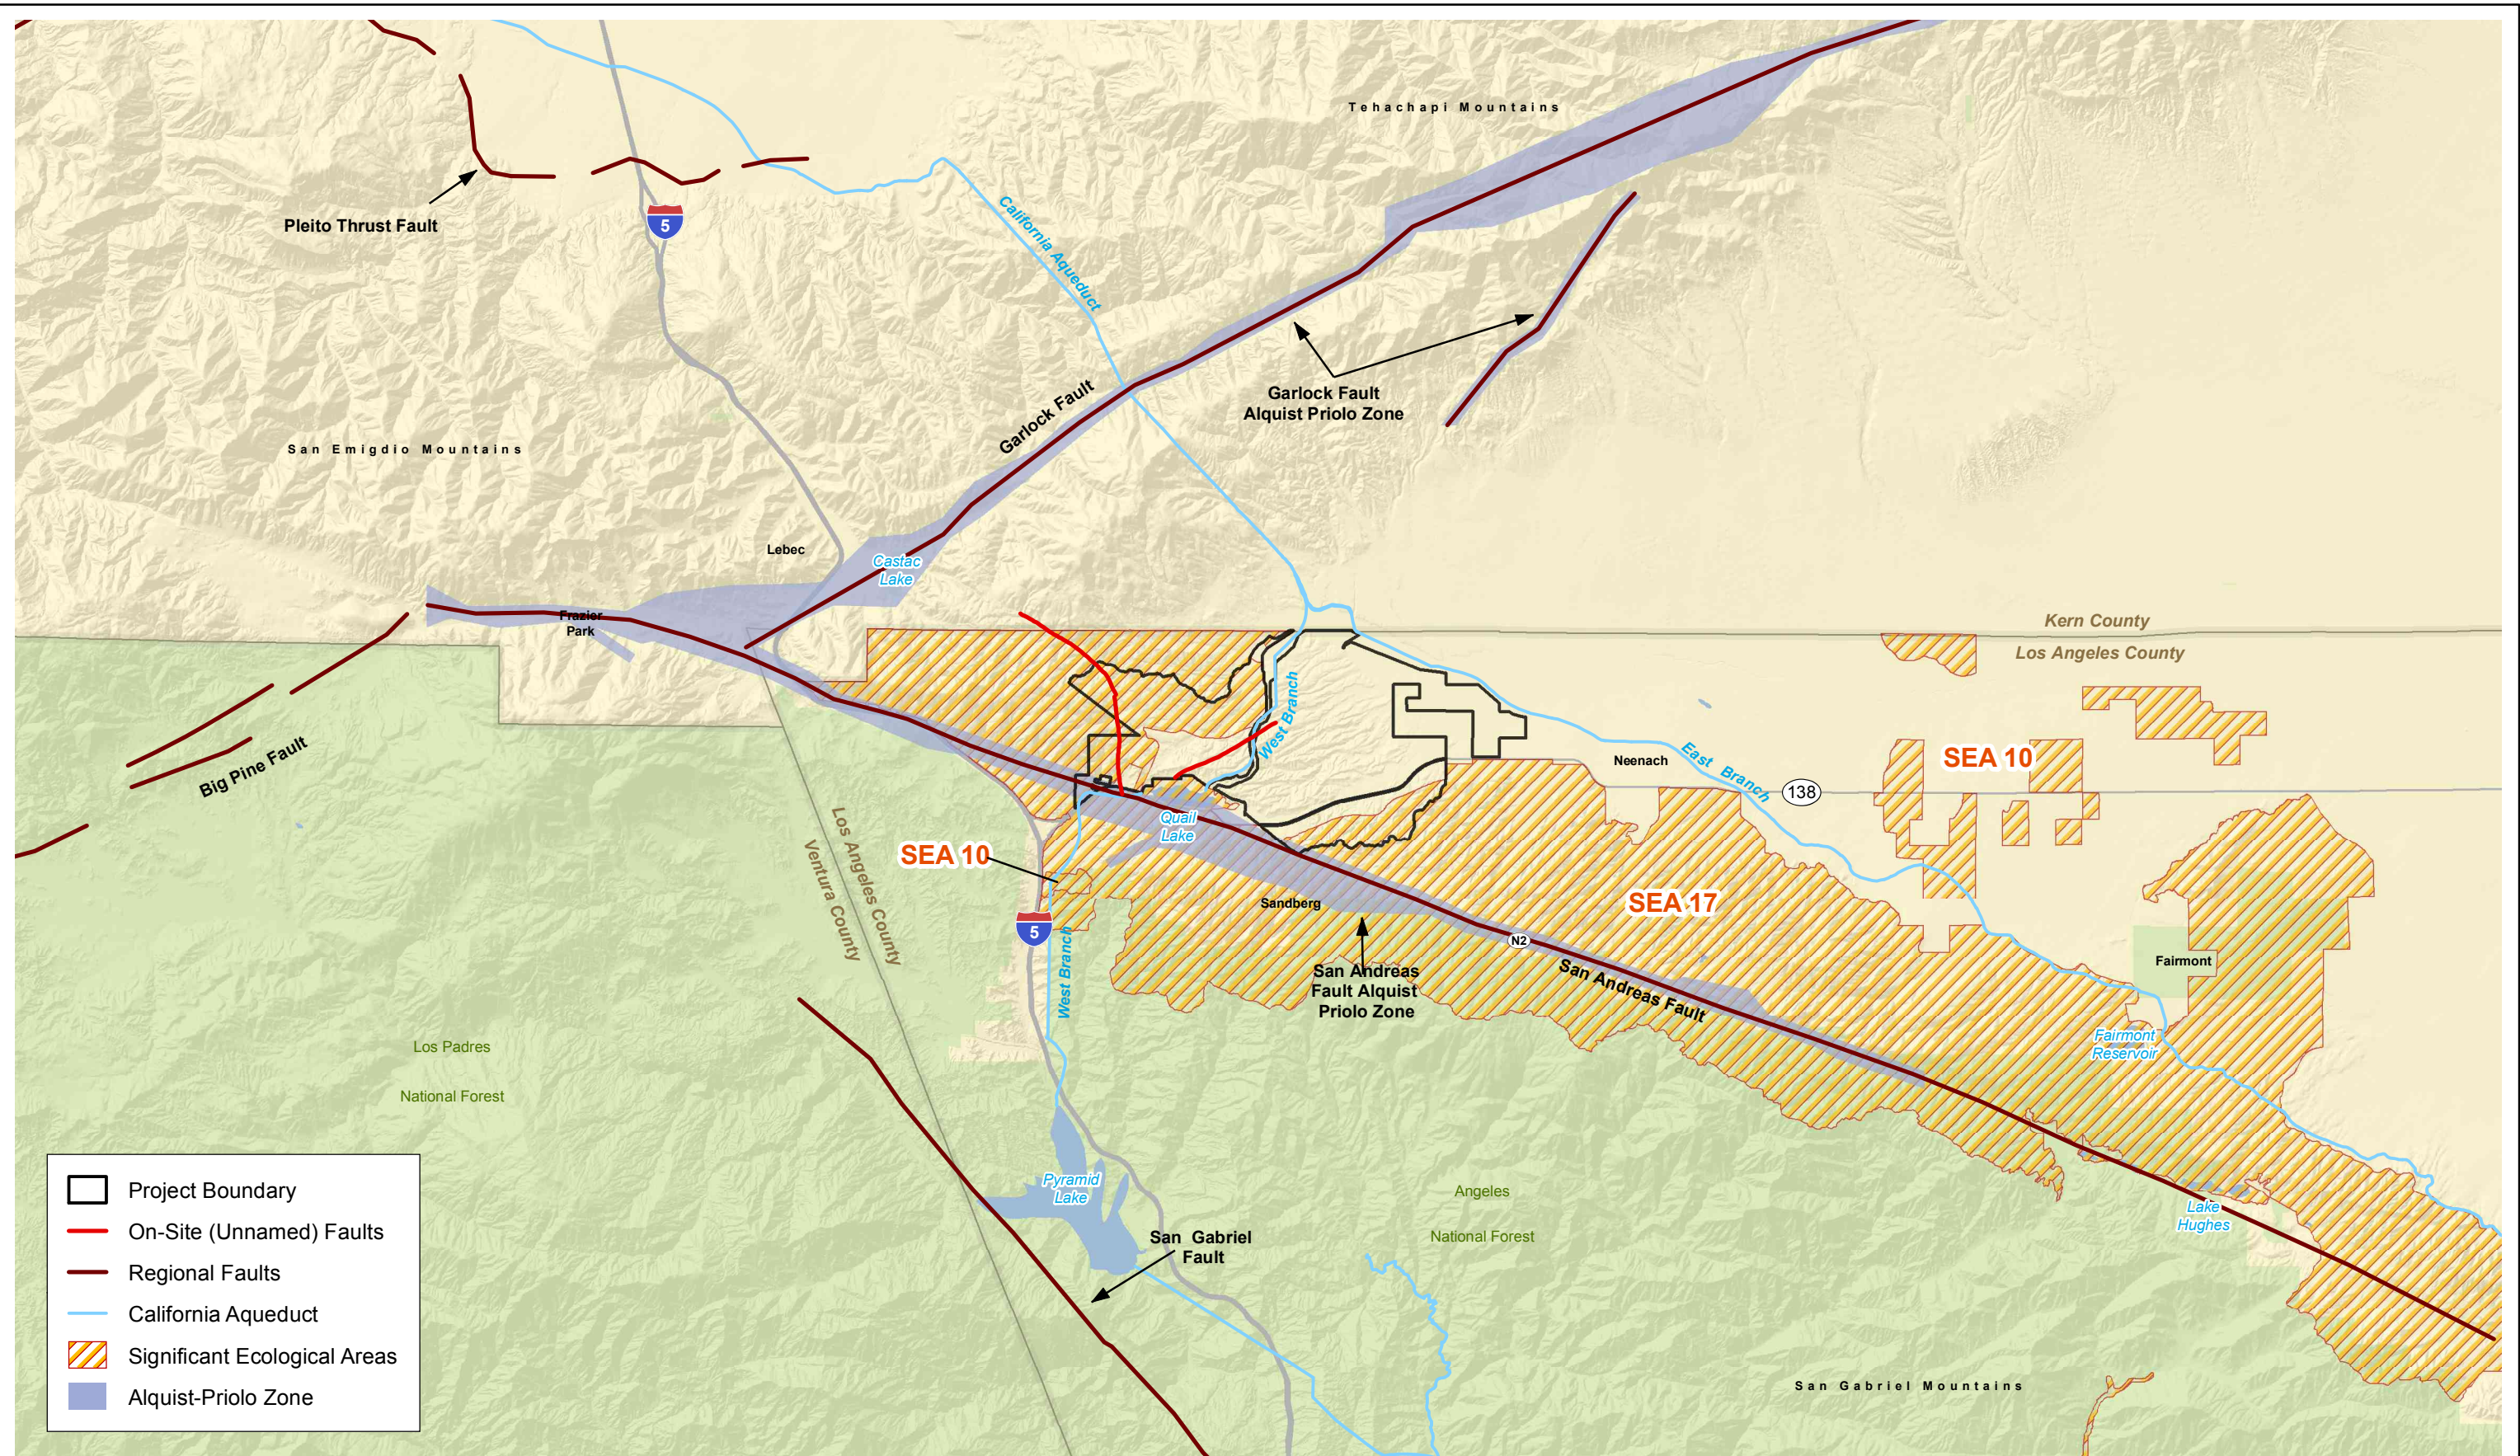

Details of the 2012 and 2040 projected jobs/housing ratios for the Project, the North Los Angeles County Subregion, and the County as a whole can be found in Section 5.9, Population, Housing, and Employment. As identified, the Centennial Project proposes development of 19,333 dwelling units and anticipates creation of approximately 23,675 permanent jobs within its commercial areas and employment centers. The projected jobs/housing balance for the Project would be approximately 1.22 to 1.

## **3.5 CONSTRAINTS AND OPPORTUNITIES**

### **3.5.1 CONSTRAINTS**

Exhibit 3-4, Local Area Constraints, provides a depiction of several physical and policy constraints to development on the Project site, including the Alquist-Priolo Zones and fault lines, the California Aqueduct, and designated Significant Ecological Areas (SEAs). The AVAP has designated a majority of the Project site as having Class 2 Constraints (i.e., moderate constraints), as depicted on their Map 4.1, Hazards and Environmental Constraints (DRP 2015a). The easternmost and northernmost portions of the Project site include small areas of land designated with Class 1 Constraints (i.e., minimal constraints), and the southwesternmost portion of the Project site includes small areas of land designated with Class 3 Constraints (i.e., severe constraints), which are related to the Alquist-Priolo Earthquake Fault Zone.

-  Project Boundary
-  On-Site (Unnamed) Faults
-  Regional Faults
-  California Aqueduct
-  Significant Ecological Areas
-  Alquist-Priolo Zone

**Local Area Constraints**

Centennial Project

(Rev. 1-20-2016 CJS) R:\Projects\CentFou (CEN)\3CEN000306\Graphics\EIR\Ex3-4\_local\_area\_constraints\_20150831.pdf

## **Geotechnical Features**

As discussed above, the southwestern corner of the Project site overlies the northern edge of the San Andreas Fault Zone (see Exhibit 3-4, Local Area Constraints). The San Andreas Fault runs an approximate length of 660 miles throughout California and is considered the longest active fault in the state. There is a designated Alquist-Priolo Earthquake Fault Zone associated with the San Andreas Fault (labeled Alquist Priolo Zone on Exhibit 3-4). The San Andreas Earthquake Fault Zone crosses the southwestern edge and southernmost point of the Project site. There are three faults on the Project site; site-specific geotechnical investigations identified that two of these three faults were previously unknown active faults (Geocon 2015). These unnamed faults traverse portions of the western half of the Project site (west of the California Aqueduct).

In addition to identifying the San Andreas Fault and the on-site faults, site-specific geotechnical investigations have identified a large ancient landslide in the northwestern portion of the Oso Canyon area (see Exhibit 5.1-2, Geologic Hazards). Please refer to Section 5.1, Geotechnical, for more information regarding the geotechnical features present on and around the Project site.

## **Hydrology and Flooding**

Numerous watercourses traverse the Project site, some of which are identified as blueline streams on the USGS Lebec and La Liebre Quadrangles (see Exhibit 5.2-3, Existing Watershed and Drainage Nodes). Notable drainages within the Project site include Oso Canyon and Tentrock Canyon. There are also a few springs scattered north and east of Quail Lake. The Federal Emergency Management Agency (FEMA) has identified the 100-year floodplain for Oso Creek as a flood-prone area subject to special requirements governing construction materials and methods, structure elevation and flood proofing, and utility standards. The FEMA 100-year floodplain traverses some northern portions of the Project site, both east and west of the Aqueduct (see Exhibit 4-5, Centennial Project - Safety Overlay Zones).

## **The California Aqueduct and National Cement Plant Road**

As mentioned above, the East Branch of the California Aqueduct is entirely off-site and runs in a northwest to southeast direction just north of the Project site. The West Branch of the Aqueduct bisects the Project site roughly north to south and widens at the southern Project boundary to empty into Quail Lake. Quail Lake, a part of the California Aqueduct system, is situated southwest of the Project site. The Aqueduct does not connect to any on-site drainages, but several drainages cross under the Aqueduct via culverts or flow over the Aqueduct siphon. The National Cement Plant Road runs north from SR-138 to the National Cement Plant, which is located approximately one mile north of the Project site. This road crosses over the West Branch in the southern portion of the Project site, just north of Quail Lake, and continues north running parallel to the West Branch along its western side.

## **Wildfires**

The Los Angeles County Fire Department (County Fire Department) designates lands within Los Angeles County that are determined to be highly vulnerable to wildfire as VHFHSZs (Los Angeles County Code, Title 32). The Antelope Valley area, including the Project site, is designated as a VHFHSZ. Project site characteristics that contribute to this designation include (a) access; (b) lack of existing adequate fire flows; (c) topography; and (d) vegetative cover. Because of this designation, development of the Project is subject to the County Fire Department's Fuel Modification Plan Guidelines and specific development standards. Please refer to Section 5.3.3, Fire Safety, for more information regarding wildfire potential on and around the Project site.

## **Cultural and Historic Resources**

The Project site as a whole contains numerous prehistoric and historic archaeological sites and paleontological localities. All but three of the sites in the western portion of the Project site have been determined not to be significant. The three significant sites will remain in open space and will not be affected by the current project. Prehistoric and historic archaeological sites in the eastern portion of the Project site are considered significant until further study confirms otherwise.

## **Biological Resources**

### ***Vegetation and Wildlife Habitat***

As discussed above in Section 3.1, Physical Setting, there is a variety of vegetation types on the Project site; however, the site is dominated by grasslands, with wildflower fields in some portions of the grasslands. The other main groups of vegetation types identified on the site include scrub and chaparral, oak woodland, riparian and bottomland habitat, and bog and marsh.

Some vegetation types are considered "special status" by various agencies, such as the California Department of Fish and Wildlife (CDFW). Special status vegetation types on the Project site include the following: Wright's buckwheat scrub; mixed oak woodland; alluvial scrub; cottonwood woodland; riparian herb; rush riparian grassland; southern arroyo willow riparian; southern cottonwood-willow woodland; southern willow scrub; unvegetated wash; valley oak riparian woodland; willow riparian forest; willow riparian woodland; alkali meadow; Baltic rush; coastal and valley freshwater marsh; seeps and ephemeral ponds; and native perennial grasslands and wildflower fields that are coincident and mixed with annual grasslands and other vegetation types.

### ***Special Status Plant and Wildlife Species***

The Project site supports a variety of special status plant and wildlife species either year round or seasonally. Populations of special status plants—including California androsace, round-leaved filaree, Mojave spineflower, Sylvan microseris, and Piute Mountains navarretia—occur in a patchy distribution scattered across the grassland areas of the site.

Most of the special status wildlife species are identified as species of concern by the CDFW. State- and or federally listed wildlife species may occur as flyovers, such as the California condor, or seasonal migrants, such as Swainsons hawk, but are not expected to breed on the site. However, focused surveys were negative for most special status species potentially occurring in the region.

### ***Wildlife Movement***

Due to the Project site's position at the edge of the Tehachapi Mountains and largely desert and high desert topography and vegetation, mountain wildlife species would not be expected to traverse the Project site with any regularity. The California Aqueduct and I-5 represent existing constraints to regional wildlife movement on the Project site. Because most of the larger wildlife species in the region do not typically cross large expanses of sparsely vegetated landscape (such as the majority of the Project site), the central and eastern portions of the Project site are not likely to be used by wildlife to move between and within the regional open space areas in the site vicinity. The Project site provides unobstructed local movement opportunities for small animals within large portions of the site. Therefore, wildlife movement at local scales would be expected to occur throughout the Project site.

### ***Significant Ecological Areas***

The southern and western portions of the Project site include lands designated as a SEAs. SEAs do not necessarily require protection or preservation, but instead require additional review of development proposals via the Significant Ecological Area Technical Advisory Committee (SEATAC) to ensure that heightened consideration is given to the biological resources that contribute to the long-term sustainability of the SEA. The objective of SEAs is to conserve genetic and physical diversity by designating biological resource areas that are capable of sustaining themselves into the future (DRP 2015b). There is one SEA-designated portion within the Project boundaries, SEA 17, San Andreas. SEA 17 would be conserved and would not be affected by Project-related grading or development.

### **Circulation**

Currently, access to the Project site can only be made from the south at SR-138, through the exit of Gorman Post Road south of the Project site and from 300<sup>th</sup> Street West. There are no access points in other directions. The West Branch of the California Aqueduct is another circulation constraint which runs in a north-south direction and bisects the Project site. Access across the Aqueduct will be limited to two bridges: one that will need to be widened and one new crossing that will be constructed as part of the Project. Because the Project site is currently used as grazing land, there is a network of unpaved private ranch roads that traverse the property. The Project's internal circulation system will be entirely new construction, with the exception of a portion of 300<sup>th</sup> Street West and the existing National Cement Plant Road, which is used to travel to the National Cement Plant located just north of the Project site's northernmost boundary.

## Noise

Because the Project site and surrounding areas are rural, they are relatively quiet. The primary source of existing noise in the Project area is traffic, both on the local streets and on major thoroughfares, including I-5 and SR-138. Other existing noise sources include activities at the Oso Pumping Station (located off site), at the Alamo Power Plant (located off site), at the SCE Bailey Substation (located on both Not a Part areas in the southwestern corner of the Project site), the Quail Lake Sky Park Airport (located off site and to the southeast of Quail Lake), the High Desert Hunt Club (south of SR-138, and farther to the southeast of the Project boundary), and the National Cement Plant (located in Kern County to the north of the Project). Detailed discussions of existing and projected noise conditions at the Project site are included in Section 5.12, Noise.

## Water Resources

The Project site is not within the jurisdiction of a public agency with responsibility for managing and delivering water supply and wastewater reclamation services to future residents. However, to address this constraint, Centennial Founders, LLC has requested the Golden Valley Municipal Water District (GVMWD or District) Board of Directors to consider annexing the Project area and operating the Project's proposed potable water, water recycling, wastewater, and, storm water facilities. The GVMWD is a California municipal water district formed and operated under Section 71000 of the *California Water Code*. The District's service area encompasses approximately 12.5 square miles and is adjacent to the Project's western boundary (GVMWD 2011). The GVMWD currently operates approximately 20 municipal water service connections and a wastewater treatment facility for the unincorporated community of Gorman. The GVMWD has approved the Centennial Project Water Supply Assessment, which contains the water demand projections that provide the basis for the Project's water supply need projections.

After completion of the annexation process, the Project's water, wastewater, and storm water systems would be owned and operated by the GVMWD or by another public utility district (PUD) that manages potable water supply systems and wastewater collection, treatment, recycled water, and storm water systems. Annexation of the Project into a PUD service area would require approval by the Los Angeles County Local Agency Formation Commission (LAFCO) and would occur after certification of this EIR.

### 3.5.2 OPPORTUNITIES

#### Hydrology and Flood

The Centennial Project's Green Development Program, in combination with the Drainage Plan will provide a combination of debris basins, water quality basins, infiltration and retention/detention basins, flood-control structures, and other Low Impact Development (LID) techniques to preserve natural drainage features, incorporating techniques that will mimic undeveloped storm water runoff rates and volumes and prevent water quality and hydromodification impacts to natural drainage systems. These systems, in combination with the Project's preservation of primary drainage corridors, would provide a storm water

management system that is highly sustainable because of its use of natural systems to control runoff rates and to promote groundwater recharge.

This integrated water resources management approach would promote natural hydrologic processes to manage storm water runoff, including implementation of the Floodplain Safety Overlay District, the Flood Control Systems Plan (Exhibit 4-16, Centennial Project - Conceptual Drainage and Flood Control System), specific Best Management Practices (BMPs), other requirements of the Standard Urban Stormwater Management Plan (SUSMP), and additional features. Implementation of these proposed storm water management features ensures that habitable structures are not constructed within a 100-year floodplain. The Project includes these storm water management techniques as Project Design Features (PDFs) and would incorporate these techniques into Project plans and specifications as part of the development plan approval process for building and grading permits.

## **Wildfires**

With development of the Project site, fire hazards associated with the natural vegetative cover would be reduced through its replacement with urban landscape vegetation. In accordance with State law, fire-safe landscaping and minimum clearance (defensible space) requirements will be used in areas susceptible to wildland fire. While the potential for fire hazards would still exist, the potential for fires to burn out of control through undeveloped land would be minimized with development. Detailed discussions of existing and projected fire hazard conditions at the Project site are included in Section 5.3, Hazards and Fire Safety.

## **Biological Resources**

Because the Project site is both large and undeveloped, there is an opportunity to preserve open space areas in perpetuity. The development of a planned community allows for the strategic incorporation of open space areas while still providing an appropriate mix of land uses needed for a new community. Conservation of open space areas also provides the opportunity to improve the biological value of these lands through habitat management, enhancement, and/or restoration. For appropriate portions of the preserved open space areas on the Project site and proposed conservation lands adjacent to the site, mitigation efforts would restore previously impacted biological resources, which would result in a higher biological value than currently exists given the history of grazing activity.

The proposed Grassland Adaptive Management Plan includes managed grazing activity as a component of maintaining the preserved grassland areas (refer to Section 5.7, Biological Resources, for more detail). However, this grazing activity would differ from current grazing activity in that the primary goal would be protection of the biological resources. Only the preserved grasslands would incorporate grazing as a management tool. Other vegetation types that would be preserved, such as oak woodlands and riparian habitat, would have limited grazing.

The location of proposed preservation areas presents an opportunity to support local wildlife movement because these areas are positioned contiguous to off-site open space areas, thereby providing a larger total area of continuous preserved open space for local

wildlife to use as habitat and for movement. The preservation of enhanced or restored open space is also an opportunity to preserve portions of SEA-designated lands. As discussed above, the SEA designation does not confer protection of those lands, but only designates these SEA lands as having high biological value. As such, development is not prohibited on SEA lands, but allowed only with a discretionary permit. Portions of the proposed preservation areas associated with the Project overlap portions of the San Andres SEA; therefore, these areas would preserve the biological resources important to the SEA in perpetuity, providing permanent protection.

## **Land Use and Planning**

As discussed above under Section 3.1.1, the Project site occupies 12,323 acres of the Antelope Valley with elevations that range from 3,635 feet above msl along a ridge overlooking Quail Lake to approximately 2,975 feet above msl in the alluvial drainage area in the east portion of the site. As such, the Project site occupies a large expanse of relatively flat topography, with the majority of the site having low rolling hills. Because of this, there is an opportunity to design a land use plan that harmoniously incorporates a wide variety of different land uses and sustainable features that are more difficult to achieve in a high-relief setting. As discussed earlier, the Project is designed to comply with the vision, assumptions, goals, and policies of the AVAP, which was approved by the Los Angeles County Board of Supervisors on June 16, 2015. The Project implements the requirements of the AVAP by including a balance of land uses consistent with the intent and the land use designations set forth in the West Economic Opportunity Area (EOA) and consistent with the AVAP.

## **Population, Housing, and Employment**

Because the Project site is largely undeveloped, development of a planned community would provide the opportunity to accommodate projected increases in population, housing, and employment in the region while allowing for a jobs/housing balance and the protection of open space and environmentally sensitive areas. The potential implementation of the Project was known at the time of the development of the AVAP and was accounted for in the AVAP's land use and population/employment growth assumptions.

The Project has been designed to provide a variety of housing stock ranging from estate to small lot single-family detached residences and single-family and multi-family attached residences (including townhomes, condominiums and apartments) in a region of Los Angeles County projected to experience substantial population growth through 2040 (see Table 5.9-2, Los Angeles County Population Projections, from Section 5.9, Population, Housing, and Employment).

The Project would include up to 19,333 housing units and would have a buildout population of approximately 57,150 residents. In addition, the Project would include the development of employment-generating uses, resulting in the creation of an estimated 23,675 permanent jobs. These jobs would be located in the West EOA, where future growth is planned and in accordance with the AVAP's Land Use Policy Map. This growth would also be consistent with adopted economic development as well as population and housing plans and projections included in the AVAP and SCAG's 2016–2040 RTP/SCS. By providing a mix of both residential

and employment-generating development on site, and in consideration of the Project's location in the vicinity of the Tejon Industrial Complex along the I-5, the Project would capitalize on the existing regional transportation network and would serve to implement regional policies aimed at environmental protection and the location of housing near job opportunities, thus reducing vehicle trips and related emissions.

## **Circulation**

The Project is adjacent to and will be served by SR-138, which removes the need for Project-generated vehicles to travel through existing neighborhoods and communities in order to access a major highway. SR-138 runs in an east-west direction and connects to I-5 to the west and SR-14 to the east. The Project site is also close to I-5, which runs the length of California. SR-14 provides access to the Palmdale-Lancaster area.

## **Existing Open Space and Recreation Areas**

The Project site is situated in northern Los Angeles County, an area with numerous public open space and recreation areas. There are federal, State-, County-, and privately operated open space and recreational areas in the Project site vicinity, including but not limited to the Angeles National Forest, the Los Padres National Forest, the Castaic Lake State Recreation Area, Quail Lake, Pyramid Lake, the Hungry Valley SVRA, the Antelope Valley California Poppy State Reserve, the Arthur B. Ripley Woodland State Park, the Fort Tejon State Historic Park, the Castaic Sports Complex, Frazier Mountain Park, the Wind Wolves Preserve, and a portion of the PCT (see Exhibit 5.14-1, Existing Open Space and Recreation Areas). Please refer to Section 5.14, Parks and Recreation, for more information on existing and proposed parks and other recreational facilities that would serve the Project site.

## **Water Resources**

Recognizing that various water sources vary in reliability and access difficulty from year to year in sometimes unpredictable ways, the Project relies upon multiple sources of water that collectively exceed the expected demand at full buildout: local groundwater, recycled water, AVEK water (including SWP water previously purchased by the Project), banked water, and imported water from sources other than the AVEK service area (described more fully in Section 5.18, Water Resources). This approach gives reliability to the Project in that, if one or more of its sources are not available in the expected amounts or in a given year, other sources of water are available to make up the difference until future years when the other sources become fully available again.

The Project's water strategy is based on principles that balance the following practices, which would ensure the Project will meet growth demands in a way that most efficiently uses scarce water resources:

- Incorporation of comprehensive water conservation design features to limit Project demand;
- Maximum use of recycled water to meet non-potable Project demands;

- California Department of Water Resources (DWR) supplies purchased or received, when available, and other AVEK (allocated or third party purchased) supplies; and
- Water banking for additional water supply security allowing for excess water supplies, when available, to be used as banked supplies in dry years to supplement or even entirely replace direct annual supplies.

## Existing Utility Infrastructure

Although the Project site is largely undeveloped, there is existing dry utility infrastructure on and immediately surrounding the site (see Exhibit 4-17, Centennial Project - Dry Utilities Plan) that could be extended to and/or upgraded, as necessary, to serve Project site development. Specifically, there are (1) SCE electric lines running north-south to the Oso Pumping Plant and National Cement Plant and east-west along SR-138 as well as the Bailey Substation located on an SCE-owned parcel in the southwestern portion of the Project site; (2) an AT&T underground telephone line running northwest to southeast across the western portion of the Project site, lines along National Cement Plant Road and the California Aqueduct, and a line along SR-138 along California Department of Transportation (Caltrans) right-of-way; (3) a SoCalGas high-pressure line along SR-138 and a line running north-south immediately west of the Project site; and (4) fiber-optic lines installed by Quest Communications adjacent to I-5. In addition, the Bailey Substation, also operated by SCE, is located adjacent to the southwestern corner but is not a part of the Project site. Please see Section 5.20, Dry Utilities, for more information regarding existing dry utility infrastructure.

Because the site is largely undeveloped, there is an opportunity to incorporate widespread energy conservation features into a planned development at several levels, from site planning to individual building construction. The Centennial Project incorporates a Green Development Program with an energy conservation element, which integrates required resource efficiency and conservation features throughout the Project (see Appendix 1-B of EIR Appendix 4.0-A).

## Climate Change

As previously discussed, the Project site is largely undeveloped; therefore, there is an opportunity to incorporate Project Design Features into a planned development that would minimize the Project's contribution to global climate change. The Project incorporates (1) a Green Development Program, which includes construction-related measures to reduce pollutant emissions from construction equipment and activity; (2) measures promoting reduction in local vehicle trips, including opportunities for pedestrian movement and reliance on public transportation; (3) required energy conservation measures intended to lower energy consumption, thereby reducing pollution associated with generation, storage, and distribution of power; (4) a community open space, landscaping, and urban forestry program to enhance greenhouse gas emissions reduction benefits; (5) water conservation measures to reduce the energy expenditures on water service; and (6) resource conservation measures to reduce the need for and associated energy cost of mining and extraction of raw materials.

Because the Project would be an entirely new and independent development, it would not rely on aging infrastructure systems, obsolete structural engineering, or land planning constraints associated with an existing urban environment. Rather, the Project will use cutting-edge technology and land use planning principles to create a balanced master-planned community where a mix of land uses are proximate to each other and connected by a network of pathways to reduce reliance on automobile use and offsite commuting in order to actively reduce greenhouse gas emissions.

## 4.0 PROJECT DESCRIPTION

### 4.1 SECTION ORGANIZATION

The purpose of the Project Description section is to describe the Centennial Project in a way that will be meaningful to the public, reviewing agencies, and decision makers. The “Project” is defined as development of all of the land uses and of the associated actions identified in the Project’s Conceptual Land Use Plan, including all ministerial and discretionary actions required for short-term construction activities and long-term operation activities.

Section 15124 of the California Environmental Quality Act (CEQA) Guidelines (*California Code of Regulations* [CCR], Title 14) requires that an environmental impact report’s (EIR’s) project description contain (1) the precise location and boundaries of a proposed project; (2) a statement of objectives sought by the proposed project including the underlying purpose of the project; (3) a general description of the project’s technical, economic, and environmental characteristics; and (4) a statement briefly describing the intended uses of the EIR, including a list of the agencies that are expected to use the EIR in their decision making, a list of the permits and other approvals required to implement the project, and a list of related environmental review and consultation requirements required by federal, State, or local laws, regulations, or policies. An adequate project description need not be exhaustive, but should supply the detail necessary for project evaluation.

An EIR is the most comprehensive form of environmental documentation identified in CEQA and the CEQA Guidelines. This Project Description provides the information needed to assess the environmental effects associated with the planning, construction, and operation of the Project. The mitigation measures for the Centennial Project are listed in the Mitigation Monitoring and Reporting Program (MMRP) located in Appendix 2.0-C of this EIR.

This section is organized as follows:

- 4.1 Section Organization** – A statement of purpose for the Project Description and the organization of the section.
- 4.2 Project Location** – A description of the Project location, boundaries, and general site characteristics.
- 4.3 Project Objectives** – A statement of the Project objectives, including overall planning goals and implementation objectives.
- 4.4 Project Overview** – An overview of the Project’s required entitlements (*Centennial Specific Plan, General Plan Amendment, Zone Change, Development Agreement; Conditional Use Permits [CUPs] for Grading and Infrastructure, and Vesting Tentative Parcel Map.*)
- 4.5 Centennial Project Components** – A description of the various Project characteristics including the conceptual land use plan designations, overlay districts, mobility plan, parks/recreation, open space, utilities and associated

infrastructure, public services/facilities, landscape and lighting, solid waste management, technology plan, affordable housing program, and construction and grading. Implementation of the Project through buildout is addressed in the EIR.

- 4.6 Phasing and Implementation** – A description of the development phasing of the Project and fiscal implementation.
- 4.7 Off-Site Project Features** – A description of Project features that occur outside the limits of the Project boundary.
- 4.8 Intended Uses of the EIR** – A listing of the requested Project actions to be considered by the County of Los Angeles along with permits and approvals that may be required from responsible and trustee agencies.
- 4.9 References.** Includes an alphabetical listing of all references used in this section.

## 4.2 PROJECT LOCATION

The Project site consists of approximately 12,323 acres (or approximately 19.3 square miles) and is located in the northwestern portion of the Antelope Valley in unincorporated Los Angeles County and is contiguous to the southern boundary of Kern County. The Project site's western boundary is approximately one mile east of Interstate (I) 5, and State Route (SR) 138 runs through the southern portion of the Project site. The Project site is located approximately 35 miles north of Santa Clarita, 5 miles east of Gorman, 36 miles west of Lancaster, and 50 miles south of Bakersfield. The community of Gorman in Los Angeles County is adjacent to I-5 approximately four miles north of the I-5/SR-138 junction. As presented in Section 3.0, Environmental Setting, Exhibit 3-1, Regional Location, and Exhibit 3-2, Project Vicinity Map, depict the Project site in a regional and local context, respectively.

As shown on Exhibit 3-2, the Project site is immediately south of the divergence in the California Aqueduct into its East and West Branches. The West Branch of the Aqueduct runs in a north-south direction and generally bisects the Project site. The East Branch runs off-site along the northern boundary of the Project site. Quail Lake is adjacent to the Project site's southern boundary. The Project site's eastern boundary is 290<sup>th</sup> Street West. The Project site extends for approximately seven miles between its western boundary (west of Quail Lake) and its eastern boundary near 290<sup>th</sup> Street West. Elevations range from approximately 3,000 feet above mean sea level (msl) on the floor of Antelope Valley in the northeastern portion of the site to approximately 4,250 feet above msl in the northwestern portion of the property.

The Project site is generally bound by the Tehachapi Mountains to the north, and the Antelope Valley to the east; the northern edges of the Liebre and San Gabriel Mountains (Angeles National Forest) are approximately one mile to the south, and privately owned vacant land is immediately adjacent to the site to the west. The Los Padres National Forest is approximately seven miles to the west.

There are two “Not a Part” (NAP) parcels located within the Project boundaries. These two parcels are in the western portion of the Project site, encompassing 25.2 and 1.9 acres, and are owned by Southern California Edison (SCE). One of these parcels includes an Edison substation (see Section 4.5.10, Dry Utilities, for more information about this substation), and the other is vacant. Additionally, although the California Aqueduct (West Branch) and the SR-138 pass through the Project site, they are not part of the Project site nor within the Project boundaries.

## 4.3 PROJECT OBJECTIVES

Section 15124(b) of the State CEQA Guidelines requires “a statement of the objectives sought by the proposed project” (14 CCR 15124[b]). Not only is the Project analyzed in light of its objectives, but compatibility with the Project objectives is one of the criteria used in selecting and evaluating a reasonable range of Project alternatives. Clear project objectives simplify the selection process by providing a standard against which to measure project alternatives. The Centennial Project objectives are detailed below in Section 4.3.2.

### 4.3.1 PURPOSE

According to Section 15124(b) of the State CEQA Guidelines, “the statement of objectives should include the underlying purpose of the project”. The underlying purpose for the Project stems from the need to develop a sustainable community in the greater Los Angeles County region that creates a balance among residential, commercial, and other employment-generating uses and institutional/public uses, all while being sensitive to the environment.

The Project is designed to be in compliance with the vision, assumptions, goals, and policies of the *Antelope Valley Area Plan (AVAP)*, which was adopted by the Los Angeles County Board of Supervisors on June 16, 2015 (LACDRP 2015c). The potential implementation of the Project was known at the time of the development of the AVAP and was accounted for in the AVAP’s land use and population/employment growth assumptions, as well as implementation program.

The AVAP sets forth a vision that includes the creation of opportunities for the Antelope Valley to change and grow while preserving the rural lifestyle enjoyed by current residents and support a vibrant economy. The AVAP was prepared to achieve this vision through the development of four types of environments that would facilitate the preservation of rural areas of the Antelope Valley, including:

1. Rural Preserve Areas, where residential densities would be reduced in order to protect important ecological and agricultural resources and to minimize development in very high hazard areas;
2. Rural Town Areas, where maximum residential densities and minimum lot sizes would be established to preserve rural character;
3. Rural Town Centers, where urban commercial uses would be discouraged but rural commercial uses would be incentivized; and

4. Economic Opportunity Areas (EOAs), where plans for major infrastructure development are underway that may create the need for more detailed planning activities for these areas in the future.

The AVAP identifies three EOAs, and the Project site is located entirely within the West EOA. EOAs are defined as clusters of land with higher development densities along the routes of two proposed major infrastructure projects in the Antelope Valley; the High Desert Corridor (HDC) and the Northwest 138 Corridor Improvement (NW138) Project. The West EOA is adjacent to the SR-138. This joint project (SCH No. 2013111016) between the California Department of Transportation (Caltrans) and the Los Angeles County Metropolitan Transportation Authority (Metro) proposes widening and slightly realigning SR-138. The Centennial Project complements the County's AVAP by capitalizing on the transportation infrastructure investment that State and regional agencies are bringing into the area, while still achieving the overall goal of rural preservation in the Antelope Valley.

Prior to any master-planned development approval in the West EOA, a specific plan, community plan, or other similar planning document is required to ensure orderly development. EOAs include land use designations that allow for a balanced mix of residential, commercial, and light industrial uses, while preserving the rural character and ecological resources of the surrounding areas. As such, the Project implements the requirements of the AVAP by including a balance of land uses consistent with the intent and the land use designations set forth for the West EOA in the AVAP.

### **4.3.2 OBJECTIVES OF THE PROJECT**

The Project demonstrates consistency with the AVAP through the following Project Objectives:

1. Implement the Antelope Valley Area Plan (AVAP) by creating an environmentally and economically sustainable master-planned community on the Project site to help accommodate planned regional population and economic growth within the West EOA.
2. Design the Project to maximize efficient utilization of regional infrastructure while preserving hundreds of thousands of acres of contiguous natural open space and important biological resources.
3. Size the Project to include a broad range of employment, residential, institutional, and recreational land uses to encourage walkability and wellness, while reducing off-site employment-related commuter trips.
4. Ensure that all Project site infrastructure and public services are funded by the Project to avoid creating any financial obligations on existing residents and other taxpayers.
5. Integrate a multi-modal transportation network, renewable energy, water conservation, community wellness, and other green development features into the Project's design, build out, and ongoing operations.

## **A Healthy Community**

The Project will provide the opportunity for a healthy and sustainable lifestyle for its residents and workers. Critical elements in reversing unhealthy lifestyle trends are design features that will allow children to walk or bicycle safely to schools and the placement of parks and recreational facilities near homes. The Project will provide an extensive system of community trails and greenways as well as a County multi-use (hiking, equestrian, and mountain biking) trail with connectivity to other (or non-County) proposed trails and greenways, the Pacific Crest Trail, and proposed open space. The Project includes 163 acres of public Park Overlay, which includes acreage to meet the County's Parkland Dedication Ordinance requirement through neighborhood parks, community parks, and community regional parks. The Project also includes private recreational facilities, including one or more community-wide recreation centers with pools and sports courts, among other amenities to meet the County's General Plan parkland requirement.

Planned uses such as schools, the library, greenways, open space, neighborhood retail, and parks will be integrated into a pedestrian-friendly network of streets that will safely and easily accommodate bicycles and pedestrians. These factors will encourage walking and bicycling within the community. Active and social infrastructure will be built into the community with the incorporation of commercial-recreation areas, parks, and greenways. This infrastructure will support programs that promote healthy lifestyles, education and lifelong learning, ranging from open space to public gathering spaces, farmer's markets, community center, and private schools and colleges, that could occur in the Project's planned commercial-recreation areas and supplement public open spaces and schools to promote community and civic engagement, and promote wellness including physical and mental health.

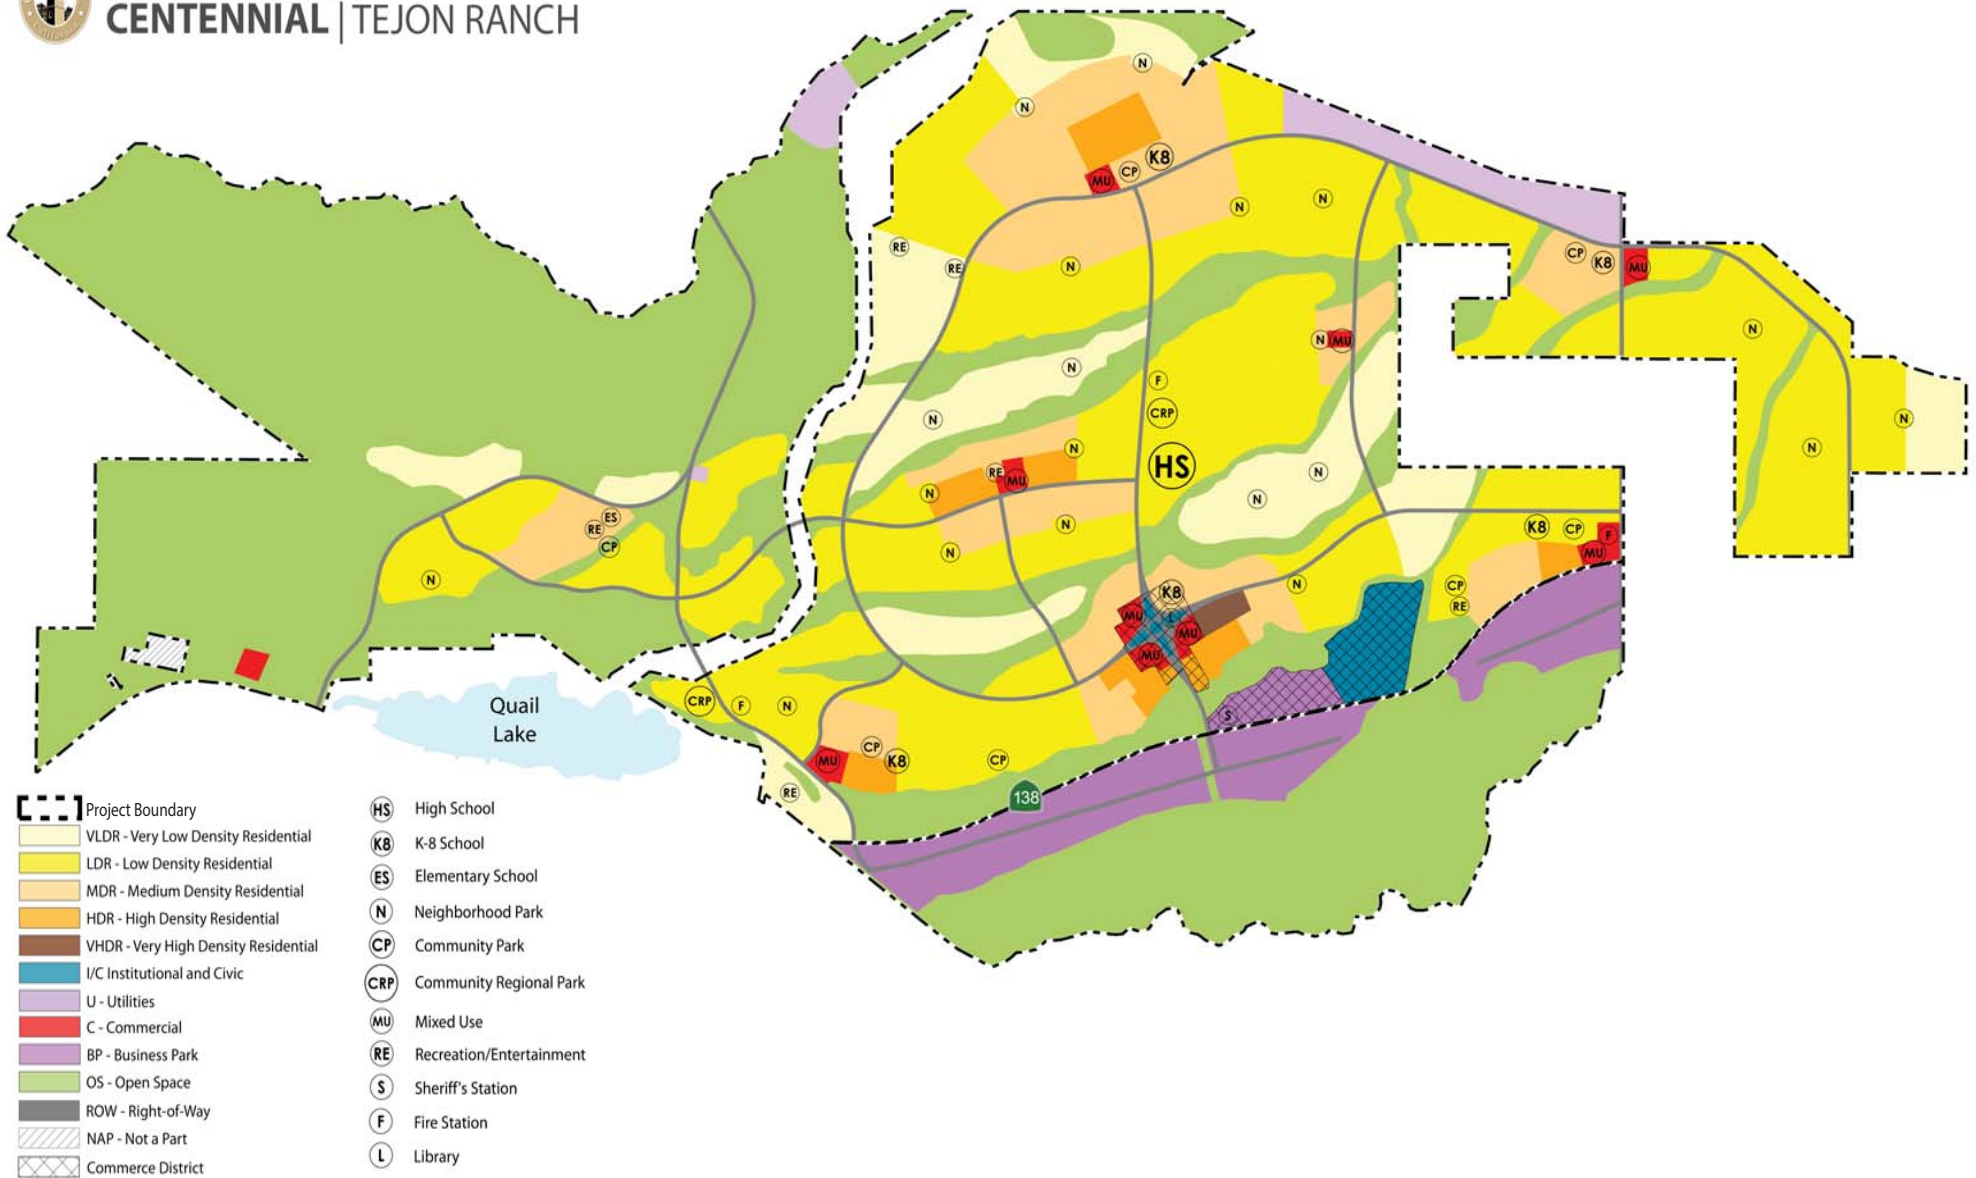

The Project Applicant/Developer has collaborated with the Los Angeles County Department of Public Health, the local educational/academic community, and others in an effort to optimize design and infrastructure amenities during planning efforts and to continue to encourage a healthy community. In addition, the Project Applicant/Developer will continually assess the needs of the community as a whole and the available resources in the area in order to understand its demographics and the programs its residents can use. The Project Applicant/Developer will also assess the needs of the different groups (e.g. retirees, working families, school-age children) within the Project in an effort to create programs for all groups within the community.

## **4.4 PROJECT OVERVIEW**

The Project involves the development of a new community with residential, commercial, business park, recreational/entertainment, and institutional/civic uses. The Project includes open space, parks, schools, utilities, and infrastructure to support the proposed land uses and future residents. The Project's land uses (including proposed land use designations) are depicted on Exhibit 4-1, Centennial Project – Conceptual Land Use Plan. As noted in Section 4.2 above, the NAP parcels shown on Exhibit 4-1 are not owned by the Project Applicant/Developer and are not included in the Conceptual Land Use Plan.

# LAND USE CENTENNIAL | TEJON RANCH

## Centennial Project – Conceptual Land Use Plan

Exhibit 4-1

Centennial Project

Map Not to Scale

The primary entitlement action associated with the Project includes the adoption of the *Centennial Specific Plan*, and, as described in Section 4.8, Intended Uses of the Environmental Impact Report, additional entitlement actions include a General Plan Amendment, Zone Change to Specific Plan; Development Agreement; Parcel Map; and Conditional Use Permits (CUPs) for Grading and Project-related infrastructure. Project buildout would be implemented in phases, based on future market conditions, over an approximate 20-year period through a series of future tract and parcel maps.

As identified in Table 4-1, Centennial Project Overview, the Project site encompasses approximately 12,323 acres and would allow up to 19,333 dwelling units (du) on approximately 4,987 gross acres<sup>1</sup> of land designated for residential uses. Other land uses include approximately 7,363,818 square feet (sf) of Business Park uses (office, research and development, and warehousing or light manufacturing uses) on approximately 597 gross acres; and approximately 1,034,550 sf of Commercial uses on approximately 102 acres. Proposed Institutional/Civic land uses (such as schools for higher education, medical facilities, library, and other civic uses) encompass approximately 1,568,160 sf on approximately 110 acres.

The Project includes approximately 130,680 sf of Recreation/Entertainment uses (clubhouse, farmers market, childcare facilities, health clubs) on approximately 75 acres. Proposed sites for major Utility facilities that would serve the entire community (e.g., wastewater reclamation facilities, water treatment facility, water bank, materials recovery facility) encompass approximately 191 acres, and Kindergarten through 12<sup>th</sup> grade (K-12 schools would be located on approximately 145 acres. Approximately 5,624 acres (approximately 45.6 percent) of the 12,323-acre Project site are proposed for Open Space for natural resource protection and greenways, and parks for active and passive recreational use. The Project also includes a vehicular and a non-vehicular circulation system.

The Project includes an integrated network of roadways, walking and biking trails to reduce automobile use and facilitate safe and efficient travel. An extensive network of sidewalks, greenway trails (approximately 13 miles), and community trails (approximately 60 miles) would link residential, schools, shopping, and employment areas. Consistent with State and regional planning objectives that focus on reducing the use of single occupancy vehicles (SOVs) for travel, the Project must meet the following mobility performance standards: (1) a minimum of 20 percent of total daily peak morning and afternoon external (e.g., commuting) trips must be completed by using non-SOV transit modes; and (2) a minimum of 30 percent of total daily internal (e.g., local) trips must be completed by using non-SOV transit modes.

---

<sup>1</sup> Acreages for all categories are considered gross acreage and does not account for transitional slopes or internal slopes. Actual developable acreage may be reduced with future detailed planning.

Source: Placeworks 2017. Note: totals may not add due to rounding.			
<sup>a</sup> The ROW include acreage for the arterials and collectors identified in the Centennial Circulation Plan.			

This EIR addresses the development of the Conceptual Land Use Plan, including all ministerial and discretionary actions required for short-term construction activities and long-term operation activities. In the future, the Project Applicant/Developer will submit applications for tentative tract maps (TTMs) and other approvals needed for the development (“future approvals”), and/or the Project Applicant/Developer may request changes in the Conceptual Land Use Plan or other aspects of the Project in accordance with Chapter 4 of the *Centennial Specific Plan*. Implementation of the Project, including subsequent County approvals, are described in Chapter 4 of the *Centennial Specific Plan*.

#### 4.4.3 LAND USE PLANS

Section 5.8, Land Use, Entitlements, and Planning, provides a detailed discussion of these planning documents and goals and policies relevant to the Project.

#### Regional Transportation Plan- Sustainable Communities Strategy

On April 4, 2012, SCAG adopted the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The RTP/SCS provides a plan for meeting greenhouse gas (GHG) emissions reduction targets set forth by the California Air Resources Board (CARB) through the integration of land use, housing, transportation, and environmental planning strategies. SCAG was tasked with the development of the SCS through the mandate set forth in Sustainable Communities and Climate Protection Act of 2008 (Senate Bill [SB] 375), which is expected to help California reach its GHG reduction goals in per capita transportation emissions of 9 percent by 2020 and 16 percent by 2035 (from a 2005 base year).

The RTP/SCS's Integrated Growth Forecast reflects the 2010 Census, employment data from the California Employment Development Department (EDD), and population and household data from the California Department of Finance (DOF). Discussions with local jurisdictions led to some adjustments, which resulted in SCAG's ability to obtain a consensus on the Integrated Growth Forecast to serve as the foundation for the 2012–2035 RTP/SCS.

On April 7, 2016, the SCAG Regional Council adopted the 2016–2040 RTP/SCS. The RTP/SCS combines the need for mobility with a “sustainable future” through a reduction in the amount of emissions produced from transportation sources. This would be made through the operation of low or no emission transportation systems by 2040. The 2016–2040 RTP/SCS, like the 2012–2035 RTP/SCS, includes population, household, and employment projections in Traffic Analysis Zone (TAZ) maps. TAZ projections for the area that includes the Project site, which were also reflected in corresponding figures included in SCAG's 2012 RTP/SCS (SCAG 2012a) and 2016 RTP/SCS (SCAG 2016), are consistent with the household and employment components of the Project.

## **Los Angeles County General Plan**

The *California Government Code* (Section 65300) requires that each City and County adopt a comprehensive, long-term General Plan that provides a blueprint for the growth and development of the jurisdiction. The General Plan is implemented through the zoning and subdivision processes and other subordinate land use entitlements and approvals. The *County of Los Angeles General Plan “Update 2035” (General Plan)* was approved by the Los Angeles County Board of Supervisors (Board) on March 24, 2015 and adopted by the Board on October 6, 2015. The *General Plan* became effective on November 6, 2015.

The *General Plan* provides the policy framework and establishes the long range vision for how and where the unincorporated areas of the County will grow; it establishes goals, policies, and programs to foster healthy, livable, and sustainable communities. The *General Plan* is the foundational document for all 11 community-based Area Plans in the County. The purpose of an Area Plan is to establish standards and criteria that are responsive and tailored to the unique conditions in a specific community, and which are also consistent with the general countywide provisions. The Project site is located in the area covered by the AVAP, which is a component of the *General Plan*, and was adopted by the Board on June 16, 2015. The AVAP became effective on July 16, 2015 (LACDRP 2015c).

The Project includes internal roadways which are required to be added to the General Plan Circulation Map, and thereby requires a conforming General Plan amendment since this internal roadway circulation information was not known and could be approved for inclusion in the County Highway Plan (filling in internal project roadways to Figure 7.3 in the General Plan) until the CEQA review process is completed and the Project entitlements (including the amendment to Figure 7.3) is approved by the County.

## **Antelope Valley Area Plan (AVAP)**

An Area Plan sets forth goals and policies to achieve the communities' shared vision of how growth and development should occur into the future. The AVAP's vision is centered on the

preservation of the rural lifestyle and rural character of the region. As previously discussed, the AVAP describes four types of environments, including Rural Preserve Areas, Rural Town Areas, Rural Town Centers, and EOAs. EOAs are adjacent to major infrastructure projects being planned by State and regional agencies, which would bring opportunities for growth and economic development in the vicinity of these projects.

The Project site encompasses the majority of the land within the designated West EOA and is also adjacent to the SR-138. SR-138 runs in a general east-west direction through the southern section of the site and is currently a two-lane highway, but the California Department of Transportation (Caltrans) is proposing to widen and realign SR-138 into a four- to six-lane highway through and near the site, as part of its comprehensive Northwest 138 Corridor Improvement Project. As such, the Project anticipates and would complement the planned SR-138 improvements, as intended by the West EOA.

The Project is consistent with and proposed to implement a development that meets the requirements of the AVAP by including a balance of land uses set forth within the West EOA. Allowed land use designations in the West EOA include:

- Residential 5 (H5) – Maximum density of 5 residential units for each 1 net acre
- Rural Land 1 (RL1) – Maximum density of 1 residential unit for each 1 gross acre
- Rural Land 2 (RL2) – Maximum density of 1 residential unit for each 2 gross acres
- Rural Land 10 (RL10) – Maximum density of 1 residential unit for each 10 gross acres
- Rural Land 20 (RL20) – Maximum density of 1 residential unit for each 20 gross acres
- Conservation (OS-C)
- Rural Commercial (CR)
- Mixed Use – Rural (MU-R)
- Light Industrial (IL)

Exhibit 4-2a, Antelope Valley Area Plan Land Use Designations, illustrates the land uses for the Project site. Per the AVAP, current land use designations on the Project site include H5: Residential 5 (0–5 du/net acre); OS-C: Open Space Conservation; CR: Rural Commercial; RL1: Rural Land 1 (1 du/1 gross acre); IL: Light Industrial; RL2: Rural Land 2 (1 du/2 gross acres). The AVAP requires that prior to any master-planned development approval in the West EOA, a specific plan, community plan, or other similar planning document is required to ensure orderly development.

The Project is consistent with the land use designations of the AVAP and no General Plan Amendment to change the land use designations for the site is required. The Project Applicant/Developer's Project application was deemed complete on May 31, 2008; therefore, the potential implementation of the Project was known by the Los Angeles County Department of Regional Planning (LACDRP) and was accounted for in the development of the AVAP. As such, the potential benefits and impacts associated with the Project

KERN COUNTY

Project Boundary	Economic Opportunity Area
<b>Antelope Valley Area Plan Land Use Designations</b>	
RL1 - Rural Land 1 (1 du / 1 gross ac)	IL - Light Industrial

Antelope Valley Area Plan Land Use Designations

Exhibit 4-2a

Centennial Project

implementation as reflected on the AVAP Land Use Policy Map, is considered within the AVAP and within the AVAP's EIR and are further considered in this EIR.

The Project includes the development of nine Villages that will each contain a mix of land uses that enable residents to live near schools, shopping, neighborhood businesses and services, civic buildings, medical facilities, and employment centers. The Project includes a mix of housing options within each Village, ranging from apartment homes close to the Town Center to single-family homes in lower-density areas. A full range of light industrial, business, and other commercial uses are planned that are intended to yield a broad range of employment opportunities, from retail services to large corporate employers. The opportunities for employment diversity increase the overall economic sustainability of the Project and the West EOA.

In support of the AVAP's prioritization for the preservation of natural open space resources, development in areas of significant biological value would be minimized and there would be no disturbance or development within the designated Significant Ecological Area (SEA) on the Project site.

AVAP designates the Project site as within the West Economic Opportunity Area (EOA); AVAP also requires approval of a Specific Plan for a new master planned community in this EOA. Further, the Land Use Map includes an SP overlay designation over the site. In compliance with the County's Specific Plan requirements and State law, the *Centennial Specific Plan* includes the location of the Project's internal circulation network of roadways. Some of these internal roadways that meet the criteria for being included in the Antelope Valley Area Plan Highway Plan (Map 3.1 of the Antelope Valley Area Plan, which includes major highways, secondary highways, limited secondary highways, parkways, and expressways). Amending Map 3.1 of the Antelope Valley Area Plan and Figure 7.3 of the County General Plan is being proposed to fill in the above roadways that are interior to the Project site, consistent with AVAP's requirement for a Specific Plan for a new master planned community in this EOA. The Project remains consistent with the AVAP as described above, and no text amendments to the AVAP or County General Plan are proposed.

In support of the AVAP's goal of reducing single-occupancy vehicle use, the Project includes alternatives to automobile travel (e.g., public transit, bicycle network, and pedestrian system) that would minimize traffic, pollution, and greenhouse gases. Efficient use of land and a balance of uses that result in a jobs/housing balance would reduce single-occupancy automobile travel and vehicle miles traveled.

#### **4.4.4 ZONING**

The Los Angeles Zoning Code is adopted by ordinance and promotes the implementation of the County General Plan. Zoning regulates permitted and prohibited land uses and establishes development standards for land uses. Exhibit 4-2b, Antelope Valley Area Plan Zoning, illustrates the zoning for the Project site. Current zoning on the Project site includes O-S: Open Space; A-1-2: Light Agricultural – Two Acre Minimum Required Lot Area; RPD: Residential Planned Development; CPD-DP: Commercial Planned Development – Development Program; and MPD-DP: Manufacturing Industrial Planned Development –

Development Program. The Project site is designated on the AVAP zoning map as within the West EOA.

As discussed in Chapter 8, Plan Implementation, of the AVAP, the preparation and adoption of a specific plan or similar planning document is required for property within the West EOA before any development of five or more residential dwelling units, any commercial use, any industrial use, or any combination thereof can be approved. The AVAP further clarifies the requirements for the specific plan:

In order to allow for more flexibility in the future detailed site design of specific neighborhoods in this area, a Specific Plan for a project in the West EOA may be allowed to convert the areas designated as Residential 5 (H5) to General Commercial (CG) or Public and Semi-public (P) designations without amending this Area Plan, so long as the resulting residential densities do not exceed those provided for by this Area Plan and no change in unmitigated significant impacts occurs. The Specific Plan may also include provisions for the conversion of residential to commercial areas, provided the amount of planned commercial building square footage does not result in any new unmitigated significant impacts. The Specific Plan shall also stipulate that these provisions (i.e., converting residential to commercial or other designations) are subject to a traffic study that confirms that no new unmitigated significant traffic impacts will occur.

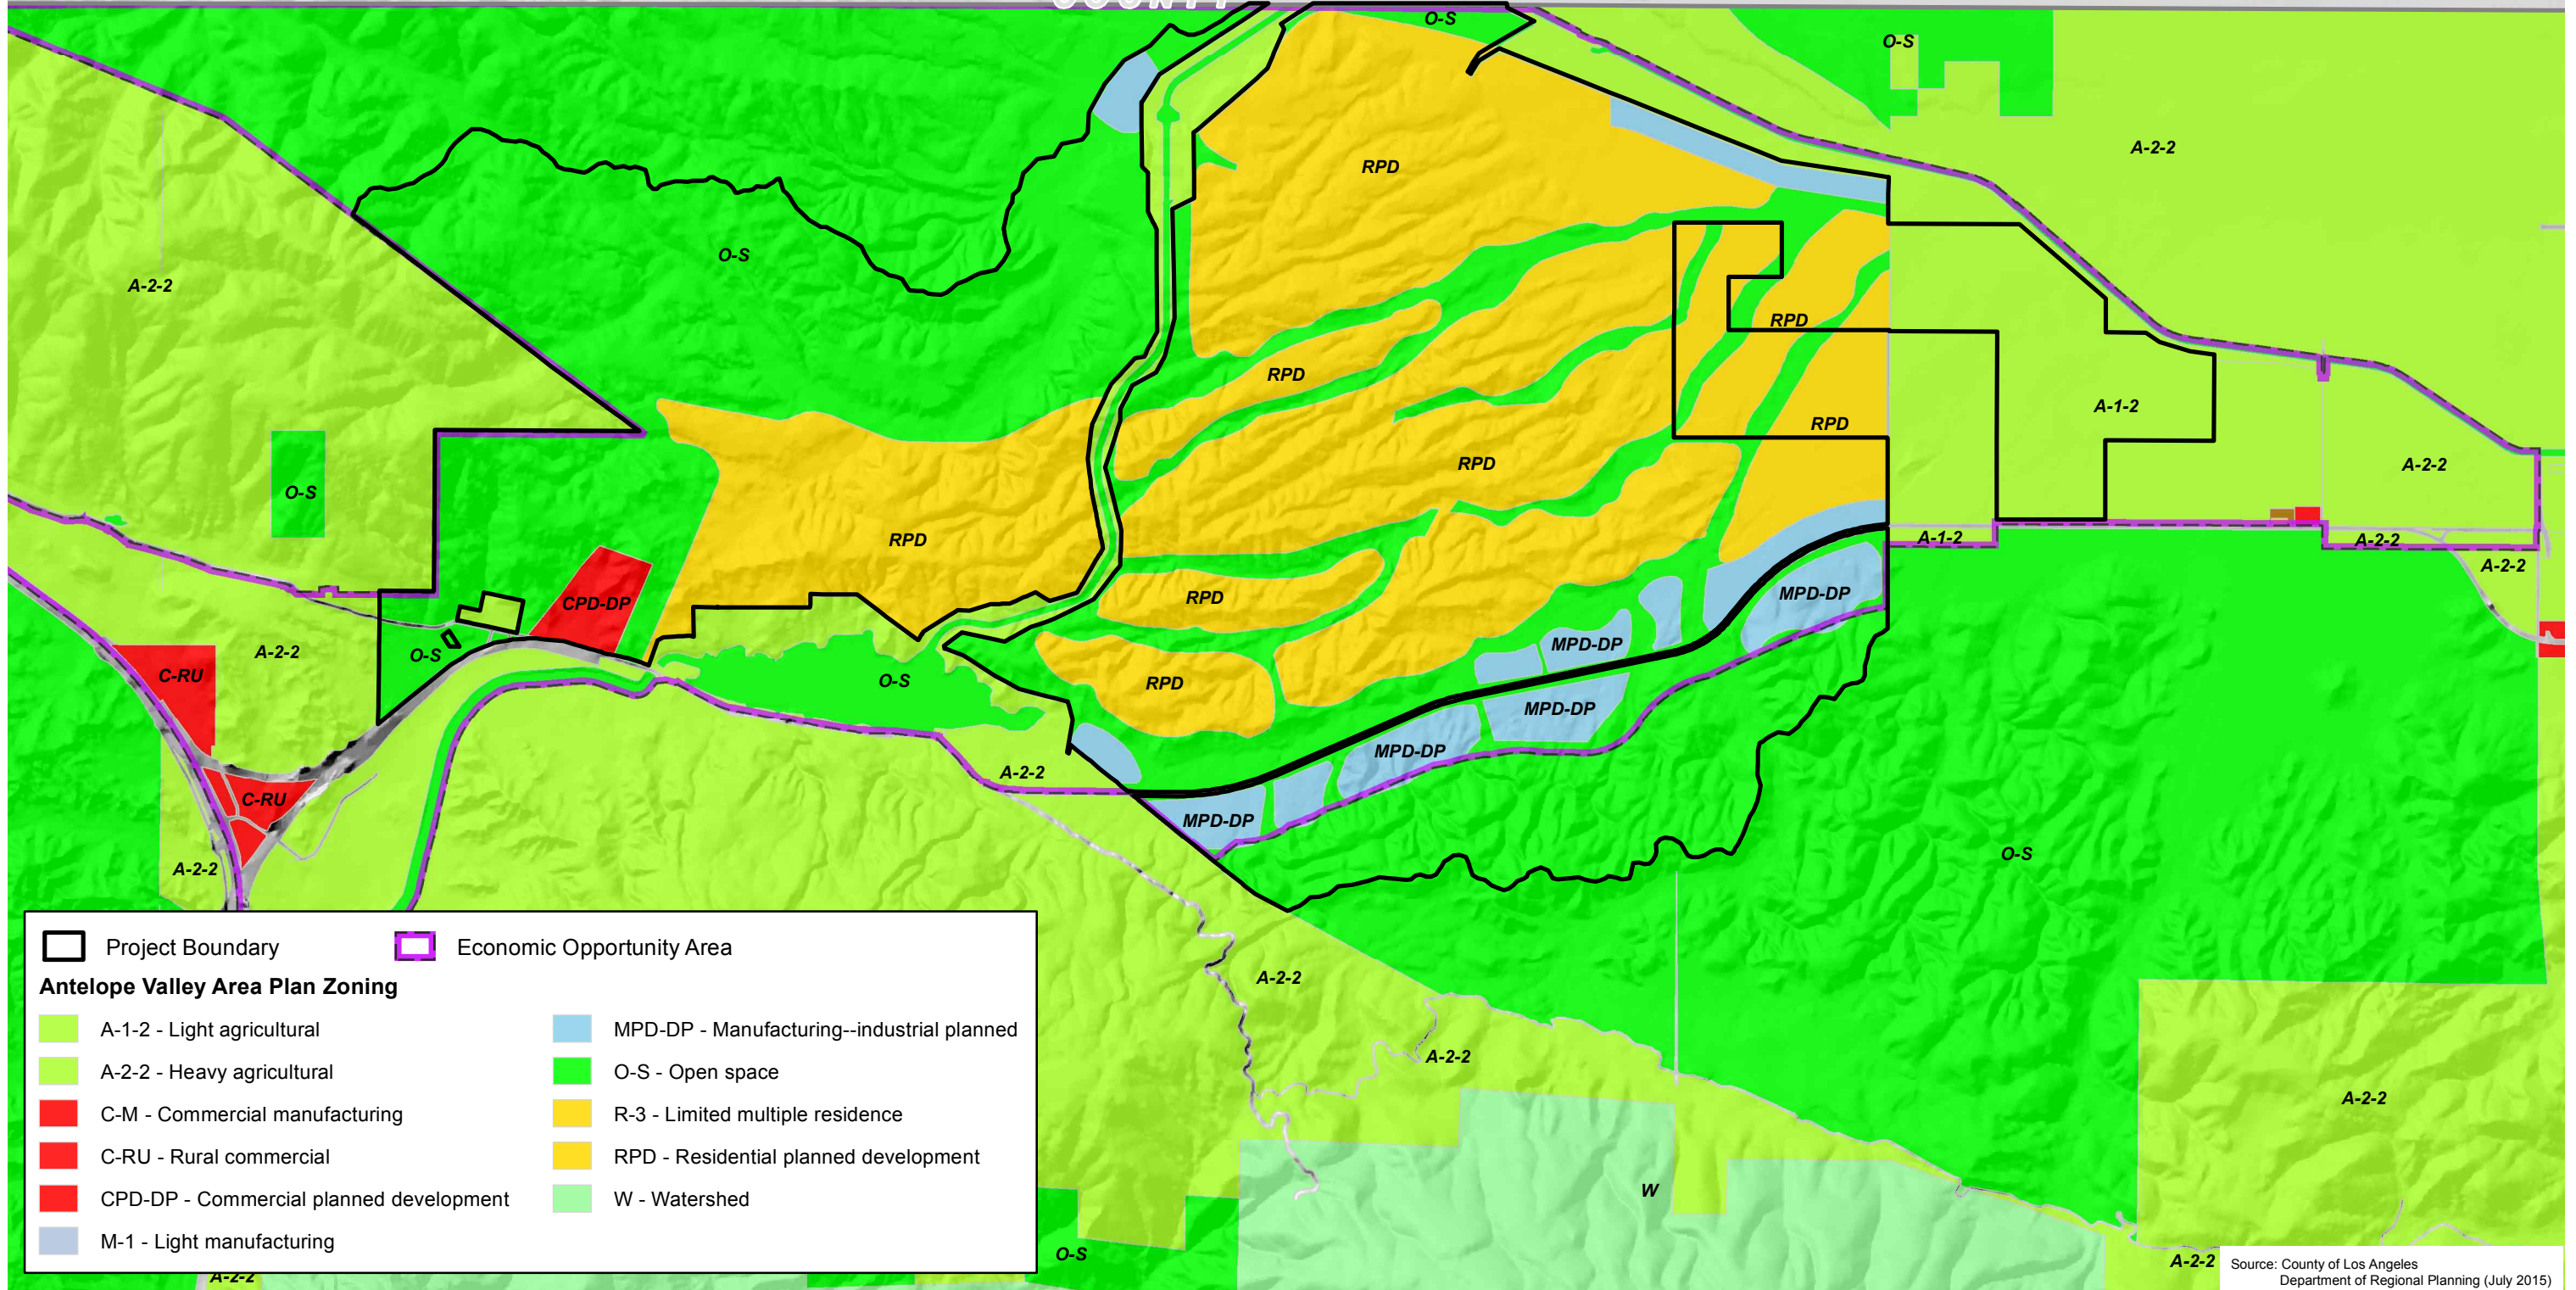

Overall, land use adjustments within designations are permitted as part of a Specific Plan provided that the adjustments: 1) do not increase the total number of developable acres, dwelling units or square footage; 2) increase the total amount of open space and do not decrease the total amount of natural open space; and 3) do not result in new unmitigated significant impacts.

As set forth in Chapter 2, Land Use, of the AVAP, a Specific Plan is an Overlay on the Land Use Policy Map. As such, a “Specific Plan Overlay” must be placed on the Land Use Policy Map for an adopted specific plan. To implement the Project, a zone change to “Specific Plan” is proposed for the entire Centennial Project site, as depicted on Exhibit 3-2, Project Vicinity Map. The development standards and land use designations described in the *Centennial Specific Plan* will apply to the site upon adoption of the *Centennial Specific Plan* rather than the zoning standards established by Title 22 of the Los Angeles County Code. Topics not addressed by the *Centennial Specific Plan* shall be governed by the rules and regulations of Title 22 of the Los Angeles County Code.

Since a Specific Plan would be adopted for the site, the Project would be consistent with the County’s Hillside Management Areas (HMA) Ordinance and no Hillside Management conditional use permit (CUP) is needed. The Project’s Hillside Design Guidelines in Appendix 1-B of the Specific Plan would be consistent with the County’s Hillside Design Guidelines by (1) locating development outside HMAs to the extent feasible; (2) locating development in the portions of HMAs with the fewest hillside constraints; and (3) using sensitive hillside design techniques tailored to the unique site characteristics. However, proposed grading on the site would exceed 100,000 cubic yards and a CUP would be needed pursuant to Section 22.56.217 of the Los Angeles County Code. The Project also requires a CUP for approval of

KERN COUNTY

Project-related infrastructure, including roadway circulation system, gas, telephone, cable and internet and electric lines within road right-of-way, a water system including domestic and recycled water tanks and pipelines and accessory booster pumps and storage ponds, sewage disposal pipelines and waste water reclamation facilities, water banks, water wells, flood control and drainage facilities, water treatment facilities, wireless communication facilities, green waste composting, solid waste and materials recovery facilities and recycling centers and an electrical substation.

#### 4.4.5 CENTENNIAL SPECIFIC PLAN

The *California Government Code* establishes the authority for cities and counties to adopt specific plans either by resolution as policy or by ordinance as regulation. Specific plans are customized regulatory documents established to provide a framework for the planning and development of multi-use projects. They provide more focused guidance and regulations by detailing the permitted uses of specific areas. They describe a project’s purpose, vision, and features and present the project description including type and distribution of land uses (which constitutes zoning, infrastructure plans, development standards, and implementation measures).

The *Centennial Specific Plan* is a regulatory document that would be considered for adoption by either resolution (as policy) or by ordinance by the Board of Supervisors. Upon adoption of the *Centennial Specific Plan*, the development standards and zoning of the *Centennial Specific Plan* become the zoning for the site. (Chapters One through Four of the *Centennial Specific Plan*—including Appendices 1-A, 1-C, and 1-D—would be adopted by ordinance, and Appendix 1-B, 2-A, and 2-B of the *Centennial Specific Plan* would be adopted by resolution.)

A statistical summary of the *Centennial Specific Plan* is provided in Table 4-2, Centennial Specific Plan Statistical Table. The *Centennial Specific Plan* has organized the development into nine “Villages” as well as areas designated as Public Facilities, Civic, and Business Park (described below and in Section 2.1 of the *Centennial Specific Plan*). A detailed description of the Project components outlined in various sections of the *Centennial Specific Plan* (including graphic representations) is provided in Section 4.5, Centennial Project Components, including the subsections noted below. Specific Plan implementation procedures are also described in Chapter 4 of the Specific Plan.

- 4.5.1 Project Design Features

## 4.5 CENTENNIAL PROJECT COMPONENTS

### 4.5.1 PROJECT DESIGN FEATURES

The Project has been planned with design elements called Project Design Features (PDFs). The Project Applicant/Developer has planned the Centennial Project to include the design elements listed as PDFs listed in each section; these PDFs have been incorporated into the Project to prevent the occurrence of or to reduce the significance of potential environmental effects. Because PDFs have been incorporated into the Project, they do not constitute mitigation measures as defined by CEQA. However, if the PDFs have mitigation value to reduce a potentially significant impact, then a corresponding mitigation measure (MM) has been prepared to ensure the implementation of the measure through the Mitigation Monitoring and Reporting Program (MMRP). The PDFs are generally described in this section, and are specifically itemized and numbered within each topical issue addressed in Section 5.0 (i.e., Sections 5.1 through 5.21) of this Draft EIR.

### 4.5.2 CONCEPTUAL LAND USE PLAN

Exhibit 4-1, Centennial Project – Conceptual Land Use Plan, depicts the Project boundary and conceptual-level locations and distributions of the proposed land uses, as well as the main roadways throughout the Project site. The Conceptual Land Use Plan provides one possible interpretation of site development in compliance with the AVAP, and is the basis for the environmental analysis set forth in this EIR.

The Project has been designed to respect the existing landforms and to consider the topography, elevation, presence of the Aqueduct, major roadways, drainages, and biologically sensitive areas. As such, development has been organized into nine “Villages” as shown in Exhibit 4-3, Centennial Project – Villages and Core Areas. Villages 1 through 8 are located east of the West Branch of the California Aqueduct and Village 9 is located west of the Aqueduct.

The Villages have been designed to incorporate the main principles of “Smart Growth”. Smart Growth is a movement in land use and transportation planning that formally began in the early 1990’s. It promotes compact, transit-oriented, walkable, bicycle-friendly communities, including “Complete Streets” and mixed-use neighborhoods and with a range of housing choices. Smart Growth emphasizes the connection between preservation of open space and smaller community footprints. Medium- to very high density development is generally included in the central area of each Village, and the density of development progressively lowers with increased distance from core areas, called the Village Core, Town Center or Neighborhood Center<sup>2</sup>. The Town Center of Centennial is located in Village 3, and is the “downtown” area of the Project. Villages 1, 2, 5, and 7 have a Village Core. Villages 6, 8, and 9 have a Neighborhood Center. As shown in Exhibit 4-3, Villages and Core Areas, 100 percent of all residential development (i.e. total number of dwelling units) will be located within ¼

---

<sup>2</sup> A Village Core/Town Center/Neighborhood Center areas are defined by having a combination of uses, including retail, office, civic, and higher density residential, that are supported by adjacent residential areas that transition out to low density development. These areas vary in size and intensity, and generally extend two blocks in any direction from the activity center of each core including the block (or blocks) containing some mixed-use development.

## Centennial Project – Villages and Core Areas

## Exhibit 4-3

Centennial Project

Map Not to Scale

mile walking distance of a park, trailhead, club house or other public amenity; and an 80 percent average, but no less than 50 percent of residential units will be located within ½ mile of a Village Core or the Town Center. Village Cores will have a public gathering space (e.g., square or plaza) of 10,000 sf or more, with street frontage on at least one side and at least two points of access from a sidewalk, trail, or other pathway. The Town Center shall have a public gathering space of 1 acre or more, with street frontage on at least two sides. Additionally, 30 percent of Village 3 residential units will be within the Town Center; and 15 percent of the residential units within Villages 1, 2, 5, and 7 will be within the Village Core.

Residential land uses are designated as either Very Low Density Residential (VLDR), Low Density Residential (LDR), Medium Density Residential (MDR), High Density Residential (HDR), or Very High Density Residential (VHDR). Other land uses in the Villages include Commercial (C) and Institutional/Civic (I/C). Overlays in the Villages include the Recreation/Entertainment Overlay (R/E), School Overlay, and Park Overlay. Designated land uses that are excluded from the Villages acres include Open Space (OS), Business Park (BP), Right-of-Way (ROW), and Utility (U).

Exhibit 4-1, Centennial Project – Conceptual Land Use Plan also depicts the current alignment of SR-138, which runs adjacent to the Business Park land use in the southern portion of the Project site and is excluded from the Project boundary.

### **4.5.3 VESTING TENTATIVE PARCEL MAP**

To facilitate the overall phasing of Project development, the Project Applicant/Developer proposes to subdivide the entire 12,323-acre property into 20 parcels through Vesting Tentative Parcel Map (VTPM) No. 060022. The minimum parcel size on VTPM No. 060022 is 102 acres. Exhibit 4-4, Centennial Project – Vesting Tentative Parcel Map No. 060022, depict the proposed subdivision, which may correspond to future TTMs. The VTPM is intended to create parcels that can be used for finance and conveyance purposes only. Construction of residential and nonresidential buildings will require further subdivision of the large parcels created by the VTPM, as well as other subsequent land use permits and approvals.

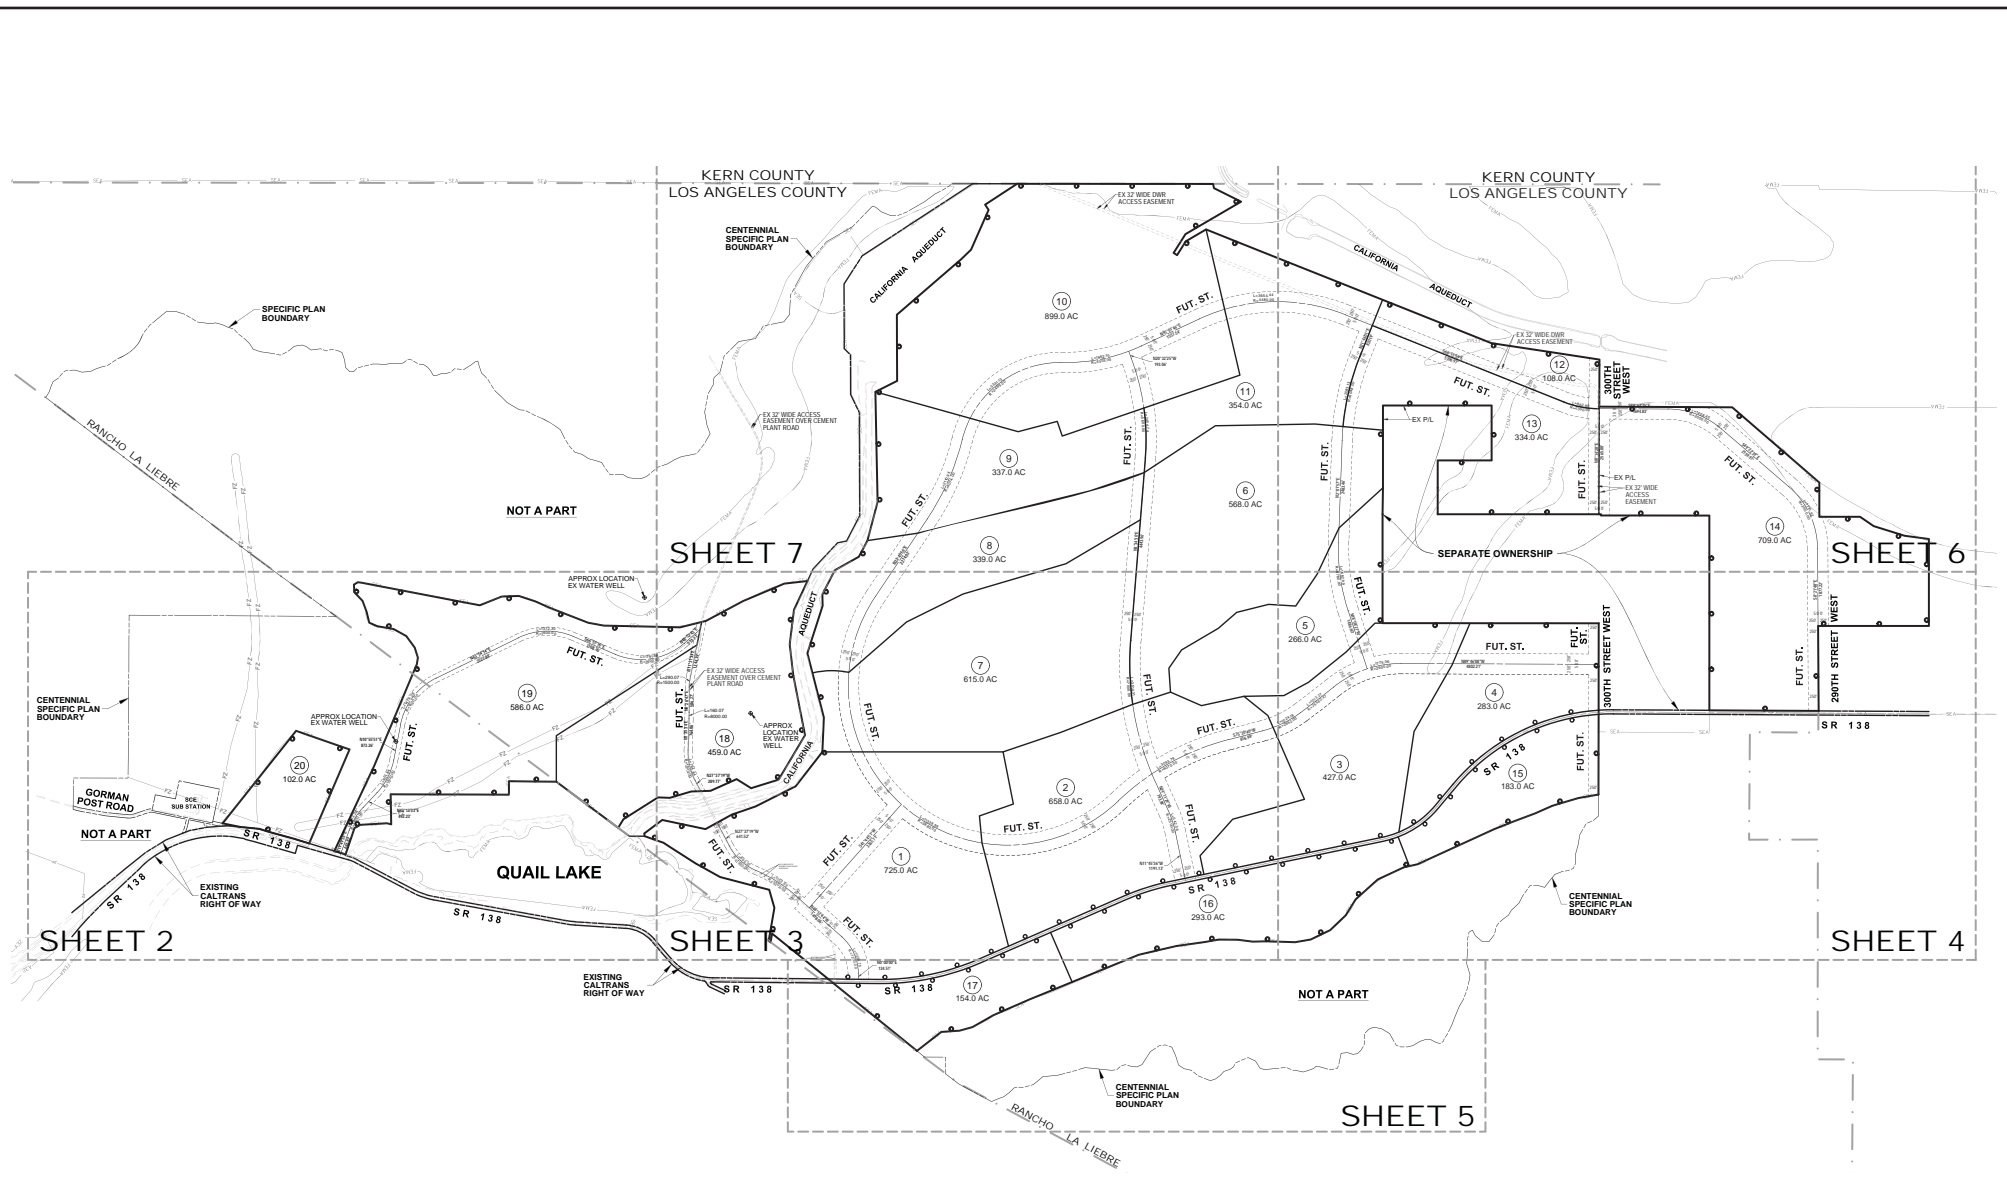

### **4.5.4 CONCEPTUAL LAND USE PLAN AND DEVELOPMENT STANDARDS**

The Conceptual Land Use Plan (also referred to herein as the Land Use Plan), as shown in Exhibit 4-1, was developed to create a self-sustaining community through the development of various land use designations. The *Centennial Specific Plan* establishes development standards to regulate minimum lot areas and average lot widths, building setbacks, height limits, and landscaping and parking requirements for each permitted land use designation. Table 2-16 of the *Centennial Specific Plan* (Land Use Matrix) provides a detailed breakdown of uses that are permitted; that are permitted under a substantial conformance review process; that are permitted with a ministerial or discretionary interim use permit; or that are permitted with a conditional use permit.<sup>3</sup> The complete list of uses that may be permitted in each land use designation, as presented in the Land Use Matrix, is extensive but includes the following general categories: residential, agricultural, public and semi-public,

---

<sup>3</sup> Uses not listed in Table 2-16 of the *Centennial Specific Plan* are not permitted unless approved through the administrative processes outlined in Chapter 4, Administration and Implementation.

Map Not to Scale

commercial, open space/recreation, manufacturing, light industrial, accessory, interim, and temporary. Section 4.6 of the *Centennial Specific Plan* provides information on guidelines for adjustments, transfers, and conversions that respond to the needs to maintain the goals of the Project, subject to County approval.

The Land Use Plan, development standards and permitted and conditional uses are summarized below and are discussed in detail in Section 2.2.1, Land Use Designations and Development Standards, of the *Centennial Specific Plan*. The number of dwelling units by residential land use designation described in the following discussion is based on the *Centennial Specific Plan*, as summarized in Table 4-2, Centennial Specific Plan Statistical Table. For reference, Land Use designations can be found on Exhibit 4-1, Centennial Project – Conceptual Land Use Plan.

## Residential Land Uses

### ***Very Low Density Residential (VLDR)***

As detailed in Table 4-2, Centennial Specific Plan Statistical Table, the *Centennial Specific Plan* proposes a total of 1,270 Very Low Density Residential (VLDR) units throughout the Project area. The VLDR designation provides for larger lot, single-family detached (fee lot) homes ranging in density up to and including 2.0 du/gross acre (du/ac) of land. The lot area is a minimum of 10,000 sf when non-clustered and 5,250 sf when clustered. The *Centennial Specific Plan* would allow for a maximum building height for a home or garage of 40 feet, and of 17 feet to 35 feet for a second unit, in the VLDR designation. For non-clustered/clustered development (shown as #/# feet), respectively, the minimum front yard setback is 40/20 feet to habitable structure or to front entry garage, 33/25 feet to a habitable structure on a cul-de-sac or knuckle, 35/25 feet to covered porch, 40/20 feet to a front entry garage, and 15/10 feet to a front or side entry garage. Side yards for lots located adjacent to a public street (corner lot) are a minimum of 20 feet from the lot line. The minimum side yard setback to habitable structure is 15/10 feet; to a covered porch is 10/5 feet; to a front- or side-entry garage is 15/10 feet, to the front entry of a garage in the rear half is 10/5 feet, and to a corner lot is 20/15 feet. The minimum interior side yard setback to a habitable structure or second unit is 30/15 feet, and to a front entry garage (no second unit) is 15/10 feet.

Second units, also known as accessory dwelling units,, Living Suites or “granny flats” (collectively, “ADUs”) on the same lot, are allowed in this designation, subject to the overall maximum building site coverage. The total number of allowable ADUs must be specified in, and will be approved as part of the processing of, each Tentative Tract Map application, ADUs are subject to the applicable design standards in the Specific Plan. The second units may be detached or attached to the primary unit or garage and must meet setback requirements for habitable structures. As described in the Table 2-3 in the *Centennial Specific Plan*, VLDR (less than or equal to 2 du/ac), second units shall comply with Section 22.20.105 of the *Los Angeles County Code (as it may be amended) and applicable state law*. Under the Specific Plan, reconfiguring an existing single family home to create an ADU is permissible and does not create a new dwelling unit or new parcel, and cannot be sold separately from the single family lot; instead, an ADU is a building space configuration for the single family home allowed on this lot. No new environmental impacts occur as a result of the ADU configuration

option, since variations in household occupancy (e.g., the number of adults and children allowed in each household) always exist and are taken into account in the average household size estimates evaluated in this EIR. There is also no basis for estimating whether or when an ADU would be built by any given homeowner, and CEQA does not require speculation. Without regard to whether a state density bonus is ever used on the Project site, the total number of dwelling units, inclusive of all product types, cannot exceed the maximum number of 19,333 dwelling units.

The VLDR land use designation is typically located in areas with slopes generally ranging from 15 percent to 25 percent and is intended to provide a transition between the development and adjacent natural hillside areas. Development in the VLDR-designated areas is required to conform with the hillside development criteria contained in Section 3.13.7, Hillside Preservation and Section 3.1.1, Grading Goals and Guidelines, of the *Centennial Specific Plan*), which encourages the use of contour landform grading techniques in order to maintain a natural appearance.

### ***Low Density Residential (LDR)***

The Project includes 9,660 Low Density Residential (LDR) units that are intended to provide a buffer between more intense residential and commercial/retail development in the core areas and the open space areas on the Project site. The LDR designation provides for single-family detached homes on lots with a minimum area of 3,000 sf. ADUs are allowed on single-family detached LDR parcels or lots, and ADUs are not considered a separate unit (e.g., are on the same legal parcel or lot and cannot be independently sold). The density for this land use category ranges from two to seven du/ac. Other products typically associated with a condominium map or plan may occur within the LDR residential designation—such as single-family detached cluster, cottage, 2-pack, and single family attached, duplex, triplex, and townhome—are allowed so long as the density within the total area as shown in Exhibit 4-1, Centennial Project – Conceptual Land Use Plan, falls within the LDR residential designation range of two to seven du/ac. Residential architectural styles vary, with at least 25 percent of homes incorporating rear-entry (alley loaded), side-entry, split, or front-entry garages located in the rear of the lot.

The *Centennial Specific Plan's* development standards allow a maximum building height of 40 feet. The minimum front yard setback permitted is 15 feet with a provision to allow a shorter setback (10 feet) when a front- or side-entry garage is used or in the case of alley-loaded residential product design. The minimum interior side yard setback is either five feet or there is no setback where one side of the structure is placed on the lot line. Side yards for lots located adjacent to a public street (corner lot) are a minimum of ten feet from the lot line. The minimum rear yard setback is 15 feet to a habitable structure or second unit, 10 feet to a garage in the rear, and 3 feet to an alley-loaded garage.

### ***Medium Density Residential (MDR)***

The Project includes 6,048 Medium Density Residential (MDR) units that are generally within walking distance of the commercial uses, schools, and services provided in the Village Cores. The MDR designation is intended to provide for mostly single-family attached units

but also some tradition and non-traditional arrangements of single-family detached housing types at a density of 7 to 15 du/ac. Detached homes may either be part of a subdivision map providing fee lots for each unit or may be constructed as part of a condominium map or plan on a single large lot or multiple large lots. ADUs are allowed on single-family detached MDR parcels or lots, and ADUs are not considered a separate unit (e.g., are on the same legal parcel or lot and cannot be independently sold). The minimum lot area for the MDR designation is 2,000 sf.

Typical detached housing types proposed for this designation include single-family homes with zero lot line or reciprocal easements (such as cottage homes or 2-pack), alley loaded (garage in rear), motor court cluster, and green court cluster configurations. Typical attached housing types proposed for this designation include single family detached cluster, cottage, and 2-pack, and single-family attached, townhome, duplex, and triplex. Examples of these product types are provided in Appendix 2-B of EIR Appendix 4.0-A, which is not intended to provide an all-inclusive list. Products may range in density, both as low as 0 du/ac and higher than 15 du/ac, so long as the density within the total area as shown in Exhibit 4-1, Centennial Project – Conceptual Land Use Plan, falls within the MDR residential designation range of 7 to 15 du/ac.

Building heights, whether for detached or attached units, are restricted to 40 feet. The minimum street frontage for fee lots only is 30 feet for a straight street, 25 feet for a cul-de-sac or knuckle, 25 feet for a flag lot with a shared driveway, and 20 feet for a flag lot with a single entry. The minimum front yard setback is 10 feet to a habitable structure, 5 feet to covered porch, 18 feet to a front-entry garage, 5 feet to a front-entry garage on a private driveway, and 5 feet to a side-entry garage. The minimum interior side yard setback would be zero or five feet to a habitable structure, five feet to a covered porch, three feet to a garage in the rear half, and ten feet where adjacent to a public street or lot line. All front/side setback requirements for dwelling units on private driveways are measured from the back of the curb. The minimum rear setback is 10 feet to the habitable structure or front-entry garage in the rear half, 3 feet to alley-entrance garage, and 15 feet to habitable structure or front-entry garage in the rear half at the edge of open space or a trail. The minimum building separation is 30 feet front to front, 20 feet from rear to rear, and 10 feet from side to side of habitable structures.

### ***High Density Residential (HDR)***

The Project includes 2,055 High Density Residential (HDR) units. The HDR land use category is proposed in the Village Cores adjacent to commercial and employment areas. The HDR designation provides for a wide range of single-family or multi-family attached residential products at densities ranging from 15 to 25 du/ac. The minimum lot area for the HDR designation is 0.5 acre. Typical attached housing types provided in this designation include rowtown, garden court, greencourt, town/flat, and apartments. Other single family attached products that may be provided in this designation are duplex, triplex, and townhomes. Examples of these product types are provided in Appendix 2-B of EIR Appendix 4.0-A.

A maximum building height of 50 feet is allowed under this land use designation. The minimum front yard setback is 10 feet to habitable structure; 5 feet to covered porch; and

18 feet to front-entry garage on a public street. The minimum interior side-yard setback is 10 feet, 5 feet to front-entry/alley-loaded garage in rear, and 10 feet adjacent to a public street or lot line. The minimum rear-yard setback is 3 feet to the alley-loaded garage. The minimum building separation is 10 feet side to; 20 feet rear to rear; and 30 feet front to front of habitable structures.

### ***Very High Density Residential (VHDR)***

The Project includes 300 Very High Density Residential (VHDR) units. The VHDR designation is intended to provide for attached residential dwelling units within or close by the Town Center at densities of 25 to 50 du/ac. Typical housing types provided in this designation include multiple-story apartments with a variety of parking arrangements, including remote carports, tuck under, podium and wrap. Other single-family attached products that may be provided in this designation are townhomes, rowtown, garden court, green court, and town/flat. The minimum lot area in the VHDR designation is 1.0 acre.

The VHDR designation establishes a maximum building height of 80 feet and a minimum usable common open space coverage of 10 percent with. The minimum front yard setbacks adjacent to a public street must be ten feet to habitable structure and five feet to covered porch; setback for a private driveway is measured from the back of the curb. The minimum side-yard setback is ten feet to a habitable structure or adjacent to a public or private street or lot line. The minimum rear setback is ten feet to a habitable structure or three feet to an alley-served garage. The minimum building separation is 10 feet side to side; 20 feet rear to rear; and 30 feet front to front of habitable structures.

Table 4-3, Summary of Residential Development, provides the breakdown of the proposed residential units by Village and by residential land use category.

---

## Commercial Land Uses

### *Commercial (C)*

The Project includes 1,034,550 sf of Commercial (C) uses on 102 gross acres. It is estimated that approximately 2,913 employment opportunities would be created by such uses. This land use is intended to provide for the retail commercial, office and service needs of the community. The commercial designation is intended to accommodate commercial centers or freestanding buildings that are designed to minimize impacts on adjacent residential uses and to complement the physical character each village.

A maximum floor area ratio (FAR) of 0.70 is allowed with a minimum FAR of 0.20. The maximum building height for a habitable structure allowed is 120 feet, with an additional 10 feet allowed above the maximum for non-habitable structures. Minimum front setbacks allowed are 50 feet to the SR-138 right-of-way (edge of pavement), 10 feet to the front without parking, and 50 feet with perpendicular front parking, 15 feet to the side, and 25 feet to the rear. The Centennial Project also proposes development standards for outdoor display, outdoor dining, outdoor storage, and landscape coverage; it also restricts the locations of certain uses.

### *Business Park (BP)*

The Project includes 7,363,818 sf of Business Park (BP) uses on 597 gross acres. Business parks are primarily concentrated along SR-138, which is the major east-west transportation corridor. The BP designation is intended to provide for research and development (R&D), light industrial, manufacturing, professional office, private educational and trade schools, hotels, and the smaller commercial services required to support these uses. It is estimated that approximately 14,513 employment opportunities would be created by such uses. If hotel(s) are developed, approximately 300 additional employment opportunities would be provided.

A maximum FAR of 1.0 is allowed with a minimum FAR of 0.25. The smallest sized BP project that can be submitted as a Tentative Tract Map is five acres. The maximum building height for a habitable structure allowed is 150 feet, with an additional 10 feet allowed above the maximum for non-habitable structures. Minimum front setbacks allowed are 50 feet to the SR-138 right-of-way (edge of pavement), 10 feet to the front without parking, 50 feet with perpendicular front parking, 25 feet to the side, and 25 feet to the rear where adjacent to non-BP use or a public road. Setbacks apply to public streets or lot lines. The Centennial Project also proposes development standards for outdoor display, outdoor dining, outdoor storage, and landscape coverage; it also restricts the locations of certain uses.

## Other Non-Residential Land Uses

### *Institutional/Civic (I/C)*

The Project includes 1,568,160 sf of Institutional/Civic (I/C) land uses on 110 gross acres. This designation accommodates higher education facilities, postsecondary schools,

hospitals/medical centers, libraries, and other public/institutional safety facilities. It is estimated that approximately 4,608 jobs would be created by such uses. Institutional development requirements will be determined on a case-by-case basis through the development review process. Issues that may affect development requirements include compatibility with surrounding uses and adjacent structures. Proposed public facilities are further discussed in Section 4.5.10, Public Services/Facilities.

The requirements for this land use designation are to be determined on a case-by-case basis through the development review process depending on the type of use proposed. Structures in the designation have 50-foot minimum front, rear, and side setbacks from habitable structures to SR-138 (from edge of roadway); these can include fencing, fencing or a solid wall as well as landscaping as a screen is required. The minimum front setback from all other public streets is ten feet. The minimum side or rear setback from adjacent to non-institutional uses is 25 feet. The maximum building height is 75 feet.

### ***Open Space (OS)***

The Project's Open Space (OS) designation includes 5,624 acres of land that would remain as permanent open space, including significant drainages, sensitive habitat areas, and steep slopes. This designation also encompasses significant drainages that are referred to as drainage corridors. Public access and improvements to the drainage corridors will be limited to trails, habitat enhancement, and flood control improvements. This designation allows for passive recreation uses such as hiking, picnicking, an interpretive (educational) center or nature center, and continued grazing in certain areas, as discussed in Natural Resource/Open Space Management Plan (see Section 3.13 of EIR Appendix 4.0-A). The permitted and conditionally permitted uses for the OS designation are contained in Table 2-16, Land Use Matrix, in Section 2.2.7, Permitted and Conditional Uses of the *Centennial Specific Plan* (see EIR Appendix 4.0-A). The maximum height for habitable structures in the OS designation is 40 feet. The larger Open Space areas are located south of SR-138 and in the northwestern portion of the Project area. There would be limited public access to these areas in an effort to protect the natural resources present. The OS designation is intended to preserve and/or enhance the natural features and resources in Oso Canyon and the oak woodlands and oak communities south of Oso Canyon and south of SR-138.

### ***Utility (U)***

The Project includes approximately 191 gross acres designated for Utility (U) uses located along the northern portion of the Project site and also on the west side of the West Branch of the Aqueduct. This designation provides a location for necessary public infrastructure facilities, including but not limited to wastewater reclamation facilities, water recharge facilities, recycled water storage, solid waste facilities, water treatment facilities, materials recovery facilities, recycling centers, and maintenance yards for the County of Los Angeles Departments of Public Works and Parks and Recreation. In the event that the public or semi-public use of mapped facilities is terminated, alternative uses that are compatible with the surrounding development, in keeping with community character, are permitted, as set forth in Section 4.0 Administration and Implementation of the *Centennial Specific Plan*.

As specified in Section 2.2.8, General Development Standards, of the *Centennial Specific Plan*, U-designated uses are sited to be compatible with adjacent properties through use of site planning, architectural design, and use types in addition to features such as landscaped areas, walls, and similar border features to make the development adequately buffered. The minimum front, rear, and side setback under the Utility land use designation is 30 feet. The maximum height allowed is 55 feet.

### ***Right of Way (ROW)***

The Project's Right-of-Way (ROW) designation includes 327 acres of land that would be required to develop the Project's internal roadway system of arterials and collectors, as depicted on the Conceptual Land Use Plan (see Exhibit 4-1).

### **Overlays and Zones**

The Project includes several Overlays and Zones applied throughout the Project site. These are described in Section 2.2, Land Use Plan, of the *Centennial Specific Plan* and are intended to either address specific environmental conditions on the Project site or the potential for mixed-use development within the Commercial areas. Overlays and Zones have additional requirements that must be followed in addition to the Development Standards discussed above.

#### ***Centennial Commerce District (CCD) Overlay***

Portions of Village 3 and nearby Business Park and Civic/Institutional development areas make up the Centennial Commerce District (CCD). This district, which can also be thought of as a central business district, is the core of business activity for Centennial. Consistent with the Metrics of the Specific Plan, the majority of office space, shall be planned near the Town Center, as well as in the Business Park, and the Institutional/Civic designated areas located north of SR-138.

Uses in the CCD include Commercial (C), Mixed-Use (MU), Residential (MFR and HDR), Business Park, and Institutional/Civic. The CCD Overlay also includes a proposed transit hub. This land use mix is the foundation for a strong commercial base and institutional uses, such as a medical center or center for higher education, all of which will be supported by nearby residential development.

#### ***School (S) Overlay***

The Project includes seven public school sites (five K–8, one K–5 and one high school) in the School (S) overlay. The specific design and student capacities of the school facilities are subject to Title 5 of the *California Government Code*, which contains standards for school site selection, site planning, and construction of school facilities in the State of California. The locations of school sites take into consideration the standard requirements of Title 5. Approximately 146 gross acres have been set aside to accommodate schools. Potential school sites are further discussed in Section 4.5.13, Public Services/Facilities and Section 5.15, Education.

A K–8 school would be developed in the first phase of site development to be available at the first occupancy of the Project; decisions regarding the location and configuration of this school would ultimately be made by the Gorman Joint School District. The K–8 school is initially intended to serve grades through-K–12, then revert to a K–8 school once the high school that is able to adequately serve grades 9 through 12 has been constructed on the Project site and is operational. With the consent of the Gorman Joint School District, the Antelope Valley Union High School District (AVUHSD) students will be housed in the first school.

The second and subsequent K–8 schools are to be constructed subject to the terms of the mitigation agreement with the Gorman Joint School District, and the timing depends on the rate of Project development and actual demand for school facilities, as determined by the Gorman Joint School District. It is anticipated that one high school would provide sufficient capacity to accommodate anticipated high school students. The high school is expected to open in compliance with school district mitigation agreements; however, the actual implementation timing of school facilities depends on the rate of Project development and actual demand for school facilities, as determined by the AVUHSD. As identified in the *Centennial Specific Plan*, any rejected school site shall revert to residential land use at the density of the surrounding residential designation; however, the maximum number of units allowed by the *Centennial Specific Plan* would not be exceeded.

### ***Park (P) Overlay***

The Project includes 163 acres of Park Overlay, which would include neighborhood parks, community parks, and community regional parks that would be dedicated to the County of Los Angeles in a fully developed condition. In addition to the 163 acres of Park Overlay, the Project would also provide pocket parks (public and private); private commercial recreation facilities; private community recreation facilities (e.g., in multi-family complexes); and the regional hiking trail.

Per the Los Angeles County General Plan, neighborhood parks are typically between three and ten acres and are located to serve surrounding neighborhoods within a 1/2-mile radius. Neighborhood parks are intended to provide the daily recreation needs of children as well as residents within the immediate vicinity of the park.

Community parks are typically 10 to 20 acres, and serve several neighborhoods within a 1 to 2-mile radius, and are intended to provide a wide variety of active and passive recreation activities, including group activities that may not be feasible in a neighborhood park. Community parks typically provide neighborhood-level facilities, such as tot lots, barbeque areas, and informal play areas (open lawn areas), combined with other types of community-serving facilities, such as sports parks with athletic fields, soccer, softball, tennis and basketball courts, community/centers, cultural/interpretive centers, and other specialty uses. Community parks also incorporate trails and picnic facilities for more limited, passive use and scenic enjoyment. The parks are located adjacent to, and connected by, the Centennial trail system in order to facilitate connectivity among open space elements, as shown on the Land Use Plan.

Community regional parks are typically 20 to 100 acres, and have a service radius of 20 miles. Amenities for community regional parks can include sports facilities, a jogging exercise course, informal open play areas, children's playground equipment, group picnic areas, barbecues, public restrooms, a concession building, recreation offices, maintenance buildings, and on-site parking areas. Community regional parks may also have one or more of the following features: multiple sports facilities, an aquatics center, a fishing lake, a community building and gymnasium, and scenic views and vistas.

As shown in Exhibit 4-1, there is a combined total of 30 neighborhood, community, and community regional parks proposed for the Project, which equate to the 163 acres of Park Overlay. Because this designation is an overlay, the sizes, distribution of each park type, and location that would ultimately be developed in consultation with the County may vary from the conceptual land use plan, but would remain a total of 163 acres. The minimum front, rear, and side setback is 30 feet to a habitable structure, and the maximum building height is 45 feet. Proposed park uses are further described in Section 4.5.6. Section 5.14, Parks and Recreation, describes the impact analysis related to the parks proposed within the Project.

### ***Recreation/Entertainment (R/E) Overlay***

The Centennial Specific Plan's Recreation/Entertainment (R/E) Overlay includes approximately 75 gross acres and accommodates a variety of potential recreational uses, including a clubhouse with pool/spa and other recreation facilities, restaurants, golf course, ancillary pro shop and administrative offices, greenhouse/nursery areas, childcare facilities, fitness and health clubs, convenience markets/general stores or farmer's market/fresh fruit and vegetable stands, wine and beer tasting rooms, and community gardens. The western Recreation/Entertainment Overlay area would be sited on both sides of the Cement Plant access road and would include a portion of the Oso Canyon Drainage. The eastern area is in the southeastern portion of the Project site, north of SR-138.

Minimum front, rear, and side setbacks for would be 30 feet to a habitable structure, except for along SR-138 where the minimum setback would be 50 feet. The maximum permitted building height would be 55 feet, with an additional 15 feet for architectural features such as towers, roof peaks, and parapets. Should a golf course be developed within the R/E Overlay, it would be required to meet the certification standards of Audubon International's Cooperative Sanctuary Program or equivalent standards. Any use built in the R/E Overlay would be required to comply with appropriate regulations associated with significant drainages, as further described in Section 5.7, Biological Resources.

### ***Mixed-Use (MU) Overlay***

The Mixed-Use (MU) Overlay is an optional designation for uses within the Commercial areas. The MU Overlay is intended to allow for a combination of commercial, office, and residential uses in either vertically or horizontally (uses side by side) integrated projects, as an optional land use in select Commercial areas. Such a mixture in the same area enhances the vitality of businesses, creates an active street life, and offers additional housing types. This overlay may be applied to all or portions of the designated area. The MU Overlay allows for a live/work/environment; adds diversity and walkability to the Village Cores; and

reduces reliance on the automobile and the associated costs of energy and pollution. The overall design of Commercial areas may include a “main street” atmosphere with on-street parking; wider sidewalks; safe and convenient pedestrian and vehicular access into and around the area; quality streetscape features; attractive storefronts; integrated sign programs; public plazas; courtyards; and architecture that creates a strong indoor/outdoor relationship.

The *Centennial Specific Plan* proposes a minimum 0.25 FAR and maximum 2.0 FAR for commercial uses where the MU Overlay is applied. The front setback would be 10 feet minimum without parking; however, if there is perpendicular parking in the front, then the setback would be 50 feet minimum. The side and rear setbacks would be ten feet minimum; however, no minimum rear or side yard setback applied between adjacent vertical mixed-use development. The maximum building height for habitable structures, which includes parking structure heights, would be 60 feet; and the maximum building height for non-habitable structures, including towers and other architectural elements, may be extended an additional 10 feet for a total maximum height of 70 feet. Setbacks would apply to public streets or lot lines. The maximum residential density would be up to 50 du/ac so long as the maximum number of residential units within the village is not exceeded. The *Centennial Specific Plan* also proposes development standards for open space (10 percent minimum), outdoor display, outdoor dining, outdoor storage, separation of commercial and residential uses, sound attenuation, and parking design.

### ***Potential Civic Site (CI) Overlay***

An overlay for a potential civic building is also shown at the Town Center (see Figure 3-30, Conceptual Public Services Plan of the Specific Plan), which reflects the Metrics of the Specific Plan for the Town Center to include a site for a potential civic building on approximately two acres of land; the civic site shall be located adjacent to the Town Center’s public gatherspace; and the civic site shall be shown as an overlay on the Land Use Plan map and its potential location depicted on the tract map.

### ***Floodplain Safety Zone***

The Floodplain Safety Zone is described in Section 2.3.1 of the *Centennial Specific Plan*. The intent for the Floodplain Safety Zone (100-year floodplain), as shown on Exhibit 4-5, Centennial Project – Safety Zones, is to identify the areas with potential for flooding prior to the development. Existing regulations applicable to development within potentially flood-prone areas to protect public safety, promote public health, and minimize economic loss would apply. This zone applies to areas that the Federal Emergency Management Agency (FEMA) considers to have a special flood hazard or that the Flood Insurance Administration has or will define in their Los Angeles County Flood Insurance Study. Because these areas have special building requirements set forth by governing agencies, new construction within these areas “shall be subject to the provisions of the County Code relating to construction materials and methods, elevation and flood proofing, and utility standards” (Placeworks 2017). Flood hazards identified on the Project site would be mitigated through the drainage

Source: Placeworks 2016

## Centennial Project – Safety Zones

Exhibit 4-5

Centennial Project

Map Not to Scale

concepts and hydrology review. Additional discussion of the hydrology is presented in Section 5.2, Hydrology and Flood.

### ***Geologic Safety Zone***

The Geologic Safety Zone is described in Section 2.3.2 of the *Centennial Specific Plan* and is depicted on Exhibit 4-5, Centennial Project – Safety Zones. An overlay for the fault setback zone and Alquist-Priolo Zone was created in an effort to provide greater public safety by establishing review procedures and setbacks for areas that are subject to potential surface fault rupture. The areas within the currently designated Alquist-Priolo Earthquake Fault Zones and within new fault hazard areas (identified as part of the site-specific geotechnical investigations conducted during environmental review of the Project site) have been given the Geologic Safety Zone designation. Additional discussion of the seismic conditions present on site is presented in Section 5.1, Geotechnical.

Section 2690 of the *California Public Resources Code* specifies that no human-occupied structures can be located within an Alquist-Priolo-designated Earthquake Fault Zone unless specific investigations prove these areas to be free of active faulting. The San Andreas Fault, which crosses the southwestern most tip of the Project site, is located within a designated Alquist-Priolo Earthquake Fault Zone.

To promote avoidance of fault-related hazards, the *Centennial Specific Plan* requires a minimum setback of 100 feet in each direction from faults determined to be active. The Geologic Safety Zone delineates a zone with a setback of 100 feet in each direction from the 2 active on-site faults as a conservative measure and includes the location of the Alquist-Priolo Earthquake Fault Zone for the San Andreas Fault. The width of the setback may be reduced to 50 feet with the concurrence of the County of Los Angeles Department of Public Works, based on more specific evidence of fault activity from further trenching that would be performed as part of the site development process.

### ***Significant Ecological Area Zone***

The Significant Ecological Area (SEA) Zone is described in Section 2.3.3 of the *Centennial Specific Plan* and is depicted on Exhibit 4-6, Centennial Project – Significant Ecological Area Zone.

The SEA designation does not confer protection or preservation nor does it prohibit development. Instead, it requires additional review by the Significant Ecological Area Technical Advisory Committee (SEATAC); SEATAC reviews development proposals according to specified design compatibility criteria in order to ensure heightened consideration of the biological resources that contribute to the long-term sustainability of the SEA. The SEA Overlay's purpose is to ensure that the portions of the site within an SEA designation are appropriately considered as part of Project development.

A portion of SEA No. 17, San Andreas, is located on the Project site. SEA No. 17 encompasses a small portion of the western Tehachapi foothills then stretches in a southeasterly direction to include Quail Lake; the northern foothills of Liebre and Sawmill Mountains; large portions of Portal Ridge; Leona Valley; Ritter Ridge; Fairmont and Antelope buttes; Anaverde Valley;

and Lake Palmdale. This SEA was designated to support a unique mosaic of plant communities, flora, and fauna representing a transitional area between the Mojave Desert, the Transverse Range, and the Tehachapi Mountains; it provides a wildlife movement linkage between these mountain ranges. This SEA No. 17 incorporates two former SEAs (i.e. SEAs 58 and 59). The Project would not include any development within the SEA No. 17.

#### **4.5.5 MOBILITY PLAN**

The Project's Mobility Plan includes four sections: (1) Performance Standards; (2) Street/Trail Design; (3) Urban Design, Planning, Land Use; and (4) Transportation Demand Management Program. The Mobility Plan for Centennial is an integral part of the Land Use Plan and provides for an integrated network of roadways, walking and biking trails to reduce automotive use and facilitate safe and efficient travel.

The Mobility Plan also requires the formation and funding of a Transportation Management Agency (TMA) prior to the issuance of the first occupancy permit. The TMA is responsible for monitoring the form of travel, or transit modes, used by the people who live and work in Centennial. Consistent with state and regional transportation, air quality and greenhouse gas planning objectives that focus on reducing the use of single occupancy vehicles (SOVs) for travel, Centennial must meet the following mobility performance standards: (1) a minimum of 20 percent of total daily peak morning and afternoon external (e.g., commuting) trips must be completed by using non-SOV transit modes; and (2) a minimum of 30 percent of total daily internal (e.g., local) trips must be completed by using non-SOV transit modes.

The TMA is responsible for conducting travel mode surveys and implementing transportation demand management (TDM) measures as required to verify the achievement with these minimum mobility performance standards. The Mobility Plan strives to achieve the following objectives:

- Reinforce and serve the Land Use Plan;
- Ensure the development of a “complete streets” network;
- Provide an environment that encourages for the use of alternative modes of transportation;
- Provide options to reduce vehicle trips and emissions by linking effective travel demand management with transportation systems and parking policies; and
- Provide an aesthetically pleasing environment that is consistent with the Specific Plan goals and still meets the required Centennial mobility objectives.

#### **Mobility Performance Standards**

Reducing demand for single occupancy vehicle use is one of the eight Guiding Policies in the 2016-2040 RTP/SCS. California's landmark Sustainable Communities and Climate Protection Act of 2008 includes multiple provisions to reduce SOV use within the State (c.f. Cal. Gov't Code Sections 65081 (d), (f) and (i)(4)) The Centennial Mobility Plan is also consistent with AVAP's Chapter 3: Mobility Element goals and policies (1.1, 1.3, 1.4, 1.5, 2.1,

2.2, 2.4, 2.5, 3.3, 3.4, 4.2, 4.3, 6.9, 7.5, 8.1, 8.2, 9.2, 9.3, 9.4, 10.4, 10.5, 10.7, 10.8, 11.3, 11.5). There is a broad consensus that encouraging non-SOV transportation options, such as walking, biking, carpools, bus and train travel, alternative work schedules, and telecommuting is essential to reduce congestion, improve air quality, and address climate change as well as promoting healthy living and affordable housing.

Consistent with these well-established objectives, Centennial must achieve the following external and internal trip mobility performance standards for non-SOV transit:

- **External Trip Mobility Performance Standard:** External trips refer to travel either into or out of Centennial. These are trips with either an origin within and destination outside, or an origin outside and destination within Centennial. These trips are primarily associated with employment-related travel and reach their highest levels during morning and afternoon peak commute periods. Centennial must ensure that a minimum of 20 percent of all peak morning and afternoon external trips use non-SOV transit modes, such as carpools, transit, telecommuting, or alternative work schedules.
- **Internal Trip Mobility Performance Standard:** Internal trips refer to travel that occurs within Centennial. These are trips with both origins and destinations within Centennial. These trips typically include shopping, recreational, employment, and educational-related travel. Centennial must ensure that at least 30 percent of all internal trips use non-SOV transit modes, such as walking, biking, carpools, or local transit.

## **Street/Trail Design**

The Mobility Plan proposes a multi-modal transportation system with various components (Roadways, Transit, Bicycle, and Pedestrian) and is designed to provide safe and efficient mobility throughout the community. Centennial will implement a system of complete streets and multi-mode, non-motorized transportation facilities consistent with the California Complete Streets Act of 2008 and in accordance with applicable County policies. The objective of complete street design is to provide safe, efficient and accessible mobility for all motorized and non-motorized users, including motorists, cyclists, pedestrians, and transit riders. Non-motorized transportation planning elements are integrated into the Centennial Circulation Plan to encourage non-automotive transit modes, including the following design criteria:

- Small- to medium-sized streets and blocks that allow for shorter walking distances to retail, parks, schools, and other destinations;
- Facilities that make walking, cycling and transit use safe, comfortable, attractive, and efficient transportation options;
- Parking behind buildings to encourage walking in retail areas along street frontage;
- Streetscapes designed as public spaces to promote social interaction and physical activity;

- Context sensitive design to respect adjacent land use types and neighborhood character and aesthetics

### **Roadway Classification**

The Project's Circulation Plan is provided in Exhibit 4-7, Centennial Project – Circulation Plan, and contains a hierarchy of roadways (each with a specific function), consistent with the County Subdivision Code. The circulation system has been designed to accommodate all users, the estimated vehicular traffic volumes, and the roadway function in relation to the part of the community that is being served. Therefore, based on roadway characteristics, different roadways would have different median widths, parking, sidewalk widths, bicycle amenities, and landscaped areas. As proposed, the Project's system of roadways is designed to effectively distribute vehicular, bicycle, and pedestrian traffic. The five categories of roadways are discussed below.

- **Major and Secondary Highway.** Roadways designed for the highest volume of use include Major and Secondary Highways. A Major Highway generally consists of six to eight lanes and Secondary Highways typically consist of four lanes. All Centennial roadways that are classified as a highway will be constructed with a raised median.
- **Collectors.** Collectors are designed for moderate levels of use and include two to four lanes with varying cross-sections. Designated Centennial Collector roadways conform with the County collector classifications and also may include additional special design features such as wider parkways or raised medians for landscaping. The Industrial Collector classification features four lanes with or without a raised median and will also be constructed with Class II Bike Lanes.
- **Local and Private Roadways.** Local and private two-lane roadways are designed to serve the lowest volume of use and vary in design in accordance with the presence or absence of allowed parking. Local and private road residential, commercial and business park serving cross-sections are also variable to reflect different patterns of automobile and truck traffic.

For any gated community approved, certain roads that meet County standards for a “private and future street” could be incorporated, with controlled access and would be maintained by an HOA as long as the roads remain private streets. Please refer to Section 3.2, Mobility Plan, of the *Centennial Specific Plan* for conceptual roadway cross-sections. There are a number of different sections featured within the basic roadway categories; the two-lane local roadways, in particular, have several variations, each of which would be deployed according to the characteristics of the area being served. Table 4-4 provides a summary of the Roadway Standards for the *Centennial Specific Plan*.

Opt.: Optional					
a Bike lanes can either be Class I, II, or IV.					
b Secondary is a 4-lane roadway; Limited Secondary is a 2-lane roadway.					
Source: Placeworks 2017					

### ***Intersection Controls***

Intersection controls will be provided to safely and efficiently manage vehicular and non-vehicular traffic throughout the community. Major Highways use features such as, but not limited to, traffic signals, separated bike lanes and crossings (e.g. bridges and tunnels) at intersections and limited access is provided between signalized intersections.

Modern roundabouts are used at certain secondary and collector road intersections where four-lane and two-lane or two two-lane roadways connect. All roundabouts within the project will be designed to help traffic flow better while making sure all pedestrian and bike crossings are well marked and safe. Roundabouts also may be landscaped to increase aesthetic values. Several figures in the Specific Plan illustrate configurations for roundabout design. Other intersections within the community will be controlled with features such as, but not limited to, stop sign and yield sign controls. As shown on Exhibit 4-7, in addition to the intersections proposed on the Project site, two new intersections are proposed with SR-138, as discussed further below.

### ***Traffic-Calming Measures***

Traffic-calming measures are roadway designs that control excessive speeds and ensure compatibility with multiple users, such as emergency-service vehicles, pedestrians, joggers, and cyclists. Traffic-calming design measures that may be incorporated into the street improvement plans the following:

- Narrower street widths.

- Roundabouts in place of traditionally controlled intersections.
- Speed tables (long, raised speed humps with a flat section in the middle and ramps on the ends, sometimes referred to as flat top speed bumps or raised crossings).
- “Bulb-outs” or curb extensions at intersections to narrow the pedestrian’s crossing distance and restrict roadway width.
- Raised intersections and/or raised crosswalks where the roadway is raised vertically as with speed tables.
- Chokers that narrow the roadway at mid-block and facilitate mid-block pedestrian crossings.
- Chicanes or lateral shifts that result in a narrower street width while also providing space for on-street parking or landscaping on alternate sides of the street.
- Textured pavement and cul-de-sacs.

Traffic calming and control measures associated with any gated residential community would include an entry guard-house with gates or a card-entry control system. Traffic-calming measures are appropriate in many situations and when incorporated into new construction, will result in a roadway system that is accommodating to all users. Design details should be coordinated with those responsible for managing the street system (e.g., Department of Public Works, Fire Department, law enforcement, and paramedics). The actual location and specific traffic-calming measures would be incorporated into street improvement plans as part of the subdivision map approval process.

## **Urban Design, Planning, Land Use**

Centennial’s unique land planning has created an urban design integrated throughout each Village to allow people to work, live and play without having to drive to experience them. Centennial has been designed with a metrics that will guide all development that occurs within the Project. The following design criteria will reinforce the goals of the Mobility Plan:

- An 80 percent average, but no less than 50 percent of all residential units located within one-half mile of a Village Core or Town Center that includes retail and services uses;
- All residential units located within a 5-minute walk (0.25 mile) of a park of 10,000 sf or more, trailhead, clubhouse, or other public amenity;
- Parks located within a 5-minute walk (0.25 mile) of 80 percent all residential units;
- All neighborhoods within each village connect to each other via a network of trails;
- An extensive network of sidewalks, greenway trails (approximately 13 miles), and community trails (approximately 60 miles) that link residential, schools, shopping, and employment areas;
- Two underpasses and one overpass bridge crossing over SR-138 to facilitate both pedestrian and bike access to employment area.

- High-density residential uses located adjacent to commercial centers and a Mixed-Use Overlay areas permits residential uses in commercial centers.
- Implementation of a community intranet system (Section 3.9 of the Specific Plan) to reduce demand for automobile travel to obtain information, provide easily accessible information to facilitate telecommuting and non-automotive transit mode use.

### ***Bikeways***

The Project contains a non-vehicular circulation system that consists of bikeways and pedestrian access/trails. A system of bikeways would serve the community, as shown in Exhibit 4-8, Centennial Project – Conceptual Bicycle Plan. The following types of bikeways would be provided:

- *Bike Path (Class I Bikeway/Multi-Use Trail)*. A bike path (multi-use trail) that provides a completely separated right-of-way for the exclusive use of bicycles and pedestrians, with cross-flow minimized. These bikeways are found in community and greenway trails (described below).
- *Bike Lane (Class II Bikeways)*. A bike lane that provides a striped lane for one-way bike travel on a street or highway (refer to the roadway standards provided in Table 4-4, Centennial Project Roadway Standards, and the roadway cross-sections provided Section 4.7). When roadways contain additional rights-of-way, a painted or physical separation may be included to buffer bicyclists from automobiles and transit. This buffered design is commonly referred to as an Enhanced Class II Bikeway.
- *Bike Route (Class III Bikeway)*. A bike route that provides for shared use with motor vehicle traffic and routes that are marked with appropriate signage. Painted shared lane markings on pavement, commonly referred to as sharrows, may also be incorporated into Class III bikeways.
- *Protected Bike Lane (Class IV Bikeway)*. A protected bikeway (cycle track) that combines the user experience of a separated path with the on-street infrastructure of a conventional bike lane. Cycle tracks vary in configuration, but consistently provide a physical separation from motor vehicle traffic through such means as raised medians, on-street parking, bollards, or elevated pathways. They may be one-way (one direction on each side of the street) or two-way (both directions side-by-side on one side of the street). The buffers shown for Class IV bikeways may be raised to provide additional safety for cyclist and vehicular traffic.
- *Trails*. Community, Greenway, and Regional trails within Centennial provide for shared use trails by bicycle, pedestrian, and in some cases equestrian activities.

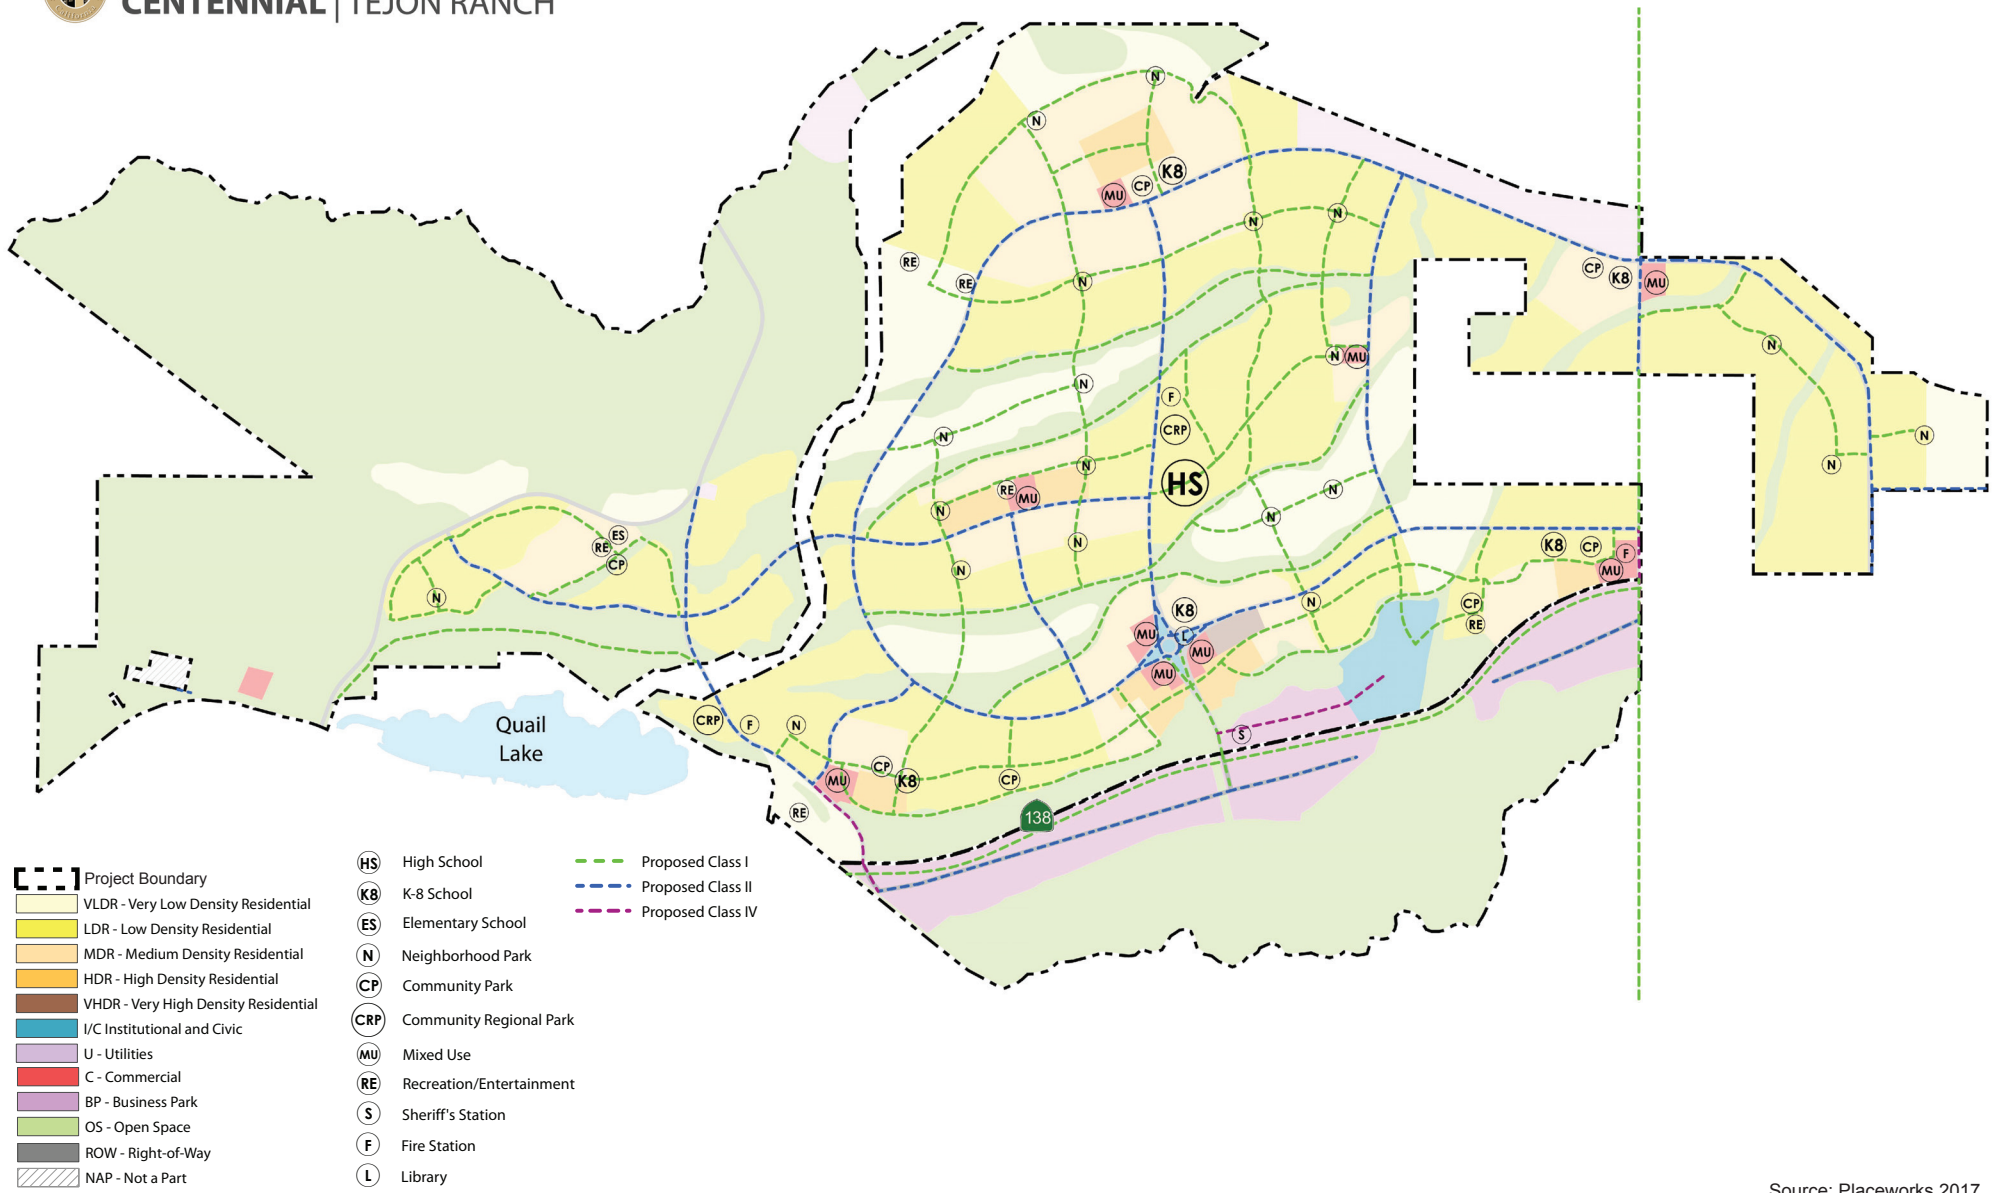

It is important to note that the designation of bikeways by class should not be construed as a hierarchy in which one is better than the other. Each class of bikeway has its appropriate application based on context.

Pedestrian amenities throughout the community include specific allocations of land to greenway and community trails (described in Section 3.11.7, Trails Plan of the *Specific Plan*) so that pedestrians can circulate throughout the community. The pedestrian system is

designed to avoid roadway crossings to the extent feasible. Sidewalks will be provided on all streets. Additionally, two underpasses and one overpass bridge crossing will be constructed to cross the SR-138 to facilitate both pedestrian and bike access to employment centers.

## **Transportation Demand Management**

Transportation demand management refers to strategies that increase mobility efficiency by discouraging SOV trips, encouraging non-SOV transit modes, and by reducing auto trips during peak periods. TDM measures include increasing non-SOV travel options, providing incentives and information to encourage travel behavior changes, and by reducing the physical need to travel through telecommuting and other online and remote media. Potential future mobility innovations that could further reduce inefficient transit modes and associated emissions, such as intelligent transit systems (ITS) technologies, have been discussed in the 2016-2040 RTP/SCS.

A Transportation Management Association (TMA) will adaptively manage compliance with the Centennial internal and external mobility performance standards by conducting transit mode surveys and other appropriate monitoring activities. Additional TDM measures will be implemented by the TMA as may be required to ensure that minimum of 20 percent of total daily peak morning and afternoon external trips and a minimum of 30 percent of total daily internal trips are completed by using non-SOV transit modes. The TMA will be a non-profit entity that is formed and funded prior to the issuance of the first occupancy permit for Centennial. Other TMA activities include the following:

- Coordinate with regional and local transit providers to develop transit service for Centennial;
- Provide transit fare media for all transit service providers and end users;
- Support the formation of vanpools/carpools and rideshare matching databases;
- Develop transit affordability measures and/or incentives;
- Prepare custom transit itineraries for larger employers;
- Provide transit route maps and schedules;
- Required employee commute reduction programs for employers with 250 or more employees;
- Conduct transit network meetings/workshops; and
- Monitor transportation-related technological developments for potential deployment in Centennial.

Street network transit facilities will be developed in conjunction with the Project's transportation demand management (TDM) program and will include the following:

- Partner with Antelope Valley Transit Authority to provide bus service within Centennial and to the rest of the Antelope Valley.

- Partner with Santa Clarita Transit Authority to provide bus service within Centennial and to the rest of the Santa Clarita Valley.
- Partner with Kern Transit to provide bus service between Centennial and the neighboring communities of Tejon Mountain Village, Tejon Ranch Commerce Center and Grapevine to the north.
- Provide ride-share program, on demand pick up, shuttle service or similar methods to employment, commercial and residential areas of Centennial.
- Identify locations for transit centers in proximity to village cores and employment centers such as business park and institutional/civic land uses.

The Project includes a comprehensive system of public transit and other forms of transportation that provides alternatives to the automobile through a coordinated network of public transit routes, bikeways, and pedestrian trails. The Project would accommodate local (internal) and external trips, as described below.

- **Local Backbone and Feeder System.** A transit route easement no less than 25 feet wide shall be reserved in the CCD (connecting the Town Center, BP and I/C areas) and also run northerly connecting to the Village 5 Core. At buildout, a local backbone route along the major north/south collectors would be provided connecting from SR-138 to the northern end of the Project site. This backbone route would be supplemented by feeder lines that loop through the Project (local transit routes). The transfer locations along the backbone route would provide connectivity to the local system (shown on Exhibit 4-7). The exact route alignments and operational characteristics are conceptual at this time and would be determined as the community builds out. The local transit system would operate more as a demand-responsive system, at least initially.

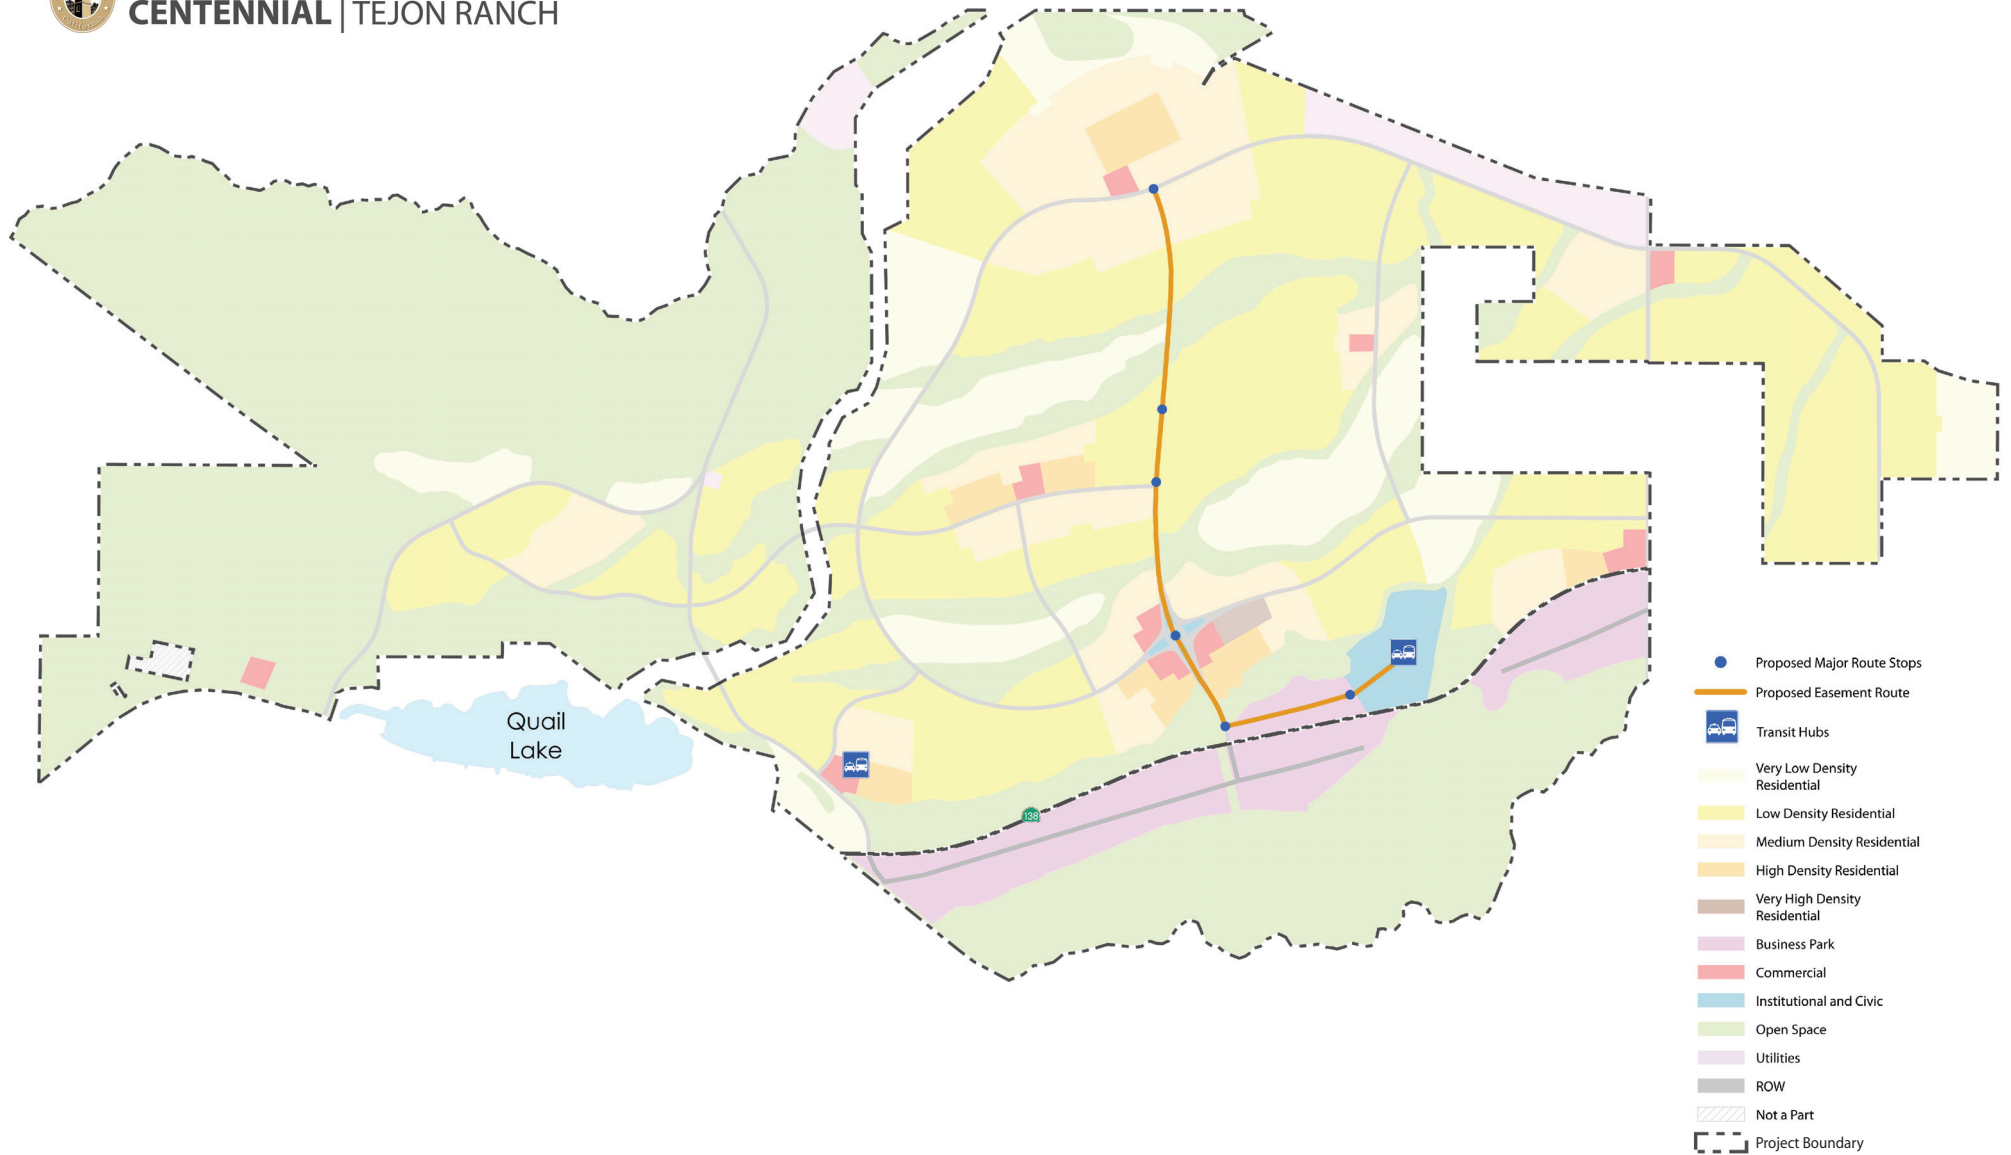

As with other unincorporated areas of Los Angeles County, funding for the local transit system would come from a combination of Proposition A and property taxes. The operation of this transit service may be contracted with an existing service provider, or a newly formed operator serving Centennial may be established. The decision of either establishing a new operator or contracting with an existing operator would be made by Los Angeles County Department of Public Works.

- **External Trips.** As shown in Exhibit 4-9, Centennial Project- Conceptual Transit Plan, two transit centers are proposed to be located north of the SR-138 and would be connected by the backbone transit system traveling through the site. The transit centers would cater to a variety of transportation activities and would include other compatible uses allowed on site (e.g., business park, retail services, institutional and civic uses). The centers would provide convenient access to public bus transportation, carpooling, park and ride, special charter operations, and/or similar types of activities related to local or off-site transit usage. An information center would be an important part of the services offered. The primary objective of such centers is to provide focal and gathering points for a variety of private and public transportation activities, all of which reduce dependency on the private automobile.

# TRANSIT PLAN

## CENTENNIAL | TEJON RANCH

Source: Placeworks 2017

### Centennial Project – Conceptual Transit Plan

### Exhibit 4-9

Centennial Project

Map Not to Scale

D:\Projects\CEN\Centennial\GRAPHICS\EIR\Ex\_Bikeways\_20170203.ai

The transit centers are intended to be accessible for both Centennial residents and residents of nearby communities.

Commuter service may be provided by Santa Clarita Transit, Antelope Valley Transit, or a combination of both. It is envisioned that commuter service from Centennial would be integrated with existing services provided by these operators and would connect Centennial to existing Metrolink service, future high speed rail service, and employment centers throughout the region. These centers would, at least initially, be used to promote carpooling and vanpooling until such time as ridership justifies commuter service. The majority of the operating costs for this service would come from farebox revenues (i.e., fares from the riders). Existing commuter service provided by Antelope Valley Transit recovers approximately 90 percent of its operating cost from farebox revenue. It is anticipated that, at buildout, Centennial would be able to approach similar numbers from farebox revenue. The short fall in operating cost would be covered through Proposition A and/or property tax revenue. A bus storage and maintenance facility would be provided in future phases of development, if necessary. The location would be determined at a later phase; however, it is anticipated that this type of facility would be accommodated within areas designated for Institutional land uses. There is sufficient land available within these areas to accommodate such a facility.

- ***Pedestrian Access/Trails.*** Pedestrian amenities are proposed throughout the community and include specific allocations of land to sidewalks and greenway trails. The trails system is comprised primarily of a County multi-use (hiking, equestrian, and mountain biking) trail and a system of community trails within the street right-of-way that can also be used as a bike path, as trails within the greenways (also considered bike paths), and as Class II Bicycle Lanes. The trail system would connect residential neighborhoods to commercial, employment, school, parks, civic, and institutional land uses.

Exhibit 4-10a, Centennial Project – Recreation and Trails Plan shows the Project's non-vehicular circulation system components, including the two underpasses and one overpass bridge crossing will be constructed to cross the SR-138 to facilitate both pedestrian and bike access to employment centers.

- *Greenway Trails.* These are improved trails within greenways that traverse the Project site. Greenway trails are located along the edges of the Open Space and residential designations. The trails may be constructed of poly-pavement, decomposed granite, soilcrete, asphalt, concrete, or other pervious surface. Signs would be posted along trails cautioning against disturbing any sensitive drainages. The cross-section for a typical greenway trail is provided in Exhibit 4-10b, Centennial Project – Greenway Trails.
- *Regional Trail.* A regional multi-purpose trail extending across the Project site, connecting to the town of Gorman through the residential development on the west side of the Specific Plan area across SR-138 and across the BP designation in the southern portion of the site and ultimately connecting to the realigned Pacific Crest Trail. In the open space areas, this trail will be a porous surface

trail, such as decomposed granite. It will be a minimum of eight feet wide and will accommodate pedestrians and cyclists, as well as equestrian use.

- *Community Trails.* The Project will include the development of community trails, in addition to the greenways, that would be a minimum of eight-foot-wide and be shared bike and pedestrian paths, conceptually located adjacent to the backbone road system. These trails are shown on Exhibit 4-10a, Centennial Project – Recreation and Trails Plan. A cross-section is depicted on Exhibit 4-10c, Centennial Project – Typical Community Trail.

Also, Pacific Crest Trail (PCT), which is designated as a National Scenic Trail that traverses approximately 2,650 miles through 3 states (California, Oregon, and Washington) will be relocated to the west side of 300<sup>th</sup> Street West, which travels through the Project site. This realignment is not a part of the Project, but is assumed to be the future alignment for evaluation purposes in this EIR. Cross-section graphical depictions of these trails are included Section 5.14, Parks and Recreation.

### **National Cement Plant Road Re-Alignment**

The current alignment of National Cement Plant Road traverses from the off-site National Cement Plant in Kern County, through off-site open space areas in Los Angeles County, through the Project area and over the West Branch of the Aqueduct, ultimately connecting to SR-138. A portion of the roadway alignment within the Project boundaries is planned to be re-aligned through the Project site to access the SR-138 from the western side of Quail Lake rather than from the current connection on the east side of Quail Lake. This realignment serves the purpose of providing a shorter route of access for the cement trucks to the I-5, eliminates concrete truck travel over the bridge that crosses the West Branch of the Aqueduct, and eliminates cement truck traffic from traversing through one of the entrances to the Project site. The proposed re-alignment of National Cement Plant Road will be consistent with Caltrans' SR-138 intersection spacing requirements.

The re-alignment of the National Cement Plant Road will occur entirely within Tejon-owned property within Los Angeles County. The new alignment will intersect with SR-138 on the western side of Quail Lake. Intersection improvements (e.g. deceleration lane, an acceleration lane, turn pocket) would be constructed within the Caltrans right-of-way to allow for safe ingress/egress to the re-aligned National Cement Plant Road from SR-138, as discussed in Section 4.8, Off-Site Project Features.

Upon completion of the re-alignment, Project-related traffic would use the remaining portions of the existing National Cement Plant Road, which currently connects to SR-138 just east of Quail Lake and the Quail Lake Skypark, as one point of access into the Project site.

### **Intersection Improvements at State Route -138**

In anticipation of necessary regional improvements, Caltrans has prepared a Project Study Report/Project Development Support (PSR/PDS) for the NW138 Project that addresses the long-term alignment and right-of-way needs of SR-138 between I-5 and SR-14. There is no implementation schedule in the PSR/PDS for the improvements along SR-138. A portion of

# Centennial Project – Typical Community Trail

# Exhibit 4-10c

Centennial Project

Not to Scale

Caltrans' SR-138 study area and proposed re-alignment traverses the Project site, as depicted on Exhibit 4-7, Centennial Project – Circulation Plan.

Caltrans is the lead agency for the completion of the Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for the NW138 Project. Metro is a funding partner and is responsible for transportation improvements in Los Angeles County. Together, Caltrans and Metro have identified specific roles and responsibilities, and with delegated authority from the Federal Highway Administration (FHWA), Caltrans will ensure that the Final EIS/EIR is in compliance with the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). As such, all aspects of the re-alignment and any other improvements to the SR-138 would be analyzed under the NW138 Project EIR/EIS. The NW138 Project environmental document considers a No Build Alternative and three other alternatives (Metro 2014).

Build (2040) Alternative 1 improvements would include modifying the existing SR-138 roadway into freeway (six-lane divided) and expressway (four-lane divided) sections, including changing the alignment in some areas. The portion of SR-138 between 300th Street West and I-5, which is applicable to the Project site, is envisioned by Caltrans to be a 6-lane divided freeway that includes a 22-foot median. As shown on Exhibit 4-7, Centennial Project – Circulation Plan, the proposed future alignment of the NW138 Project Alternative 1 is depicted as a “Caltrans Study Area”, which includes land owned by Caltrans within their right-of-way as well as land owned by Tejon Ranch, LLC. Build (2040) Alternative 2 considers the construction of an Expressway/Limited Access Conventional Highway. Caltrans also considered the implementation of a Transportation System Management (TSM) Alternative. Specified sets of improvements were analyzed as part of the build alternatives and included mainline widening, connector improvements, access type and intersection control treatments. The Transportation Analysis Report (TAR) also listed additional access types and control treatment options for the build alternatives. The analysis of the additional options is documented in the Supplemental Intersection Control Evaluation report (ICE Report).

The Centennial Project site has three existing intersections with SR-138: Gorman Post Road, the Cement Plant Road (identified as private road by Caltrans), and 300<sup>th</sup> Street West. Alternative 1 would involve a grade-separated undercrossing of the SR-138 at all three intersections. It is noted this would result in the largest SR-138 right-of-way among the alternatives. However, it does not include additional right-of-way for the inclusion of potential future commuter rail services (Metro 2015). If additional consideration of a rail component is pursued by Metro, it would require additional right-of-way that is outside of the currently depicted Caltrans Study Area, and would be outside of the scope of the Caltrans EIR/EIS.

Alternative 2 improvements would modify the existing SR-138 roadway into expressway (six and four-lane divided) and limited access conventional highway (four-lane) sections, including changing the alignment in some areas. Alternative 2 would involve a grade-separated undercrossing at Gorman Post Road, and at-grade intersections at Cement Plant Road and 300<sup>th</sup> Street West. The Transportation System Management (TSM) Alternative would provide operational improvements without adding capacity or access restrictions,

and would widen the shoulder through the majority of the corridor. This alternative would also provide a curve correction to a stretch of SR-138 immediately east of Quail Lake near the Ridge Route intersection.

Because the ultimate implementation of SR-138 is unknown, the Project depicts the current alignment of SR-138 on the Land Use Plan as being an “off-site” feature. For the purposes of this EIR analysis, all Caltrans right-of-way property up to the existing edge pavement of the SR-138 is considered to be “on-site”, whereas all existing paved areas of the SR-138 are considered “off-site” (see Exhibit 4-21, Centennial Project – Off-Site Project Components).

The Project will have five intersections that interface with SR-138. The connection of the proposed realigned National Cement Plant Road to SR-138 on the west side of Quail Lake, and the intersection of 290<sup>th</sup> Street West, are discussed as “off-site” improvements in Section 4.8, Off-Site Project Features below. The remaining three intersections include: slight relocation of the existing intersection of National Cement Plant Road with SR-138 approximately 580 feet to the east; a new connection with SR-138 in the central portion of the site near the main Town Center in Village 3; and the existing roadway connection with SR-138 at 300<sup>th</sup> Street West. Each of these five intersections would require roadway improvements, including the construction of acceleration/deceleration lanes and turning pockets within the Caltrans right-of-way. Improvements associated with these intersections are anticipated in this EIR and are based on the current SR-138 alignment.

The draft NW 138 EIR/EIS, TAR and ICE Report do not identify a preferred alternative and Caltrans has deferred the selection of a preferred alternative to the Final EIR/EIS. Caltrans has also reserved the right to determine the specific preferred intersection control based on the traffic and safety data at the time the improvements occur. Thus, depending on the timing of the implementation of the realigned SR-138; the timing of the implementation of the Project; and which Caltrans alternative is chosen, the ultimate connection requirements for Project roads to SR-138 may need additional future CEQA analysis in conjunction with future phases of development. All construction activities within Caltrans right-of-way would be closely coordinated with Caltrans, subject to their review and design standards, and subject to their approval.

## **Bridges Over West Branch of the Aqueduct**

In addition to the existing National Cement Plant Road bridge, the Project includes the construction of one new bridge over the West Branch of the Aqueduct. These are discussed further below in Section 4.7, Off-Site Project Features, because the California Aqueduct is not a part of the Project site. The new and existing bridge would span the width of the Aqueduct and would not interfere or intrude into the Aqueduct itself; however, construction activities on both bridges may require some grading within California Department of Water Resources (DWR) property adjacent to the West Branch. Bridge widths would be designed to accommodate the travel lanes identified on each highway classification and would have a separate road deck for the travel lanes on each side of the roadway median. A sidewalk area would be provided at the outer edge of each bridge section and would be wide enough to accommodate pedestrian and bicycle use. A raised barrier would be provided between the

travel lanes and greenways for protecting pedestrians. Aesthetically enhanced traffic barriers would be provided along both sides of each bridge structure.

#### 4.5.6 PARKS/RECREATION

Under the Parks and Recreation Plan, the Project devotes approximately 163 gross acres to Park Overlay, which would include public neighborhood parks, community parks, and community regional parks. In addition, 75 acres is designated Recreation/Entertainment, which would include private recreation facilities. The Project includes a County multi-use trail, that would connect to the realigned Pacific Crest Trail, and a system of community trails within the street right-of-way that can also be used as a bike path, as trails within the greenways (also considered bike paths), and as Class II Bicycle Lanes. The trail system would connect residential neighborhoods to commercial, employment, school, parks, civic, and institutional land uses. Section 5.14 of this EIR describes in detail how the Project satisfies the requirements of the *General Plan* and the County's Parkland Dedication Ordinance, located in Title 21 of the *Los Angeles County Code*. Exhibit 4-10a, Centennial Project – Recreation and Trails Plan, depicts the conceptual location of park uses.

There are three types of public parks that would be developed as part of the Project and dedicated to the County (neighborhood, community, and community regional), which are described above in the description of Park Overlay. In addition to the 163 acres of public parks, there are additional recreation amenities that would be developed including pocket parks (public and private), private commercial recreation facilities, private community recreation facilities (e.g., in multi-family complexes), and the County multi-use. The County multi-use trail and greenway trail system are described further below. Designated open space areas would also provide the Project area with passive and/or active recreational opportunities.

Pocket parks are typically less than ½-acre, and the intent is to provide an average of one 10,000-sf pocket park per 200 units. Amenities for pocket parks can include both active and passive features, such as (e.g., children's play apparatus, picnic areas, fountains and seating areas) depending on the community's setting and need. Pocket parks may be developed as both public and private parks, but do not count towards to Project's parkland obligation. Pocket parks would be privately owned, but open to the public, and would be maintained by the Homeowner's Association (HOA), Landscape and Lighting Maintenance District (LLMD), or other similar entity. Community gardens are edible gardens that can stand alone or be a component within a park. View Parks are another form of pocket park. Their purpose is for passive recreation like picnicking and the enjoyment of scenic vistas of the mountains and surrounding open space that frame Centennial.

Neighborhood parks are typically between three and ten acres and are located to serve surrounding neighborhoods within a ½-mile radius. Amenities can include informal open play areas, children's play apparatus, picnic facilities and barbeques, and sports fields.

Community parks are generally 10 to 20 acres and serve several neighborhoods within a 1- to 2--mile radius; they are intended to provide a wide variety of active and passive recreational activities, including group activities that may not be feasible in a neighborhood

park. Amenities can include those provided for neighborhood parks as well as group picnic areas with overhead shelters, lighted sports fields, basketball and tennis courts, concession buildings, maintenance buildings, on-site parking areas, and information kiosks.

Community regional parks are typically 20 to 100 acres and have a service radius of 20 miles. Amenities for community regional parks can include a jogging exercise course, informal open play areas, children's play apparatus, group picnic areas with overhead shelters, barbecues, lighted sports fields, basketball courts and tennis courts, information kiosks, public restrooms, concession buildings, recreation offices, maintenance buildings, and on-site parking areas. Community regional parks may also have one or more of the following features: multiple sports facilities, an aquatics center, a fishing lake, a community building and gymnasium, and scenic views and vistas.

Private commercial recreation facilities and private community recreation facilities could include pools, sports courts, workout equipment, crafts, meeting rooms, ballrooms, food service exclusive to a clubhouse, and banquet facilities, among other amenities. Other private recreational facilities could include a clubhouses for active adult communities and small recreation centers for multi-family developments that could include a pool, a cabana, a meeting room and a kitchen, among other uses. The private recreation facilities would provide a varied array of amenities. No specific locations for the commercial or community recreation facilities have been identified; locations would be determined as part of each future tract map.

#### **4.5.7 NATURAL RESOURCES/OPEN SPACE**

##### **Natural Resources/Open Space Management Plan**

The preservation and management of natural resources is an important component of the Project. The Open Space Management Plan (OSMP), as described in Section 3.13 of the *Centennial Specific Plan*, provides a set of standards by which the biological and natural resources in the Project area would be managed during the short-term construction activities and the long-term life of the Project. This Plan governs the Open Space designation areas within the Project site boundaries (see Exhibit 4-11, On-Site Open Space/Mitigation Area); specifies which land is to be protected; and discusses how the protected land (e.g. greenways, transition areas, hillsides, and wildfire modification zones) are to be maintained. The Plan governs the provisions of the oak tree resources program, recreation and access, riparian and other types of habitat enhancement or restoration, and long-term management of the open space.

The Project has been designed to preserve areas of higher biological value. As a result of this effort, all 3,861 acres of the County of Los Angeles' San Andreas Significant Ecological Area (SEA 17) that fall within the Project site boundaries are avoided. Preservation of these SEA lands provides a layer of protection for a unique assemblage of plant and wildlife populations known to occupy the area. The preservation also protects local wildlife movement on and off-site because these areas are positioned contiguous to off-site open space areas, thereby providing a larger total area of continuous preserved open space for local wildlife to use as habitat and for movement. No Project development would occur within SEA 17.

## Centennial Project – On-Site Open Space/Mitigation Area

## Exhibit 4-11

Centennial Project

Map Not to Scale

The Project requires that some drainage corridors be modified to incorporate necessary flood-control or water quality features; whenever possible, these modifications will incorporate “naturalized features” to blend the improvements into the natural appearance of unmodified areas. In addition, implementation of the Project would avoid or minimally impact riparian resources along sensitive drainages. Of the 12,323 acres within the Project site, approximately 5,624 acres would be included in the Open Space land use designation. Of the 5,624 acres of designated Open Space, approximately 5,116 acres (42 percent of the total Project site) are intended to (1) remain in their original natural condition; (2) be restored; and/or (3) be enhanced by weed abatement, fencing, and native species planting, among other means. Of this amount, approximately 3,861 acres are designated as SEA 17 to be preserved in perpetuity within the Project site boundaries.

Additionally, approximately 23,547 acres of off-site areas would be set aside for preservation to mitigate impacts to biological resources, as discussed further in Section 4.7, Off-Site Project Features and depicted in Exhibit 4-12, Centennial Project – Off-Site Mitigation Preserve. The Developer would provide a conservation easement for both the 3,861 on-site preserved acres and the 23,547 off-site preserved acres to ensure preservation of the total 27,412-acre open space preserve in perpetuity. Importantly, contained within this 23,547 acres of off-site preservation are approximately 8,935 acres of SEA 17 lands, which contain high-value biological resources.

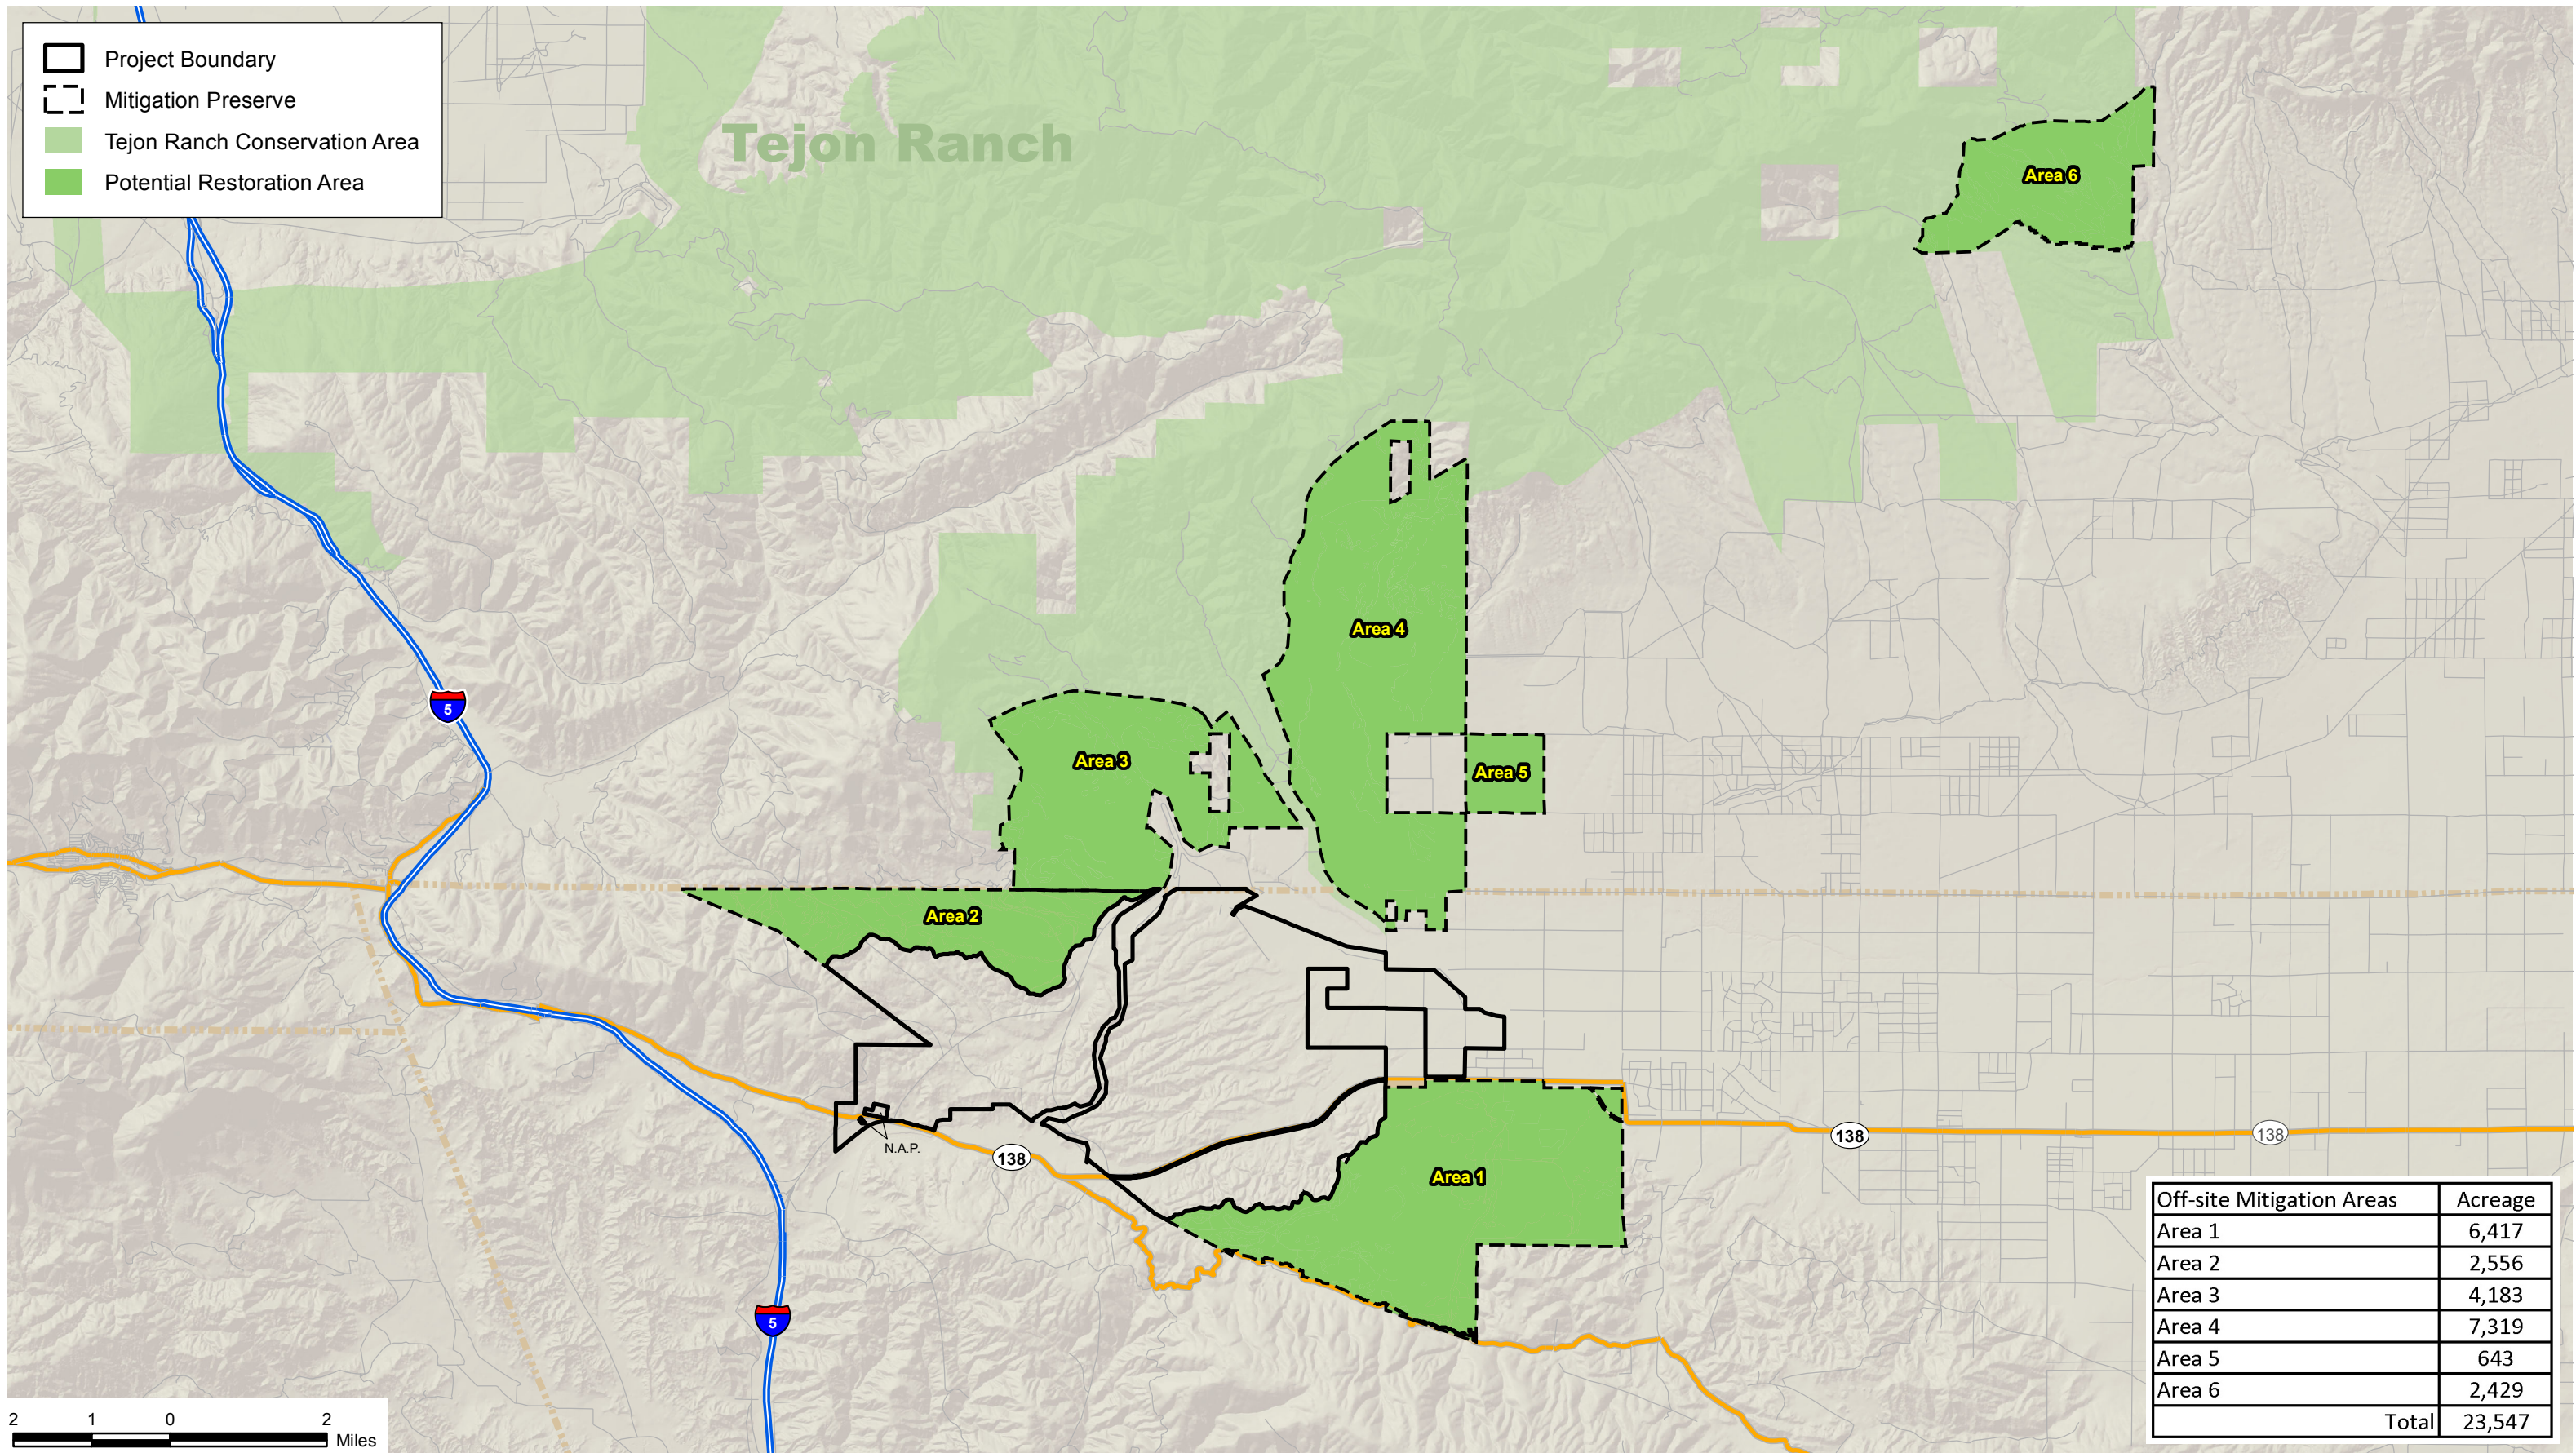

Therefore, when considering the amount of preserved on-site and off-site lands (i.e. 27,412 acres) compared to the total disturbed/developed areas within the Project site boundaries based on the Grading Plan (i.e., 7,751 acres), almost 3.5 times as much land would be preserved as would be developed.

### **Grassland Mitigation Plan**

The lands designated as Open Space (OS) on-site are generally divided into two large areas: the northwest portion of the Project site and the southeastern portion of the site. The area in the northwestern part of the site is comprised primarily of Oso Canyon, which includes a blueline stream and foothills/canyons with slopes of 25 percent or greater. The southeastern portion of the site contains similar vegetation and associated biological resources.

Grazing would occur within the OS designation. Grazing operations would be directed under the provisions of the Grassland Mitigation Plan, which is a component of the Mitigation Preserve Management Plan and/or the Ranch-Wide Management Plan (which is being prepared by the Tejon Ranch Conservancy); grazing would include temporary and long-term activities, possibly in perpetuity if determined necessary to maintain grassland values based on the Grassland Mitigation Plan (refer to Mitigation Measure [MM] 7-10 in Section 5.7, Biological Resources). The Grassland Mitigation Plan would preserve and manage existing native grasslands to ensure their sustainment in perpetuity. The Plan is intended to be a dynamic program that allows for incorporation of new restoration and enhancement treatments over time to determine the optimum methods of treatment for management and restoration of native grassland communities.

**Off-Site Mitigation Preserve**

Centennial Project

Exhibit 4-12

---

## Other Relevant Plans

### ***Tejon Ranch Conservation and Land Use Agreement (TRCRWA)***

On June 17, 2008, Tejon Ranch Company (TRC) entered into a Conservation and Land Use Agreement (Agreement) with Audubon California, the Endangered Habitats League, Natural Resources Defense Council, Planning and Conservation League and Sierra Club (Resource Groups) and the nonprofit Tejon Ranch Conservancy (Conservancy). Known as the Tejon Ranch Conservation and Land Use Agreement (TRCRWA), the Agreement allows TRC and its development partners to pursue approvals for development of portions of the Tejon Ranch (Ranch), including the Project, without opposition from the Resource Groups, while providing for the designation of Project open spaces and the dedication or sale of conservation easements over approximately 240,000 acres, or approximately 90 percent, of the 270,000-acre Ranch. Additionally, the Project Open Space Preserve includes areas of off-site preservation lands within Tejon Ranch lands. Areas 1 and 2 are located within Los Angeles County and include a total of 8,973 acres, as depicted in Exhibit 4-12, Centennial Project – Off-Site Mitigation Preserve. In total, the Off-site Mitigation Preserve includes 23,547 acres of off-site property that will be used to mitigate for Project-related biological impacts.

**Dedicated Conservation Areas.** The TRCRWA permanently protects approximately 145,000 acres through a series of phased dedications of conservation or other open space easements. Approximately 30,000 acres of the dedicated conservation areas are adjacent to or near the Project site. Dedications are phased to correspond to development approvals for the Project.

**Purchased Conservation Areas.** TRC provided options for the Resource Groups to purchase development rights, through acquisition of conservation easements, for five separate areas of the Ranch, totaling an additional 62,000 acres. The acquisition of the five conservation easements was completed in March 2011. Three of these areas, or approximately 20,000 acres, are located near or adjacent to the Project site.

**Project Open Space Areas.** The TRCRWA set aside approximately 33,000 acres within proposed development areas on the Tejon Ranch as prescribed open space areas. Some of this open space would be located within the Centennial Project boundaries, if approved, as shown on Exhibit 4-11, Centennial Project – On-Site Open Space/Preserve Area. Of the 12,323 acres within the Project site, approximately 5,624 acres would be included in the Open Space land use designation, and approximately 3,861 of the open space acres are designated as SEA 17 to be preserved in perpetuity within the Project site boundaries.

**Pacific Crest National Scenic Trail.** The TRC is working with the Conservancy, the US Forest Service and the Pacific Crest Trail Association to provide an approximate 10,000-acre easement on conserved lands to realign a 37-mile segment of the Pacific Crest National Scenic Trail through the Ranch. The majority of the realigned trail is located adjacent to the Project site and the nearby conserved lands described above. The siting and construction of this trail is subject to compliance with environmental review and other applicable laws.

The following uses for the conserved lands are also provided for in the Agreement:

**State Park.** The Resource Groups and TRC agreed to work with the Conservancy and the California State Parks Department to create a state park within the conserved lands.

**University of California Natural Reserve.** TRC agreed to work with the Conservancy and the University of California (UC) Natural Reserve System to determine whether portions of the conserved lands may be viable for a future UC Natural Reserve sponsored by University of California in Los Angeles as well as how the Conservancy and the UC Natural Reserve could partner on research projects in the Conservation areas.

The conserved lands identified above are managed pursuant to a Ranch-Wide Management Plan (RWMP) prepared by the Conservancy. The Conservancy bylaws provide for a 12-member board consisting of four members appointed by the Resource Groups, 4 members appointed by TRC and 4 independent members jointly appointed by the Resource Groups and TRC during the first 3 years and by the Conservancy Board thereafter. The Conservancy has hired experienced staff and consultants with expertise in land trust administration, conservation biology and open space land management.

The Conservancy updates, monitors and enforces implementation of the RWMP on conserved lands subject to conservation, preservation, mitigation and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch. The Conservancy manages and monitors natural resource conservation, preservation and mitigation measures required under applicable law or imposed by federal, State or local agencies as part of any permit or approval on conserved lands, including those associated with the Project. The Conservancy holds all conservation easements required by such permits or approvals.

Funding for the Conservancy is assured through a combination of advances from TRC and payment of conservation fees collected at the time of qualifying initial sales and resales of certain residential lots and units within the development projects. Conservancy activities are subject to all applicable federal, State and local laws and regulations.

#### **4.5.8 INTEGRATED WATER RESOURCES MANAGEMENT APPROACH**

Planning and engineering of the Project incorporates watershed management principles and related infrastructure and water resources planning into a comprehensive integrated water resources management approach as described below. A description of proposed infrastructure/facilities for the water-related components of the Project is presented in Section 4.5.9.

The concept of the integrated water resources management is defined as “a process, which promotes the coordinated development and management of water, land and related resources” (Rahaman and Varis 2005). The Project has been designed to optimize the use of currently available water resources and those generated by the Project's operations so as to

minimize its impact on potable and non-potable water resources. Incorporation of the Centennial Green Development Program requires reduced potable water consumption through the use of drought-tolerant or native plants in greenways, transition areas, and rights-of-way; low-flow showerheads, faucets and toilets; intelligent irrigation devices; and recycled water use primarily for landscape irrigation. Additionally, the Project's water resource management infrastructure for wastewater treatment, recycled water, flood control/drainage, water quality, hydromodification control, and sediment management are integrated to create a cohesive infrastructure system that minimizes the Project's effects on the environment.

For example, the Project includes two wastewater reclamation facilities for the tertiary treatment of all wastewater generated by Project uses. This recycled water will be delivered throughout the Project site for non-potable uses (e.g., irrigation), thereby reducing the Project's demand for imported water and groundwater resources. The Project will also use its underground aquifers to bank imported water supplies available but not needed during average and wet years to provide for Project uses in dry years. The Project's flood control/drainage and water quality facilities have been designed in such a way that they can increase groundwater recharge, thereby increasing the amount of groundwater available for Project uses and decreasing the Project's need for imported water resources. As a result of this integrated approach, the Project will be able to rely on its groundwater and wastewater resources, as well as its Green Development Program requirements to reduce the demand for imported water from the State Water Project (SWP) that the Project would otherwise create, and will be more protective of its natural drainages and sensitive habitats.

The key objectives of the integrated water resources management approach are listed below.

- Promote water conservation by
  - Minimizing water use.
  - Minimizing use of imported water supplies.
  - Maximizing water reuse.
- Promote Water Supply Reliability by
  - Providing potable water from a variety of sources (e.g., SWP water, groundwater, other non-SWP supplies, banked water) to address dry year conditions.
  - Purchasing surplus SWP water in years when it is available for storage in local water banks.
  - Monitoring water usage to ensure conservation benefits are achieved.
- Protect water quality on site and off site.
- Balance hydrologic factors by
  - Maintaining macro-drainage patterns on site and
  - Avoiding hydrologic impacts.
- Promote reliability of structural systems.

Consistent with the County’s CEQA Initial Study Checklist, the following topics are typically addressed separately in EIRs: water quality/runoff, wastewater generation and treatment, water supply, and flood control/drainage. Therefore, this Centennial Project EIR considers these topics separately in Sections 5.4, 5.19, 5.18 and 5.2, respectively. However, to recognize the environmental benefits that would result from implementation of the Integrated Water Resources Management Approach, each of these sections in this EIR also includes a description of how the traditional CEQA analysis topic contributes to the Integrated Water Resources Management Approach. These descriptions are provided below.

## **Water Supply Overview in Antelope Valley**

### ***Mandatory Water Conservation***

Governor Brown declared a State of Emergency on July 15, 2014, resulting in the State Water Board adoption of Resolution No. 2014-0038 prohibiting several activities, including (1) the application of potable water to outdoor landscapes in a manner that causes excess runoff; (2) the use of a hose to wash a motor vehicle except where the hose is equipped with a shut-off nozzle; (3) the application of water to driveways and sidewalks; and (4) the use of potable water in non-recirculating ornamental fountains. The State Water Board resolution also directed urban water suppliers to implement the stage of their water shortage contingency plans that impose mandatory restrictions on outdoor irrigation of ornamental landscaping or turf with potable water and report monthly water production information to the State Water Board.

On April 1, 2015, Governor Brown signed Executive Order (EO) B-29-15, which contains a total of 31 directives—the primary requirement being a 25 percent statewide water reduction in potable urban water use through February 28, 2016, as compared to the amount used in 2013. EO B-29-15 required the State Water Resources Control Board (SWRCB) to impose restrictions to achieve the 25 percent reduction, and is directed to consider the relative per capita water usage of each water supplier’s service area, as reported monthly to DWR. Those areas with high per capita use were required to achieve proportionally greater reductions than those with low use.

In May 2016, the Governor issued EO B-37-16, which continued the requirement for monthly reporting of water conservation levels versus 2013 use but allowed each urban water supplier to set its own target customized to fit its unique conditions. Following this EO, the State Water Board adopted a revised emergency regulation which extends restrictions on urban water use through January 2017. Under the new regulation, last year’s state-mandated conservation targets are being replaced with locally determined measures established under a self-certification approach (“Stress Test”). The Stress Test requires each water supply agency to ensure a three-year supply assuming three more years of drought conditions. Water agencies that would face shortages under three additional dry years are required to meet a conservation standard equal to the amount of shortage.

### ***Antelope Valley Groundwater Adjudication Judgment and Physical Solution***

The Antelope Valley Groundwater Basin is regulated in accordance with a Court-approved adjudication Judgment and Physical Solution entered in December 2015 in the consolidated complex proceedings commonly known as the “Antelope Valley Groundwater Cases”. In 2005, the Judicial Council of California consolidated several related lawsuits (Judicial Council Coordination Proceeding No. 4408) which were assigned to the Hon. Jack Komar in the Santa Clara County Superior Court (Case No. 1-05-CV-049053). Four trial phases were completed in the proceeding, including the determination of the adjudication basin boundaries (phase 1); the determination that all of the basin is hydrologically connected for adjudication purposes (phase 2); the determination that the basin is overdrafted and that the total sustainable yield, including native groundwater and return flows, is approximately 110,000 afy (phase 3); and the determination of groundwater production amounts for parties to the proceedings during 2011 and 2012 (phase 4).

A “physical solution” refers to agreed-upon or judicially imposed resolution of conflicting groundwater claims. The Judgment and Physical Solution adopted for the Antelope Valley establishes a regional watermaster to regulate groundwater use consistent with applicable law and the total sustainable yield of the basin under the auspices of the court. As of January 2016, all groundwater users in the basin are required to begin a 7-year “rampdown” period during which groundwater production will be reduced to levels consistent with the total sustainable yield of approximately 110,000 afy. Among other provisions, the Judgment and Physical Solution allows for interbasin groundwater transfers subject to watermaster approval; water banking in accordance with storage agreements with the watermaster; the production of return flows from imported water use within the Antelope Valley; the production of return flows from imported water use in the watershed surrounding the basin subject to watermaster approval; and the carryover and storage of unused groundwater allocations (see Section 5.18.3, “Antelope Valley Groundwater Basin”). The Judgment and Physical Solution approved by the court is attached as Appendix 5.18-D.

### ***Model Water Efficient Landscape Ordinance***

In response to the governor’s Drought Executive Order (B-19-15) the State DWR updated the Model Water Efficient Landscape Ordinance (MWELo), which was adopted by the State on July 15, 2015. This ordinance will effectively reduce water use for new landscaping and among other things, it effectively limits the use of turf in residential landscapes to 25 percent of the total landscaped area, and prohibits the use of turf in non-residential landscapes, except where irrigated with recycled water. Agencies have until February 1, 2016, to adopt this model ordinance or a similar ordinance and must start reporting on implementation and enforcement of the ordinance by December 31, 2015, and then by January 31 in subsequent years. The impact of this new MWELo will be reduced water demands in nearly all new and renovated landscapes, with the exception of areas irrigated with recycled water, as any area over 500 square feet must comply with the ordinance.

## Water Supply/Demand Element

Section 5.18, Water Resources, of this EIR includes a summary of the Water Supply Assessment (prepared pursuant to Senate Bill [SB] 610) for the Project. Key principles of the Centennial Water Supply/Demand element of the Management Strategy are:

- To comply with SB 610.
- To maximize water conservation.
- To maximize use of recycled water.
- To minimize use of SWP supplies,
- To incorporate water banking to provide supplies for Project demand during single and multiple dry year conditions.
- To provide water supplies from multiple sources, including local groundwater, recycled water, Antelope Valley - East Kern Water Agency (AVEK) water, banked water, return flows, and other purchased water supplies from outside the AVEK service area in order to increase water supply reliability in years of normal or average hydrology, as well as single- and multiple-dry year conditions.<sup>4</sup>

Demand for water supplies purchased from outside the AVEK service area would be minimized through water conservation, including using low flow and ultra-low flow fixtures; installing smart irrigation devices; planting drought-tolerant or low-water usage landscaping; and maximizing water reuse. Smart irrigation controller devices include but are not limited to (1) rain gauges or sensors attached to a dwelling unit with a controller that would shut off in a rain event and (2) controllers that receive real time data from weather stations and adjust irrigation quantities accordingly. Smart irrigation controller devices can be manipulated on site or by the Internet. Water use in the Project area would be reduced substantially over more traditional developments, and wastewater generated would be recycled for use in landscape irrigation throughout the community.

The Centennial Water Service Plan was created with Southern California's specific water challenges in mind. As described above, the Water Plan includes a mandatory water conservation program that uses a variety of techniques to minimize potable water demand; it also uses multiple sources of water such as local groundwater, SWP supplies from AVEK, surplus imported water when available, banked water, and recycled water for non-potable uses.

The Project site is within the AVEK service area; however, it is not currently within the boundaries of a retail water utility. Centennial Founders, LLC has requested the Golden Valley Municipal Water District (GVMWD or District) Board of Directors to consider annexing the Project area and operating the Project's proposed potable water, recycled water, and wastewater facilities. The GVMWD is a California municipal water district formed and operated under Section 71000 of the *California Water Code*. The District's service area

---

<sup>4</sup> Banked water is water purchased from within the AVEK service area during times of surplus for use in recharging the aquifer. Other purchased water is purchased from outside the AVEK service area.

encompasses approximately 12.5 square miles and is adjacent to the Project's western boundary (GVMWD 2011). GVMWD currently operates approximately 20 municipal water service connections and a wastewater treatment facility for the unincorporated community of Gorman.

The GVMWD qualifies as a Water Supply Assessment (WSA) preparer for the Project under Section 10910(b) of the *California Water Code*. If the Project is annexed into the jurisdiction of the GVMWD, it is proposed that the GVMWD would become the operator of the potable and recycled water systems servicing the Project. Once the Project is annexed into the GVMWD, the District will become a public water system as defined by Section 10912(c) of the *California Water Code*, as a result of supplying water to the Project. Annexation of the Project into the GVMWD service area would require approval by the Los Angeles County Local Agency Formation Commission (LAFCO) and would occur after the certification of this EIR.

The GVMWD adopted a WSA on May 18, 2011, for the Project that separately analyzes the water supplies required the full planned buildout of the Project and for implementation of the first phase of Project implementation. In the adopted WSA, full buildout was assumed to occur at the end of the 20<sup>th</sup> year of the Project, which is also reflected in the analysis shown in Table 5.18-16 in Section 5.18, Water Resources. The Project timing assumptions used in the WSA are conservative because the Project's construction and market absorption are likely to occur over a longer period than 20 years. If the Project's buildout occurs over more than 20 years, surplus supply will be available for potential banking until the first Project phase is developed and buildout water demands become available.

The adoption of a WSA does not create a right or entitlement to water service or impose, expand, or limit any duty concerning the obligation of a public water system to provide certain service because the lead agency has a separate (from the water provider's WSA) and independent obligation to assess the sufficiency of water supplies for the Project. The WSA is included in the Project EIR for consideration by the County in accordance with Section 10911(b) of the *California Water Code* (See Appendix 5.18-A). The GVMWD or an alternate qualified public utility district (collectively, "PUD") would serve as the Public Water Purveyor and would provide water service to the Project.

Subject to the factors described in the WSA and Section 5.18 of this EIR, Project water demand (potable and non-potable) will be met by utilizing several different supplies, including: (1) water currently banked at the existing TRC Water Bank (2) AVEK SWP Table A water supplies available to the Project; (3) previously purchased water supplies loaned to the AVEK; (4) new imported SWP water from transfers of SWP Table A Amounts from SWP contractors located outside the Antelope Valley and purchased from AVEK; (5) recycled water generated by the collection and tertiary treatment of Project wastewater; (6) return flows generated by Project imported water use that infiltrates into local groundwater; and (7) groundwater. To provide needed reliability through all water-year types, portions of the water derived from imported sources, and potentially recycled water, will be banked in local aquifers in wetter years or when surplus supplies are available.

The Project includes a “total water management” plan with a specific water budget (a conservative estimate of water demands) and a water supply strategy that identifies secure water sources to serve this demand over the long term. The amount of water obtained from each source may vary from year to year depending on availability, cost, demand and other factors, but the mix of sources is designed to ensure that adequate water for Project demand would be available under all conditions and circumstances. The storage (or “banking”) of water in the groundwater basin would provide for increased reliability during dry years. The total water management plan also includes water conservation and water reclamation strategies to minimize water demand. The analysis of water for the Project is located in Section 5.18, Water Resources, of this EIR.

## **Wastewater/Recycled Water Resources Element**

The Wastewater/Recycled Water Resources Element of the Centennial Management Strategy focuses on recycling and reusing all wastewater generated within the community. Two key principles of the Centennial Wastewater/Recycled Water Resources Element of the Management Strategy are summarized below and described in Appendix 5.2-H of the EIR:

- Maximize water reuse; and
- Minimize use of imported water.

Two wastewater reclamation facilities (WRFs) would be constructed (one to the west and one to the east of the West Branch of the Aqueduct) to provide tertiary treated recycled water for community landscaping throughout Centennial. The first WRF would be constructed on the east side of the Aqueduct and would be operational at the time of Project occupation. No temporary package plant is anticipated. Seasonal storage ponds would be provided at the WRF East to store recycled water during periods of lower demand (e.g., during winter months) for use during high-demand periods (e.g., during summer). Approximately 4.62 million gallons per day (mgd) of wastewater will be produced at Project buildout, which will result in a recycled supply of approximately 4.16 mgd (4,660 afy). Approximately 40 percent of the Project’s total annual water demand at buildout will be met by using recycled water. The analysis of wastewater for the Project is located in Section 5.19, Wastewater, of this EIR.

## **Flood Control and Drainage**

The County has traditionally required development projects to analyze hydrologic conditions on a Project site from both a pre-development and post-development perspective. These analyses have focused on the volumes and flow rates of storm water runoff before and after proposed development to ensure that downstream properties are not negatively affected. Drainage concepts are required to demonstrate the locations and sizing of necessary storm water facilities (e.g., debris basins, infiltration and retention/ detention basins, flood-control structures) to address the requirement that downstream areas would not be negatively affected by Project runoff.

As an integral component of the Project’s integrated water resources management approach, the drainage concept will comply with County requirements by considering the potential

negative effects of increased impervious areas on the environmental resources in on-site and downstream drainages (hydromodification). Hydromodification considerations control the basin size and type of facility required. Under the integrated water resources management approach, hydrology and flood-control considerations are addressed through compliance with Low Impact Development (LID) standards, source-control best management practices (BMPs), and treatment-control BMPs throughout the Project. The hydromodification BMPs for the Project would be consistent with County requirements for new development set forth in Section 8 – Hydromodification Impacts of the County LID Standards Manual and the Project will comply with all applicable storm water and sediment management requirements. As future tract maps are prepared for Project land uses, drainage concepts will be submitted for County approval as part of the tract map review process.

The potential hydromodification effects of the sequential phased development and buildout of the Project have been evaluated through the engineering design of the drainage features in the drainage concept in this EIR. As the first phase of development is implemented, adjustments to the traditionally required structures would be incorporated, as needed, in order to avoid downstream impacts to natural drainages and to create groundwater recharge potential. These adjustments, or Project Design Features (PDFs), incorporate flow-duration control basins (e.g., infiltration basins) and balance flow and sediment impacts using grade-control and in-stream flow structures to demonstrate that downstream natural systems would not be negatively impacted by the flood-control and drainage system improvements serving the proposed development. Similar features would be implemented in subsequent phases.

Providing flow-duration control basins, as designed in the drainage concepts, provides mechanisms for avoiding hydrologic source loading impacts to creek systems on the Project site. Under more traditional approaches in which only in-stream protection measures are provided, downstream erosion impacts can occur. Only through strategic placement of in-stream flow structures and flow-duration controls can impact avoidance be achieved. Implementation of the proposed system and facilities exceeds current County requirements. Furthermore, the facilities and structures associated with flood control and drainage that are not maintained by the Homeowners Association (HOA) would be operated and maintained by the PUD (after annexation) or, if annexation does not occur as related to facilities and structures associated with flood control and drainage, by a company regulated by the California Public Utilities Commission (CPUC), a Community Services District (CSD), or other agency approved by Los Angeles County (the Maintenance Entity) and agreed to by the Project Applicant/Developer.

The use of the integrated water resources management approach also addresses sediment management within the hydromodification analysis, as it recognizes that sediment loss can contribute to increased erosion potential in downstream areas. This approach encourages the use of sediment-carrying flow-through techniques, thereby reducing the number of traditionally required debris basins and providing for a more balanced sediment transport and control system within Centennial. The key principles that have been used in developing the sediment management elements of the drainage concept are:

- Avoiding development alterations to natural conditions whenever possible;

- Minimizing impacts from sediment management systems when avoidance is not possible; and
- Mitigating any impacts that remain after avoidance and minimization techniques have been implemented.

The analysis of hydrology for the Project is located in Section 5.2 of this EIR.

## **Water Quality**

Typically, water quality considerations in development projects focus on compliance with the Standard Urban Stormwater Management Plans (SUSMP) which, for most of Los Angeles County, were established under Municipal Separate Storm Sewer Systems (MS4) permits. SUSMPs address water quality and drainage issues by specifying design standards for structural- or treatment-control BMPs that infiltrate/treat storm water runoff and control peak flow discharge. The MS4 Permit requires Project-specific SUSMP documents to describe how the BMPs incorporated into the Project demonstrate compliance with applicable storm water quality standards in receiving waters. Water quality/infiltration basins are proposed to serve as storage/treatment for storm water runoff in the major and minor greenways.

Approximately 93 percent of the Project site is within the jurisdiction of the Lahontan Regional Water Quality Control Board (Lahontan RWQCB); this area is not covered by an MS4 Permit due to the lack of development in the area. The remaining approximately 7 percent of the Project site is within the jurisdiction of the Los Angeles Regional Water Quality Control Board (Los Angeles RWQCB); an MS4 permit has been approved by the Los Angeles RWQCB and is applicable to the portion of the site under the Los Angeles RWQCB's jurisdiction. Although the MS4 Permit for Los Angeles County and related SUSMP requirements are not valid in the Lahontan RWQCB portions of the Project site, in the absence of an MS4 Permit for the Lahontan RWQCB, they have been utilized as the controlling analysis standard for the entire Centennial Project site. Furthermore, the facilities and structures used to address water quality issues that are not maintained by the HOA will be operated and maintained by the PUD (after annexation) or, if annexation does not occur as related to facilities and structures used to address water quality issues, by a CPUC-regulated company, a CSD, or other entity approved by Los Angeles County (the Maintenance Entity) and agreed to by the Project Applicant/Developer.

Additionally, the integrated water resources management approach used in planning and designing Project infrastructure proactively addresses water quality through the application of Low Impact Design (LID) principles on a macro-scale throughout the Project site. The overall result of the water quality components of the drainage system design would exceed applicable water quality design requirements. A description of proposed water quality treatment features is provided below under the "Drainage Plan" discussion. Refer to Section 5.4, Water Quality, for an analysis of the water quality impacts of the Project and additional discussion regarding the Project's compliance with the Los Angeles County LID Ordinance.

## 4.5.9 WATER-RELATED UTILITIES AND INFRASTRUCTURE

### Water Service Plan

The Project includes a domestic (potable) water supply system, including water treatment, storage and distribution systems (collectively, “Potable Water System”). The design, construction, and operation of the Potable Water System would be required to comply with standards set by the California Division of Drinking Water (DDW) and Los Angeles County Department of Public Works. The Project site is currently not within the boundaries of a retail water purveyor. As noted above, Centennial Founders, LLC has requested the GVMWD Board of Directors to consider annexing the Project area and operating the Project’s proposed potable water, water recycling, and wastewater facilities. Either the GVMWD or a PUD will provide service to the Project.

After completion of the proposed annexation, the Project’s water and wastewater systems would be owned and operated by the PUD, including the wastewater collection, treatment, and recycled water systems. Additionally, annexation of the Project area could allow PUD to own and maintain facilities and structures used to address flood control, drainage, and water quality issues. Annexation of the Project into the PUD service area would require approval by the Los Angeles County Local Agency Formation Commission (LAFCO) and would occur after the certification of this EIR.

If the PUD does not annex the Project site, a company regulated by CSD, or other agency approved by the County (the Maintenance Entity) and agreed to by the Project Applicant/Developer will be established, that will own, operate, and maintain the water, sewer, recycled water and storm drain facilities (including the water quality treatment and hydromodification control facilities) on the Project site. The Maintenance Entity will be funded through a rate-payer system imposing fees on the Project properties/service customers.

### *Existing and Proposed Water Facilities*

There are two existing aboveground water storage tanks on the Project site. One water storage tank is located in the southwestern portion of the Project site. The second tank is located in the northwestern portion of the Project, near Oso Canyon; a water well is also in this location. These existing facilities would be removed as part of the Project.

The planned domestic water facilities are depicted on Exhibit 4-13, Centennial Project – Conceptual Domestic Water System, and include the following items: a water treatment facility, storage tanks, booster pump stations, pressure-reducing stations, infiltration basins/water bank, groundwater extraction wells, and distribution lines. The potable water distribution system requires four pressure zones; each zone would provide an appropriate water pressure to meet peak demand and County-required fire flow requirements.

- **Water Treatment Facility.** As shown on Exhibit 4-13, the water treatment plant (WTP) would be constructed just west of the West Branch of the California Aqueduct and would tie into the backbone potable water distribution pipelines. A new turnout

### Centennial Project – Conceptual Domestic Water System

### Exhibit 4-13

Centennial Project

Map Not to Scale

D:\Projects\CEN\Centennial\GRAPHICS\EIR\Ex\_Domestic\_Water\_System\_20170203.ai

on the West Branch has been constructed by the DWR, which is owned and managed by AVEK. The locations of the Project WTP, the West Branch turnout, and the primary connecting pipelines between these facilities are identified in Exhibit 4-13. The WTP would be sized to treat the full maximum daily potable water demand of the Project. The Project's buildout potable water demand of 6,788 afy will be augmented by 4,577 afy of recycled water used primarily for outdoor landscaping use. Total Project water demands, including potable and recycled, will be approximately 11,365 afy, with a per capita water use of approximately 177.5 gpcd. It is expected that the WTP would be constructed in stages as the Project site builds out. The WTP would treat the incoming water using three processes common to most community-scale water treatment plants: coagulation and settling of impurities; filtration; and disinfection. The specific technologies to be used would be determined during design of the WTP; the output quality of the water from the WTP would meet all applicable drinking water standards. The WTP would be constructed of concrete and steel materials and would generally be at or below grade, with a few structures (e.g., filters, tanks, administrative areas) having maximum heights roughly between 30 and 40 feet. Security fencing, night lighting, and landscape screening would be provided along the perimeter of the WTP site.

- **Storage Tanks.** Consistent with County requirements, the amount of domestic water storage is based on operational storage at 40 percent of a maximum day's demand plus 2 times the average day demand, which is equivalent to one maximum day (or a total of 2.8 times an average day) plus fire flow storage (which varies depending on the land uses within each zone). As shown on Exhibit 4-13, the domestic storage demand for the Project would require implementation of potable water tanks at three locations. The tanks at these sites would be closed and constructed of reinforced concrete or steel and would be located and designed to be screened from view by most Project residents. The tanks would have a maximum height of approximately 32 feet. One or more of the following techniques would be used to accomplish this screening:
  - partially or fully burying the reservoir.
  - constructing a berm around the perimeter of the reservoir.
  - providing landscape screening that is compatible with the adjoining areas.
- **Booster Pump Stations.** The water system includes three booster pump stations to feed distribution lines to water tanks that supply water to the four different water pressure zones. One booster station at the water treatment plant would have pumps pumping to both Zones A and B; one booster station would pump from Zone B to C; and one station would pump from Zone C to D. The locations shown for these facilities are preliminary, but would generally be constructed in graded areas adjacent to roadway rights-of-way or on reservoir sites; specific locations would be determined during detailed system design. The final design for the booster pump stations would be determined during preparation of the final design plans for the water system, and it is expected that each would be above ground. The booster pump stations would be designed to minimize operating noise and would be enclosed in buildings. These

buildings would be screened from the view of proposed residences with landscaping and/or walls.

- **Pressure-Reducing Valves.** Five pressure-reducing valves would be located where needed to transfer water from higher zones to lower pressure zones in order to increase system reliability. The locations shown for these facilities are preliminary, but would generally be constructed in graded areas adjacent to roadway rights-of-way; specific locations would be determined during detailed system design. These valves are typically constructed below ground and are housed in vaults ranging in size between four and six feet wide by eight to ten feet long with a double door access from the top.
- **On-Site Water Bank/Infiltration Basin Area.** An approximate 100-acre water banking facility will be designed, permitted, financed, and constructed by the Project along the northern edge of the site to provide additional water recharge capacity. The on-site bank will also facilitate the periodic rotation of infiltration or extraction between the TRC Water Bank and the on-site bank to avoid potential impacts to the local aquifer. A transmission pipeline will extend from an existing East Branch turnout located at approximately the intersection of 320<sup>th</sup> Street West and the California Aqueduct, and will be routed along the southern edge of the bank to allow for delivery to recharge ponds within the facility. The turnout will be upgraded and managed in accordance with the turnout operating and maintenance agreements between AVEK and the DWR. The on-site water bank will also be able to obtain water from a turnout located on the West Branch of the California Aqueduct. A series of contoured infiltration basins separated by a network of berms and overflow weirs will be constructed to receive and infiltrate the water. The on-site water bank's soil and storage characteristics are similar to those of the existing TRC banking facility and will have the capacity to infiltrate and store approximately 7,200 afy. There is at least 161,000 acre-feet of unused aquifer storage within 0.5 mile of the proposed on-site and the existing TRC Water Bank facilities (GEI 2010, 2005). The on-site water banking facilities are depicted in Exhibit 4-13.

Groundwater depths would also be monitored around the perimeter of the infiltration basin to ensure the depth to groundwater is maintained at acceptable levels from the surface and excessive sub-surface mounding does not occur.

- **Wells.** Up to nine groundwater wells would be located within the Project site for extraction of previously banked imported water; groundwater level monitoring; recovery of return flows from on-site irrigation by capturing water that infiltrates into the surface and migrates into a well's cone of influence; and groundwater extraction (approximately 1,250 gallons per minute capacity per well) from the underlying aquifer for use in the Project's potable water supply system. The new wells would be installed in phases to match the domestic water demands of the Project. As part of the water supply verification required at the TTM stage, the specific pumping capacities of each well would be determined during detailed design studies as detailed infrastructure plans are developed. The wells would supply potable water to distribution lines and storage tank components of the Domestic Water System, as depicted on Exhibit 4-13.

Of the nine possible groundwater wells proposed to serve the Project, two are existing wells (TRC Well 98 and TRC Well 106); up to seven would be new on-site wells identified as Centennial Extraction Well (CEW)-1, CEW-2, CEW-3, CEW-4, CEW-5, CEW-6, and CEW-ALT. The existing on-site TRC Well 98 would be renamed CEW-8, and the existing off-site TRC Well 106, located adjacent to the Tejon Ranch Water Bank, would be renamed CEW-7. Based on the hydrogeologic studies of the underlying aquifer performed to date as part of the Project, it was determined that a total of eight wells would be needed (including existing and new wells), assuming the need to supply peak day demand entirely from groundwater with one well out of service; this would be considered a worst-case scenario in the event that potable water cannot be supplied by the California Aqueduct. Although the hydrogeologic studies indicate the need for a total of eight wells, the conceptual groundwater well system identifies nine total well locations to ensure the provision of adequate water supplies to the Project. Accordingly, the analysis assumes that CEW-ALT would be installed in addition to, rather than as an alternate to, the other new well locations.

The installation of production wells involves (1) drilling and installing an approximate 14-inch diameter casing to a depth of 800 to 1,000 feet below ground surface; (2) installing sanitary seals; (3) developing and testing the well by pumping; and (4) then equipping the well with an aboveground pump and installing electrical and control equipment contained within an enclosed structure with an approximate 12 foot by 16 foot footprint and which is approximately 12 feet to 14 feet in height. The well housing structure would have a flat, or nearly flat, roof with skylights for pump removal, if necessary. Depending on the water quality at each well site, there may or may not be a need for treatment at the well. If water quality meets drinking water standards per Title 17 and Title 21 of the *California Code of Regulations*, there may be disinfection at the well site and the water would then be discharged directly into the water distribution system. In this event, the groundwater is expected to be treated with chlorine (in the form of sodium hypochlorite, commonly referred to as bleach or chlorine bleach), which would be stored in a 500-gallon tank at the well site.

This aboveground tank and associated chlorine feed system would be housed in a separate, adjacent, 10-foot by 12-foot structure, up to approximately 12 feet to 14 feet in height, sharing one common wall with the well housing structure. Depending on factors such as well capacity, groundwater production rates, and water quality, it is estimated that a 500-gallon tank would need to be re-filled approximately every 2 weeks. It should be noted that while sodium hypochlorite is classified as a hazardous material, it has been commonly and safely used throughout California as an effective means of disinfecting water. As such, the type, form, and concentrations of material proposed for use at the wells is not unusually dangerous or uncommon. However, if further treatment is required (i.e., beyond disinfection), both the disinfection and further treatment would not take place at the well locations but at the proposed on-site water treatment plant.

- **Distribution Lines.** The proposed water distribution system includes potable and non-potable water lines ranging in size from approximately 8 to 30 inches to be constructed primarily within the proposed roadways.

## Wastewater Service Plan

A Conceptual Wastewater Service Plan has been prepared as part of the Project and is illustrated in Exhibit 4-14, Centennial Project – Conceptual Wastewater System. Two wastewater reclamation facilities (WRFs) will be required and constructed in accordance with Title 22 of the *California Code of Regulations* and the PUD's or the Maintenance Entity's criteria. Title 22 specifies California's Wastewater Reclamation Criteria (WRC), and all recycled water in the state must meet or exceed these standards. The specifications outlined in Title 22 apply to the treatment process by setting performance standards for removal efficiencies and overall effluent water quality. Title 22 also (1) establishes process-monitoring programs that set the type and frequency of water quality monitoring; (2) requires preparation of facility operations plans; and (3) requires the incorporation of necessary reliability features into the design of the treatment facility.

Wastewater treatment would occur at two permanent on-site WRFs and would consist of primary, secondary, and tertiary treatment processes; in order to avoid crossing the Aqueduct with raw sewage pipelines, one WRF would be located west of the Aqueduct (WRF West) and one would be located east of the Aqueduct (WRF East). Both WRFs are proposed in locations that allow wastewater to generally flow by gravity to the WRF for treatment. The treated effluent from the two WRFs would be supplied to the recycled water distribution system to meet irrigation demands throughout the Project site, as well as some indoor uses such as wastewater and cooling uses in the business park.

The WRFs would be operated and maintained by the PUD (after annexation) or, if annexation does not occur, by a CPUC-regulated company, a CSD, or other agency approved by Los Angeles County (the Maintenance Entity) and agreed to by the Project Applicant/Developer.

Construction of WRF East would occur first and would be operational upon site occupancy. The facility would be expanded in phases, as required to treat the wastewater flows generated by occupied land uses. WRF East, intended to serve the wastewater treatment and wastewater reclamation (i.e., production of recycled water) needs for the initial phase of development on the Project site east of the Aqueduct and would have a design capacity of approximately 4.28 mgd. This facility is proposed for development on a site near the northeastern corner of the Project site, just west of 300<sup>th</sup> Street West, as shown on Exhibit 4-14.

Property located to the east of 300<sup>th</sup> Street West at the northern edge of the Project boundary, which is currently designated as Low-Density Residential, could serve as an alternate location for the WRF East. If the facility were to be located within a 23-acre site at this location, the environmental impacts discussed in this Draft EIR would remain largely unchanged, and may be reduced for some topical areas. For instance, due to topographical differences between the Specific Plan's proposed Utility designated area and the property located east of 300<sup>th</sup> Street West, the eastern site would be able to receive more wastewater via gravity flow and would require one less pumping station as a result, thereby also slightly reducing energy demands. However, this location would require a General Plan Amendment to change the current AVAP designation of RL2 (Rural Land for 1 dwelling unit per 2 gross acres) to Utility. The current AVAP Land Use designation for the Specific Plan's Utility land

# CONCEPTUAL WASTEWATER SYSTEM

use is the IL- Light Industrial. The Utility land use is proposed to contain the following facilities: WRF East, groundwater infiltration basins, MRF/TS, composting and green waste facilities, and maintenance yards/animal control. Potentially moving the WRF East and some of the facilities listed above to this alternate 23-acre property would not present land use compatibility concerns and would be similar to the juxtaposition of the currently proposed land uses.

Recycled water storage capacity at buildout would need to be approximately 1,000 acre-feet with the majority of that provided within the WRF East site and some in lakes on the Project site. The WRF would be constructed of concrete and steel materials that would generally be at or below grade, with a few structures (e.g., administrative/lab facilities, secondary treatment digesters, sludge centrifuges, and filtration facilities) having maximum heights of approximately 30 to 40 feet. Security fencing, night lighting, and landscape screening, if needed, would be provided along the perimeter of the WRF East site. Sludge generated by both WRF West and WRF East would be sent to a suitable off-site landfill or would be transported to a fertilizer conversion site for reuse.

WRF West would serve the subsequent phase of Project development located to the west of the Aqueduct; it would have an approximate capacity of 0.34 mgd and is proposed to be located on an approximate 3.0-acre site, also shown on Exhibit 4-14. Recycled water from WRF West would be pumped directly to the Zone C recycled water tank located nearby, west of the Aqueduct. WRF West would be constructed of concrete and steel materials that would generally be at or below grade, with a few structures (e.g., administrative/lab facilities, secondary treatment digesters, sludge centrifuges, and filtration facilities) having maximum heights of approximately 30 to 40 feet. Security fencing and night lighting would be provided along the perimeter of the WRF West site.

The Project also includes a wastewater collection and conveyance system that would primarily consist of 8- to 18-inch lines to be constructed within the proposed roadways. Areas such as those near WRF East would require larger diameter gravity trunk sewers (up to 27-inches in diameter) due to flatter slopes and the higher combined volumes of flow.

Approximately eight small sewer lift stations would be required to pump the wastewater from development areas against uphill grades to locations where they could flow by gravity to the WRFs. The locations of the pump stations are discussed further in Section 4.7 and are shown on Exhibit 4-14, Centennial Project – Conceptual Wastewater System. Pump stations would be sized to accommodate peak flows and would be equipped with backup emergency power generators. Force mains from the pump stations would be sized depending upon the pumping capacity of the station.

Pump stations would generally be below ground. They may be fitted with either submersible pumps in a wet well or standard motors in a pump house above the wet well. If a pump house building is required, it would be designed to blend architecturally with adjacent structures. Landscape screening may also be provided. For a submersible pump installation, a metal cabinet would be provided at ground level to house the electrical and pump control equipment. Both types of pump stations would be provided with an emergency generator and automatic transfer switch to provide continued operation in the event of an electrical

power failure. Access driveways and parking areas would be provided for maintenance activities.

## Recycled Water

The tertiary treated effluent (recycled water) from the WRFs discussed above would be used primarily to meet the Project's non-potable water needs, including community-wide landscape components. At full buildout, recycled water will be used for (i) 100 percent of the commercial, business park, institutional, school, hotel, park, and slope outdoor irrigation demand; (ii) outdoor irrigation demand within 50 percent of the total very low and low density residential lot landscaped area; and (iii) wastewater and cooling use within the proposed business park except where prohibited by applicable law for particular types of areas or uses (e.g., employee cafeterias). Exhibit 4-15, Centennial Project – Conceptual Recycled Water System illustrates the conceptual recycled water system. In addition to providing a source of non-potable water for large-scale irrigation needs, the recycled water program would avoid the need to dispose of treated effluent. This is a common practice in California and is recognized as a sound water conservation practice. Additionally, this process is in compliance with State Water Resources Control Board Resolution No. 2009-0011, Recycled Water Policy (adopted on May 14, 2009), which is intended to increase the use of recycled water from municipal wastewater sources (SWRCB 2009). A description of the components of the recycled water system is included below.

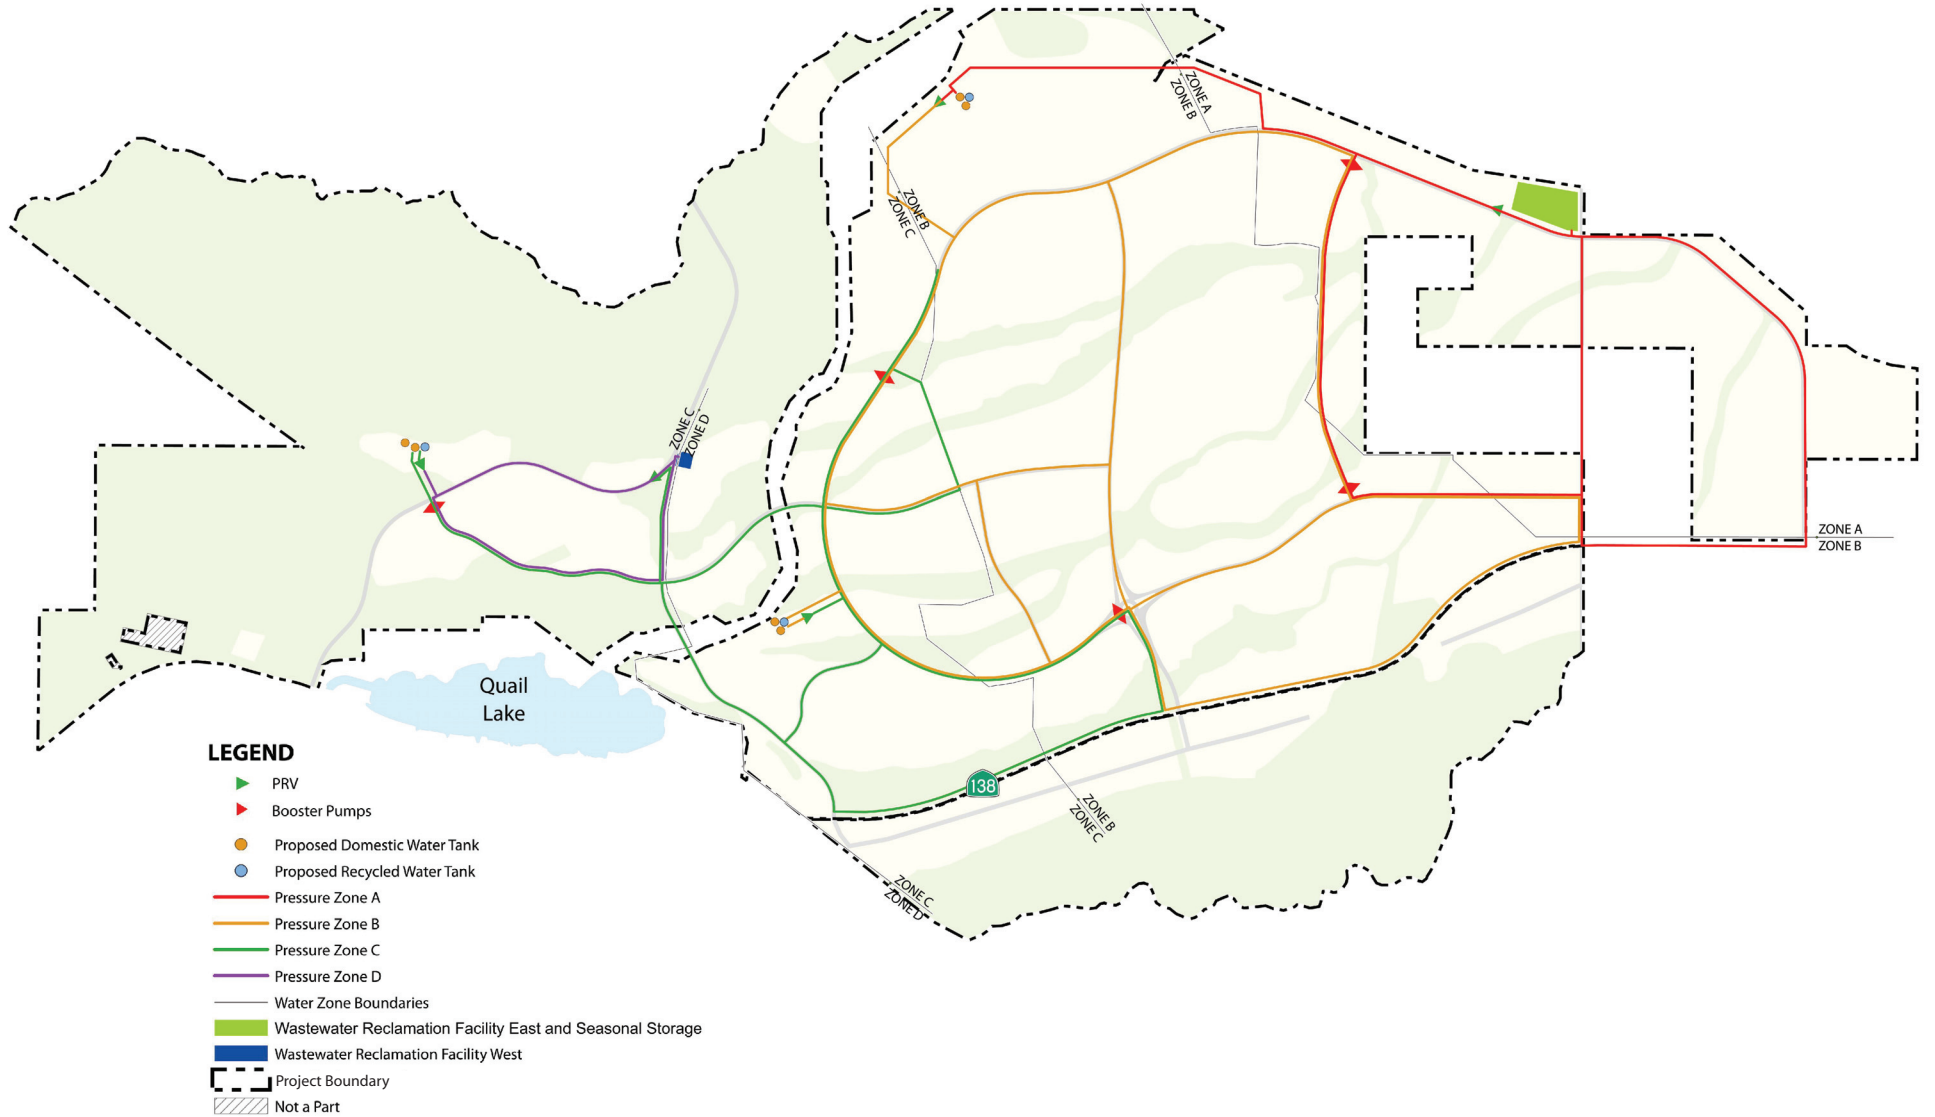

As shown on Exhibit 4-13, each of the three on-site domestic water tank sites would also provide space for a water storage tank for recycled water for a total of three recycled water storage tanks. The capacity of the recycled water tanks would be approximately half the capacity of the domestic water supply tanks since they do not need to have fire flow or emergency storage. However, they would be approximately the same height (e.g., 32 feet above grade) as the domestic water tanks with which they would be co-located. In addition to the storage tanks, the recycled water system includes the distribution facilities listed below.

- **Booster Pump Stations.** The proposed recycled water system includes five booster pump stations to feed distribution lines to recycled water storage tanks that would supply recycled water to the four water pressure zones. There would be one large pump station supplying recycled water from the WRF East site to Zone A; one pump station from Zone A to B; one pump station from Zone B to C; one pump station from Zone C to D; and a pump station from the WRF West to Zone C. The locations shown for these facilities are preliminary, but would generally be constructed in graded areas adjacent to roadway rights-of-way; specific locations would be determined during detailed system design. The physical characteristics of the booster pump stations for recycled water would be the same as those described for the domestic water system.
- **Seasonal Storage.** Seasonal storage ponds are proposed for the majority of the seasonal storage requirement within the WRF East site (refer to Exhibit 4-14). These ponds would be uncovered; would be lined to prevent infiltration; and would be used to temporarily store recycled water during winter months (when irrigation demand

# CONCEPTUAL RECYCLED WATER SYSTEM

Centennial Project

Map Not to Scale

is low) for use later that year during higher demand periods (e.g., summer). These storage ponds would have security fencing and lighting. In addition to the ponds at the WRF East site, surplus recycled water could also be stored in the lakes within the project during winter months. A total seasonal storage capacity of approximately 1,000 acre-feet is proposed for the Project, which would be provided at the WRF East site and on-site lakes.

## Drainage Plan

As illustrated in Exhibit 4-16, Centennial Project – Conceptual Drainage and Flood Control System, the flood-control system incorporates three storm water management methods for flood and storm water control. These methods include: on-site water quality and infiltration basins; underground storm drainage facilities; and use of natural drainage courses. Natural drainage courses would be used whenever possible; however, some locations provide no alternative other than constructed channels or underground facilities. In these circumstances, surface runoff would be intercepted and conveyed by a network of storm drains.

Water quality and infiltration basins are proposed for use as storage and/or treatment facilities for storm water runoff in greenways and in some natural water courses. Many of the existing natural drainages throughout the Project site are incised and highly erodible. As a result of these conditions, many of the natural drainages proposed to be incorporated into the storm water drainage system may require modification. It is the intent of the backbone storm water drainage plan to restore drainages to a naturalized<sup>5</sup> condition while taking into account public safety requirements and public recreational objectives. Traditional flood-control techniques use reinforced concrete or grouted rock riprap to minimize erosion while maximizing the volume of flood flows carried by the drainage. As a part of the Project, “naturalized features” (e.g., the use of buried-bank stabilization are proposed where necessary to protect against erosion. Buried bank stabilization uses soil cement, concrete, or riprap and is buried beneath the existing banks of a river to provide a functional backstop that resists scouring, which could pose a threat to infrastructure. Upon completion of construction, the soil placed on top of the bank stabilization is replanted with native vegetation to return the disturbed area to a more natural condition.

Soft bottom culverts and pipe or box culverts would be provided to convey storm water flows beneath planned roadways. In future phases of development, road crossings of drainage courses would be accomplished using conventional reinforced pipe or box section culverts with inlet and outlet head walls and rock riprap energy dissipation at the downstream outlets of each culvert. Soft-bottom culverts would typically be constructed where roads cross planned greenways that contain natural channels. The Project’s Land Use Plan depicts road crossings of greenways and natural channels, including existing culvert crossings, which will be retained as part of the Project. Refer to Exhibit 4-1 for the Conceptual Land Use Plan.

---

<sup>5</sup> Naturalized, in this sense, is a habitat that was disturbed and has been restored with the characteristics of an unaltered, natural state.

### Centennial Project – Conceptual Drainage and Flood Control System

### Exhibit 4-16

Centennial Project

Map Not to Scale

D:\Projects\CEN\Centennial\GRAPHICS\EIR\Ex\_Flood\_Control\_20170203.ai

Conventional culvert crossings may range in size from 48-inch diameter pipe to the equivalent of double 120-inch diameter pipes. Soft-bottom culverts could range in size from a single 15-foot-wide and 10-foot-high culvert to double culverts that are each 30 feet wide and 15 feet high. The final size and configuration would be determined during final engineering following tentative map approval for that part of the development. During development of future tentative maps, additional culverts may be identified and would be incorporated into the drainage concept design at that stage.

Implementation of the Project would require permits/agreements from governmental agencies having jurisdiction over these drainages. This may include permits/agreements with U.S. Army Corps of Engineers (USACE), the California Department of Fish and Wildlife (CDFW), and/or either or both the Regional Water Quality Control Boards (RWQCBs) with jurisdiction over the site (i.e., Los Angeles or Lahontan).

As specified in the Project's Floodplain Safety Zone, proposed development would not encroach upon the designated 100-year floodplain. No habitable structures would be permitted within the 100-year flood level in accordance with Los Angeles County policies to protect public property and safety and in conformance with the Federal Emergency Management Agency (FEMA) requirements/policies. As part of the Project, a Conditional Letter of Map Revision (CLOMR) will be submitted to the Federal Emergency Management Agency (FEMA) to revise the FEMA Floodplain boundary and to demonstrate that habitable uses are not proposed within the FEMA Floodplain. Please also refer to Section 5.2, Hydrology and Flood, for more detailed information.

#### **4.5.10 DRY UTILITIES**

Exhibit 4-17, Centennial Project – Dry Utilities Plan, identifies existing dry utilities within and adjacent to the Project site, as well as dry utilities proposed as part of the Project, including electric, natural gas, telephone and wireless telecommunications, and cable television. As shown, existing on-site dry utilities include (1) Southern California Edison (SCE) electric lines running north-south to the Oso Pumping Plant and National Cement Plant, which include lines that run southwest to northeast across the Project site connecting to the lines feeding the Oso Pumping Plant and National Cement Plant, as well as electricity lines running east-west along SR-138; (2) an AT&T underground telephone line running northwest to southeast across the western portion of the Project site; (3) a SoCalGas line that runs north-south immediately west of the Project site; and (4) fiber-optic lines installed by Quest Communications, which are adjacent to the I-5. In addition, although not a part of the Project site (i.e., off-site), SCE's Bailey Substation is located on an SCE-owned parcel in the southwestern corner of the Project site (i.e., although not a part of the Project, it is surrounded by the Project on all sides). A high-pressure natural gas main is located adjacent to SR-138. Currently, the dry utilities in proximity to the Project site are limited in terms of their servicing capacity. Following is a discussion of the dry utilities proposed to be implemented as part of the Project. The analysis of dry utilities for the Project is located in Section 5.20 of this EIR.

## Centennial Project – Dry Utilities Plan

## Exhibit 4-17

Centennial Project

Map Not to Scale

## Electricity

SCE serves approximately 14 million customers within a 50,000 square mile service area that covers Central, Coastal, and Southern California and would serve the Project site. Electric service is available through SCE facilities, as regulated by the California Public Utilities Commission's (CPUC's) Tariff Rules 2, 15, and 16. SCE has both transmission and distribution facilities located within and near the Project site. Existing conditions and proposed improvements to the substations and electric lines are described in detail below.

### **Substations**

SCE maintains one existing substation (known as the Bailey Substation) in the immediate vicinity of the Project site, located north of SR-138 in southwestern corner of the Project site. As shown on Exhibit 4-17, the substation is located on an SCE-owned parcel—the “Not a Part” (NAP) parcel immediately north of SR-138—and is therefore considered “off site”. This substation currently serves as a transmission-only substation (220 kilovolt [kV]/66 kV) and is not currently equipped for distribution (12 kV) capability.

SCE also maintains the existing Gorman distribution substation, located approximately 3.6 miles northwest of the Project site along Gorman Post Road. This substation is equipped for distribution voltage and serves as the primary electric distribution facility in the Project area. It is from this facility that the existing 12-kV lines extend east along Gorman Post Road toward and within the Project site. The current capacity of the existing 12-kV facilities extending from the Gorman Substation along SR-138 can accommodate approximately 300 dwelling units. Therefore, the provision of electric service beyond the initial units developed in the first phase of Project implementation would require additional capacity through infrastructure improvements.

As discussed further in Section 4.7, Off-Site Project Features, two options were developed for bringing the additional capacity to serve the western portion of the Project site: (1) upgrading the existing Bailey Substation located on an SCE-owned parcel within the southwestern corner of, but not part of, the Project site or (2) upgrading the Gorman Substation and retrofitting existing overhead transmission lines to handle the higher load.

Provision of electrical service to the remainder of the Project would ultimately require a new substation, currently named the “Centennial Substation”, in addition to the upgraded Bailey or Gorman substation. The Centennial Substation would be located in the vicinity of 300<sup>th</sup> to 310<sup>th</sup> Street West either north or south of SR-138, as described further below (refer to Exhibit 4-21).

### **Centennial Substation**

SCE has indicated that the electricity demand anticipated from Project implementation would require construction of a new substation (the Centennial Substation) in the eastern portion of the Project site. The proposed substation would be constructed on an approximate 4.5-acre site. The Centennial Substation would be located in the vicinity of 300<sup>th</sup> to 310<sup>th</sup> Street West either north or south of SR-138. The Centennial Substation would be an unmanned, 66/12/6.9 kV, 28 Mega Volt Ampere (MVA), Substation Automated Station (SAS)

Automated Station. The complete equipment specifications of the Centennial Substation are summarized in Table 4-5, Centennial Substation Equipment Specifications.

The substation pad would be surfaced with ¾-inch crushed untreated rock with a depth of four inches and graded to be level with the surrounding lots. A Landscape Plan for the substation would be prepared by a Licensed Landscape Architect and would include an eight-foot-high, architect-designed block wall surrounding the substation topped with security barbed wire that would be mounted on the substation side of the wall. The area around the substation would be landscaped to shield views of the substation structures and equipment from surrounding areas.

The existing 66 kV lines (overhead or underground) along SR-138 would be extended to the proposed Centennial Substation site. This substation would convert the incoming 66 kV to outgoing 12 kV/6.9 kV, which would then be distributed to the Project site. The extension of the 66 kV facilities would either be in or out of the proposed roadways. SCE would require easements or joint-use easements for these facilities. The 12 kV/6.9 kV distribution facilities would be extended underground within the roadways. Transmission and distribution lines over the rest of the Centennial site are discussed below.

The Centennial Substation would have both security and maintenance lighting. The security lights would be low-intensity, photo-sensor-controlled lights integrated into the landscape and the architectural design of the substation; they would be in operation from dusk until dawn. Maintenance lighting would consist of high-pressure sodium lights located in the switchracks, around the transformer banks, and in areas of the substation yard where maintenance activities may occur during nighttime hours. All maintenance lighting would be controlled by a manual switch and would normally be in the off position. The substation's equipment and structures would be grounded in accordance with current SCE standards, and ground grid calculations would be based on soil resistivity measurements taken by SCE. Animal-control features would also be installed in accordance with current SCE standards.

The existing 66-kV lines (overhead or underground) along SR-138 would be extended to the proposed Centennial Substation site. This substation would convert the incoming 66 kV to outgoing 12 kV/6.9 kV, which would then be distributed to the Project site. The extension of the 66-kV facilities would either be in or out of the proposed roadways. SCE would require easements or joint-use easements for these facilities. The 12-kV/6.9 kV distribution facilities would be extended underground within the roadways. Transmission and distribution lines over the rest of the Centennial site are discussed below.

### ***Transmission and Distribution Lines***

SCE maintains overhead 66-kV transmission lines and 12-kV distribution lines running parallel along the north side of SR-138. Additionally, there are distribution lines that extend northeast from the existing Bailey Substation area to the Oso Pumping Plant and north from SR-138 along National Cement Plant Road to the National Cement Plant. The existing lines to the Oso Pumping Plant run through the Open Space north of Oso Canyon.

As shown on Exhibit 4-17, the Project would involve the installation of new dry utility corridors consisting of joint and sole electric, natural gas, telephone, and cable television

facilities within the roadway rights-of-way. The new systems would be installed underground within proposed roadways and would be constructed in advance of the land uses that require the facilities in order to ensure that the Project's electrical needs are met as the site develops. It would be necessary to install a distribution transformer at the Bailey Substation to carry sufficient load to the Project. The extension to the Project could be overhead on the existing pole line paralleling the north side of SR-138 or by way of a temporary pole line constructed within the Project limits around the north side of Quail Lake to reach the initial development phases of the Project.

Once the boundary of the initial phase of development is reached, any overhead facilities would be placed underground and run throughout the Project site. As the Project develops on the west side, the temporary overhead lines would be placed underground to accommodate the construction phasing. The new utility corridors would be installed underground within proposed roadways and would be constructed in advance of the land uses that require the facilities in order to ensure that the Project's electrical needs are met as the site develops. The timing for engineering, construction of these facilities, and the specific facilities' locations and sizing have been coordinated with SCE. The proposed electrical distribution system would be developed on the Project site to supplement and, in the case when electricity generation exceeds Project demands, sell power back to the regional electrical grid.

Implementation of the Project would also involve the removal, relocation, and/or realignment of the existing 66-kV and 12-kV electricity lines that extend along SR-138 and within the Project site. The existing electricity lines along SR-138, or portions of these facilities, could remain in place, be relocated, or be placed underground. The existing 66 kV lines that extend from the Bailey Substation and run northeast within the Project site may be relocated and/or segments may be placed underground (which would require an easement). The existing 66-kV lines are shown on Exhibit 4-18, Known Major Utilities in Project Area. Furthermore, there are existing distribution lines for local distribution that run parallel to 300<sup>th</sup> Street West on the western side of the street. The Centennial Substation discussed above would be required in the area of 300<sup>th</sup> to 310<sup>th</sup> Street West along SR-138. Approximately 4.5 acres would be required for this site.

## **Gas**

SoCalGas would provide natural gas service to the Project site. SoCalGas is also regulated by the CPUC and provides natural gas service to much of the Southern California region. Natural gas service is available through SoCalGas facilities, as regulated by the CPUC's Tariff Rules 20 and 21.

There are existing SoCalGas gas lines within and near the Project boundary; however, none are located within the Project development area. There is one high-pressure gas main in the vicinity. It is a 33-inch diameter, north-south running gas transmission line (Line 225) within a SoCalGas-owned easement that originates at SR-138 just east of the I-5. A six-inch high-pressure distribution line branches from Line 225 and travels east to serve the National Cement Plant. Existing natural gas service to the Project site is available through a medium-pressure gas distribution main in SR-138, which branches from Line 225 and travels east to

D:\Projects\SCEN\Centennial\MXD\EIR\Ex\_utilities\_20160906.mxd

Aerial Source: ESRI 2015  
Data Source: BJ Palmer & Associates, Inc 2015

Note: Utility line work is for conceptual illustration only is not intended for site specific use.

### Known Major Utilities in Project Area

### Exhibit 4-18

Centennial Project

the Quail Lake area (SCGC 2006). These facilities are shown on Exhibit 4-17, Centennial Project – Dry Utilities Plan. Additional, various-sized, medium-pressure gas distribution mains are located in and around SR-138 in the Project vicinity, and are shown on Exhibit 4-18.

The Project's demand for natural gas service would be served by tapping into an existing high-pressure main and constructing a sub-surface regulator station and run distribution medium pressure and/or transmission high pressure to and through the Project site. This will be determined in the future as part of the Project planning and implementation process. Regardless, natural gas service would be provided to the Project site via a series of transmission and distribution gas mains that would be installed within the roadway rights-of-way. Due to gas line installation requirements, transmission main extensions would be in separate trenches within proposed roadways. Distribution main extensions would be installed within the proposed utility corridors (shown on Exhibit 4-17). Some of these transmission and distribution mains may parallel each other in the same roadway. It may be necessary to extend a high-pressure line to and within the Project site for the placement of a series of future regulator stations.

Future phases of development may require the tapping of the transmission high pressure main and construction of a sub-surface regulator station along SR-138 to augment transmission and run distribution medium pressure and/or transmission high pressure to and through the Project site. Gas distribution efficiency and operating integrity require that the gas mains are looped. As the Project develops, the mains may be tied to each other for pressure stabilization. Regulator stations can be within roadway rights-of-ways or on private property within an easement. An underground extension of gas facilities will need to be constructed along Gorman Post Road from the proposed regulator station to the Project's westerly entrance, where it would follow the route along with electricity and telephone within the Project around the north side of Quail Lake. The main could also be extended along SR-138, just outside the right-of-way, easterly to the initial construction phases of the Project.

Specific standards to promote energy efficiency and to minimize future energy demand in residential, commercial, school, and civic structures are described in Section 2.2.7, Performance Standards, of the *Centennial Specific Plan* (see Appendix 4.0-A).

## Telephone

AT&T is a national provider of voice and data telecommunications services and currently serves the Project area; as such, they provided the information contained in this section. Telephone service is available through SBC/AT&T facilities as regulated by the CPUC's Tariff Rule 15. Several other communications companies (such as MCI World Com, Rapid Cable, and Quest Communications) operate existing underground fiber optic systems adjacent to I-5 for regional services.

The AT&T Central Office is responsible for providing service to the Project area and is located north of the Project site in Lebec. Underground and overhead fiber optic (fiber) and twisted pair (copper) distribution facilities are located within the Project site (refer to Exhibit 4-17).

A Litespan 2000 unit is located on Gorman Post Road, approximately 14,000 feet northwest of the Project site's west boundary. The Litespan 2000, a digital loop carrier, is a telecommunications system that carries telephone signals from a central office to subscribers in the local loop using digital signals as the transport mechanism. This structure's usage is based on the high-capacity circuit needs of the National Cement Plant and was installed in anticipation of future growth in the area. AT&T has aboveground telephone lines and underground facilities adjacent to I-5.

To extend telephone service to the Project site, telephone fiber or cabling would be provided in the proposed backbone systems. The preliminary extension of telephone lines would occur along Gorman Post Road in the current franchise area entering the Project site at its most westerly entrance. This new extension would involve retrofitting and replacing the current overhead system that extends from the Frazier Park area to Gorman, and then to the Project site, using the existing poles. The Project would be developed as a "full fiber" project, with the extension of fiber lines (as opposed to cable lines) to all homes on the site.

This would include placing fiber from AT&T existing facilities either overhead on the existing pole line along SR-138 or a temporary overhead/underground line within the Project limits line along the north side of Quail Lake, along with electrical facilities, to service the initial phases of development. Several telephone fiber pedestals would be placed throughout the Project allowing for a complete fiber system to be constructed, allowing for fiber to the home, including high speed service capabilities. Placement and location of these future facilities will be determined during development. However, they are typically placed out of roadway right-of-way on private property within an easement. AT&T would plan for a substructure system that would allow for this service. To support the development of the Project as "full fiber", additional fiber from existing AT&T facilities would either be placed overhead on the existing pole line along SR-138 or on a temporary overhead/underground location within the Project limits line along the north side of Quail Lake, along with electrical facilities, to service the initial phases of development. Several telephone fiber pedestals would be placed throughout the Project allowing for a complete fiber system to be constructed allowing fiber to the home, including high speed service capabilities. These new fiber facilities would be in addition to existing copper/fiber facilities currently in place (BJ Palmer 2015).

The determination of whether these additional facilities are needed and the locations of the telephone fiber pedestals or other AT&T facilities would be determined in the future as part of Project planning and implementation. In addition, AT&T has stated that upgrading the Central Office in Lebec would be necessary and would involve internal upgrades to distribution facilities, which would expand the Central Office's service capacity and meet the overall Project demand (BJ Palmer 2015).

The required off-site telephone system Project features are described in Section 4.8.3. Retrofitting the existing facilities outside the Project site would include re-cabling the existing pole line and/or placing a new underground substructure system to support the facilities capable of servicing the Project. This line extension would be conducted within the existing roadway and is currently the responsibility of the utility; however, the physical environmental impact associated with off-site telephone facility upgrades are addressed as part of the Project in this EIR.

The Project would also accommodate wireless communication facilities, including antennas (mounted on buildings or stand-alone structures) and equipment shelters. These facilities would be designed to blend with the surrounding environment. Using “stealth design” techniques, antennas can be mounted on buildings; placed within tall architectural features such as a clock tower, steeple, or entry signage; or strategically placed among a cluster of trees of similar height to render them invisible to the casual observer. Standards for wireless equipment are outlined in Section 2.2.7(Q) of the *Centennial Specific Plan*.

## **Cable and Internet**

There are no existing cable television (CATV) facilities located within or immediately adjacent to the Project area. CATV service is a free-enterprise system and is open to competition. Local service providers in the vicinity of the Project site include CalNeva Broadband (formerly Rapid Cable) and Time Warner Cable. CalNeva Broadband is a national CATV provider that serves customers in California and throughout the country. CalNeva Broadband currently provides service to the City of Gorman and has indicated a willingness to expand services to the Project site (BJ Palmer 2015). Time Warner Cable’s closest facility is in Castaic, and the company does not currently plan on extending service further to the north. At this time, the cable provider may be CalNeva Broadband or some other provider.

The closest existing CATV trunk and/or distribution facilities are CalNeva Broadband facilities and are located in Gorman, approximately four miles northwest of the Project site. CalNeva Broadband’s plant is located north of the Project site in Frazier Park, which is approximately eight miles west-northwest of the western boundary of the Project area.

As shown on Exhibit 4-17, cabling for cable services would be provided as part of the on-site main utility corridors for dry utilities. The extension of CATV lines would proceed from the nearest location of service from whichever provider is chosen. If CalNeva Broadband is chosen, extension of their facilities would include a trunk system (overhead and/or underground) from Gorman to the Project. Extension onto the site would follow the route along with electricity and telephone lines within the Project limits around the north side of Quail Lake. Facilities could also be extended along the SR-138 roadway overhead on the existing pole line easterly to the initial construction phases of the Project. As part of Project development, CATV service connections would be stubbed to each property line. The CATV provider would extend fiber facilities providing phone, video, data, and high speed internet access.

The required off-site cable system Project features are described in Section 4.7.3. Section 4.5.16, Technology Plan, describes how the Project would provide community-wide networking and other broadband options to provide internet access to Centennial residents and businesses.

### **4.5.11 GREEN DEVELOPMENT PROGRAM**

The Centennial Green Development Program encompasses a range of sustainable development practices that have been incorporated into the Project at all phases of site development, from land use planning to long-term resource conservation. The purpose of

the Green Development Program is to integrate sustainable practices into the development of the Project from the beginning, taking advantage of the new community from its inception. The selection of development practices in the Green Development Program has been tailored to reflect the environmental conditions at the Project site and the range of proposed land uses.

Centennial's Green Development Program encourages environmentally sustainable development in two ways:

- First, in addition to satisfying all mandatory measures of the CALGreen Code, all residential and non-residential development within the Specific Plan shall be required to satisfy the measures necessary to achieve CALGreen Tier 1 then currently applicable.
- Second, this Green Development Program includes additional measures for Centennial that exceed applicable state, regional and local requirements, including but not limited to exceeding 2016 CALGreen Tier 1.

With this approach, development of the Project will meet and exceed the mandatory standards of the CAL Green Code, CAL Green Tier 1, and the requirements of the County's "Green Building Ordinances" existing on the date of adoption of the *Centennial Specific Plan*. Therefore, as stated in Section 4.2 of the *Centennial Specific Plan*, Appendix 1-B shall apply instead of the County's Green Building Ordinances.

If the County adopts new or additional County-wide regulations applicable to environmentally sustainable development after the adoption of the *Centennial Specific Plan*, then such new or additional regulations shall apply, subject to the right of an applicant to demonstrate the functional equivalency of the Centennial Green Development Program's required measures or suggested BMPs pursuant to the procedures set forth in Section 4.2 of the *Centennial Specific Plan*. In addition, as industry continues to innovate in "green building" and "sustainable communities" means and methods, the Project Applicant/Developer will have the opportunity to present new or improved technologies that achieve functionally equivalent outcomes of the program's required measures or additional measures, or otherwise help attain the applicable Green Development Program standard for review and approval by the Director of the appropriate County department(s). In some cases, the program anticipates the flexibility desired for new innovations, as requirements are described in general terms to allow for the incorporation of new technologies as they are developed. Minor changes to the Green Development Program that reflect improvements in the program or incorporation of new standards or technologies will not require a Specific Plan amendment. Revised laws and regulations, such as more stringent energy and water conservation standards, are also anticipated to be adopted over the buildout period for the Specific Plan. The flexibility to address revised technologies and innovative practices, as well as evolving legal mandates, makes implementation measure flexibility integral to Centennial's Green Development Program.

Sustainable and resiliency features will be incorporated in the design from the earliest stages to provide benefits for builders, future occupants, and the community. Many sustainable design principles have no or minimal cost impacts if incorporated early. Any costs can

frequently be offset through reducing construction costs and providing long-term operations and maintenance savings. For example, passive solar design and energy efficient building construction can reduce heating, ventilation and air conditioning (HVAC) system size requirements and lower utility bills. Reduced energy consumption costs may also increase a homebuyer's ability to afford a better home loan, through programs such as the federally recognized energy efficient mortgage program. Energy efficient housing is more affordable to own and occupy when recurring energy consumption costs are lower.

The Green Development Program is organized into three major components: (1) Green Planning and Infrastructure Measures; (2) Green Building Measures (i.e. Energy Efficiency; Water Efficiency and Conservation; Material Conservation and Efficiency; and Environmental Quality; and (3) Innovation and Adaptation Measures.

These categories are not mutually exclusive. In fact, there is significant overlap among categories because sustainability practices often take into account multiple systems, the interrelationships among ecological co-benefits, and environmental, and economic factors. Some measures may appear redundant or repetitive. However, a comprehensive approach to creating a sustainable community recognizes, acknowledges, and celebrates the overlap and interconnectedness of green and sustainable community development practices and allows for context-sensitive solutions that achieve Green Development Program objectives. For example, drought-tolerant landscaping relates not just to water conservation but also has a role to play in natural drainage systems and green infrastructure.

### **Green Planning and Infrastructure Measures**

The Project has been designed with a mix of land uses and density to help minimize the need for internal combustion automobiles and maximize pedestrian, bicycle and low speed vehicle (LSV) access. This Green Development Program category includes planning level principles, such as the fact that most larger private sector employers are located along SR 138, and have an east-west elongation to facilitate the design of north-south oriented buildings that incorporate passive solar design. The Project's Greenways have been planned community-wide to serve the multiple purposes of off-street transportation, preservation of native habitat, and a water filtration and recharge system for stormwater runoff in conjunction with water features that may be used to capture water for aquifer recharge.

These sustainable community design features are designed to work in tandem with the objectives of smart growth, multi-purpose function, connectivity, and utilization of natural processes. The Project incorporates green infrastructure and related methods for watershed management to improve water quality, conserves water, and reduces runoff volumes as well as peak flows and durations. In addition to these direct benefits to the watershed, and reduced climate impacts, implementing such methods also benefits the quality and preservation of biological habitat, provides energy conservation by reducing the heat island effect of typical land development, and provides for visual amenities that enhance the Project's aesthetics.

---

## Green Building Measures

### ***Energy Efficiency***

This part of the Green Building Program requires all residential and nonresidential development to implement energy conservation measures that will exceed the 2016 California Building Energy Efficiency Standards (Title-24) by 15 percent for all residential projects and 10 percent for non-residential projects. Energy conservation techniques, including efforts to increase building efficiency, also result in the reduction of carbon dioxide emissions, a major contributor to global climate change. Through techniques such as maximizing solar orientation of streets and buildings, increasing the use of natural daylight, creating a tight, well-insulated building, installing appropriately sized and high-efficiency HVAC systems, and strategically placing trees and other shading devices, the Project can achieve a substantial reduction in total energy use. In addition, to decrease the Project's dependence on carbon-based fuel consumption, a minimum of 50 percent of the anticipated electrical energy demand at build out (i.e. household, business, civic/institutional, recreational, and public facilities) shall be met by onsite renewable energy, and charging stations will be provided throughout the Project area.

### ***Water Efficiency and Conservation***

This part of the Green Building Program includes measures to promote water conservation, and water reuse to net minimize consumption of water. The incorporation of native and/or drought tolerant non-invasive species, and the use of energy efficient appliances and water-wise landscaping irrigation systems that minimize water use are among the measures required to substantially reduce the amount of valuable water resources that are used by and that flow into and out of the community.

### ***Material Conservation and Efficiency***

This part of the Green Building Program includes measures to promote recycling and reduce the amount of solid waste produced within the Project. For example, The Project is required to divert 100 percent of soil during grading activities, and at least 70 percent of non-hazardous construction and demolition waste, away from landfills to recycling or salvage or current County standards. In addition, the Project has an operational waste diversion goal of 75 percent. The implementation of recycling programs (such as dedicated collection areas in commercial buildings and separate containers for residential units), and the management of green waste are but a few areas in which the Project can substantially reduce the amount of waste produced by the community and reduce the environmental impact of development pursuant to the *Specific Plan*.

### ***Environmental Quality***

This part of the Green Building Program includes measures to provide a safe and healthy living environment inside and outside of homes and buildings. Materials and actions that improve indoor air quality, respect circadian sensitive lighting design to enhance the health and comfort of homes, and maximize daylighting and natural ventilation are critical to good community health and well-being.

---

### ***Innovation, Adaptation and Resiliency***

Technological advances and emerging practices and services related to sustainable community development and green building are rapidly advancing; as is the legal framework for removing barriers to innovation (e.g., with clear standards for recycled water), creating incentives for green practices and facilities (e.g., with continued federal and state support for distributed energy generation models such as rooftop solar), and changing public and private sector practices influencing longstanding transportation and employment behaviors (e.g., with on-demand car services and telecommuting). Continued technology innovations such as autonomous vehicles and battery-assisted bicycles and scooters, as well as continued public sector support for green practices that reduce greenhouse gas emissions and conserve water, and new private sector service models including flexible work hours and locations, are expected to continue.

This Innovation and Adaptation component allows development pursuant to the *Centennial Specific Plan* to comply with applicable legal standards and to adapt to changing technologies and practices by substituting alternate measures for those identified in Table 1-B-1 that achieve equal or greater environmental benefits, and that do not result in any new significant adverse environmental impacts. Changes to legal standards, for example, are likely to include additional requirements to reduce greenhouse gas emissions. Technology are inherently difficult to predict and account for, it is possible for example that improved and more cost-effective electricity storage technology may make it more feasible for “net zero” electricity importation at residential and commercial structures. It is also foreseeable that predicted advances in autonomous vehicle technology make private ownership of cars less prevalent among homeowners and employees, which could reduce the need for parking at residential and commercial buildings while increasing the need for a centralized parking and autonomous vehicle servicing facilities. It is also possible that future drone or other delivery technology could reduce the need for “brick and mortar” retail goods establishments in village centers, while changes in work practices may increase the desirability of shared work spaces and service/food-based retail uses in village areas. The Innovation and Adaptation component is intended to address these and other potential changes in laws, technologies, and practices.

Innovation and Adaptation measures would be proposed by the Project Applicant/Developer for County approval in the same development review process steps included for the corresponding measures included in Table 1-B-1. Specifically, proposed Innovation and Adaptation changes relating to Green Planning and Infrastructure measures will be proposed as part of tentative and final mapping, site plan review, and infrastructure permitting. Proposed Innovation and Adaptation changes relating to Green Building measures will be proposed as part of building permit, conditional use permit, and occupancy permit approvals. Compliance with (and enforcement of) approved Innovation and Adaptation measures will be managed in the same monitoring and enforcement procedures applicable to Table 1-B-1 Measures.

### **Green Development Program Process**

Builder participation in the Green Development Program is mandatory. Required measures apply to all buildings except multi-family residential which have separate requirements as noted in the Centennial Green Development Program. To allow maximum flexibility in the application of sustainable design practices by individual developers, any residential

development in the Project that achieves certification by the National Association of Home Builders for compliance with the National Green Building Standard or certification by the U.S. Green Building Council for performance under the Leadership in Energy and Environmental Design (LEED) – Homes Rating System will be considered consistent with the intent of the Green Development Program for the building portion of the Project, so long as such certification otherwise exceeds the mandatory residential requirements of the CAL Green Code in effect on the date of application for a building permit and the measures required to achieve Cal Green Tier I as described in the 2016 version of the Cal Green Code. Any commercial development in the Project (as defined within a business park, light industrial, or commercial land use designation) that is awarded a LEED Silver Certification or better will be considered consistent with the Program, so long as such certification otherwise exceeds the mandatory nonresidential requirements of the CAL Green Code in effect on the date of application for a building permit and the measures required to achieve Cal Green Tier 1 as described in the 2016 version of the Cal Green Code. The comprehensiveness of these certification programs guarantees, for their respective types of development, the achievement of a high minimum standard equivalent to CAL Green Tier 1 and the unique measures otherwise required by Table 1-B-1 of the *Centennial Specific Plan*. (see Appendix 2-A of EIR Appendix 4.0-A).

A complete description of the Centennial Green Development Program, including a listing of all development practices and the specific components are provided in Appendix 1-B of the *Centennial Specific Plan* (Appendix 4.0-A of this EIR). Additionally, each analysis in Section 5.0 (i.e., 5.1–5.21) of this EIR includes Project Design Features (PDFs) based on the Green Development Program, if applicable, that list the required development practices germane to that environmental topic and a brief explanation of how these practices would reduce the Project’s impact compared to a more traditional development. However, unless specifically indicated the environmental impact analysis in each section of this EIR does not take quantitative credit for the potential mitigating effects of achieving the performance standards of the Green Development Program or implementing the required measures and suggested BMPs of the Green Development Program. For example, unless noted, Green Development Program measures that reduce greenhouse gas emissions are not given quantitative credit as emission reductions in the Climate Change analysis. Implementation of the Centennial Green Development Program is also discussed in Chapter 4 of the *Centennial Specific Plan*.

#### **4.5.12 PUBLIC SERVICES/FACILITIES**

The Project reserves sites for schools, parks, and recommends and permits locations for a library, sheriff, and fire stations to serve future residents and employees. Exhibit 4-1, Centennial Project –Conceptual Land Use Plan, shows the conceptual location of the proposed public facilities described below.

#### **Fire and Emergency Service**

Fire protection service is provided to the Project site by the Consolidated Fire Protection District of Los Angeles County, commonly known as the Los Angeles County Fire Department

(LACFD). The nearest station (Fire Station No. 77) is located at 46833 Peace Valley Road in Gorman, west of the I-5 and SR-138 interchange.

As shown on Exhibit 4-1, the Conceptual Land Use Plan includes conceptual site locations for up to four new fire stations in the Project area. The number of on-site fire stations and their general locations were determined through preliminary consultation with the LACFD and were based upon the projected increase in population to be served, types of development proposed, geographic distribution of proposed land uses, circulation system, and projected response times to calls from the Project site. According to the Insurance Service Office (ISO), using a Fire Suppression Rating Schedule (FSRS), a five-minute response time is typically the standard for adequate fire protection. The new fire stations would provide 5-minute response times to 90 percent of fire calls from the Project site. This is consistent with the LACFD's goal of a five-minute or less response time at Project buildout within the Centennial Project. Ultimately, the LACFD would approve the final station site locations. The Project permits or conditionally permits fire stations within most land use designations by providing adequate flexibility to meet County siting criteria. Precise locations for all fire stations would be established when future tract maps are processed.

The Project would construct up to three medium stations and one large station on the Project site. A medium station would consist of an approximate 10,000-square-foot (sf) building on an approximate 1.25-acre lot. A large station consists of an approximate 15,500-sf building on an approximately 4.00-acre lot. The large station lot is sized to also accommodate training facilities for fire fighters. It should be noted that fire station size requirements are continually modified to meet federal, State, and local requirements. The actual square footage of each fire station would be determined by the LACFD at the time of Project development.

Staffing requirements for all new fire stations mandate a minimum of a four-person engine company. The first fire station would be opened in conjunction with the occupancy of the 1,000<sup>th</sup> residential unit. The timing of development of this fire station will be coordinated between the Project Applicant/Developer and LACFD. The timing for the construction of the remaining fire stations will be established by the LACFD and the Applicant, depending upon the phasing of the remainder of the Project development.

As required under the LACFD Developer Fee Program, the Project Applicant/Developer is required (1) to pay fees as annually updated in the County Developer Fee Program for the purchase of land for fire station sites and construction of fire stations and (2) to provide for certain equipment. The Project Applicant/Developer is responsible for providing land for on-site fire stations and for constructing, furnishing, and equipping the stations to the LACFD specifications and requirements. The improvements would meet all applicable State and County fire codes and ordinances. Specific provisions of the agreement between the Project Applicant/Developer and LACFD would be determined in future negotiations. It should be noted that this EIR addresses the potential environmental impacts associated with construction and operation of the fire stations within the Project site.

The existing heliport located at the site for the existing Fire Station 77 will continue to be located at the site and remain operational. The existing heliport at Fire Station 77 would be

operational for refueling and patient pick up and could be used to scoop water from Quail Lake for brush fire protection. On site, a fire hydrant system would be constructed to fight fires within the development area. Refer to Section 5.16, Fire and Law Enforcement Services, for a discussion on fire and emergency services.

## **Law Enforcement Service**

The Santa Clarita Valley Station of the Los Angeles County Sheriff's Department (LASD) is responsible for providing general law enforcement to the Project site, while the California Highway Patrol (CHP) provides traffic control. The closest Sheriff's Station is located near the intersection of Magic Mountain Parkway and Valencia Boulevard, at 23740 Magic Mountain Parkway in Valencia, approximately 35 miles south of the Project site. Currently, emergency and priority response times to the Project area exceed the optimal response times.

The Project would provide for one on-site Sheriff's station. Prior to development of this permanent Sheriff's station, the LASD would operate a temporary station (e.g., store front station) in the first phase of Project development. This store front Sheriff station would be developed and fully operational prior to issuance of the first certificate of occupancy and be located in the first retail center the first phase of Project development. Once the permanent Sheriff's station is constructed, the store front station will be closed. The permanent Sheriff's Station would be constructed prior to occupation of any future phases that could not be adequately served by the temporary station, in accordance with the needs and timing of the LASD and Project Applicant/Developer.

The CHP may need to increase staffing levels, adjust boundaries, and purchase new equipment in order to address the increased demand for services created by the Project. However, implementation of the Project would not require new or physically altered CHP facilities to maintain acceptable service ratios, response times, or other performance objectives (Miler 2016). Refer to Section 5.16, Fire and Law Enforcement Services, for a discussion on law enforcement services and the CHP.

## **Schools**

The majority of the Project site is located within the jurisdiction of the Gorman Joint School District (Gorman District) and a portion of the Project site at the eastern end of the site is located in the Westside Union School District (WUSD). These districts provide public elementary and junior high/middle school education (grades Kindergarten through 8<sup>th</sup> [K-8]). The Project site is also located within the Antelope Valley Union High School District (AVUHSD), which provides high school education (grades 9-12).

To accommodate the demand for educational facilities created by future Centennial residents, the Project reserves sites through a "Schools" land use designation for five K-8 schools, one K-5 school and one high school. The proposed school sites are centrally located in the Villages and are generally adjacent to parks and minor and major greenway systems that offer pedestrian trail linkage. The School (S) Overlay on Exhibit 4-1, Centennial Project -Conceptual Land Use Plan, identifies the preliminary locations for the school sites reserved

in the Project site; however, final school site locations would be determined at when future tract maps are processed and in coordination with the respective school districts. Final locations would comply with the Project's intent of connecting schools to pedestrian trails and locating them close to parks.

The reservation of school sites through a land use designation would allow the Gorman District, the WUSD, and the AVUHSD to acquire the sites and provide school facilities. The Project Applicant/Developer would either pay required Senate Bill 50 (*California Government Code*, Section 65995) developer fees to the respective school districts, or enter into an agreement with the school districts to facilitate the financing, construction, and operation of new school facilities in the Project site to ensure the timely provision of schools corresponding to the Project's phased development. Although construction of the schools may be the responsibility of the respective school districts, this Draft EIR addresses environmental impacts associated with construction and operation of schools on site.

### ***K-8 School Sites***

Five K-8 school sites are anticipated to be constructed on the Project site. The K-8 school sites would each occupy approximately 15 acres. The first school will be built and operational prior to the first certificate of occupancy. Therefore, it is anticipated that the K-8 school (initially a K-12 facility, see below) would be opened by the Gorman District at occupancy of the first residential units. The planned approach is to initially construct a kindergarten through Grade 12 campus (K-12) in order to provide public school accommodations at all education levels at Project opening. As Project buildout occurs, this school would revert to a K-8 school when the high school is constructed. Eventually, other K-8 schools would be constructed as needed, including a smaller K-5 school that would be constructed west of the Aqueduct. The actual timing of school facilities implementation would depend on the rate of Project development and the actual demand for school facilities, as determined by the Gorman District and the WUSD.

The K-12 school option would be accommodated on a school site within the physical impact area identified for the Project and evaluated in this EIR. The off-site school option (attendance of Project residents at the existing off-site Gorman Elementary School until the first on-site elementary school is built) would be available to accommodate students up to the school's normal operating capacity.

### ***High School Site***

One high school site is proposed within the Project site. The high school site would have a minimum of 60-net useable acres per the agreement with AVUHSD. The high school site would accommodate between 2,850 and 3,350 students. As previously discussed, the proposed interim K-12 campus would ensure public school accommodations at all education levels during the initial phase of Project implementation.

The opening of the high school facility would depend on the rate of Project development and actual demand for high school facilities, as determined by the AVUHSD. In the interim, a grades K-8 and grades 9-12 joint-use campus is proposed to provide public school

accommodations at all education levels. Students from the Project also would have the option of attending Quartz Hill High School (by busing through AVSTA) or applying for an interdistrict transfer to attend the El Tejon Unified School District's Frazier Mountain High School, which is located approximately ten miles northwest of the site. Frazier Mountain High School had 286 students in 2015-2016 and has capacity for additional students (ETUSD 2016). The El Tejon Unified School District also allows interdistrict transfers subject to approval of the student's home district (ETUSD 2015). It should be noted that this interim option would be for a short time until the first grades 9 through 12 school is operational.

## **Library**

The Project includes a public library in the Town Center, which would be part of the County of Los Angeles Public Library (County Library) system. The Project Applicant/Developer would provide the land; construct the library; and would provide all furniture, fixtures, equipment, and materials for this library. The area where the library site is conceptually located in the Land Use Plan is of adequate size and in a location that addresses the County's library siting requirements, including related parking. Providing for a proposed library facility of this size and materials would exceed the projected demand based on the County Library's planning guidelines for the projected population of the Project.

While the location is conceptual and may change as determined in coordination with the County Library, the proposed inclusion of a library on the Project site is definitive. The Project proposes a public library that would be on an approximate 2.5-acre site at the Town Core. The Library would be completed and operational on a date mutually agreed to between the County Librarian and the Project Applicant/Developer, taking into account the demands on library services within and adjacent to the Project site. The library will be developed in accordance with current County library guidelines. The exact location, facility design, and phasing of the proposed permanent library would be determined by the County Library during subsequent levels of Project approval.

Flexibility is a key concern of the library staff to ensure that space within the library can be changed as the needs of the community change such as the need for more computer stations. Other components of priority for the County Library are the inclusion of meeting rooms, technology, and construction of an appropriately sized facility to serve the community.

Library services, such as access to online databases and reference materials, would also be provided via internet services to increase access and use of library resources. Schools, residences, and businesses would be "connected" through the community intranet system, as described in Centennial's Technology Plan (refer to Section 3.9 of the *Centennial Specific Plan*).

## **Maintenance Yards and Animal Control**

Project demand for the maintenance of future County-owned facilities and infrastructure would be met by the provision of land for two on-site maintenance yards and the payment of fees and taxes that fund these services. The maintenance yards will operate as a joint use service yard and will include both a road maintenance yard and a maintenance yard for

parks. The County may also construct, equip, and operate a permanent new animal control facility adjacent to the maintenance yards, if such a permanent facility is needed in the Project area.

The County will construct, equip, and operate a permanent animal control facility when, in the judgment of the County, such a permanent facility is required. The land will be provided through an irrevocable offer for dedication of the property from the Project Applicant/Developer or subdivider. This facility will consist of up to approximately 5,000 square feet of space including office space; dog kennels (up to a total of 54); a cat room (with up to 40 cages); a veterinary medical suite; storage space; and required parking. It may also include a facility to house farm animals and reptiles.

During the initial development of the Project, the County may provide modular units to temporarily house lost and abandoned animals on the land set aside for the County's future permanent facility. Alternately, should the permanent site not be available to accommodate the modular units, the Project Applicant/Developer may contract with Shelter on the Hill, a Humane Society, or another entity acceptable to the County, to provide temporary animal shelter facilities. The temporary animal shelter will be located in Shelter on the Hill's facilities in Lebec or in other facilities located near the Project site. The operator of the off-site Animal Control Facility would be required under the agreement to provide the services stated below to Centennial for five years after the issuance of a certificate of occupancy for the 2,000<sup>th</sup> residential unit.

This facility will provide the following services: (1) temporary shelter to lost, injured, and abandoned dogs and cats identified by the County Animal Control during patrols of Centennial; (2) temporary shelter for dogs and cats relinquished by their owners; (3) information and referrals to the public regarding local veterinarians that perform spaying and neutering of pets; (4) the same level of basic medical care and treatment of dogs and cats that are impounded from Centennial that is offered to other animals that are being boarded at the this off-site facility; and (5) the ability to temporarily quarantine up to two dogs through a segregated, single-occupancy kennel run. If an animal is not redeemed by its owner from the temporary facilities after ten days or more, the animal may be moved to (and shall be accepted by) the Los Angeles County Castaic Animal Control facility for potential adoption. The County Department of Animal Care and Control shall respond to patrol calls requested by Centennial residents with respect to lost, injured, abandoned, or dangerous animals until the permanent facility is established.

#### **4.5.13 LANDSCAPE, FUEL MODIFICATION, AND LIGHTING**

##### **Landscape Plan**

The Landscape Plan is a major component in Centennial's infrastructural concept. The Project area has been grazed for more than a century, and the predominant vegetation type on the Project site consists of grasslands. The Landscape Plan seeks to establish regionally appropriate "urban forests" within Centennial. The primary landscape objective is to preserve the Project site's natural beauty and resources; to maintain the historical agrarian character of the region; and to create the look and feel of a rural small town that meets the

everyday needs of the community. The Landscape Plan is structured to reflect the uniqueness of the Project site's varied topography and habitats while providing a uniform treatment of landscape components. Differing elements of the plant palette would be used for variety depending on the landscape purpose. The predominant landscape theme along the streetscapes would feature natural and rural settings that could include a blend of trees to provide themes that resemble groves and orchards; vineyards; wildflowers; and grasslands.

A thematic treatment is to be used at main entryways to identify neighborhoods and other significant land uses or major intersections. The Landscape Plan is divided into the following two components: open space and developed areas. Additionally, as part of the integrated water resources management approach for protecting water quality, a Landscape Management Plan is identified as a project design feature and will be implemented for common area landscaping on the Project site that includes a planting plan; procedures for removing non-native vegetation and planting native vegetation; fertilizer guidelines; and Integrated Pest Management (IPM). IPM is a strategy that focuses on long-term prevention or suppression of pest problems (i.e., insects and diseases) through a combination of techniques including using pest-resistant plants; biological controls; cultural practices; habitat modification; and the judicious use of pesticides according to treatment thresholds, when monitoring indicates pesticides are needed because pest populations exceed established thresholds. The Landscape Management Plan and a discussion of its general components are identified in Section 5.4, Water Quality.

### ***Open Space Zones***

Open space consists primarily of a native, undisturbed vegetation zone; a transition zone (for transition slopes); a greenway zone; and a natural drainage zone. Fuel modification requirements may apply to some portions of any of these zones.

***Native Zone.*** This zone includes only native vegetation. The native zone may include areas selected for restoration with native vegetation and biological mitigation (as detailed in Section 5.7, Biological Resources). Select areas of the native zone may also continue to be managed using historical seasonal patterns of grazing, where allowed.

***Greenway Zone.*** The greenway landscaping zones typically contain existing drainage features or unique topographic features. Elsewhere in the greenway zone, there may also be transition zones, which shall be treated as described below. The overall goals of the landscaping concept in the greenway zone are resource conservation (preservation) and enhancement and establishing an appropriate natural setting for drainages to increase ecological values. Plants in the major greenway zone outside of the natural drainage zone should be chosen so that they will not interfere with those efforts. The major greenways may also be used for stormwater management. The stormwater management facilities should be designed and planted where possible to blend with the natural setting of the greenway zone.

Greenways are a multipurpose area that can be found throughout the Project site, providing conservation areas and stormwater management where necessary. They are a

combination of manufactured and conserved open space and can be landscaped in a variety of ways depending on use. For example, they may contain areas for stormwater overflow, educational nature displays, and seating areas along the trails. Trails are typically meandering and are intended to provide a shorter connection to village centers and recreational amenities providing an alternative to using a car. Although potentially varied, the landscaping in this zone shall be primarily native or utilize similar drought-tolerant plant material and shade trees with the goal of being self-sustaining in most locations. Drifts of native and or drought-tolerant wildflowers and perennial grass-dominated meadows should be used to enhance paths that will be used by bicyclists and pedestrians.

**Transition Zone.** The transition zone, an area between the native zone and developed areas, is graded and may contain a fuel modification zone. Landscaping in this zone must be dominated by native and/or drought-tolerant, trees, shrubs and ground cover, also taking into consideration fuel modification requirements, which include plants that are inherently fire resistant. The goal of the transition zone is to seamlessly blend the native landscape with the human-made environment. This process results in a landscape that is identified in various figures in the Landscape Plan as “naturalized.”

**Natural Drainage Zone.** The natural drainage zones are areas where major drainage features shall be preserved and/or restored within the developed area of the Project site. Only the natural drainage zones are subject to the requirements of the Landscape Plan. The extent of drainage preservation and/or restoration, as well as the plant material chosen for this zone, must be consistent with the mitigation measures set forth in Section 5.7, Biological Resources.

### **Developed Areas**

Developed areas consist of all man-made features in the Project, including the neighborhoods, parks, shopping, and commercial areas. Within this man-made environment are common unifying landscape zones such as the streetscape and internal slopes that are manufactured. The common goal of these zones is to (1) use regionally appropriate plant species and conserve resources by using native and drought-tolerant species; (2) plant minimally for maximum impact (e.g., shade); (3) group plants according to water requirements (hydrozones); and (4) use smart irrigation practices (such as low-volume spray heads and drip irrigation). Using native or drought-tolerant plant species would also minimize the need for soil amendments and the energy to integrate them. A Plant Palette and Prohibited Plant Species list are provided in Sections 3.4.3 and 3.3.4, respectively, of the *Centennial Specific Plan* and have been prepared in consultation with the County Biologist to determine which species should be selected according to the conditions within Centennial sites. The plant palette and design is tailored to the Project site’s unique environmental conditions and allows for both native and adopted species of pines, oaks, willows, cottonwoods, grasses, spring and fall colors, and a wide range of tree forms. Ultimately, the Landscape Plan would help to define the visual character of the community by balancing planting in selective landscapes while leaving open other natural landscapes in their original conditions.

## Fuel Modification Plan

The Los Angeles County Fire Department designates land in Los Angeles County according to wildfire susceptibility; the Project site is located within a Very High Fire Hazard Severity Zone (VHFHSZ), which means it is highly vulnerable to wildfires (Los Angeles County Code, Title 32 [Fire Code]). The default fuel modification setback standard within a VHFHSZ area is 200 feet from the closest structure; however, some flexibility is permitted where characteristics of land within a VHFHSZ do not warrant such large setback requirements. Since the Project site is predominantly characterized by annual grassland habitat and most of the proposed developed area on the Project site is characterized by low combustible vegetation, an alternative compliance of a 100-foot setback from a structure is likely more appropriate for the majority of the site. However, in some instances, an alternative compliance of a 150-foot setback from the structure may be appropriate, especially in cases where a number of trees are in the immediate vicinity of lots but are at a grade uphill from the lots. In addition, MM 3-9 (see Section 5.3, Hazards and Fire Safety) requires that new property owners be informed of their individual responsibilities for maintaining fuel modification zones on their property, either via the Covenants, Conditions, and Restrictions (CC&Rs) or disclosure statements. While this proposed Fuel Modification Plan has been reviewed by the Fire Department and represents a probable scenario, a final determination of the fuel modification setbacks for each lot will not be made until building permits are issued.

Within each setback requirement are three possible zones with associated landscape characteristics, namely Zone A, Zone B, and Zone C. The general characteristics of each zone are described later in this section. The recommended distance requirements for each zone are described below:

For areas with a 200-foot setback, the distance requirements would be as follows:

1. Zone A extends 20 feet from the edge of any combustible structure, accessory structure, appendage, or projection.
2. Zone B extends from the outermost edge of Zone A to 100 feet from the structure (or 80 feet from the outermost edge of Zone A).
3. Zone C extends from the outermost edge of Zone B to 200 feet from the structure (or 100 feet from the outermost edge of Zone B).

For areas with a 150-foot setback, the distance requirements would be as follows:

1. Zone A extends 20 feet from the edge of any combustible structure, accessory structure, appendage, or projection.
2. Zone B extends from the outermost edge of Zone A to 50 feet from the structure (or 30 feet from the outermost edge of Zone A).
3. Zone C extends from the outermost edge of Zone B to 150 feet from the structure (or 100 feet from the outermost edge of Zone B).

For areas with a 100-foot setback, the distance requirements would be as follows:

1. Zone A extends 20 feet from the edge of any combustible structure, accessory structure, appendage, or projection.
2. Zone B extends from the outermost edge of Zone A to 50 feet from the structure (or 30 feet from the outermost edge of Zone A).
3. Zone C extends from the outermost edge of Zone B to 100 feet from the structure (or 50 feet from the outermost edge of Zone B).

According to the *Fuel Modification Plan Guidelines*, the revised *California Public Resources Code* (Section 4291), and the *California Government Code* (Section 51182) defensible space guidelines, a Fuel Modification Program consists of 3 zones that are within an approximate 200-foot buffer and that are subject to partial or total replacement of the native or ornamental vegetation with drought-tolerant and fire-retardant plants. The actual width of each zone can vary from one site to another depending on the ability to provide acceptable clearance distances and concurrence from the County Fire Department and the County of Los Angeles Department of Regional Planning.

- **Zone A** is a minimum 20-foot setback zone; it is in closest proximity to the habitable structures and is irrigated. Most vegetation in this zone is limited to groundcover, green lawns, and selected ornamental plants. This zone requires regular vegetation trimming, a well-maintained irrigation system, and the removal and replacement of dead and dying plants.
- **Zone B** is the irrigation zone that provides defensible space for fire suppression forces. This setback zone may extend up to 100 feet from the habitable structure. Some native or existing vegetation may remain if spaced according to the *Fuel Modification Plan Guidelines* and are free of dead wood. The maintenance requirements are the same as for Zone A.
- **Zone C** is the thinning zone and is designed to slow the rate of wildfire spread, reduce flame lengths, and minimize the intensity of the fires prior to reaching irrigated areas. This zone allows for predominantly existing vegetation with the removal of undesirable plant species. Natural vegetation is thinned by reduced amounts as the zone moves away from the development.

Fuel modification is generally not recommended by the County Fire Department for areas outside a project boundary due to problems inherent with enforcing regulations on adjacent property and the potential for confusion regarding the responsibility for fuel-modification areas outside legal ownership. Consequently, the County Fire Department recommends the implementation of alternative modes of wildfire hazard protection, such as alternative means and methods that can be implemented on site to attain a comparable level of wildfire protection. According to the *Fuel Modification Plan Guidelines*, these alternatives may include, but are not limited to (1) increasing the width of the setback or irrigated zones to reduce thinning zone dimensions; (2) enhancing fire protection construction techniques (including indoor fire sprinkler systems); (3) adjusting structure orientation; and/or (4) constructing non-combustible fencing material (LACFD, Prevention Bureau, Forestry Division, Brush Clearance Section 1998). Therefore, in areas where a 200-foot buffer cannot

be accommodated on site, a comparable level of wildfire protection must be provided through a combination of these means and methods; however, all fuel modification will be outside the SEA boundary.

## **Lighting Concept**

Plans for street lighting, trail lighting, and accent lighting would be created at the final street and/or landscape plan level for each phase of the Project. Lighting would be designed to enhance the safety of vehicular, bicycle, and pedestrian flows and be concentrated at intersections and crosswalks. Light sources would be directed downward and shielded from streets and adjoining properties. Lighting for streets, public facilities (such as ball fields), and commercial areas would be used appropriately to minimize visual nuisances and maximize safety. General development standards for Project lighting are identified in Section 2.2.8(P) of the *Centennial Specific Plan*. The Project would be consistent with the County's Rural Outdoor Lighting District Ordinance.

In addition, the Project's Green Development Program (Appendix 1-B of EIR Appendix 4.0-A) includes a section with required measures that establish environmentally sensitive lighting standards for all proposed lighting (e.g., street and security lighting) within the Project (see Table 1-B-1 of the *Centennial Specific Plan's* Appendix 1-B). These measures would be enforced through the HOAs and would include requirements for shielding exterior lighting and limiting the hours, height, direction, and lumens of outdoor lighting.

The lighting concept would be designed to limit light trespass while providing effective nighttime visibility. By minimizing light spillover, the environmentally sensitive lighting standards would preserve nighttime skies and community aesthetics, reduce indirect impacts to surrounding residential uses and wildlife, and conserve natural resources. The lighting concept would be designed to maintain a dark night sky while providing effective nighttime visibility.

### **4.5.14 SOLID WASTE MANAGEMENT PLAN**

The Project's Solid Waste Management Plan has been developed in accordance with the Los Angeles County Source Reduction and Recycling Element (SRRE) and California Department of Resources Recycling and Recovery (CalRecycle) (formerly the California Integrated Waste Management Board) policies regarding reducing, reusing, and recycling solid waste, as outlined in the California Integrated Waste Management Act of 1989 (Assembly Bill [AB] 939), AB 341, AB 1826, and SB 1383. With implementation of the Solid Waste Management Plan, 75 percent of solid waste generated from Project operation would be diverted from landfills. The analysis of the Project's solid waste impact can be found in Section 5.17, Other Public Services, of this EIR. The Solid Waste Management Plan has many interrelated components, which are described further below.

## **Community Education**

A comprehensive waste diversion and educational program for residents would be created and implemented. The first purchaser of each residential unit and Centennial's residential

renters shall be given educational or instructional materials that will describe what constitutes recyclable and hazardous materials, how to separate recyclable and hazardous materials, how to avoid the use of hazardous materials and what procedures exist to collect such materials. Educational materials shall be passed to consecutive buyers through the HOAs and rental agreements and will be available on the community intranet.

## **Waste Collection and Recycling**

A comprehensive residential and commercial curbside recycling program would be implemented that includes automated trucks; the “three-bin system” (or other appropriate waste-reduction system), which provides separate receptacles for yard waste such as leaves and tree trimmings (and possibly food waste, per property’s hauler); recyclables; and permitted, nonrecyclable and noncompostable solid waste; a pick-up program for fall leaves, used motor oil, paint products, Christmas trees, electronics and appliance waste, and other household hazardous waste; and regular pick up of cardboard from commercial areas.

Semi-annual “exchange days” are planned to be organized, publicized, and paid for by the HOA. Under this scenario, large dumpsters (including those for green waste only) would be brought into the neighborhoods for a weekend where the community members will be able to exchange with their neighbors items they no longer want. Homeowners would then be motivated to do spring cleaning and major yard trimming while neighborhood volunteers monitor the dumpsters to make sure they are used efficiently and that only authorized waste is discarded in them.

Construction waste would be managed with the use of recycling bins for glass, metals, paper, wood, plastic, green waste, and cardboard. The collected materials would then be sent to existing recycling and/or processing facilities.

## **Materials Recovery Facility/ Transfer Station (MRF/TS)**

The Project Applicant/Developer will set aside a minimum of 5 acres for a future Materials Recovery Facility/Transfer Station (MRF/TS) that includes a household hazardous waste permanent collection and reuse center and allows for mulching/composting operations. The site will be located in a suitable location with the capacity to manage the nonhazardous solid waste and household hazardous waste generated by the Centennial Project at buildout. The Project Applicant/Developer will prepare and grade the site, and install basic mainline infrastructure fronting the property prior to the issuance of any occupancy permits associated with the first phase of Project implementation. Specifically, the Project allows an MRF/TS, hazardous waste collection center, solid waste conversion technology facilities, and transformation facilities in the Utility land use designation.

The Developer will continually encourage a waste management company to build these facilities on this build ready site. The CC&R for the future MRF/TS site will require the land to be set aside for the MRF/TS in perpetuity. The MRF/TS would allow for all recyclable material to be sorted and compacted for shipment to an off-site recycling processing facility. This process would transfer an early step of the solid waste management process (sorting) from the public to materials recovery professionals. It is expected that, if the MRF/TS is constructed, it would occur after the first phase of Project implementation. Prior to this

facility's construction and operation, if built, waste would be disposed of at a municipal solid waste landfill, as described in Section 5.17, Other Public Services.

## **Composting and Green Waste Facilities**

At a minimum, green waste would be separated by Project occupants in separate green waste bins through the three-bin or other waste-reduction system discussed above. Collection and/or a mulching and composting facility would be incorporated into an MRF/TS with the goal of a 100 percent diversion of green waste from landfills. The landscape plan and turf limits are, in part, designed to reduce the amount of green waste generated by the Project and to reduce the demand for irrigation. Green waste is a resource that can be shredded, chipped, and composted to be used as ground cover in the community at low or no cost to residents. To encourage at-home composting, the County offers free workshops, which can be conducted at the Smart Gardening Learning Center to be built as part of this Project, to teach residents techniques and benefits of composting and offers discounted compost bins. Green waste can also be composted with sludge produced by the wastewater treatment plant and sold as fertilizer. In addition to encourage at-home composting, composting facilities provide environmental benefits at a regional level. Also, there are components of the Green Development Program that relate to green waste management, above and beyond the Solid Waste Management Plan.

## **County Smart Gardening Learning Center**

The Los Angeles County Department of Public Works operates 10 Learning Centers equipped with educational and demonstration materials designed for Smart Gardening workshops. Each center has various backyard and worm composting bins and drought-tolerant plants. Some include grasscycling demonstrations to show how easy and beneficial grasscycling can be.

The Project includes a County Smart Gardening Learning Center within the Project area, which would be part of the County of Los Angeles Smart Gardening system. The Project Applicant/Developer would provide the land; construct the learning center; and would provide the furniture, fixtures, equipment, and materials for this learning center according to the Development Agreements between the County and the Developer. The area where the leaning center site must address the County's Smart Gardening Learning Center siting requirements, including related parking.

The Project proposes a Smart Gardening Learning Center that would be on an approximate 4,000 sf site. The learning center would be completed and operational on a date mutually agreed to between the County Smart Gardening Program Manager and the Project Applicant/Developer. The learning center will be developed in accordance with current County Smart Gardening Learning Center guidelines. The exact location, facility design, and phasing of the proposed center would be determined by the County Smart Gardening Program during subsequent levels of Project approval.

## Household Hazardous Waste Collection

Household hazardous waste and less commonly disposed materials (such as electronics and appliances) would have special pickups or disposal locations and may also be accepted by an MRF/TS year-round. Prior to the facility's construction and operation, or if an MRF/TS is not constructed, waste would be sent to a facility that accepts household hazardous waste, as discussed in Section 5.17, Other Public Services.

### 4.5.15 COMMUNICATION BASED TECHNOLOGY PLAN

Technological advances such as Wi-Fi connectivity, Bluetooth, fiber optic lines, and satellite systems to name a few have been integrated into everyday life via smart phones, tablets, computers and the like. Being "connected" has become a necessity for businesses and residents. The technology vision for Centennial is to connect the community, businesses, and homes with advanced but economically feasible infrastructure and services that are seamless, transparent, and easy to use. The Project would be constructed so that it can accommodate changes to the technology industry in years to come. The Technology Plan includes the following four core components that will be refined and expanded as needed to reflect the inevitable shifts in technology and the changing needs of customers:

- **Connected Homes:** Home builders in Centennial are encouraged to provide enhancements such as smart home features that allow residents to connect to appliances, HVAC, door locks, security systems, thermostats, internet, lights, sprinkler systems, etc. Residential development must also comply with the Green Development Program, Appendix 1-B, which includes many technology features that also offer more sustainable alternatives. The Master Developer must assure there is adequate infrastructure to ensure every home can be a "smart" home.
- **Connected Businesses:** Commercial builders must provide enhanced automated systems that comply with the Green Development Program, Appendix 1-B, which includes many technology features that also offer more sustainable alternatives. Connected and smart, office and manufacturing space is demanded by the market. The Master Developer must assure that there is adequate infrastructure to ensure that every business can be located in a "smart" building.
- **Connected Transportation Options:** The Master Developer is required to provide connected infrastructure such as synced traffic signals, automated parking meters, and technology driven transportation options as discussed in Section 3.3 Mobility Plan.
- **Connected Institutional and Civic Centers:** Developers of uses such as a medical center, higher education facilities, libraries, schools, etc. are encouraged to provide automated building systems and connectivity for integration of smart technology and community building.

## 4.5.16 AFFORDABLE HOUSING PROGRAM

The Project Applicant/Developer has designed an Affordable Housing Program that provides Very Low-, Low-, and Moderate-Income affordable housing opportunities in several housing categories, including for-sale units and/or rental units. It is anticipated that most affordable units would be single-family attached, multi-family, and mixed-use units; this would allow for higher density residential uses that can provide affordable sales and rental rates to lower income households. The housing types provided would appeal to different types of citizens including renters, first-time homeowners, and senior citizens.

The proposed Centennial Affordable Housing Program is consistent with the goals of the current 2014–2021 Housing Element of the *County of Los Angeles General Plan*. The Housing Element was adopted on February 4, 2014, by the County of Los Angeles Board of Supervisors. This Element was certified by the State Department of Housing and Community Development (HCD) on April 30, 2014.

It is anticipated that Centennial's Affordable Housing Implementation Plan (Appendix 3-C of EIR Appendix 4.0-A) will be included as part of the proposed Development Agreement under consideration between the County and the Project Applicant/Developer. The Plan details the provision of very low-, low-, and moderate-income affordable housing opportunities. The Affordable Housing Implementation Plan is based on the implementation criteria found in the Affordable Housing Program and provides an overview of the affordable housing options proposed as part of the Project. Consistent with the goals of the *County of Los Angeles General Plan's* Housing Element, it is anticipated that affordable units would include a mix of affordable housing products.

The Project will include a minimum of 10 percent of the dwelling units (approximately 1,933 dwelling units throughout the Project site if fully implemented) as affordable units, per the Centennial Affordable Housing Implementation Plan. While the number of affordable homes per community will be adjusted through the approval process for the tentative tract maps, the total number of affordable homes proposed within Centennial will not be less than 10 percent of the total development.

The Centennial Affordable Housing Implementation Plan utilizes the same affordability criteria as does the County of Los Angeles with respect to the economic definitions of moderate, low, and very low incomes.

According to the Centennial Affordable Housing Implementation Plan, at buildout, affordable housing opportunities would be distributed throughout the Project site as follows:

- **Very Low-Income Units.** 387 dwelling units (20 percent of the affordable housing units) would be for very low-income (50 percent of the Los Angeles County median income) households.
- **Low-Income Units.** 483 dwelling units would be for low income (25 percent of the affordable housing units) households with incomes greater than 50 percent but less than 80 percent of the Los Angeles County median income.

- **Moderate-Income Units.** 1,063 dwelling units (55 percent of the affordable housing units) would be for households within incomes equal to or less than 120 percent of the Los Angeles County median income.

All very low income (less than 50 percent) and low income (50 to 80 percent) affordable units would likely be developed as rental units. Moderate income units would likely be a mix of rental and for sale units. The proportion of very low, low income, and moderate income units in each development phase will be provided in approximately the same proportion as their respective ratio to the total to ensure the distribution of affordable units throughout the Project, with the exception of Villages 1, 4, and 9.

Home buyers of affordable units would be eligible to receive a percentage of any appreciation with respect to the value of their property over time, depending upon the homebuyer's length of ownership; all affordable rental homes will maintain affordable monthly rents for a minimum of 30 years.

Per the Centennial Affordable Housing Implementation Plan, annual Affordable Housing Reports will be submitted to Los Angeles County Department of Regional Planning until such time as it is demonstrated that the goals identified in the Plan have been achieved.

#### **4.5.17 GRADING AND CONSTRUCTION**

Grading for the Project would occur in phases over an approximate 20 year timeframe, with all earthwork ultimately balanced on site. Grading for one phase with an approved tentative tract map may extend into adjacent phases that may or may not be covered by an approved tentative tract map and require the import or export of soils among phases, but earthwork within the Project boundary would achieve an overall earthwork balance. Project implementation requires a total approximately 100 million cubic yards (cy) of cut and fill. Overexcavation and remedial grading for contaminated soils is not anticipated. However, the conceptual grading plan is gross, and estimated cut and fill quantities are conceptual.

Earthwork for development on each side of the Aqueduct as well as on each side of the SR-138, would be balanced within each area. Consequently, given the large scale of the Project, grading of a particular tract map may be undertaken in phases. The limit of a grading phase may extend beyond the limits of a particular final unit map or tract map boundary in order to achieve a phased grading balance. An interim Hydrology Report will be prepared for each phased grading area, and required drainage devices will be provided to support the phased grading.

For analysis purposes, it is estimated that on-site cut and fill is expected to occur at an average daily rate of 40,000 cy, with a daily maximum on-site cut and fill of 100,000 cy during grading activities, which would be ongoing during Project buildout. As construction progresses, it is likely that various construction stages would occur at the same time (grading, vertical construction, and off-site infrastructure installation). Assumptions regarding use of construction equipment during the construction phases are outlined in Section 5.11, Air Resources.

The preliminary slope analysis of the Project site is provided on Exhibit 4-19a, Centennial Project – Slope Analysis, with the majority of the Project site with a less than 25 percent slope. As shown on Exhibit 4-19a, the majority of the areas with the greatest slopes are located south of SR-138 or along the western portion of the site, within areas proposed as Open Space. The proposed Master Grading Plan and rough elevations for the entire Project site are provided on Exhibit 4-19b, Centennial Project – Conceptual Grading Plan. Approximately 56 percent of the Project site would be graded. The Grading Plan takes into consideration the natural terrain of the area; avoids the steepest slopes; and preserves the most significant natural features., as discussed in further detail in the Specific Plan Section 3.3, Conceptual Grading Plan, and Appendix 1-B, Hillside Design Guidelines.

Grading techniques for the manufactured slopes within the Project site are identified in Section 3.2.1, Grading Goals and Guidelines, of the *Centennial Specific Plan*. Generally, permanent manufactured slope banks would be constructed at a gradient not greater than 2:1 (horizontal to vertical); cut slopes would not exceed 2:1. Exceptions may be made in the case of rock or natural outcroppings, or as otherwise approved by the Los Angeles County Department of Public Works. To the extent feasible, exposed manufactured slopes would be subject to contour grading to approximate natural slopes. Existing landforms may be recontoured, as necessary, to provide a smooth and gradual transition to graded slopes while preserving the basic character of the site. Graded slope faces would be revegetated to blend with the surrounding terrain where appropriate. Other erosion-control measures would be implemented as part of the required measures to be approved with grading plans submitted to the County of Los Angeles Department of Public Works.

Blasting may be required in areas where grading cuts extend into bedrock material that cannot be ripped with a single shank ripper.

## 4.6 PHASING AND IMPLEMENTATION

### 4.6.1 LAND USE PHASING

The Centennial Phasing Plan provides an organizational framework to facilitate development while assuring provision of infrastructure and the public facilities necessary to support Project development. A conceptual phasing plan is provided in Exhibit 4-20, Centennial Project – Conceptual Phasing Plan. As shown, the Project is proposed to be developed in ten phases. Buildout of the Project would generally follow this sequence of phasing; however, some permanent and temporary infrastructure would be needed in locations that do not follow this phasing plan precisely. The basic phasing mechanism is the tentative tract map.

The phasing program is for informational purposes only and may be revised by the Project Applicant/Developer without a Specific Plan Amendment, subject to County approval during the tentative tract map process and *Centennial Specific Plan* requirements. Any changes in the Project must comply with CEQA requirements and the Development Agreement. The actual timing of development would be based on (1) the state of the economy; (2) market demand for uses on the site; and (3) the timing of regional and off-site infrastructure

conditions and needs. Development of the Project site can be expected to extend over a 20-year time frame.

#### **4.6.2 FISCAL IMPLEMENTATION**

Several different methods are available to fund the construction and ongoing maintenance of infrastructure needed to serve the Project. The most likely method of financing would be through the establishment of a Community Facilities District under the provisions of the Mello-Roos Communities Facilities Act of 1982. Such a district is formed to finance designated public services and capital facilities by levying special taxes in a project area. In this case, the special tax lien recorded on each individual property on the Project site could be used to fund capital costs. Other sources of Project-generated revenue include but are not limited to property taxes, sales tax, gasoline taxes, other district assessments, and business license fees.

#### **4.6.3 FIRST PHASE OF DEVELOPMENT**

The first phase of development on the Project site will require development and implementation of future Tentative Tract Maps (TTMs). As the implementing mechanisms for Project uses, the TTMs demonstrate a more precise and specific level of detail compared to what is described in the Conceptual Land Use Plan. While there may be discrepancies in actual unit counts and land use acres between the Project and the details set forth in future TTMs, the TTM land uses will stay within the limits established under the *Centennial Specific Plan*. The first phase of development will include permanent and temporary uses, major infrastructure, public services, and roadway/circulation improvements, as discussed below.

The first phase of development will ensure that all services and infrastructure components are of sufficient size and capacity to serve the early residents and occupants (e.g., schools, roadways, public park maintenance, and utilities). The timing of any interim facility and its relationship to permanent facilities are described below.

Facilities included in the first phase of development will be designed as permanent facilities, with the exception of the store front LASD station and the temporary placement of high school students within the first school, which will revert to K-8 when the High School is constructed. The initial facilities will be sufficient for early residents. However, these facilities may be relocated and consolidated in larger facilities as part of future development phases. If future development phases are delayed or do not occur, however, the initial facilities will continue to provide permanent services and infrastructure.

#### **Public Service Facilities**

The public service facilities described below are proposed within the first phase of Project development.

## ***Schools***

A K–8 school would be developed in within the first phase of Project development to open at the first occupancy of the Project; decisions regarding the final school location and configuration would ultimately be made by the Gorman Joint School District (Gorman District). With the consent of the Gorman District, the Antelope Valley Union High School District (AVUHSD) will also use the first school for high school students. The K–8 school is initially intended to serve grades kindergarten through 12, then revert to a K–8 school once the high school has been constructed on the Project site and is operational. The four other K–8 schools and one K–5 school are to be constructed subject to the terms of the mitigation agreement with the Gorman District, and the timing depends on the rate of Project development and actual demand for school facilities, as determined by the Gorman Joint School District and Westside Union School District (WUSD).

This first school may also include preschool classrooms and, with the cooperation of the Antelope Valley Community College District, junior college classes could be accommodated in the evenings. This combined campus would ensure public school accommodations at all education levels based on school needs assessments and student enrollment for the first phase of Project development.

Temporary modular classrooms may be used at the existing and proposed schools to accommodate students prior to the construction of permanent facilities. If temporary modular school facilities are utilized in the early years of this combined K–8 and 9–12 campus, then the Project Applicant/Developer will post a bond in an amount sufficient to complete construction of a combined K–8 and 9–12 school campus with permanent, non-modular structures.

High school students at the Project also have to option to be bussed to Quartz Hill High School or attend the El Tejon Unified School District's Frazier Mountain High School. Transfer requests would be handled by the AVUHSD based on their transfer procedures and would take into account the then-current capacity of existing high schools.

## ***Fire Protection and Law Enforcement Services***

Fire services and emergency response for fire incidents during the initial development phases of the Project would be provided from Fire Station 77, located at 46833 Peace Valley Road in Gorman, which is currently staffed with a three-person engine company. This station would serve the Project until such time that the 1,000th dwelling unit is built on the site, at which time the first on-site fire station shall be operational. It is anticipated that up to four fire stations will ultimately be developed on the Project site.

Prior to development of a permanent Sheriff's station, the LASD will operate out of a temporary store front station until the permanent station is required to be developed. The ultimate location and timing for implementation of a permanent station would be determined by the LASD in coordination with the Project Applicant/Developer and would be dependent upon the development rate on the Project site and its location. The store front facility for the LASD would be properly outfitted in accordance with applicable occupancy requirements and would be fully operational prior to the issuance of the first occupancy permit to ensure that response times to the site for emergency and non-emergency calls

would be within the County guidelines. If no future phase development occurs, the LASD would permanently operate out of the temporary store front facility.

### ***Parks***

The Project would provide abundant and varied on-site recreational amenities in an area that currently has little local parkland, including public (i.e., State or federal owned or County-dedicated and maintained) and private (i.e., Homeowner's Association or other privately maintained) parks and other recreation amenities. The Project would include approximately 183 acres of Park uses, which includes private and public neighborhood parks, community parks or sports park facilities, and private pocket parks; community recreation center(s); private recreation facilities associated with multi-family residential developments; planned open space; a system of community trails and greenways; and a regional hiking trail.

The parks will be open to the public, including residents of Centennial and neighboring communities, and will be improved in accordance with schematic designs approved by the Department of Parks and Recreation. Also, all parks will be developed consistent with the Conditions of Approval recommended by the Department of Parks and Recreation and/or as approved by the Planning Commission and/or the County Board of Supervisors as part of approval of the TTMs or per the Development Agreement.

Parks will be constructed within each phase of development to ensure that the acreage and condition of parks available when new residents move in meet County requirements for per capita parkland. Specifically, the Conditions of Approval stipulate that Centennial is financially responsible for developing these parks. Also, Centennial will enter into a Park Development Agreement (PDA), post bonds, and submit a Park Delivery Schedule for the community park prior to clearance of the first TTM containing housing.

### ***Maintenance Yards***

Land for maintenance yards for the Los Angeles County Department of Public Works and the Department of Parks and Recreation will be provided adjacent to the permanent wastewater reclamation facility site constructed in the first phase of development. Maintenance yards will operate as a joint use service yard and will include both a road maintenance yard and a maintenance yard for parks. The County will be responsible for the construction and operation of the maintenance yards.

### ***Animal Control Facility***

The County plans to construct, equip, and operate a permanent new animal control facility adjacent to the maintenance yards described above when, in the judgment of the County, such a permanent facility is required. As discussed above, during the initial build out of the Project, the County may provide modular units to temporarily house lost and abandoned animals on the land set aside for the County's future permanent facility. Alternately, should the permanent site not be available to accommodate the modular units, the Project Applicant/Developer may contract with Shelter on the Hill, a Humane Society, or another entity acceptable to the County, to provide temporary animal shelter facilities. The

temporary animal shelter will be located in Shelter on the Hill's planned facilities in Frazier Park or in other facilities located near the Project site.

## **Infrastructure and Utilities**

The infrastructure and utilities facilities discussed below are proposed within the first phase of Project development:

### ***Roadway/Circulation***

New roads will be constructed on-site and SR-138 will be improved to provide roadway access to the Project site. For the first phase of Project development, new roads will be timed and constructed per the Conditions of Approval approved by the County so that adequate access will be provided to all new land uses at Centennial.

### ***Electricity, Communications, Natural Gas***

All on-site dry utilities will be constructed within public rights-of-way (e.g., roadways) on the Project site will be permanent facilities designed to adequately serve the first Project occupants. The Project includes conditions and specifications for assuring adequate distance and capacity of these on-site dry utilities.

Off-site dry utility upgrades and connections are likewise designed to provide permanent and adequate service for the first phase of Project implementation. Electricity service will be provided from the Gorman and/or Bailey Substations. Existing overhead lines along SR-138 and Gorman Post Road, as well as the lines running from the Bailey Substation to the northwest within the site, will be upgraded to handle anticipated loads. These may be relocated; they may remain overhead; or they may be placed underground. Natural gas will be piped in via the existing high pressure gas main along Gorman Post Road west of the Project site or the SR-138. Communication services will be provided by AT&T by extending telephone lines along Gorman Post Road and may require an upgrade of the Central Office facility in Lebec if fiber-optic connections to the Litespan 2000 cabinet<sup>6</sup> are impacted. A cable television service provider has not yet been identified.

### ***Potable Water, Recycled Water, Wastewater, and Storm Water***

Water-related utilities and infrastructure will be designed and sized to permanently serve the first phase of Project implementation. The phasing for anticipated wet utility improvements are summarized below.

- Potable water will be primarily from groundwater wells. Well water will be combined with water received from the existing State Water Project (SWP) Aqueduct via turnouts on the East and West Branch, and combined well water and SWP water will be treated in an on-site water treatment facility. It is expected that three groundwater

---

<sup>6</sup> Litespan 2000 system is an optical network (SONET)-based next-generation digital loop carrier (NGDLC) that provides both ATM-based Digital subscriber line (DSL) and time division multiplexing (TDM)-based narrowband/wideband services from the same plug-in channel unit slots. Litespan supports multiple voice switch Interface types simultaneously from the same Litespan common control (Alcatel-Lucent 2013).

wells would be needed to serve the first phase of Project implementation, with the remaining up to six wells (including existing and new on- and off-site wells) brought online during future phases of implementation. However, which of the existing and new on- and off-site wells would be used to serve the first phase of Project implementation would be determined while the TTM's are being prepared. Therefore, to provide a conservative analysis, the EIR assumes that the three well locations serving the first phase of Project implementation would include three new, off-site wells at the Tejon Ranch Water Bank. All water treatment, storage and distribution pipeline infrastructure must be designed to be in place, and permanent, as part of the approval process for each future TTM.

- Recycled water is produced from the tertiary treatment of wastewater (sewage), and will be used for outdoor irrigation. Recycled water production will begin concurrently with the operation of the wastewater reclamation facilities. The wastewater reclamation facilities include pumps, tanks, piping, and related equipment. Recycled water distribution piping will be constructed to deliver recycled water for outdoor landscaping. Any excess recycled water would be delivered to a planned sod/nursery site for future development phase landscaping needs and/or used for construction grading and dust control. All sewage and recycled water facilities must be designed to be in place, and permanent, as part of the approval process for each future TTM.
- Storm water runoff is managed at a neighborhood and regional scale with a variety of water quality management measures, including detention and retention basins. All storm water management measures must be designed to be in place, and permanent, as part of the approval process for each future TTM.

## 4.7 OFF-SITE PROJECT FEATURES

The Project would require the implementation of off-site features consisting of roadway improvements and connections and upgrades to existing off-site utility systems. Exhibit 4-21, Centennial Project – Off-Site Project Components, depicts the locations of the off-site features. This graphic shows off-site utility improvements in green, as depicted on the legend.

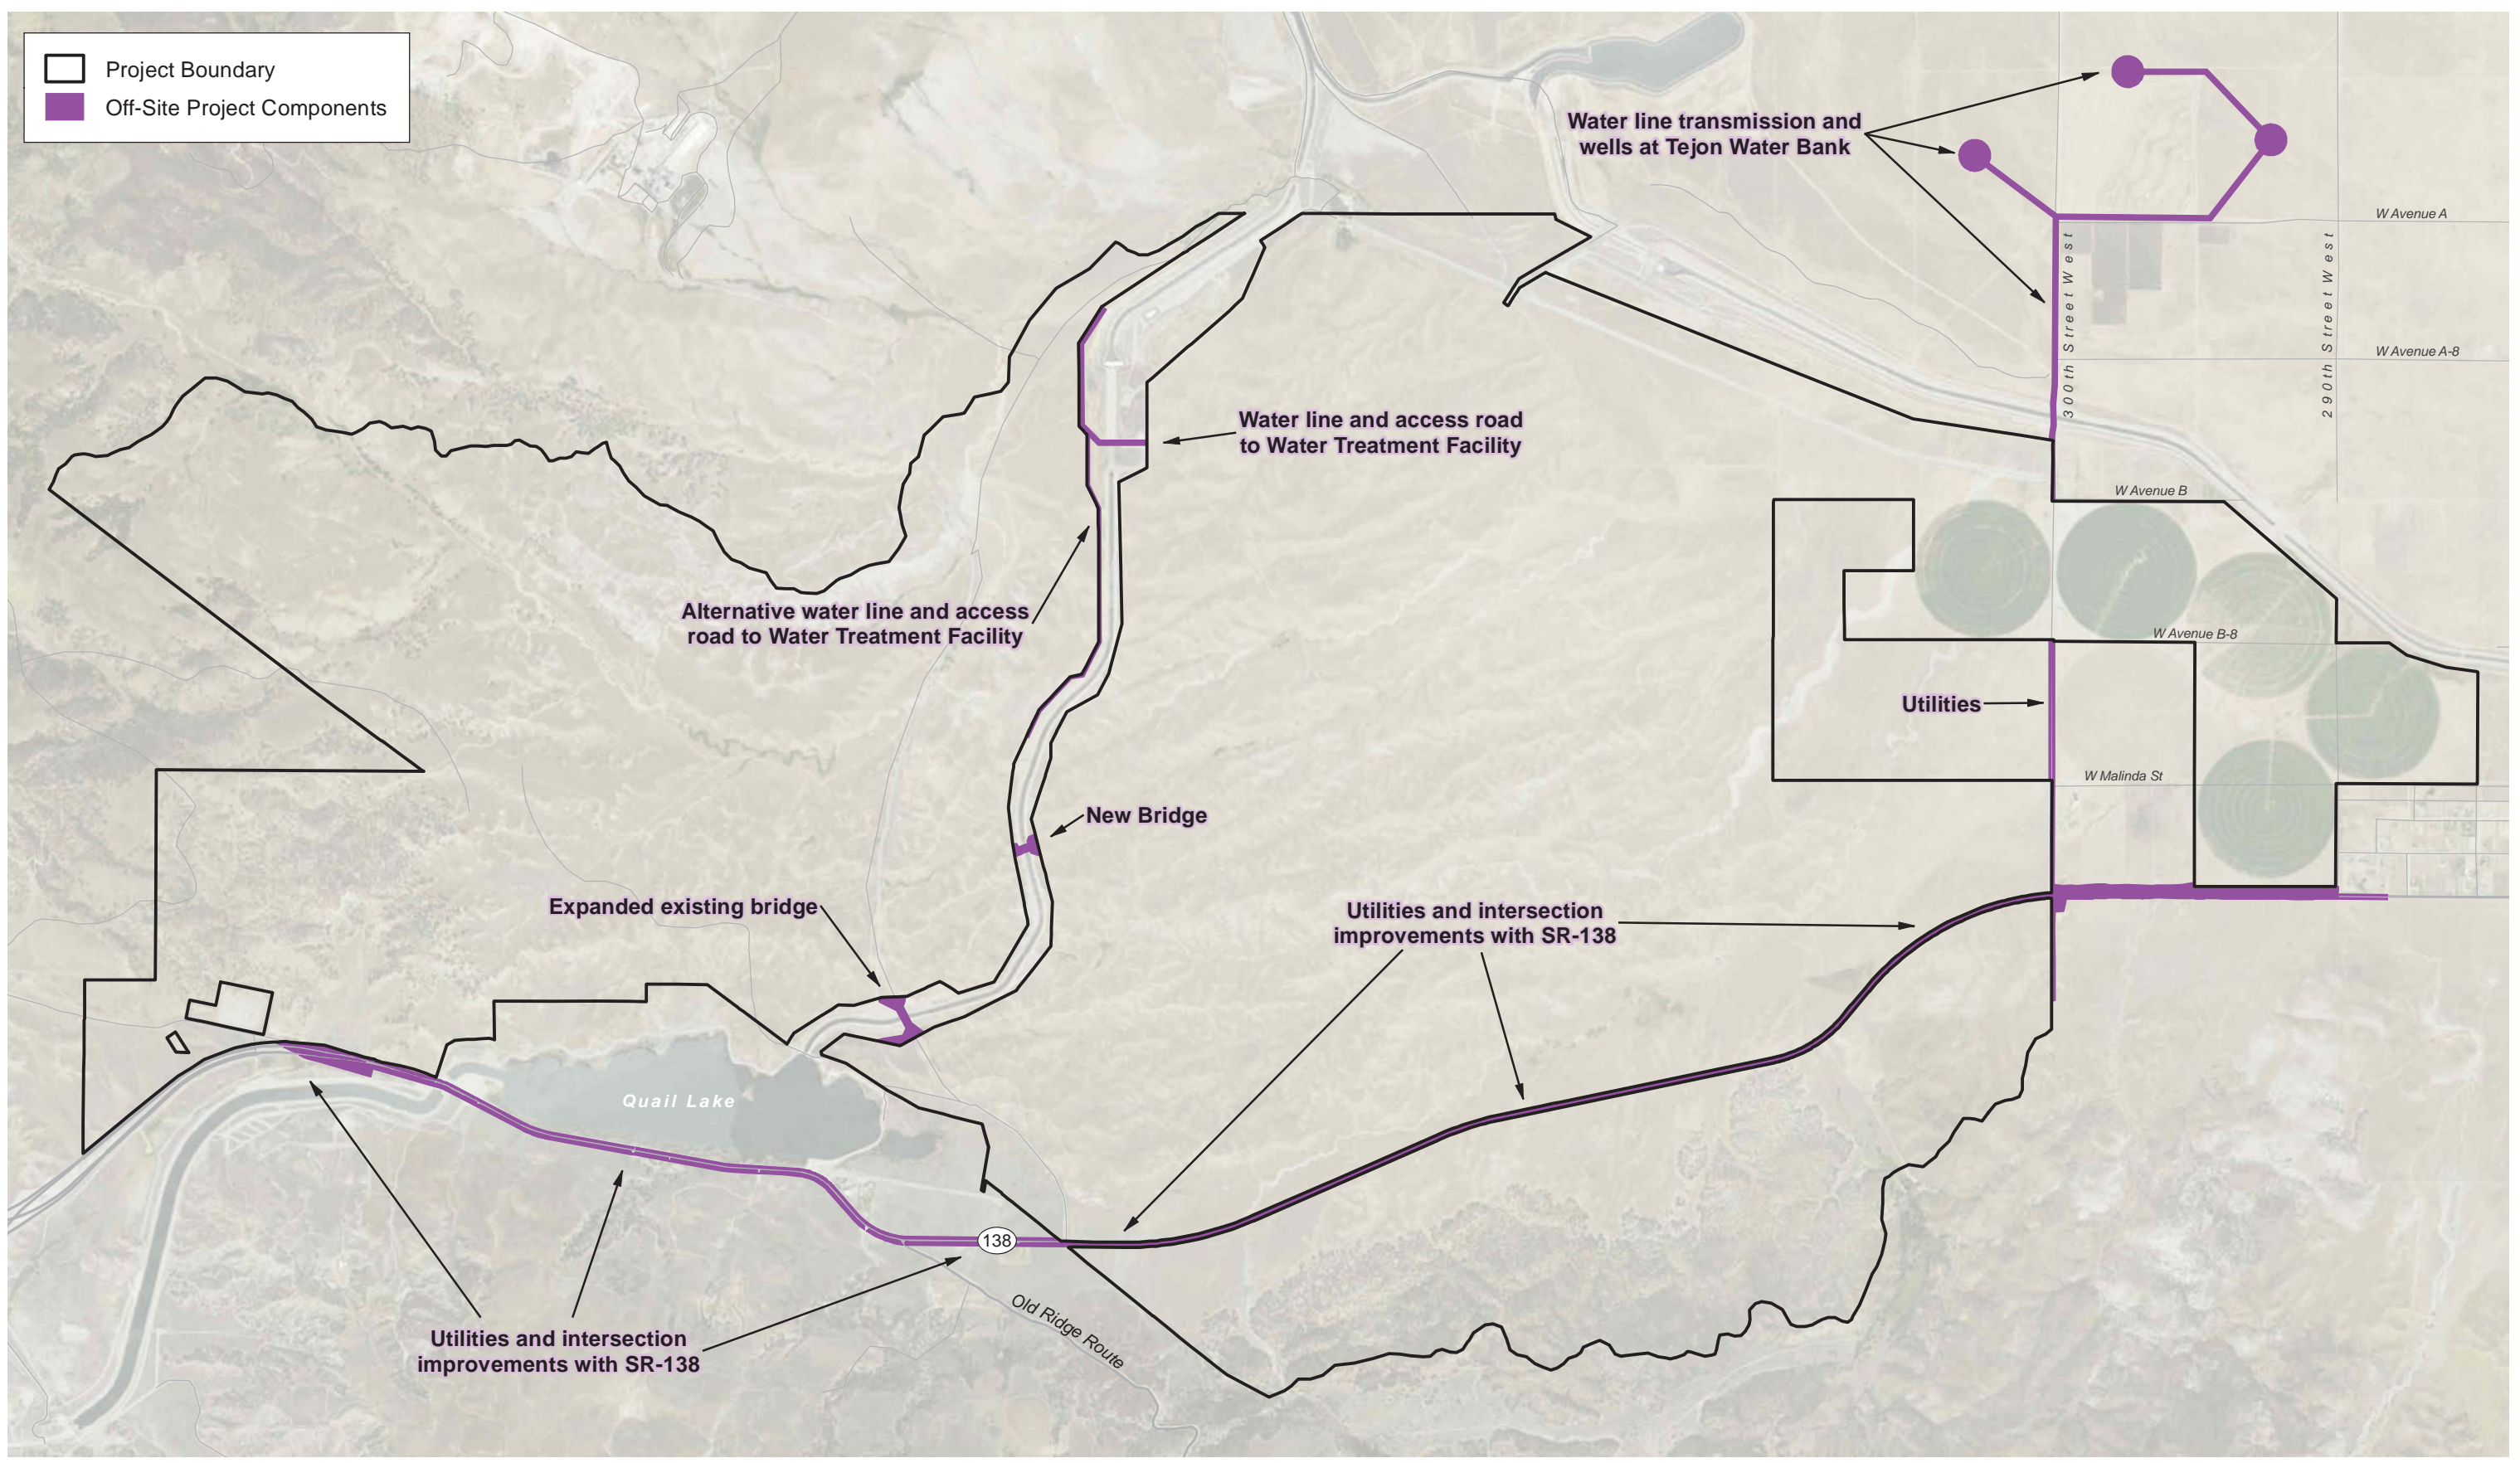

### 4.7.1 ROADWAY IMPROVEMENTS

As previously discussed, Caltrans and Metro are proposing the Northwest 138 Corridor Improvement (NW138) Project that addresses the long-term alignment and right-of-way needs of SR-138 between I-5 and SR-14. There is no implementation schedule for the NW138 Project; however, the draft EIR/EIS for the proposed improvements was made available for public review in July 2016.

A portion of SR-138 within the Caltrans study area traverses the Project site, and this portion of the alignment is proposed for improvements/expansion. The current alignment of the SR-138 is depicted on Exhibit 4-1, Centennial Project – Conceptual Land Use Plan. A potential future alignment for SR-138 is depicted on Exhibit 4-7, Centennial Project – Circulation Plan. However, Caltrans has deferred the selection of a preferred build alternative and has also

- Project Boundary
- Off-Site Project Components

**Centennial Project – Off-Site Project Components**

(Rev: 06-07-2016 LEW) R:\Projects\CEN\000306\Graphics\EIR\Ex4-21\_Off-Site\_Components\_20160606.pdf

D:\Projects\CEN\Centennial\MXD\EIR\Ex\_Off-Site\_Components\_20160606.mxd

reserved the right to determine the specific types of intersection controls at the time the improvements occur.

The NW 138 EIR/EIS includes an environmental analysis of all components of the proposed SR-138 improvements and all short-term and long-term environmental impacts of the improvements; no additional analysis within this Centennial Draft EIR is required for any needed clearances associated with the SR-138. Since the timing of the SR-138 improvements are unknown and since the ultimate implementation of the improvements cannot be assumed, the Centennial Project and this Draft EIR assume the current alignment of the SR-138 is the baseline condition for Project implementation.

The Project involves five intersections with the SR-138. Two of these intersections are considered “off-site”, as they are not surrounded on both sides by the Project site. These two off-site intersections include the proposed re-alignment of the National Cement Plant Road at the western edge of Quail Lake and the intersection of 290<sup>th</sup> Street West with the SR-138. All five of the intersections with the SR-138 will require construction within Caltrans right-of-way. The construction of acceleration and deceleration lanes, turn pockets, and signalized traffic lights at each intersection could be required for Project implementation. Additionally, two underpasses and one overpass bridge crossing over SR-138 would be constructed to facilitate both pedestrian and bike access to employment centers.

Wet and dry utility facilities would cross beneath the paved areas of the SR-138 and would encroach into Caltrans right-of-way and/or otherwise require future coordination with/approval from Caltrans for construction of actual improvements at various locations. Additionally, storm drainage crossings would be constructed at intermediate locations to accommodate the existing and proposed drainage systems. Other intermediate utility crossings may be required to accommodate final designs for both dry and wet utilities. Where feasible, these utility crossings would be grouped together at common crossing locations. Additional encroachments beyond those listed may occur to accommodate installation of required infrastructure.

Tejon Ranch has already contributed or will contribute fair-share funds to provide the following roadway improvements and mitigations:

- Contribute fair-share to planned freeway mainline improvements for the following segment:
  - Between SR-14 and Calgrove Boulevard (add 1 truck lane in the northbound direction and two truck lanes in the southbound direction).
- Contribute fair-share to implement operational improvements, such as intersection lane restriping and/or Intelligent Transportation Systems (ITS) at the following locations:
  - Hasley Canyon Road/Sedona Way Interchange
  - Magic Mountain Parkway Interchange
- Contribute fair-share to re-stripe intersection lanes at the following locations:
  - SR-126 Interchange

- McBean Parkway Interchange
- Contribute fair-share to planned freeway mainline improvements for the following segments:
  - Between Rye Canyon Road and McBean Parkway (Add one high occupancy vehicle (HOV) in lane each direction)

The environmental impacts of these improvements have already been considered in other environmental documentation pursuant to CEQA, and the impacts of these facilities does not require additional analysis in this EIR. These improvements are provided as disclosure for activities associated with Project implementation.

#### **4.7.2 AQUEDUCT CROSSINGS AND WATER INFRASTRUCTURE**

Off-site groundwater wells are expected to be required within the existing Tejon Ranch Water Bank in Kern County as a result of the Project, and that water would require conveyance through the construction of new water pipelines from Kern County to the Project site, as shown on Exhibit 4-21, Centennial Project – Off-Site Project Components. The proposed off-site wells would not involve modifications to existing roadways, nor would they require new roadways. Connecting the Tejon Ranch Water Bank wells to the Project site would require trenching for water pipelines to connect the wellheads to the “untreated wellhead pipelines” to be installed along 300<sup>th</sup> Street West and a crossing of the California Aqueduct.

The system of wellhead pipelines would convey all pumped groundwater requiring disinfection/treatment to the proposed on-site water treatment plant located near the West Branch of the California Aqueduct, where it would be treated and then delivered directly to the Project’s water distribution system or blended with State Water Project (SWP) water, which would also be treated at that same location. The wellhead pipelines would range from 12 inches to 30 inches in diameter; they would be installed at a depth of approximately 4 to 5 feet deep via trenching the length of the pipe; they would be installed slightly deeper if required to safely cross under existing utility lines or underground structures.

The proposed off-site well locations would be accessed via the existing dirt or decomposed granite (DG) roads serving the Tejon Ranch Water Bank. It is anticipated that one daily visit to each well location would be necessary for maintenance and monitoring purposes. The visiting personnel would park on the existing access road near the well location. Also, each proposed well would be equipped with a System Control and Data Acquisition (SCADA) system to enable remote monitoring and control.

The Project would require four crossings of the California Aqueduct, including the wellhead pipeline crossing of the East Branch of the Aqueduct. As discussed in Section 4.8.2, the Project would require an Encroachment Permit from the California Department of Water Resources (DWR) for the new and expanded bridge crossings of the Aqueduct and for the crossing of potable and recycled water pipes. The pipelines may extend over or under the Aqueduct, depending on DWR’s requirements and the specific engineering conditions at each crossing location.

Crossings of the California Aqueduct would all be considered off-site impacts because the Aqueduct is not a part of the Project site. Aqueduct crossings are discussed below.

- An expansion to the existing National Cement Plant Road bridge crossing. The bridge would maintain its existing alignment, but would be widened to accommodate pedestrian/bicycle access. Water and recycled water pipelines would be either attached to the bridge structure or would cross beneath the Aqueduct.
- A new bridge crossing would be constructed that would be wide enough to accommodate vehicular travel and pedestrian/bicycle access. Water and recycled water pipelines would be either attached to the bridge structure or would cross beneath the Aqueduct.
- Trenched at-grade crossing of the Aqueduct south of the Oso Water Treatment Plant. At this location, the Aqueduct is underground. Therefore, water pipeline extensions from the Water Treatment Plant to the portions of the Project site located to the east of the Aqueduct would require trenching across the subterranean Aqueduct. If DWR prefers to avoid a crossing in this area of the Aqueduct, then an alternative would be to install the water pipelines from the water treatment plant southerly along the western boundary of the Aqueduct within the DWR property to ensure avoidance of the SEA No. 17. Once the pipeline(s) are far enough south to avoid the SEA, then the pipelines would be continued on site and would cross the new bridge crossing to provide water supplies to the portions of the Project site located to the east of the Aqueduct.
- Attachment of wellhead water pipeline to or beneath the existing 300<sup>th</sup> Street West bridge crossing of the East Branch immediately north of the Project site. No other changes to the existing bridge structure would be required.

### **4.7.3 CONNECTIONS TO EXISTING OFF-SITE DRY UTILITIES**

Implementation of the Project would require the extension of off-site utilities to connections with on-site utilities. Exhibit 4-21, Centennial Project – Off-Site Project Components, depicts the locations of off-site utility improvements in green, as depicted on the legend. As described further below, SCE electrical and telephone extensions would be constructed on the north side of SR-138 in the vicinity of Quail Lake. It is possible that the SCE electrical lines would be buried in the off-site stretch near Quail Lake for the purpose of maintaining the aesthetics of the area. A utility corridor would also be required within the right-of-way of 300<sup>th</sup> Street West as it traverses both on-site and off-site. This would likely contain both wet and dry utilities, including but not limited to sewer, recycled, water, storm drain, electrical, cable television, and telephone.

The physical environmental impacts of these off-site features are addressed as part of the Project analyzed in this EIR. To the extent feasible, off-site utilities would be extended through existing streets; however, utility placement in currently undisturbed areas would also be required. Construction of the utility extensions would be coordinated with the respective utility providers. A description of proposed off-site utility connections is included below.

- **Electricity.** Through coordination with SCE, two options were developed for bringing the additional capacity to service the western portion of the Project site: (1) reconfiguration of the existing Bailey Substation located off site along the property's western boundary and (2) upgrading the Gorman Substation and reconstructing the existing overhead transmission lines to handle the higher load. In either event, the improvements would occur entirely on lands owned by SCE, not on the Project site. No existing off-site facilities other than those discussed herein would require upgrades or retrofitting to provide adequate electrical service to the Project site.

At this time, upgrade of the Bailey Substation is considered the more likely solution; however, both options will continue to remain viable until later stages of the site development process subsequent to the CEQA process. If the Bailey Substation is upgraded, no upgrades to the Gorman Substation or other off-site facilities will be necessary to serve the first phase of Project implementation.

According to the *Dry Utilities Analysis: Centennial* prepared by BJ Palmer & Associates (BJ Palmer 2015) and included as Appendix 5.2-A, and communications with SCE (Peterson 2007; SCE 2007a, 2007b, 2007c), the improvements to the Bailey Substation would be contained within the parcel of land owned by SCE and would not extend onto the Project site. The Bailey Substation is a transmission-only substation, and is currently not configured for the voltage distribution required to service the Project. The site of the Bailey Substation is large enough for the required reconfiguration. Reconfiguration would include the placement of a large transformer to take transmission voltage (66 kV) and convert it to distribution voltage (12 kV). Distribution voltage would then be extended to the Project site on the existing overhead pole line along SR-138, or routed northerly overhead or underground around Quail Lake within the Project limits. This location would provide sufficient electric power capability to service the first phase of Project implementation.

The Gorman Substation, located approximately 3.6 miles northwest of the site, is currently configured for distribution voltage. However, this substation would require the addition of one or more additional transformers and reconstruction of the existing overhead power lines along Gorman Post Road from the substation to the Project site. At a point just west of the Project boundary, the overhead facilities would either run along SR-138 or would take the northerly route around Quail Lake.

- **Natural Gas.** The initial gas facilities for the first phase of Project implementation would be provided by tapping into the existing high pressure gas main along Gorman Post Road west of the Project site. It would be necessary to construct a gas regulator station at this location for distributing pressure and/or extending a high pressure line to and within the Project site for the placement of a series of future regulator stations. A gas regulator station is a system of valves that could include two at one location (switching between the two while one or the other is under maintenance). The space required is approximately 75 feet by 30 feet and the facilities are below ground. Regulator stations can be within roadways or on private property within an easement. Future phases of development may require the tapping of the transmission high pressure main along SR-138 for the extension of transmission and/or

distribution main extensions into the Project. SoCalGas would determine the timing for this station's development through an assessment of system operational needs.

- **Telephone.** The preliminary extension of telephone lines would occur along Gorman Post Road in the current franchise area, entering the Project site at the most westerly entrance, or continuing overhead along the pole line along SR-138. This new extension would involve retrofitting and replacing the current overhead system that extends from the Frazier Park area to Gorman, and then to the site (described previously). This would involve use of the existing poles; no physical impacts would occur. AT&T would extend the facilities/lines within existing or proposed road right-of-way areas whenever possible. When not possible, easements would be obtained for facilities placed on private property within the Project site. Any permits or authorization required for the extension of telephone service to the Project site would be the responsibility of AT&T.

Additionally, development of the Project could also impact off-site fiber-optic connections to the Litespan 2000 cabinet and require an upgrade of the existing Central Office facility in Lebec involving an internal extensive upgrade to expand the Central Office's service capacity. AT&T's implementation of necessary expansion and upgrades that would support the Project would not create significant physical impacts since all such improvements would occur within existing facility structures.

- **Cable Television.** Although a cable television service provider has not yet been identified, development of the Project could impact off-site cable television lines near the Service Provider's plant or distribution facilities and may require an upgrade of existing facilities. The extension of these facilities to the Project site would be conducted by the Service Provider.

#### 4.7.4 MITIGATION AREAS

In addition to off-site improvements to infrastructure the Project requires the preservation of off-site lands to compensate for impacts to biological resources as, described in Section 5.7, Biological Resources. These mitigation areas are depicted in Exhibit 4-12, Off-Site Open Space Mitigation Preserve. Of the 5,624 acres of designated Open Space within the Project site, approximately 5,116 acres (42 percent of the total Project site) would be ungraded/unimpacted. Of this amount, approximately 3,861 acres are designated as SEA 17 to be preserved in perpetuity within the Project site boundaries. A study of adjacent lands identified 6 areas which, when combined with the approximately 5,116 acres of on-site open space mitigation areas, would provide sufficient land and biological resources to implement mitigation strategies to fully mitigate Project impacts related to biological resources.

Areas 1 and 2 are located in Los Angeles County, and Areas 3–6 are located in Kern County, northeast of the Project area. In Los Angeles County, Area 1 consists of approximately 6,417 acres and is located adjacent and immediately east of the southeastern corner of the Project area. Area 2 consists of approximately 2,556 acres and is located adjacent and contiguous to the northwestern portions of the Project area. The area in the northwestern part of the site is comprised primarily of Oso Canyon, which includes a blueline stream as well as foothills and canyons with slopes 25 percent or greater. Vegetation in this area consists mainly of oak

woodland and grassland vegetation. The south-southeastern portion of the site contains similar vegetation and associated biological resources.

In Kern County, Area 3 consists of 4,183 acres and Area 4 consists of 7,319 acres. Area 5 consists of 643 acres and is a square-shaped parcel, immediately east of Area 4 and northeast of the Project site. Area 6 consists of 2,429 acres and is located on the northern slope of the Antelope Valley, farthest to the northeast of the Centennial Project site.

The combined off-site open space preserve area amounts to approximately 23,547 acres of mitigation lands. As previously discussed in Section 4.5.7, these six areas would be preserved in perpetuity to allow for preservation and implementation of mitigation strategies.

The Natural Resources/Open Space Management Plan includes both on-site and off-site mitigation areas. Approximately 5,116 acres of open space is available for use as on-site mitigation and off-site mitigation areas total 23,547 acres, for a combined total of 28,663 acres of preserved open space resulting from Project implementation.

## 4.8 INTENDED USE OF THE EIR

Pursuant to Section 15121 of the State CEQA Guidelines, an EIR is primarily an informational document intended to inform the public agency decision makers and the general public of the potentially significant environmental impacts of a project. The decision makers must consider the information in an EIR before taking action on a Project.

A project is proposed by a project applicant; however, an EIR is prepared by or under the direction of the lead agency. The lead agency is the public agency with the primary responsibility for approving a project. Responsible Agencies (public agencies that have a level of discretionary approval over some component of a Project) may rely upon the EIR prepared by the Lead Agency (14 CCR 15096).

The County of Los Angeles is the lead agency, and the responsible and trustee agencies listed below are expected to use the information in this EIR for consideration of approvals related to and involved in the implementation of this Project.

### 4.8.1 COUNTY OF LOS ANGELES

The discretionary actions listed below have been analyzed as part of this EIR.

- ***Adoption of the Centennial Specific Plan.*** The Project Applicant/Developer is requesting the adoption of the *Centennial Specific Plan*. A detailed discussion of the *Centennial Specific Plan* is provided in Section 4.5 above. As previously noted, the *Centennial Specific Plan* would regulate development through the Land Use Plan, the Land Use Matrix (including permitted uses), and the development standards and regulations in conjunction with Titles 21 and 22 of the Los Angeles County Code. The *Centennial Specific Plan* is a regulatory document that would be considered for adoption by either resolution (as policy) or by ordinance, by the County of Los Angeles Board of Supervisors. Upon adoption of the *Centennial Specific Plan*, the

development standards and zoning of the *Centennial Specific Plan* become the zoning for the site. Chapters 1 through 4 of the *Centennial Specific Plan* would be adopted by ordinance. A copy of the draft *Centennial Specific Plan* is located in Appendix 4.0-A of this EIR.

Several appendices to the *Centennial Specific Plan* are also requested to be adopted by the County by ordinance or resolution. Appendix 1 to the *Centennial Specific Plan* includes two appendices that would be adopted by ordinance: Appendix 1-A, *Definitions* and Appendix 1-D, *Standard Centennial Subdivision Map Notes*. While it is anticipated that Appendix 1-D will be adopted by ordinance at this time, the County may decide to adopt Appendix 1-D by resolution at the time of Project approval. Appendix 1-B, *Green Development Program*, and Appendix 2-A and 2-B, would be adopted by Resolution. Under either scenario, the Regional Planning Commission, or the Board of Supervisors if the Regional Planning Commission's decision is appealed, would seek to incorporate the standard subdivision map notes governing development of the Project on each approved tentative map subdividing a portion of the Project Site.

Specifically, the *Centennial Specific Plan* will achieve the County's Low Impact Development (LID) Ordinance and LID Manual requirements for increasing groundwater recharge, enhancing water quality, and preventing degradation to downstream natural drainage courses through the use of infiltration Best Management Practices (BMPs). Future LID plans required for the Project will comply with the provisions of the *Centennial Specific Plan's* Centennial Stormwater Management System Design Requirements and Drainage Plan, which will serve as the LID standards for those projects in lieu of the specific provisions of the LID Manual.

- **Approval of Zone Change, Los Angeles County Zoning Ordinance.** The Project Applicant/Developer is requesting a Zone Change from O-S (Open Space), A-1-2 (Light Agricultural – Two Acre Minimum Required Lot Area), RPD (Residential Planned Development), CPD-DP (Commercial Planned Development – Development Program); and MPD-DP (Manufacturing Industrial Planned Development – Development Program), to SP (Specific Plan). Approval of the zone change and concurrent adoption of the *Centennial Specific Plan* would establish the Specific Plan's land use categories as the underlying zoning. Additionally, and as described in Section 5.7, Biological Resources, the Project requires the preservation of both on-site and off-site lands to compensate for impacts to biological resources. On-site mitigation areas, totaling approximately 5,116 acres, would be zoned "Specific Plan", consistent with the rest of the Project site.
- **Approval of General Plan Amendment to AVAP and County Highway Plan.** In compliance with the County's Specific Plan requirements and State law, the Project Applicant/Developer is requesting a General Plan Amendment to amend the AVAP and County General Plan Highway Plan by adding the major highways, secondary highways, limited secondary highways, parkways, and expressways that are proposed on the Project site to serve the circulation needs of development and that meet the criteria for being included in the AVAP Highway Plan (Map 3.1 of the AVAP) and County General Plan (Figure 7.3 of the County General Plan). This amendment would reflect the location of the project's internal circulation network of roadways,

as provided in the *Centennial Specific Plan*. This amendment would not change the land use designations, allowable development or open space areas in the AVAP or General Plan.

- **Approval of Vesting Tentative Parcel Map.** Vesting Tentative Parcel Map (VTPM) is being sought as part of the initial set of project entitlements for finance and conveyance purposes. Commonly referred to as “Financing Maps”, this form of Parcel Map creates legal parcels that can be used as security to help finance infrastructure and other improvements. A VTPM does not authorize the creation of residential or commercial lots, nor does it permit construction of new buildings.
- **Development Agreement.** A Development Agreement (DA) is also anticipated to be sought as part of the initial project entitlements. Under state law, a DA is a voluntary agreement, adopted by ordinance, between the County and the project proponent. The purpose of a DA is to provide both the County and the developer with long-term contractual assurances that the project includes public benefits and can be built out as approved.
- **Approval of Conditional Use Permit - Grading.** The Project Applicant/Developer is requesting approval of a Conditional Use Permit (CUP) for Grading, pursuant to Section 22.56.217 of the Los Angeles County Code, which requires a CUP for grading over 100,000 cubic yards. The size of the Project site (i.e., 12,323 acres) is reflective of the proposed grading under the Conceptual Grading Plan and complies with the Hillside Design Guidelines in the *Centennial Specific Plan*, which are consistent with the County’s Grading Ordinance. The Conceptual Grading Plan is discussed in Section 4.5.17 above.
- **Approval of Conditional Use Permit - Infrastructure.** The Project Applicant/Developer is requesting approval of a CUP to provide a master or programmatic approval of the proposed infrastructure that would be needed to serve the Project. These infrastructure improvements include the following:
  - Roadway circulation system
  - Water system including domestic and recycled water tanks and pipelines and accessory booster pumps and storage ponds
  - Sewage disposal pipelines and waste water reclamation facilities
  - Flood control and drainage facilities
  - Electrical substations
  - Gas, telephone, cable and internet and electric lines within roadway rights-of-way
  - Green waste composting
  - Solid waste and materials recovery facilities and recycling centers.
  - Water retention/detention basins, water banks, tanks, well facilities, water treatment plants
  - Realignment of National Cement Plant Road
  - Construction of bridges over the Aqueduct
  - Improvements to the SR-138 intersections.

---

## Future Discretionary and Ministerial Actions

In addition to the discretionary actions listed above, additional ministerial and discretionary actions related to the future approvals are anticipated in the future, as discussed below.

Some future actions will be ministerial in nature as they will not require any special discretion or judgment on the part of the County official in processing the application. Rather, these actions merely require a determination of whether an application complies with applicable requirements of the Specific Plan. Accordingly, such actions will not require future CEQA review pursuant to Section 21080(b)(1) of the *California Public Resources Code* and Section 15268(a) of the CEQA Guidelines (14 CCR). Examples of such actions include, but are not limited to, the following:

- Grading and demolition permits
- Building and occupancy permits
- Encroachment permits
- Acquisition of rights-of-entry easements and rights-of-way for Project features under Caltrans jurisdiction (previously described in Section 4.7), as necessary.
- Final Subdivision Maps.

Additionally, Chapter 4 of the *Centennial Specific Plan* (Appendix 4.0-A) has been created to describe the processes and procedures for certain subsequent Centennial Project approvals. Section 15268(c) of the State CEQA Guidelines provides that “each public agency should, in its implementing regulations or ordinances, provide an identification or itemization of its projects and actions which are deemed ministerial under the applicable laws and ordinances”. As the *Centennial Specific Plan* will serve as the Project’s implementing regulations once adopted, Chapter 4 of the *Centennial Specific Plan* categorizes future approvals as ministerial and discretionary based on (1) the nature of the action; (2) the degree to which the action conforms to the *Centennial Specific Plan* and corresponding EIR analysis; and (3) the extent to which the exercise of judgment is necessary in considering such action. The following lists these ministerial and discretionary approvals as set forth in Chapter 4 of the *Centennial Specific Plan*. Each type of approval is followed by the corresponding *Centennial Specific Plan* section reference. The applicable *Centennial Specific Plan* section describes each approval in further detail; sets forth the necessary conditions that must be satisfied in order to receive approval; lists the standards the County official must use to determine whether a particular application should be granted; and provides the applicable procedures the County will follow in processing each application.

### ***Ministerial Actions***

The following actions are ministerial as they involve only (1) a determination that the proposed action conforms to the *Centennial Specific Plan*; (2) a determination of consistency with an approved Tentative Map, Final Map, Conditional Use Permit, or other approval issued pursuant to the *Centennial Specific Plan*; or (3) a determination that an application meets the standards required for that particular type of application as in Chapter 4 of the

*Centennial Specific Plan* or the County Code. As stated above, each type of approval is followed by the corresponding *Centennial Specific Plan* section reference.

- Interpretations (Section 4.5.1.1.1);
- Development standard equivalency (Section 4.5.1.1.2);
- *Centennial Specific Plan* text and figure changes (Section 4.5.1.1.3);
- Affordable housing consistency (Section 4.5.1.1.4);
- Residential signage consistency (Section 4.5.1.1.5);
- Non-residential signage consistency (Section 4.5.1.1.6);
- Deviations from development standards (Section 4.5.2.1.1);
- Exhibit map change that does not require a tentative map modification (Section 4.5.2.1.2);
- Changes in the order or configuration of phasing on an approved tentative map (Section 4.5.2.1.3);
- Minor Transfers within Villages (Section 4.5.2.1.4);
- Transfers of Park Use and Greenways (Section 4.5.2.1.5)
- Land Use Equivalency Determination (Section 4.5.2.1.6)
- Conceptual Land Use Plan and Development Standards (Section 4.5.4.1)
- Existing uses (Section 4.5.5.1);
- Ministerial interim use permit (Section 4.5.5.2.1).

### ***Discretionary Actions***

The following actions require the exercise of discretion by the County or may propose a scope of development that has not been reviewed as part of the *Centennial Specific Plan* EIR. Future CEQA review of these discretionary actions shall be processed in accordance with CEQA, including Section 21166 of the *California Public Resources Code* and Sections 15162 and 15164 of the CEQA Guidelines (14 CCR). If the County determines that an additional CEQA document must be prepared in connection with such discretionary approval, future environmental analysis should tier from this EIR whenever feasible pursuant to Section 21093 of the *California Public Resources Code*. Each type of approval is followed by the corresponding *Centennial Specific Plan* section reference.

- Land Uses Requiring “Substantial Conformance Review” (Section 4.5.3.1.1).
- Conditional use permit modifications (Section 4.5.3.1.2).
- Major Transfers within Villages (Section 4.5.3.1.3).
- Transfers of residential units and non-residential building square footage from Village to Village (Sections 4.5.3.1.4 and 4.5.3.1.5).

- Conversions (Sections 4.5.3.1.6).
- Off-site haul routes (Section 4.5.3.1.7).
- Sign and sign programs (Section 4.5.3.1.8).
- Parcel maps and minor land divisions (Section 4.5.4.2).
- Tentative maps (Section 4.5.4).
- Amended tentative maps (Section 4.5.4.3).
- Revised tentative maps (Section 4.5.4.4).
- Initial approval of exhibit maps (Section 4.5.4.5).
- Discretionary interim use permit (Section 4.5.5.2.2).
- Temporary use permit (Section 4.5.5.3).
- Conditional use permits (Section 4.5.5.4).
- Land use/planning area boundary adjustments (Section 4.6.1).
- Specific Plan amendment (Specific Plan Section 4.9).
- Roadway realignments (Specific Plan Section 4.6.1).

#### **4.8.2 RESPONSIBLE AND TRUSTEE AGENCIES**

The EIR would also provide environmental information to responsible agencies, trustee agencies, and other public agencies which may be required to grant approvals or coordinate with the County of Los Angeles as a part of Project implementation. These agencies include, but are not limited to, those listed below.

##### **Federal**

- ***U.S. Army Corps of Engineers (USACE)***. The Project would require a USACE Section 404 permit for impacts to areas determined to be “Waters of the United States.”

##### **State of California**

- ***Public Utilities Commission (CPUC)***. The Project may require the creation of an entity to operate and maintain the water supply, water treatment, and wastewater reclamation facilities, as well as the storm water facilities if annexation of the Project site into the Golden Valley Municipal Water District does not occur. Should a private entity be created to handle the operation and maintenance of these systems and facilities, then issuance of Certificates of Public Convenience and Necessity and/or Exemption would be necessary. Alternatively, if a public entity (e.g., Community Facilities District, CSD, California Water District, or other agency approved by Los Angeles County [the Maintenance Entity] and agreed to by the Project Applicant/Developer) is created to operate and maintain all water supply, wastewater reclamation facilities, and other necessary water facilities, then CPUC

action would not be required. However, some action by the Local Agency Formation Commission (LAFCO) may be necessary, depending on the public entity selected. Ultimately, the water supply, wastewater reclamation, and storm water agency(ies) providing these services would require the concurrence of the County and the applicable regulatory agencies.

- **Department of Fish and Wildlife (CDFW).** The Project would require a Streambed Alteration Agreement from the CDFW pursuant to Sections 1600 and Sections 2081 of the *California Fish and Wildlife Code*.
- **Department of Transportation (Caltrans).** Activities located within Caltrans right-of-way (described previously) would require an Encroachment Permit and must be in compliance with the Caltrans Statewide National Pollutant Discharge Elimination System (NPDES) Permit.
- **Department of Water Resources (DWR).** The Project would require an Encroachment Permit from DWR for two bridge crossings of the California Aqueduct (“A” Street and “B” Street), as well as for the crossing of potable and recycled water pipes.
- **State Water Resources Control Board, Water Division of Drinking Water (DDW).** A permit to operate a public water system for the potable water distribution system on the Project site would be required from the SWRCB’s Water Division of Drinking Water (DDW).
- **Regional Water Quality Control Board, Lahontan Region (Lahontan RWQCB) and Los Angeles Region (Los Angeles RWQCB).** Lahontan RWQCB and Los Angeles Region RWQCB approvals will be required for the following activities within their respective areas of the Project site:
  - Waste Discharge Requirements (WDRs) for the fill or alteration of “waters of the State” on the Project site located in Lahontan RWQCB’s jurisdiction.
  - WDRs and Wastewater Reclamation Requirements *or* a Master Reclamation Permit for approval and operation of the two proposed WRFs.
  - Water Quality Certifications under Section 401 of the Federal Clean Water Act.

## Regional and Special Districts

- **Gorman Joint School District.** The Gorman District would be the agency responsible for the acquisition of land, design, and development of the proposed grades K–8 schools on the Project site. The Gorman District is required to comply with the requirements of Section 15186 of the State CEQA Guidelines regarding school facilities (which addresses potential health impacts resulting from exposure to hazardous materials, wastes, and substances). This EIR would be used by the Gorman District as acceptance of three proposed grades K–8 schools and one K-5 school within the Project site. However, subsequent environmental documentation for the proposed schools may be required. The need for subsequent environmental documentation would be determined by the Gorman District when school site plans are available.

- **Antelope Valley Union High School District.** The AVUHSD would be responsible for the acquisition of land, design, and development of the proposed high school (grades 9–12) in the Project site. The AVUHSD is required to comply with the requirements of Section 15186 of the State CEQA Guidelines regarding school facilities (which addresses potential health impacts resulting from exposure to hazardous materials, wastes, and substances). This EIR would be used by the Antelope Valley Unified High School District as acceptance of one proposed high school in the Project site. However, subsequent environmental documentation for the proposed school may be required. The need for subsequent environmental documentation would be determined by the AVUHSD when school site plans are available.
- **Westside Union School District.** The WUSD serves grades K–8 students. A portion of the eastern part of the Project site falls within the boundary of the WUSD. The WUSD would be responsible for the acquisition of land, design, and development of two proposed grades K–8 schools in the Project site. The WUSD is required to comply with the requirements of Section 15186 of the State CEQA Guidelines regarding school facilities (which addresses potential health impacts resulting from exposure to hazardous materials, wastes, and substances). This EIR would be used by the WUSD as acceptance of two proposed grades K–8 schools within the Project site. However, subsequent environmental documentation for the proposed school may be required. The need for subsequent environmental documentation would be determined by the WUSD when the school site plans are available.
- **Golden Valley Municipal Water District (GVMWD) or other Public Utility District (PUD).** The GVMWD is a California municipal water district formed and operated under Section 71000 of the *California Water Code*. The District’s service area encompasses approximately 12.5 square miles and is adjacent to the Project’s western boundary (GVMWD 2011). The GVMWD currently operates approximately 20 municipal water service connections and a wastewater reclamation facility for the unincorporated community of Gorman. Centennial Founders, LLC has requested the District Board of Directors to consider annexing the Project area and operating the Project’s proposed potable water, water recycling, and wastewater facilities. Annexation of the Project into the GVMWD service area would require approval by the Los Angeles County Local Agency Formation Commission (LAFCO) and would occur after the certification of this EIR. If the Project area is annexed, GVMWD or a PUD would become the agency in charge of operating and maintaining storm water facilities.
- **Local Agency Formation Commission (LAFCO).** LAFCO is responsible for reviewing and approving proposed jurisdictional boundary changes, including annexations and detachments of territory to and/or from cities and special districts; incorporations of new cities; formations of new special districts; and consolidations, mergers and dissolutions of existing districts. For the Project, the following special districts are in the area and may be impacted, requiring action by LAFCO to include the Project site in their service area: GVMWD or PUD, Antelope Valley Health Care District, Antelope Valley Resource Conservation District, Los Angeles County Consolidated Fire Protection District, and Lancaster Cemetery District.

- **South Coast and Antelope Valley Air Quality Management Districts.** Approximately 85 percent of the Project site lies within the Antelope Valley Air Quality Management District (AVAQMD) while the remaining 15 percent lies in the South Air Quality Management District (SCAQMD). Air quality conditions in the South Coast Air Basin are under the jurisdiction of the SCAQMD while the portion of the site under the jurisdiction of the AVAQMD lies within the Mojave Desert Air Basin. Developers and businesses who plan to install equipment with the potential to emit air pollutants, including toxic and hazardous air pollutants, must obtain permits from the applicable Air Quality Management District prior to construction or operation. Examples of businesses and equipment that require permits are gas stations, dry cleaners, emergency generators, boilers for heating and hot water in large buildings, restaurant cooking equipment, and manufacturing facilities.
- **Los Angeles County Fire Department.** The Project includes construction of three new Fire Stations to provide fire and paramedic services to the Project area. A CUP will be needed to construct the facilities pursuant to the Los Angeles County Code. The environmental impacts of these facilities have been analyzed in this EIR. The Consolidated Fire Protection District of Los Angeles County, commonly known as the County of Los Angeles Fire Department, will apply for the conditional use permit at such time it is necessary in the future so that the first station will be constructed, equipped, and operational prior to the issuance of the first building permit for the first phase of Project implementation.
- **Kern County.** The Project includes new wells and water pipelines that would be located off site, all within Tejon Ranch Company-owned lands immediately to the northeast of the site in Kern County. Although the environmental impacts of these facilities have been analyzed in this EIR, approvals from the County of Kern would be required before any construction occurs.

## 5.0 REGULATORY AND ENVIRONMENTAL SETTING, IMPACTS, AND MITIGATION

### 5.0.1 INTRODUCTION

In compliance with Title 14, Section 15063(a) of the California Code of Regulations, an Initial Study was not been prepared because the County determined that the Centennial Project (Project) may have a significant effect on the environment and that an EIR will clearly be required. In accordance with the California Environmental Quality Act (CEQA) Guidelines (Sections 15125–15126), this environmental impact report (EIR) serves as a Project EIR and includes an analysis of environmental impacts, as described in detail in Sections 5.1–5.21 of this document. Each topical section includes the following information: introduction; relevant plans, policies and regulations; environmental setting; project design features; thresholds of significance; environmental impacts; mitigation measures, if required, to reduce the impacts; level of significance after mitigation; and references. For a more detailed description of these subsections, please see Section 2.0, Introduction.

### 5.0.2 THRESHOLDS OF SIGNIFICANCE

The thresholds used in this EIR have been derived from the County of Los Angeles Environmental Checklist.

### 5.0.3 ENVIRONMENTAL IMPACTS AND MITIGATION

This section describes how the environmental impacts analysis included in each topical section of this EIR (i.e., Sections 5.1 through 5.21) is formatted and how mitigation is incorporated into the analysis. The Project has been planned with design elements called Project Design Features (PDFs). The Applicant has planned the Centennial Project to include the design elements listed as PDFs listed in each section; these PDFs have been incorporated into the Project to prevent the occurrence of or to reduce the significance of potential environmental effects. Because PDFs have been incorporated into the Project, they do not constitute mitigation measures as defined by CEQA. However, if the PDFs have mitigation value to reduce a potentially significant impact, then a corresponding mitigation measure (MM) has been prepared to ensure the implementation of the measure through the Mitigation Monitoring and Reporting Program (MMRP).

Applicable local, State, or federal regulations or laws that are frequently required independently of CEQA review and also serve to offset or prevent specific environmental impacts are discussed in the Relevant Plan, Policies, and Regulations section of each EIR analysis. Typical regulations include compliance with the provisions of the Uniform Building Code, South Coast Air Quality Management District Rules, and local agency fees, among other standard building practices and programs required by law. Additional conditions may be imposed on the Project by government agencies during the approval process, as appropriate.

For each topical issue in Section 5, the impact analysis is formatted to analyze the potential Project impacts related to each identified threshold of significance. Unless otherwise noted, the analysis under each threshold addresses each of the following:

- **On-Site Impacts:** This category includes an analysis of the potential impacts associated with the Project as a whole, including all construction activities, long-term operational activities, future entitlements, and all discretionary approvals requested or required to be implemented as a part of the Project.
- **Off-Site Impacts:** This category includes an analysis of the potential impacts resulting from implementation of identified off-site Project features described in Section 4.7, Off-Site Project Features.

Where a potentially significant environmental effect has been identified and is not considered less than significant with the inclusion of PDFs, Project-specific mitigation measures have been identified where feasible. Mitigation measures (MMs) are included in the MMRP to ensure that they are incorporated, monitored, and implemented as a part of the Project.

Any MM and timing thereof that is subject to the approval of the County of Los Angeles, that will have the same or superior result with respect to significant environmental impacts, and that will have the same or a reduced effect on the environment (as demonstrated by the Applicant or subsequent party of interest to the County's satisfaction) may be substituted for a similar MM described in this EIR. For example, if an MM that is less expensive or less environmentally intrusive is feasible and yields the same or a superior result, this measure could be implemented in place of its equivalent MM identified in the EIR, subject to approval by the County. All MMs identified in this EIR are included in the MMRP.

The topical sections that follow in Sections 5.1–5.21 incorporate the approaches described above.

## 5.1 GEOTECHNICAL

### 5.1.1 INTRODUCTION

#### **Purpose**

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that geology and soils issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### **Summary**

With implementation of Project Design Feature (PDF) 1-1, the Project would not expose people or structures to potential substantial adverse effects (including the risk of injury, or death) involving strong seismic ground shaking, seismic-related ground failure (e.g., liquefaction, settlement, lateral spreading), or location on an unstable geologic unit (e.g., collapse, expansive soils). The Project has been designed with a Geologic Safety Zone so that areas with potential geologic and seismic constraints are not developed with habitable structures and are planned so that buildings near faults have a minimum 100-foot setback in either direction from the fault line (PDF 1-1). Therefore, the Project would not expose people or structures to potential adverse effects (including the risk of injury or death) from surface rupture of a known earthquake fault with implementation of PDF 1-1. Additionally, in accordance with California Department of Education's Title 5 and current building codes, no sensitive uses (i.e., schools, hospitals, or public assembly sites) would be located on sites presenting a significant geotechnical hazard, as determined by the site-specific geological and soils engineering study. Therefore, there would be less than significant impacts related to fault rupture, seismic ground shaking, and ground failure with implementation of PDF 1-1.

Development of the Project may require localized blasting associated with excavation on site, and this would have the potential to result in geotechnical instability. However, with implementation of MM 12-7 in Section 5.12, Noise, potential impacts would be reduced to a less than significant level.

There would be less than significant impacts associated with off-site Project features since no off-site features would include habitable structures; and since all off-site features would be required to comply with County and State geotechnical review and building code requirements as applied to the Project.

Development of the Project would result in less than significant impacts related to erosion or loss of topsoil with compliance with County subdivision specifications; County building code requirements; the Project's Hillside Design Guidelines, and existing and future, tract map-level geotechnical recommendations for the Project.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0 for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

Although all references cited for preparation of this analysis are listed in Section 5.1.9, the primary technical reference for this section is listed below. This report defines the geologic and seismic characteristics at the site and identifies preliminary recommendations for site development that minimize existing geotechnical constraints.

1. Geocon, Inc. 2015 (August). *Preliminary Geotechnical Summary Report; Centennial – Tejon Ranch, Los Angeles County, California*. San Diego, CA: Geocon (Appendix 5.1-A).

Between 1999 and 2006, several geotechnical investigations were performed for the Project site and adjacent areas by Geocon. The *Preliminary Geotechnical Summary Report* (2015 Geocon Report) includes a preliminary geotechnical analysis of the Project areas located between 300th Street West and 285th Street West, which was not studied in previous reports, and a review and compilation of the previous Project site investigations. The previously completed geotechnical studies prepared for the Project site, and referenced in the 2015 Geocon Report are listed in the Report's List of References Appendix (see Appendix 5.1-A).

## 5.1.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

### Federal

#### *International Building Code*

The International Building Code (IBC) is the national model building code. The 2015 IBC is the most recent edition of the International Building Code, which was incorporated into the 2016 California Building Code, and currently applies to all structures being constructed in California. The national model codes are incorporated by reference into the building codes of local municipalities, such as the California Building Code and County Building Code discussed below.

### State

#### *California Building Code*

The California Building Code is promulgated under Title 24 of the *California Code of Regulations* (CCR), Parts 1 through 12 (also known as the “California Building Standards Code” or CBC) and is administered by the California Building Standards Commission (CBSC). The national model code standards adopted into Title 24 apply to all occupancies in California except for modifications adopted by State agencies and local governing bodies. The 2016 triennial edition incorporates the 2015 IBC, discussed above, and applies to all occupancies that apply for a building permit on or after January 1, 2017. The CBC may be adopted wholly or with revisions by local municipalities, such as the County of Los Angeles Building Code, described below.

#### *Alquist-Priolo Act of 1972*

The Alquist-Priolo (AP) Earthquake Fault Zoning Act (AP Act) was adopted by the State of California in 1972 after the 1971 San Fernando Earthquake in order to mitigate the hazard of surface fault rupture along known active faults (California Public Resources Code [PRC], Section 2621 et. seq.). The purpose of the AP Act is to reduce the threat to life and property, specifically from surface fault rupture, by preventing the construction of buildings used for human occupancy on the surface trace of active faults. Under this Act, the State has defined an “active” fault as having had surface displacement during the past 11,000 years (Holocene time). This law directs the State Geologist to establish Earthquake Fault Zones (known as “Special Studies Zones” prior to January 1, 1994) in order to regulate development within designated hazard areas. City and County jurisdictions must require a geologic investigation to demonstrate that a proposed development project, which includes structures for human occupancy, is adequately set back (usually at least 50 feet) from an active fault prior to permitting. In accordance with the AP Act, the State has delineated “Earthquake Fault Zones” along identified active faults throughout the state.

#### *Seismic Hazards Mapping Act*

The Seismic Hazards Mapping Act (Act) was passed in 1990 and directs the State Department of Conservation to identify and map areas subject to earthquake hazards, such as liquefaction, earthquake-induced landslides, and amplified ground shaking (PRC 2690–

2699.6). Passed by the State legislature after the 1989 Loma Prieta Earthquake, the Act was aimed at reducing the threat to public safety and minimizing potential loss of life and property in the event of a damaging earthquake event. Seismic Hazard Zone Maps are a product of the resultant Seismic Hazards Mapping Program and are produced to identify Zones of Required Investigation; most developments designed for human occupancy in these zones must conduct site-specific geotechnical investigations to identify the hazard and to develop appropriate mitigation measures prior to permitting by local jurisdictions.

### ***California Department of Education Standards (Title 5)***

The California Department of Education (CDE) has instituted standards for school siting and construction that are promulgated through the *California Code of Regulations* (CCR, Title 5, Article 1). These standards are implemented by individual school districts (in coordination with the CDE) and describe detailed procedures and requirements for school siting and land acquisition; development and approval of plans and specifications; and goals for the operation and maintenance of schools. Section 14001(f) of Title 5 requires that planned educational facilities are “designed to meet federal, State, and local statutory requirements for structure, fire, and public safety”, and Section 14011(g) of Title 5 requires compliance with Sections 17212 and 17212.5 of the *California Education Code*, which describe requirements for the “geological and soils engineering study”. These standards would apply to the proposed public school facilities on the Project site.

## **County**

### ***County of Los Angeles Building Code***

The County of Los Angeles Building Code (County Building Code) is promulgated under Title 26 of the Los Angeles County Code. The County Building Code incorporates (and adopts by reference) the 2016 CBC described above, which, in turn, incorporates the 2015 IBC. Section 101.3 of Title 26 (Chapter 1) states that, “The provisions of this Code [the County Building Code] shall apply to the construction, alteration, moving, demolition, repair, use of any building or structure, and grading within the unincorporated territory of the County of Los Angeles and to such work or use by the County of Los Angeles in any incorporated city”. This would include the Project. Certain chapters or sections of the County Building Code specifically pertain to construction in areas that present seismic risks and would apply to the Project. These requirements are described below.

- Chapter 1, Section 110.2, “Geotechnical Hazards”, of the County Building Code restricts building and grading activities in areas where geotechnical hazards of landslide, settlement, and slippage may be activated or increased as a result of project activities. Project applicants are required to submit an Engineering Geology and/or Soils Engineering Report to indicate how the hazard will be eliminated or mitigated prior to the use or occupancy of the land.
- Chapter 1, Section 111, “Engineering Geology and Soils Engineering Reports”, of the County Building Code gives the Building Official the authority to require an Engineering Geology Report, a Soils Engineering Report, or both in cases where such reports are considered essential for the evaluation of the site’s safety. The Engineering Geology

and/or Soils Engineering Reports must be prepared by a California-certified engineering geologist or California-licensed civil engineer, respectively, and must contain a finding regarding the safety of the site of the proposed work against hazard from landslide, settlement, or slippage and a finding regarding the effect that the proposed work will have on the geotechnical stability of the area outside the proposed work.

- Chapter 16, Structural Design, of the County Building Code describes requirements for construction of structures based on earthquake loads, including modifications to requirements defined in ASCE 7<sup>1</sup>/2016 CBC Section 1613 related to Seismic Design Categories (formerly Seismic Zones<sup>2</sup>) to reflect County conditions. The Seismic Design Categories consider building location, building use, and underlying soil conditions while Seismic Zones considered only building location. These County-specific building requirements are in addition to all other requirements of the 2016 CBC.
- Chapter 17, Structural Tests and Special Inspections, of the County Building Code requires an applicant to “submit a statement of special inspections prepared by the registered design professional in responsible charge in accordance with Section 106.4.2, as a condition for permit issuance” when specified seismic conditions are met. Section 1709 includes requirements for use of the registered design professional responsible for the structural design, or another registered design professional, to perform structural observations for those buildings included in Seismic Design Category D, E, or F (as determined in Section 1613).

### ***Los Angeles County General Plan and Antelope Valley Area Plan***

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan* (AVAP), part of the County General Plan, include goals and policies that address geotechnical issues in the unincorporated County. The AVAP goals and policies applicable to the analysis of geologic and seismic issues with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project’s consistency with relevant plans, policies and regulations.

**Goal LU 3:** A land use pattern that minimizes threats from hazards.

**Policy LU 3.1:** Except within economic opportunity areas, prohibit new development on fault traces and limit the amount of development in Seismic Zones, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy LU 3.4:** Except within economic opportunity areas, limit the amount of potential development on steep slopes identified as Hillside Management Areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy LU 3.5:** Except within economic opportunity areas, limit the amount of potential development in landslide and liquefaction areas, through appropriate land

<sup>1</sup> American Society of Civil Engineers (ASCE) 7-05 “Minimum Design Loads for Buildings and Other Structures”  
<sup>2</sup> Seismic Design Categories A through F have replaced Seismic Zones 0 through 4.

use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Goal PS 2:** Protection of the public through geological hazard planning and mitigation.

**Policy PS 2.1:** Limit the amount of potential development in Seismic Zones and along the San Andreas Fault and other fault traces, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy PS 2.2:** Limit the amount of development on steep slopes (Hillside Management Areas) and within landslide and liquefaction areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy PS 2.3:** Prohibit the construction of new structures on or across a fault trace.

**Policy PS 2.4:** Ensure that new development does not cause or contribute to slope instability.

### 5.1.3 ENVIRONMENTAL SETTING

#### Overview

The Project site is situated in the western portion of Antelope Valley and in the foothills of the Tehachapi Mountains. The western portion of the site is characterized by moderate to steep hills and drainages, and the eastern portion of the site is characterized by open, gently sloping mesas that are dissected by a network of arroyos and drainages. Agricultural production occurs in the far eastern portion of the Project site on either side of 300<sup>th</sup> Street West. Elevations range from approximately 3,635 feet above mean sea level (msl) along a ridge overlooking Quail Lake to approximately 2,975 feet above msl in the alluvial drainage area in the east portion of the site. The Project site excludes both State Route (SR) 138 and the West Branch of the California Aqueduct.

#### *Soil and Geologic Conditions*

Surficial units are deposits of loose sediment on the surface while geologic units are layers of solidified material (i.e., rocks) that have been given individual names. Surficial deposits on the site include previously placed fill, topsoil, alluvium, colluvium, and shallow landslide debris. Geologic units across the site include Older Alluvium, Hungry Valley Formation, Oso Canyon Formation, Quail Lake Formation, and Neenach Volcanic Formation. The surficial and geologic units mapped on the Project site and the relevant constraints of each unit, are described below. Please refer to Appendix 5.1-A for geologic maps and cross-sections. These maps illustrate the locations of surficial and geologic units, topography, limits of fault setback zones, trench and boring locations, and cross-section locations, all overlain on the Project site's Preliminary Grading Plan Map.

### **Surficial Units**

**Previously Placed Fill (Qpf).** Isolated areas of previously placed fill exist in localized areas throughout portions of the Project site and are generally associated with the construction of existing roadways. Fills associated with dirt roadways are generally uncompacted; and fills associated with the Cement Plant Road and 300<sup>th</sup> Street West have received compaction, but are underlain by unconsolidated surficial soils. These fill soils are not suitable in their present condition to support additional fill and/or structural loading.

**Topsoil (unmapped).** A relatively thin blanket of topsoil (typically on the order of one to four feet thick) covers the natural hillsides on the site and is composed, in general, of loose, dry to humid, dark brown, silty to clayey sand. The topsoil is compressible (i.e., collapsible under weight) and not suitable for loading.

**Alluvium (Qal).** Alluvium exists in major canyons and low-lying areas throughout the site. The alluvium encountered in small-diameter borings and in exploratory trenches generally consists of dry to saturated, silty to clayey, fine- to coarse-grained sand and is often indistinguishable from thick colluvium deposits. The alluvium encountered on site varies in thickness from approximately 4 feet to 65 feet, and becomes denser with depth. Typically, the upper 5 to 15 feet of soil is dry and loose, and is not suitable for loading. Below 15 feet, the soil moisture content and density increase. Consolidation tests performed on samples of alluvium indicate that, below a depth of 15 feet the alluvium has low compressibility potential and relatively minor volume change characteristics upon saturation (i.e. low hydroconsolidation [collapse upon the addition of water] potential).

**Colluvium (Qc).** Colluvial soils were encountered beneath gently to moderately inclined slopes and semicircular bowl-shaped areas near the heads of arroyos and canyon drainages. In general, colluvium consists of loose, porous, dry to humid, dark brown to reddish brown, silty, gravelly, medium- to coarse-grained sand. The thickness of the colluvium varies greatly from approximately 3 feet to more than 50 feet. Anticipated average thicknesses range between 15 and 20 feet, but in tributary canyons to major drainages the thicknesses can be substantially greater, equaling or exceeding alluvial thicknesses. The colluvium is poorly consolidated, porous, has low moisture content, and is subject to collapse upon wetting (i.e. hydroconsolidation) and settlement from loading (i.e., compressibility).

**Landslide Debris (Qls).** A large ancient landslide was encountered over a large area in the northwestern portion of the Oso Canyon area. This area is entirely avoided and is located within the SEA No. 17; therefore, this landslide area is not identified on the Appendix 5.1-A geologic maps and cross-sections for the Project, which only include areas within the preliminary grading plan. The landslide area is designated to remain in open space. The landslide was mapped and partially delineated with exploratory trenches as well as a single large-diameter boring. Mapped landslide debris associated with this slide covers an area over 1 mile in length; is 1,000 to 3,000 feet in width; and is estimated to be as much as 200 feet thick. Previous mapping of the landslide suggests that the head of the landslide was in granitic bedrock approximately 500 feet west of the Project site's western property line. Exploratory excavations and mapping indicates that the landslide initially failed within the adversely dipping claystones and shale of the Quail Lake Formation (discussed below).

A small, shallow landslide was mapped along a north-facing arroyo slope. Several other small, shallow slumps and erosional sloughing were observed during on-site geotechnical investigations along the more steeply eroded arroyos. These features do not exceed widths of 50 feet and, while noted in the geotechnical studies for the site, are not mapped due to their small size and geotechnical insignificance. Observations and exploratory excavations indicate the shallow landslides on the relatively steep slopes initially failed in permeable cohesionless gravelly sands of Older Alluvium.

### ***Geologic Units***

**Older Alluvium (Qoal).** Older Alluvium, composed of Pleistocene-age (11,700 years old to 2.5 million years old), terrace deposits, cap the upper portions of mesas and ridges across the majority of the Project site and is one of the major deposits anticipated to be encountered during grading. Thicknesses of Older Alluvium encountered during geotechnical investigations ranged from 8 feet to 74 feet. This unit is generally composed of medium dense to very dense, humid to moist, reddish brown, silty to clayey, medium- to coarse-grained sand with lenses of coarse gravel and clean sands. Except for surficial, weathered portions or thin interbedded clayey layers, the Older Alluvium displays high shear strength characteristics and low expansion potential. Given the in situ density of the Older Alluvium, it is considered suitable for support of additional fill and/or structural loading. However, some localized layers consist of unconfined clean, gravelly sand that are subject to erosion and surficial landslides under seasonal heavy rains or perched groundwater conditions. The loose Older Alluvium overlies the solid bedrock formations listed below.

**Hungry Valley Formation (unmapped).** The Hungry Valley Formation can be found in one small area in the southwestern corner of the Project site. Although not encountered during geotechnical investigations, it could occur in localized unconformable deposits located between the Quail Lake Formation and the Older Alluvium. This unit is composed of very stiff, very moist, silty to conglomeratic claystone with bentonite clay seams overlain by Older Alluvium and underlain by the Quail Lake Formation. No Project development would overlie this geologic unit.

**Oso Canyon Formation (Toc).** The Oso Canyon Formation consists of Miocene-aged (5.3 to 23 million years old), dense to very dense, partially to well-cemented, light brown to tan sandstone. This formation was encountered at shallow depths in arroyos and lower slopes along ridges and mesas in the southern and western portions of the site. The Oso Canyon Formation, and the Older Alluvium are both anticipated to comprise the bulk of cut materials generated by proposed grading. The Oso Canyon Formation is considered suitable to support of structural fill and/or loading in its present condition. Soil derived from the Oso Canyon Formation generally has a very low expansion potential, high shear strength, and satisfactory foundation engineering characteristics in either a natural or properly compacted condition.

The previous geotechnical investigations encountered strongly cemented zones up to three feet thick in this unit. Where encountered, excavations will likely require a very heavy effort with conventional heavy-duty grading equipment and/or localized breaking or possible blasting. Once ripped or broken up, numerous oversize rock fragments will be generated that will require special placement procedures and compaction when placed in fills.

**Quail Lake Formation (Tql).** The Quail Lake Formation consists of Miocene-age, hard to very dense, dark olive-brown to gray, lignitic (i.e., including coal) clayey siltstones to silty claystones with thin interbedded sandstones. This formation is exposed in the westernmost quadrant of the Project site. Several dipping bedding plane shears<sup>3</sup> or remolded clay seams were encountered in large-diameter borings. Bedding plane shears are notable in that they represent planes of weakness in a geologic unit. In addition, some portions of the formation have intersecting sets of clay-lined joints that could impact surficial slope stability. Cut slopes in areas of adversely dipping bedding-plane shears or intersecting joints may require buttressing and/or stabilization fills to provide long-term stability. Expansion testing on the Quail Lake Formation indicates a variable range of expansion indices from low to high. Highly expansive clay exposed at finish grade will require remedial grading to provide a select low expansive soil cap.

**Neenach Volcanic Formation (Tva).** The Neenach Volcanic Formation consists of Miocene-age, dark to reddish brown andesite flows (i.e., formed by lava flows on the surface) and tuff beds (i.e., consolidated pyroclastic rocks). A small exposure of this unit was mapped in the southeastern portion of the site.

### ***Geologic Structure***

Bedding attitudes, or angles, in Older Alluvium vary from horizontal to gently dipping or undulatory. Typically, these deposits have massive (i.e., homogenous) bedding with very irregular scoured contacts on underlying units. Underlying units, principally the Oso Canyon Formation and the Quail Lake Formation, have bedding attitudes, or angles, that vary from gentle to steep to overturned, indicating a faulted and folded bedrock structure beneath the majority of the site. Outcrops and subsurface bedding attitudes in the Tertiary-age (2.6 to 66 million years old) units suggest northwest- to southeast-oriented folding in bedrock units throughout the site. Bedding plane shears or remolded clay seams were also encountered in the folded and faulted Oso Lake and Quail Lake Formations, and in bentonitic zones in the Hungry Valley Formation.

### ***Faulting and Seismicity***

The Project site, as with Southern California in its entirety, lies in a seismically active region. The California Geological Survey (CGS) defines faults as “active”, “potentially active”, or “inactive”. The CGS considers a fault seismically active when evidence suggests seismic activity within roughly the last 11,000 years. Exhibit 5.1-1, Regional Faults, depicts the locations of faults in the Project site’s vicinity and provides a regional context for potential seismic activity at the site. The site is located between the junction of the San Andreas and Garlock Fault Zones.

The only fault in the vicinity of the Project site within a designated Alquist-Priolo Earthquake Fault Zone is the San Andreas Fault (San Andreas Earthquake Fault Zone). The San Andreas

---

<sup>3</sup> This term, bedding plane shears, describes a deformation of rock resulting from stresses that cause contiguous parts of a geologic body to slide in relation to each other in a direction parallel to their plane of contact (American Geologic Institute 1984).

### Regional Faults

Centennial Project

Exhibit 5.1-1

Fault Earthquake Fault Zone and fault line cross the southwestern edge and southernmost point of the Project site, as shown on Exhibit 5.1-2, Geologic Hazards.

Due to the Project's proximity to the San Andreas and Garlock Fault Zones, Geocon retained Earth Consultants International (ECI)—a fault research company—to conduct a detailed fault investigation on the Project site (Appendix E of the 2015 Geocon Report in Appendix 5.1-A). ECI's study included a thorough review of published geologic literature and graduate thesis studies to assess known hypothetical faults and their locations on site. Once these proposed faults and locations were identified, detailed geologic mapping was conducted to assess if sufficient geology was exposed to verify faulting. Aerial photo review and mapping that showed exposures of continuous geologic strata across the proposed fault locations resulted in eliminating the majority of hypothetical faults or other linear features in the literature.

The subsequent field investigation consisted of logging 18 fault trenches and 21 soil pits. From this research, the two previously unidentified active faults were found within the boundary of the Project site. The westernmost of the two faults is located outside the development footprint. The other fault crosses the western portion of the development area in Village 9 and requires a minimum 100-foot building setback for site planning purposes, which may be reduced to 50 feet as discussed in PDF 1-1. The other active fault strand is located approximately 2,000 feet to the west of the proposed development area on the site. Site-specific fault conditions and associated setbacks are illustrated on Exhibit 5.1-2. It is noted that these faults are unnamed because they were only identified as part of the site-specific investigations. Therefore, they are not included in the Alquist-Priolo program, nor are they otherwise identified by the State; seismic characteristics are not known for these faults as they are for the known regional faults listed above.

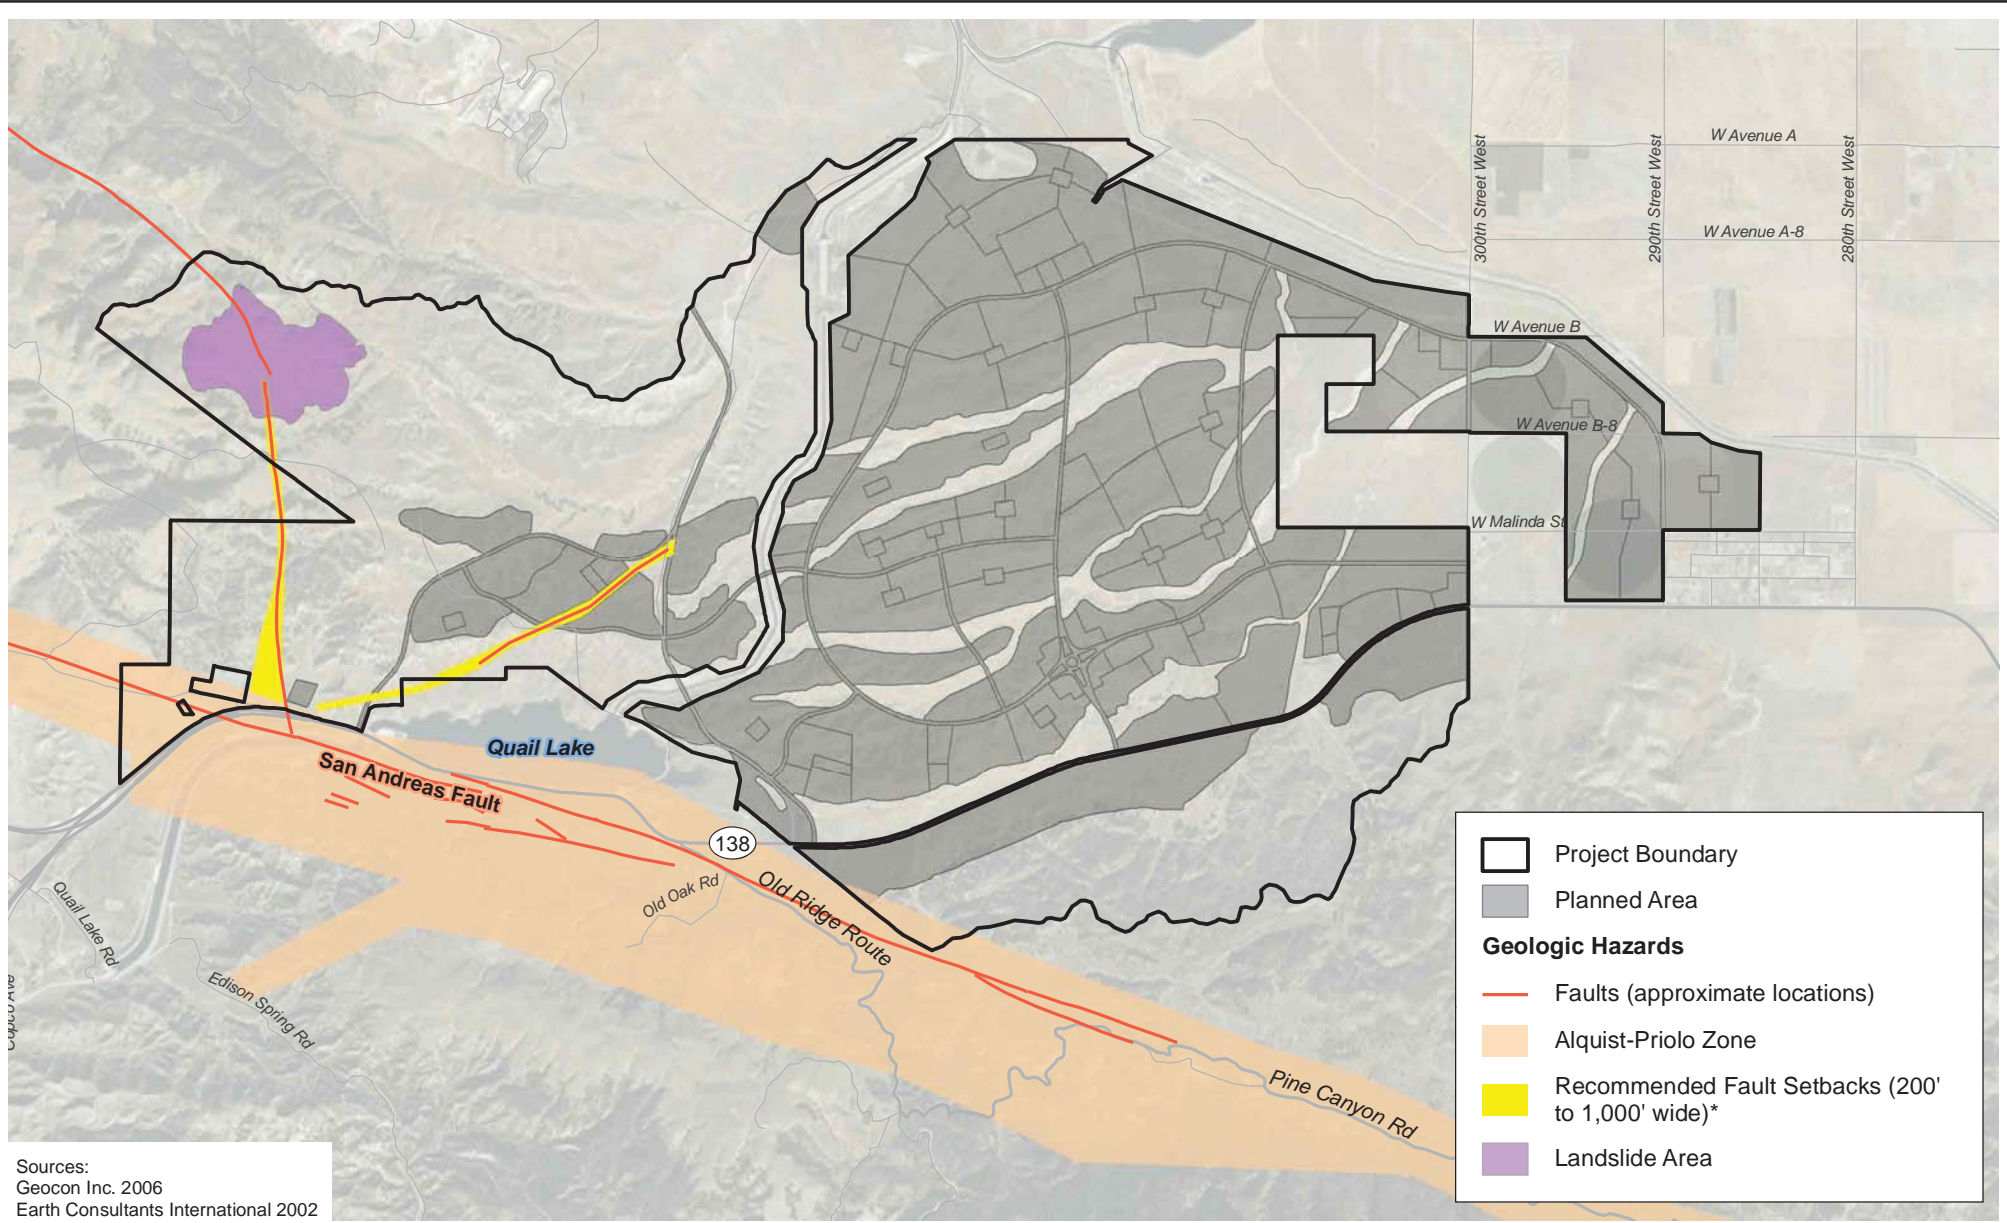

The 2015 Geocon Report included site-specific seismic hazard analysis with both deterministic and probabilities methodologies (i.e., Deterministic Seismic Hazard Analysis [DSHA] and Probabilistic Seismic Hazard Analysis [PSHA]), using the EZ-FRISK™ (Version 7.65) earthquake ground motion estimation software. These methods and the results are described below.

### ***Deterministic Seismic Hazard Analysis***

The EZ-FRISK software indicates there are 29 known active faults are located within a search radius of 50 miles from the Project site. The analysis used coordinates generally correlating to the central portion of the site. Table 5.1-1 lists the estimated maximum earthquake magnitude (M) and peak ground acceleration (g, or percent of the force of gravity) for the most dominant faults in relationship to the central portion of the Project site, listed by increasing distance, for the three different acceleration-attenuation relationships (i.e., mathematical equations related to ground motion) applied in the DSHA.

Source: Geocon 2015 (Appendix 5.1-A).					

As shown, the nearest known active fault is the Southern San Andreas Fault, located less than one mile south of the central portions of the site and the dominant source of potential ground motion. Because the analysis used coordinates generally correlating to the central portion of the Project site, this fault is shown as 0.7 mile away; however, it is located along the southern boundary of the Project site (see Exhibits 5.1-1 and 5.1-2). Earthquakes that might occur on the San Andreas Fault Zone or other faults in the Southern California and Northern Baja California area are potential generators of significant ground motion at the site. The estimated deterministic maximum earthquake magnitude and peak ground acceleration for the Southern San Andreas Fault are 8.2g and 0.59g (i.e., 59 percent the force of gravity), respectively. While listing peak accelerations is useful for comparison of potential effects of fault activity in a region, other considerations are important in seismic design, including frequency and duration of motion and soil conditions underlying the site. These other considerations are collectively addressed in the 2015 Geocon Report.

### ***Probabilistic Seismic Hazard Analysis***

Probabilistic estimates of seismic risk are based on the premise that the potential for an earthquake in an area is a function of the combined annual probabilities for earthquakes on all faults capable of generating energy of a certain level in that area. This method assumes earthquakes occur randomly in time and that the annual probability for earthquake occurrences is the same from year to year. A higher frequency of small to moderate earthquake occurrence is also considered. By calculating the expected accelerations from considered earthquake sources, the EZ-FRISK program calculates the total average annual expected number of occurrences of site acceleration greater than a specified value.

Table 5.1-2 presents the site-specific probabilistic seismic hazard parameters including the three different acceleration-attenuation relationships (i.e., mathematical equations related to ground motion) applied in the PSHA and the probability of exceedance.

**TABLE 5.1-2  
PROBABILISTIC SEISMIC HAZARD PARAMETERS (EZ-FRISK)**

<b>Probability of Exceedance</b>	<b>Peak Ground Accelerations (g)<sup>a</sup></b>		
2% in a 50-Year Period	1.19 (119%)	0.88 (88%)	1.18 (118%)
5% in a 50-Year Period	0.90 (90%)	0.69 (69%)	0.94 (94%)
10% in a 50-Year Period	0.69 (69%)	0.54 (54%)	0.73 (73%)
g: ground movement as a percent of the force of gravity			
<sup>a</sup> The three columns represent the results of the three different mathematical equations utilized to calculate the Peak Ground Acceleration, per standard practice for seismic assessment.			
Source: Geocon 2015 (Appendix 5.1-A).			

In addition to the three relationships applied in the EZ-FRISK program, the CGS has a program that calculates the ground motion for a 10 percent of probability of exceedance in 50 years based on an average of several attenuation relationships. Table 5.1-3 presents the calculated results from the Probabilistic Seismic Hazards Mapping Ground Motion page from the CGS website.

**TABLE 5.1-3

0.72 (72%)	0.72 (72%)	0.72 (72%)
CGS: California Geological Survey; g: g: peak ground acceleration (ground movement) as a percent of the force of gravity		
Source: Geocon 2015 (Appendix 5.1-A).		

### ***Secondary Seismic Effects***

The secondary effects of seismic ground shaking from earthquakes that may affect the Project site include liquefaction and settlement. Liquefaction is a phenomenon in which loose, saturated, and relatively cohesionless soil deposits lose their strength during strong ground motion. Primary factors that control the development of liquefaction include intensity and duration of ground motion; characteristics of subsurface soil; in situ (i.e., in the position originally formed) stress conditions; and the depth to groundwater. Based on previous geotechnical studies on the Project site and experience with similar geologic

conditions, the 2015 Geocon Report concludes that there is a potential for liquefaction occurring within the main alluvial drainages for the Project where shallow groundwater (less than 50 feet) and loose alluvium is present. In the event liquefaction occurs, the primary geotechnical constraint is associated with potential settlement due to seismic shaking. Groundwater depths across the site are discussed further below. Liquefaction potential is greatest along Oso Canyon, where relatively shallow groundwater was encountered during both the previous geotechnical investigations and the hydrogeologic investigation. However, no development is proposed in Oso Canyon.

Seismically induced settlement (i.e., liquefaction and settlement of dry sands) can occur during or after seismic shaking and results from rearranging of sand particles in the soil matrix. Settlement of dry sands, not related to liquefaction, has not been estimated throughout the Project site, but would be expected to occur in areas with alluvial deposits and/or known liquefaction potential.

## Groundwater

Groundwater and/or seepage were encountered within several of the exploratory trenches and borings performed during the field investigations. Groundwater/seepage was found as shallow as 3 feet and as deep as 55 feet. However, due to the geologic conditions and the natural and artificial water sources inherent to the site, groundwater conditions are expected to fluctuate seasonally. Occasional seeps and springs were also observed during the investigations and were mapped.

Seven well logs with readings from 1956 to 1971, located approximately a mile to the south and west of the Project site, were obtained from the County of Los Angeles Department of Water Resources. Review of the data indicated a high groundwater table variance from 3,226 feet above msl to 3,385 feet above msl. Surface elevations varied from 3,350 feet above msl to 3,430 feet above msl, equating to 45 to 117 feet below ground surface (bgs). However, given the distance from the wells to the site and the noncontiguous drainages, application of these high groundwater elevations can only be general (Geocon 2015).

On-site groundwater studies performed between March 2004 and December 2005 were conducted by Bookman-Edmonston (a division of GEI Consultants) to evaluate groundwater as a source for on-site potable water. Their study included numerous borings and several monitoring wells (see Appendix F of the Geotechnical Report in Appendix 5.1-A). They identified two aquifers located along the northern and southeastern portion of the site; the highest groundwater elevation was measured at 35 feet bgs. Considering that the monitoring period covered two of the wettest years on record in California, this may not represent the normal groundwater elevations for area (i.e., normal elevations would be deeper).

### 5.1.4 PROJECT DESIGN FEATURES

**PDF 1-1** A Geologic Safety Zone has been incorporated into the Project that establishes review procedures and setbacks for areas subject to potential surface fault rupture. This zone is applied to areas designated as Alquist-Priolo Earthquake Fault Zones and unnamed faults identified on the site as part of the Project's

site-specific geotechnical investigations. Also, Section 2690 of the *California Public Resources Code*, specifies that no human-occupied structures can be located within an Alquist-Priolo Earthquake Fault Zone unless specific investigations prove these areas to be free of active faulting.

This Geologic Safety Zone institutes a minimum 100-foot setback (i.e., 100 feet in each direction) from the fault lines that traverse any development area. The width of the setback may potentially be reduced to 50 feet (in each direction), with the approval of the County, provided there is no evidence of fault activity from trenching performed as part of an additional fault investigation during the site development process.

The Project, through the use of a Geologic Safety Zone, requires that:

1. No habitable structures be built within the San Andreas Alquist-Priolo Zone unless specific geotechnical investigations determine there is no active faulting present.
2. Development be setback at least 50 feet from any identified active fault on site.
3. Development will not be adversely affected by geotechnical problems.

### 5.1.5 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

- Threshold 1-1** Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known active fault trace. Refer to Division of Mines and Geology Special Publication 42.
- Threshold 1-2** Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic groundshaking.
- Threshold 1-3** Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction and lateral spreading.
- Threshold 1-4** Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides.
- Threshold 1-5** Result in substantial soil erosion or the loss of topsoil.
- Threshold 1-6** Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.

- Threshold 1-7** Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.
- Threshold 1-8** Have soils incapable of adequately supporting the use of onsite wastewater treatment systems where sewers are not available for the disposal of wastewater.
- Threshold 1-9** Conflict with the Hillside Management Area Ordinance (L.A. County Code, Title 22, § 22.56.215) or hillside design standards in the County General Plan Conservation and Open Space Element.

### 5.1.6 ENVIRONMENTAL IMPACTS

The Project was designed to avoid or minimize geotechnical constraints on the Project site. Several geotechnical investigations of the site have been conducted, and the results of the investigations were used to guide the site-planning process. Therefore, land uses were configured (1) to avoid designated setback zones for fault lines and the landslide located within the northwestern portion of the site and (2) in consideration of localized geotechnical conditions (see Exhibit 5.1-2).

The geologic investigations conducted across the Project site and incorporated within the 2015 Geocon Report determined that there is the potential for strong seismic ground shaking from on-site and regional active faults; there are also shallow groundwater areas, potentially liquefiable soils, compressible upper alluvial and surficial deposits, and some expansive soils. These are all common and easily remediated conditions. The 2015 Geocon Report concludes that there are no soil or geologic conditions present on or near the Project site that would preclude the safe development of all proposed land uses on the Project site (including homes, schools, commercial and industrial uses, community use and recreation areas, utility lines and other infrastructure, and water/wastewater treatment facilities) given incorporation of all existing and future, tract map-level, geotechnical recommendations into grading and construction plans and specifications; this includes compliance with County subdivision specifications, County zoning and building code requirements, and Project's Grading Plan, and the Specific Plan's Hillside Design Guidelines. All geotechnical recommendations found in the previously prepared and 2015 Geocon reports are standard engineering techniques, and the 2015 Geotechnical Report (Appendix 5.1-A) has determined the Project development is feasible provided the seismic and other geotechnical constraints identified within the Project site's grading boundaries are addressed, via future, tract map-level geotechnical studies to be performed as part of Project implementation consistent with County and State building code requirements.

It should be emphasized that, while the Project site has identified geotechnical constraints, the overall seismic risk at the Project site is the same as Southern California in its entirety. Compliance with geotechnical recommendations, which reflect building code requirements, would result in the construction of earthquake-resistant structures. However, in the event of a major seismic event, no structure is completely safe from damage. Incorporation of these measures reduces the potential risk from seismic and geotechnical conditions to the maximum extent practicable under current engineering practice.

**Threshold 1-1**      **Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known active fault trace? Refer to Division of Mines and Geology Special Publication 42.**

## **On-Site Impacts**

As described above, the nearest Alquist-Priolo active fault zone to the Project site is the San Andreas Fault Zone. As shown on Exhibit 5.1-2, the Project has been designed to avoid all designated fault buffer zones via the Geologic Safety Zone (PDF 1-1). Specifically, both the San Andreas Earthquake Fault Zone and the 100-foot setback (in both directions) placed on the unnamed faults on the Project site in accordance with the recommendation of the 2015 Geocon Report, are proposed as open space and drainage areas (see Exhibit 4-1 Centennial Project –Conceptual Land Use Plan). This is consistent with AVAP Policy LU 3.1 (although the Project is exempt from this policy due to location in an Economic Opportunity Area [EOA]), Policy PS 2.1, and Policy PS 2.3, related to limiting development on or near fault traces.

This Geologic Safety Zone institutes a minimum 100-foot setback (i.e., 100 feet in each direction) from the fault lines that traverse any development area. The width of the setback may be reduced to 50 feet (in each direction), with the approval of the County of Los Angeles Department of Public Works, provided there is no evidence of fault activity from trenching performed as part of an additional fault investigation during the site development process.

The Project would include the following types of sensitive land uses: schools, hospital, and public assembly sites. With respect to schools, the California Department of Education's (CDE's) Title 5 requirements would be implemented by local school districts and would ensure that school site location decisions and building designs meet all applicable seismic and public safety concerns. Hospitals are also required to reflect seismic safety concerns in their location decisions and building designs pursuant to building code requirements.

The Project must incorporate all applicable geotechnical recommendations identified in the geotechnical documents previously prepared for the Project. These recommendations include those reviewed and compiled in the *Preliminary Geotechnical Summary Report, Centennial – Tejon Ranch, Los Angeles County, California* prepared by Geocon Incorporated and dated June 2015, and those to be identified in the geotechnical reports for the Final Engineering and Grading Plans (which must incorporate the findings of all soils engineering and geologic studies) for individual tract maps and the associated final grading plans to be processed as the Project is implemented.

Implementation of the following would ensure impacts related to the proximity to active faults would be less than significant level: implementation of the Geologic Safety Zone (PDF 1-1); compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future tract map-level geotechnical recommendations identified for all

development on the Project site; and the requirements of CDE Title 5 for proposed schools. Therefore, the Project would result in less than significant impacts related to fault rupture or other constraints related to proximity of the Project site to known active faults.

## Off-Site Impacts

None of the off-site Project features, which include intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, involve habitable structures or otherwise sensitive land uses. Also, all off-site Project features would be required to comply with County and State geotechnical review and building code requirements as applied to the Project, as applicable. For instance, the California Aqueduct bridge crossings would require structural engineering design that reflects the seismic conditions of the area, and the five new intersections along SR-138 and associated deceleration/acceleration lanes would require remedial grading to ensure a stable foundation. There would be less than significant impacts related to geologic and seismic conditions from implementation of required off-site Project features.

***Impact Summary:*** There would be less than significant impacts from the Project site's proximity to active faults with implementation of the Geologic Safety Zone (PDF 1-1); implementation of the requirements of CDE's Title 5; and compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future, tract map-level, geotechnical recommendations for the Project, as described in Section 5.1.4.

**Threshold 1-2**      **Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic groundshaking?**

**Threshold 1-3**      **Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction and lateral spreading?**

## On-Site Impacts

**Ground Shaking.** Similar to conditions in the nearby communities of Palmdale, Lancaster, Santa Clarita and most of Los Angeles County, the Project site could experience moderate to severe ground shaking due to a major earthquake generated on one or more active earthquake faults on or near the site and in the region within the life of the Project. The analysis of seismic risk at the Project site determines that, with incorporation of geotechnical recommendations presented in all existing and future, tract map-level, geotechnical reports (which include conformance with applicable building codes), there would be less than significant impacts related to seismic ground shaking.

**Liquefaction and Lateral Spreading.** Liquefaction is defined as the transformation of a granular material from a solid state into a liquefied state. Liquefaction is a phenomenon in

which loose, saturated, and relatively cohesionless soil deposits lose their strength (the ability to bear the weight of overlying structures) due to saturation with water during strong ground motions. Primary factors that control the development of liquefaction include intensity and duration of ground motion, characteristics of subsurface soil, in situ<sup>4</sup> stress conditions, and the depth to groundwater. Lateral spreading is a liquefaction-related phenomena wherein lateral (i.e., horizontal) ground displacement occurs on gentle slopes due to liquefaction in underlying sediments.

Based on previous geotechnical studies on the Project site and experience with similar geologic conditions, the 2015 Geocon Report concludes there is a potential for liquefaction to occur within the main alluvial drainages on the Project site where shallow groundwater (less than 50 feet bgs) and loose alluvium are present. As discussed previously, on-site investigations have encountered groundwater levels ranging from 35 feet bgs to 55 feet bgs, not including seepage as shallow as 3 feet bgs. In the event liquefaction occurs, the primary geotechnical concern is associated with potential settlement and its effect on overlying structures or facilities (e.g., sidewalk, utility lines). Liquefaction potential is greatest along Oso Canyon, where relatively shallow groundwater was encountered during both the previous geotechnical investigations and the hydrogeologic investigation. However, no development is proposed within Oso Canyon. Accordingly, the Geotechnical Report directs that additional analysis be performed to evaluate liquefaction potential for each future tract map. These analyses would be performed in conformance with County/CBC standards in place at the time as each tract map is proposed.

The Project was designed such that the majority of proposed development areas are outside anticipated liquefiable zones. These Project areas are proposed to remain as open space or to become greenways, detention/infiltration basins, and/or hydromodification facilities. Where proposed development and/or habitable structures would overlie liquefiable sediments, the condition is remediated by either removing (overexcavating) the liquefiable soils and recompacting surficial sediments or by applying “ground modification techniques”. Ground modification techniques provide in situ (i.e., without removal/in place) remediation of liquefaction potential by making the underlying granular materials more dense. Because one of the factors necessary for liquefaction to occur is loose soils (making the soils more dense), using techniques such as deep dynamic compaction, stone columns, and/or vibro-replacement remediates the potential for liquefaction. These are standard engineering techniques used to remediate unstable soils and would be specified and implemented, as appropriate for each future tract map prepared for the Project. This is consistent with AVAP Policy LU 3.5 (although the Project is exempt from this policy due to location in an EOA) and Policy PS 2.2, related to limiting development in landslide and liquefaction areas. With implementation of all applicable geotechnical recommendations, the Project would result in less than significant impacts related to the presence of liquefiable soils as well as lateral spreading potential.

Seismically induced settlement can occur during or after seismic shaking based upon rearrangement of sand particles in the soil matrix, either subsequent to liquefaction or in dry

---

<sup>4</sup> This term is said of a rock, mineral, or fossil in its natural position (i.e., the situation in which it was originally formed or deposited) (American Geological Institute 1984).

sands. Settlement has not yet been estimated throughout the Project site, but settlement is expected to occur given the extensive alluvial deposits as well as known liquefaction potential in limited areas east of the Aqueduct. As discussed above, quantitative liquefaction and settlement analyses would be performed for the tract maps as development is proposed. Overexcavating and recompacting liquefiable and sandy soils to ensure stable foundations for proposed structures, in accordance with existing and future, tract map-level, geotechnical recommendations, would mitigate potential impacts related to seismically induced settlement. Therefore, there would be less than significant impacts related to seismically induced settlement.

## Off-Site Impacts

None of the proposed off-site Project features—including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings—involve habitable structures or otherwise sensitive land uses. Also, all off-site Project features would be required to comply with County and State geotechnical review and building code requirements as applied to the Project, as applicable. There would be less than significant impacts related to geologic and seismic conditions from implementation of required off-site Project features.

***Impact Summary:*** There would be less than significant impacts related to seismicity with implementation of the Geologic Safety Zone (PDF 1-1) and compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future, tract map-level, geotechnical recommendations.

**Threshold 1-4**      **Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?**

## On-Site Impacts

A single existing landslide has been mapped on the Project site, located in the northwestern corner of the Project site in Oso Canyon (Exhibit 5.1-2, Geologic Hazards). This large ancient landslide was investigated using review of existing geologic maps of the area, a soil boring, and exploratory trenches (which are more informative than soil borings). The landslide and associated buffer zone are entirely within the proposed open space preserve, and there would be no development on the Project site on or adjacent to this landslide. Therefore, there would be no impact related to the presence of this landslide.

Other than the landslide described above, as discussed in Section 5.1.3, Environmental Setting, a small, shallow landslide was mapped along a north-facing arroyo slope and several other small, shallow slumps and erosional sloughing were observed during on-site geotechnical investigations along the more steeply eroded arroyos. These latter features do not exceed widths of 50 feet and, while noted in the geotechnical studies for the site, are not mapped due to their small size and geotechnical insignificance. Observations and exploratory excavations indicate the shallow landslides on the relatively steep slopes initially failed in permeable cohesionless gravelly sands of Older Alluvium. The 2015 Geocon

Report states the small surficial landslides and slumps are not considered an adverse impact with respect to site development, as these can be mitigated with standard remedial grading techniques (removal and recompaction). This is consistent with AVAP Policy LU 3.5 (although the Project is exempt from this policy due to location in an EOA) and Policy PS 2.2, related to limiting development in landslide and liquefaction areas. Therefore, incorporation of all existing and future, tract map-level geotechnical recommendations into any development in the vicinity of these small landslides/slumps would ensure that potential impacts from landslides would be reduced to a less than significant level.

## Off-Site Impacts

None of the proposed off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, involve habitable structures or otherwise sensitive land uses. Also, all off-site Project features would be required to comply with County and State geotechnical review and building code requirements as applied to the Project, as applicable. There would be less than significant impacts related to geologic and seismic conditions from implementation of required off-site Project features.

***Impact Summary:*** There would be less than significant impacts from landslides with compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and other geotechnical recommendations for the Project.

### **Threshold 1-5      Would the project result in substantial soil erosion or the loss of topsoil?**

The analysis below discusses the potential for erosion to affect the Project site subsequent to construction of proposed structures, and relates exclusively to the geologic units present on the site. Please refer to Section 5.2, Hydrology and Flood, and Section 5.4, Water Quality, of this EIR for a discussion of the potential for erosion resulting from grading during construction and impacts to hydrology and water quality, respectively.

## On-Site Impacts

Localized layers of unconfined, clean, gravelly sand of the Old Alluvium Formation are subject to erosion and surficial landslides under seasonal heavy rains or if underlain by perched groundwater conditions. Cohesionless zones encountered at finish grade may require undercutting and, if encountered in cut slopes, may require stabilization fills to reduce the potential for slope erosion and shallow sloughage. Compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future, tract map-level, geotechnical recommendations for the Project, would reduce impacts related to soil erosion to a less than significant level.

## Off-Site Impacts

None of the proposed off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, involve habitable structures or otherwise sensitive land uses. Also, all off-site Project features would be required to comply with County and State geotechnical review and building code requirements applied to the Project, as applicable. There would be less than significant impacts related to geologic and seismic conditions from implementation of required off-site Project features.

**Impact Summary:** There would be less than significant impacts related to erosion potential in the Old Alluvium Formation with compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, Hillside Design Guidelines, and other geotechnical recommendations for the Project.

**Threshold 1-6** **Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse (including hydrocompaction/hydroconsolidation)?**

**Threshold 1-7** **Would the project be located on expansive soil as defined in Table 18-1 of the Uniform Building Code (1994), creating substantial risks to life or property?**

**Threshold 1-8** **Would the project site have soils incapable of adequately supporting the use of onsite waste water treatment systems where sewers are not available for the disposal of wastewater?**

There are a variety of natural soil characteristics that have the ability to adversely affect development of a site and for which specific engineering measures must be implemented to counteract the presence of such limitations. The analysis below discusses potentially adverse soil characteristics that could affect construction of proposed structures, including hydroconsolidation, expansive soils, rippability, and corrosivity. This analysis also discusses the potential for existing or induced subsidence to affect the Project site.

Liquefaction potential on the Project site is analyzed above under the discussion of Thresholds 1-2 and 1-3. Landslides are analyzed above under the discussion of Threshold 1-4.

Regarding Threshold 1-8, the proposed wastewater management for Project would involve on-site conveyance and treatment, via aboveground treatment units, which are addressed in the 2015 Geocon Report as part of the overall land use plan. However, wastewater management would not use septic tanks or underground, alternative, treatment systems such that the ability of soils to support the infrastructure is relevant. Therefore, this threshold is not applicable to the Project and is not analyzed below.

## On-Site Impacts

**Hydroconsolidation (Compressible/Collapsible Soils).** The Geotechnical Analysis concludes that topsoil, colluvium, and alluvium are susceptible to hydroconsolidation, a type of compressibility in soils. Removal of topsoil and colluvium with subsequent recompaction would be required where these sediments underlie proposed development areas; this is a standard engineering practice. Consolidation tests performed on samples of alluvium indicate that, below a depth of 15 feet, this material has low compressibility potential and relatively minor volume change characteristics upon saturation (i.e., hydroconsolidation) and that the upper 15 feet of alluvial soils would require removal and recompaction prior to placing fill. Where these soil conditions are encountered in the Project's development area, they would be remediated through incorporation of the standard engineering practices (generally overexcavation and recompaction) that would be specified in the tract map-level geotechnical reports to be prepared as the Project is implemented. Compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future tract map-level, geotechnical recommendations for the Project would reduce impacts related to hydroconsolidation to a less than significant level.

**Expansive Soils.** Expansion testing on the Quail Lake Formation indicates a variable range of expansion indices from low to high. Highly expansive clay exposed at finish grade would require remedial grading (i.e., overexcavation and replacement) to provide a low expansive soil cap. Other units present on site consist of topsoil, alluvium, colluvium landslide debris, Older Alluvium, the Oso Canyon Formation, and the Neenack Volcanic Formation. These materials exhibit a very low to low expansion potential and would not require remedial grading to reduce expansion potential. Compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future, tract map-level geotechnical recommendations for the Project, would reduce impacts related to the presence of expansive soils to a less than significant level.

**Rippability.** The rippability of a geologic material is a measure of its ability to be excavated with conventional excavation equipment, and is defined by the following levels of rippability: light, moderate, heavy, and very heavy effort. These are relative terms, expressing a continuum of effort needed to excavate underlying geologic formations on the Project site. The only areas of known substantial bedrock material are located in the Neenach and Oso Canyon formations. Excavations within the Oso Canyon Formation that encounter strongly cemented zones observed in this unit would likely require a very heavy effort with conventional heavy-duty grading equipment and/or localized breaking or possible blasting. Once ripped or broken up, numerous oversized rock fragments would be generated that would require special placement procedures and compaction, when placed in fills. The 2015 Geocon Report states that additional subsurface work would need to be performed on the Neenach Volcanic Formation to evaluate this unit's degree of weathering and rippability characteristics. Such additional geotechnical investigation would be performed for each tract map as the Project is implemented.

No development is planned within known areas (i.e., outcrops) of the Oso Canyon and Neenach Volcanic Formations. Existing bedrock outcrops are located in proposed open space areas. However, if bedrock is discovered in areas within the development footprint, heavy effort may be necessary, including blasting as noted above. Blasting can be precisely controlled by current standard procedures to limit the possibility of creating rock falls and damage due to vibration. A Blasting Plan would be required, to be reviewed and approved by the County of Los Angeles Fire Department, to conduct blasting on the Project site during construction, which would include procedures to limit rock falls, vibration, and other safety concerns to the maximum extent. In general, the blasting procedure would involve multiple days of pre-blast drilling and set up, followed by the “shot” event, which is the actual explosive use. Pre-blasting procedures vary depending on the size of the area to be blasted, depth of drilling, type of material, existing utilities, and development. Typically, only one “shot” event occurs per day.

In addition, vibration monitoring would be performed near existing structures to control and record ground vibration during blasting events. Impacts associated with blasting would be potentially significant, but would be reduced to a level considered less than significant with application of MM 12-7, which requires preparation and implementation of a Blasting Plan (see Section 5.12, Noise). The 2015 Geocon Report concludes that excavation in these two geologic units, while more constrained, is feasible and can be safely accomplished with incorporation of all geotechnical recommendations. All other geologic units mapped on the site would require light to moderate effort and only conventional equipment to excavate (i.e., they would not require implementation of MM 12-7). Therefore, the varying levels of rippability of the geologic and surficial units present within the Project site’s development boundary would represent a less than significant impact with implementation of MM 12-7.

**Corrosivity.** Water soluble sulfate testing performed on representative samples of the soil and geologic units on the Project site indicate that the materials have low sulfate content and a corresponding negligible sulfate rating based upon Table 19-A-4 of the 1997 Uniform Building Code (UBC). Samples were tested from the various soil and geologic units present across the Project site to provide a representative composite of the corrosivity potential (i.e., negligible, as noted above). Potential of hydrogen (pH)<sup>6</sup> and resistivity on represented soil samples indicates pH values that vary from 5.2 to 8.3 and resistivity values that range from 800 ohm-cm to 9,338 ohm-cm.<sup>7</sup> These results indicate that the materials tested vary from low to moderate in overall corrosive potential. Overall, there is the potential for corrosion of buried ferrous (iron) metals. The lower the ohm value, the higher the corrosive potential. Regarding pH, soils that are generally either extremely alkaline (with a high pH) or extremely acidic (with a low pH) are likely to be corrosive to steel. Soils with a pH of 5.5 or lower (acidic) are likely to be corrosive to concrete (USDA NRCS 2017).

---

<sup>5</sup> Because of the large size of the Project site, samples were taken of all surficial and geologic units present on the Project site to develop a representative composite of geotechnical conditions across the site, rather than to reflect conditions in any one place on the Project site. Therefore, the number of samples and the physical location of each sample is not relevant, nor is it depicted within the geotechnical reports.

<sup>6</sup> Hydrogen potential (pH) is a measure of the strength of an acid or a base. A neutral solution has a pH of 7; acids a pH between 0 and 7; bases a pH from 7 to 14.

<sup>7</sup> In physics, ohm is a measure of resistivity. Resistivity is measured in ohm-centimeters (cm).

However, because the presence of water-soluble sulfates is not a visually discernible characteristic, other soil samples could yield different sulfate concentrations elsewhere on the site. Therefore, the geotechnical investigation recommends that additional testing of finish-grade soil samples be performed to determine soluble sulfate contents of soils that would be in direct contact with concrete slabs and foundations. Such additional geotechnical investigation would be performed for each tract map as the Project is implemented. Existing and future, tract map-level, geotechnical recommendations must be implemented during site development consistent with building code requirements. Compliance with County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future tract map-level, geotechnical recommendations for the Project related to corrosive soils would reduce impacts related to the presence of potentially corrosive soils to a less than significant level.

**Subsidence.** Subsidence is a sinking or downward settling of the surface that may be caused by natural geologic processes (e.g., solution, compaction) and/or by withdrawal of oil, natural gas, or groundwater. The hydrogeologic investigation performed by Bookman-Edmonston from 2004 through 2006 (see Appendix F of the Geotechnical Report in Appendix 5.1-A) reports that historical groundwater withdrawal in the Antelope Valley Groundwater Basin, within which the Project site is partially located, has resulted in subsidence within the northern portion of the Lancaster sub-basin approximately 25 miles north of the Project site. However, there has been no subsidence or a negligible amount of subsidence in the adjacent Nennach and other western Antelope Valley groundwater sub-basins in the Project site vicinity. The hydrogeologic investigation determines that increased groundwater pumping and recharge as part of site development would not result in adverse impacts to the underlying groundwater basins. Further discussion of the hydrogeologic conditions in the Antelope Valley Basin can be found in the Bookman-Edmonston report located in Appendix F of Appendix 5.1-A. Therefore, the Project would result in no impacts related to current or future subsidence.

## Off-Site Impacts

None of the proposed off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, involve habitable structures or otherwise sensitive land uses. Also, all off-site Project features would be required to comply with County and State geotechnical review and building code requirements as applied to the Project, as applicable. There would be less than significant impacts related to geologic and seismic conditions from implementation of required off-site Project features.

***Impact Summary:*** There would be less than significant impacts related to existing soil characteristics (i.e., hydroconsolidation, rippability, corrosivity, and subsidence) with compliance with (1) County subdivision specifications, County building code requirements, the Project's Grading Plan, the Specific Plan's Hillside Design Guidelines, and existing and future tract map-level, geotechnical recommendations for the Project, and MM 12-7.

**Threshold 1-9**      **Would the project conflict with the Hillside Management Area Ordinance (L.A. County Code, Title 22, § 22.56.215) or hillside design standards in the County General Plan Conservation and Open Space Element?**

### **On-Site Impacts**

In accordance with Section 22.56.217, Hillside Management Areas- Additional Regulations, Subsection C.7., a conditional use permit is required for any development located wholly or partly in a Hillside Management Area, except for: development within any adopted Specific Plan, provided that such development complies with the provisions of that Specific Plan. Therefore, the Specific Plan implements the applicable requirements of the County's Hillside Management Areas Ordinance through Appendix 2-B, Hillside Design Guidelines, which supports the grading plan and goals provided in Chapter 3 of the Centennial Specific Plan. The Guidelines provide direction for site specific grading plans to minimize the height of visible slopes, provide for more natural-appearing manufactured slopes, minimize grading quantities, minimize slope maintenance and water consumption, increase non-motorized connectivity, and provide for stable slopes and building pads. Implementation of the Project's required Hillside Design Guidelines set forth in Appendix 2-B of the Specific Plan will ensure that Project implementation is consistent with the County's goals and policies related to hillside management.

The Hillside Design Guidelines include, but are not limited to, requiring that: at least 50 percent of the development footprint is located on the flattest portions of the site (i.e., those areas having slopes of less than 25 percent) when that area does not contain rare, sensitive, or State or federally listed threatened or endangered species; undulating banks for graded slopes be used to maintain the natural pattern of the topography to the greatest extent feasible; and undulating patterns and varying grades be used for roadway segments that exceed 1,000 feet in length. Project development would require grading of sloped areas as well as cutting and filling of some hillside areas. Slopes would not be graded at angles steeper than a 2:1 ratio (horizontal to vertical), in accordance with the Project's Grading Plan, County building code requirements, the Specific Plan's Hillside Design Guidelines, and all grading-related recommendations of the geotechnical reports to be prepared for each tract map as the Project is implemented.

The 2015 Geocon Report notes that because of the complexity of bedrock structure and masking by superposed Quaternary units (i.e., colluvium, alluvium, Older Alluvium), observation of excavations and cut slopes during grading by an engineering geologist will be required to map as-graded exposures and to recommend specific remediation, if warranted. Areas with slopes in excess of 25 percent generally occur west of the California Aqueduct. From a geotechnical safety point of view, the impact of topographic alterations for areas with slopes over 25 percent would not result in development hazards, nor would it adversely affect human health and safety given conformance with all geotechnical recommendations for grading in these slopes, which includes compliance with County subdivision standards, County building code requirements, the Project's Grading Plan, Specific Plan's Hillside Design Guidelines, as well as Occupational Safety and Health Agency (OSHA) requirements for construction safety. This is consistent with AVAP Policy LU 3.4 (although the Project is

exempt from this policy due to location in an EOA) and Policy PS 2.2, related to development within Hillside Management Areas (although the Project is exempt from this policy due to development within any adopted Specific Plan complying with the provisions of that Specific Plan), as well as Policy PS 2.4, related to ensuring development does not result in slope instability.

In accordance with County procedures for tract map processing, a quantitative slope stability analysis would be performed at such time as tract-map-level development is proposed and when the locations and heights of proposed cut and fill slopes are known, and the design and construction of the Project would be required to incorporate all geotechnical recommendations. Therefore, there would be no conflict with the County's Hillside Management Ordinance. There would be less than significant impacts related to slope stability.

### **Off-Site Impacts**

None of the proposed off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, involve habitable structures or otherwise sensitive land uses. Also, all off-site Project features would be required to comply with County and State geotechnical review and building code requirements as applied to the Project, as applicable. There would be less than significant impacts related to geologic and seismic conditions from implementation of required off-site Project features.

***Impact Summary:*** There would be less than significant impacts related to slope stability, including with designated Hillside Management Areas, with compliance with (1) County subdivision specifications, County building code requirements, the Project's Grading Plan, Specific Plan's Hillside Design Guidelines, and existing and future, tract map-level geotechnical recommendations for the Project.

### **5.1.7 MITIGATION MEASURES**

With compliance with existing regulations and the implementation of PDF 1-1 and MM 12-7, no other mitigation measures are necessary.

### **5.1.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION**

All impacts from development of the Project related to geotechnical conditions would be less than significant with implementation of applicable County subdivision specifications, County building code requirements, the Project's Grading Plan, Specific Plan's Hillside Design Guidelines, and other geotechnical recommendations for the Project described in PDF 1-1 and MM 12-7 in Section 5.12, Noise, of this Draft EIR.

## 5.2 HYDROLOGY AND FLOOD

### 5.2.1 PURPOSE

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that hydrology and flooding issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a Project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts related to hydrology and flooding are described in Sections 6.0 and 7.0, respectively. Water quality issues are analyzed in Section 5.4, Water Quality; water supply is analyzed in Section 5.18, Water Resources (Supply and Services); and recycled water use is analyzed in Section 5.19, Wastewater.

### Summary

In 2014, the County of Los Angeles (County) prepared a Low Impact Development Standards Manual (LID Standards Manual) to implement the National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit for storm water and non-storm water discharges issued to the County by the California Regional Water Quality Control Board, Los Angeles Region (CAS004001, Order No. R4- 2012-0175) (MS4 Permit). The LID Standards Manual also implements the County's Low Impact Development (LID) requirements (County Code, Section 12.84). The objectives and goals of the LID Standards Manual, the County MS4 permit, and the County LID standards per Chapter 12.84 of the County Code are to (1) lessen the adverse impacts of storm water runoff from development and urban runoff on natural drainage systems, receiving waters, and other water bodies; (2) minimize pollutant loadings from impervious surfaces by requiring development projects to incorporate properly designed, technically appropriate Best Management Practices (BMPs) and other LID strategies; and (3) minimize erosion and other hydrologic impacts on natural drainage systems by requiring development projects to incorporate properly designed, technically appropriate hydromodification control development principles and technologies (County Code, Section 12.84).

The proposed Project has been designed to meet or exceed County MS4 Permit, LID Standards Manual and LID requirements, and hydromodification and hydrology (flood control) requirements for new development. The Project will implement site-design, source-control, LID, hydromodification, flow-control and runoff water quality BMPs and treatment requirements. Most Project runoff will be subject to control and treatment in a regional system that consists of 28 detention and retention basins located throughout the Project site (see Exhibit 5.2-4). Other developed areas will provide runoff control and treatment by utilizing distributed, smaller or parcel-specific LID measures (see Exhibit 5.4-2 in Section 5.4, Water Quality). As discussed in Section 5.4, Water Quality, these regional and distributed measures will also meet County LID standards for new development and will provide sufficient treatment capacity to reduce potential surface and ground water quality impacts to less than significant levels.

The hydromodification BMPs for the Project would be consistent with County requirements for new development set forth in Section 8 – Hydromodification Impacts of the County LID Standards Manual, as incorporated in Mitigation Measure (MM) 2-1. Performance standards for post-development peak flow rates and volumes during major (50-year) storm events are also consistent with County requirements and are incorporated in MM 2-2. Both mitigation measures require that Project compliance with flood-control performance standards be confirmed in a Drainage System Engineering and Planning Report submitted to the County during the review and approval of each Project tract map. All Project development will be consistent with the County LID requirements. Project runoff will not exceed the planned storm drain capacity and will not require construction of additional drainage facilities not considered in this EIR and that could have significant environmental effects.

During construction, the Project will comply with and implement the requirements of the General Construction Permit issued by the State Water Resources Control Board (CAR000002, Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-0006-DWQ)(Construction General Permit). The Construction General Permit requires that potential risks to water quality be evaluated for construction activity, and the implementation of a Storm Water Pollution Prevention Plan (SWPPP), including specific BMPs that will avoid potentially significant construction period storm water impacts based on the Project risk assessment.

Portions of the Project along the northern and eastern site boundaries are located within a 100-year floodplain area mapped by the Federal Emergency Management Agency (FEMA)(see Exhibit 5.2-5). As discussed in Section 4.0, Project Description, and as required by MM 2-3, these areas will be subject to a Specific Plan Floodplain Safety Overlay (see Exhibit 4-6, Centennial Project – Safety Overlay Districts) that precludes habitable residential, commercial, school and institutional structures in the floodplain. All applications for Project tract maps that would locate any structures not precluded by the Floodplain Safety Overlay in the floodplain must include a Drainage System Engineering and Planning Report that provides a detailed description of the floodplain boundaries and a description of applicable flood protection measures. This report must demonstrate that, after construction, structure designs and floodplain flows will comply with all applicable FEMA and County of Los Angeles floodplain flood flow and development standards. If required, a conditional letter of map revision (CLOMR) from FEMA will be obtained prior to any construction within a mapped 100-year floodplain. There will be no housing development in on-site floodplains, and no significant impacts will occur from placing structures within a floodplain.

Potential mudflow impacts will be reduced to less than significant levels by capturing debris flows in on-site basins and engineered and natural stream channels and by minimizing disturbance in on-site locations with slopes in excess of 25 percent that could generate mudflows. Storm water basins will be managed to avoid potential mosquito-borne health vectors by implementing California Department of Public Health (CDPH) recommendations and fully discharging captured storm water within 96 hours. An integrated pest management program must be developed and confirmed during the County review and approval process for Project tract maps (see MM 4-2). The Project site is not subject to tsunamis, seiches or dam and levee failure inundation.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0 for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

## 5.2.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

### Federal

#### *Sections 401 and 404 of the Clean Water Act*

Section 401 of the Clean Water Act (CWA, *United States Code* [USC], Title 33, Sections 1251 et seq.) requires that any person applying for a federal permit or license that may result in a discharge of pollutants into “waters of the U.S.” obtain a State water quality certification which concludes that the activity complies with all applicable water quality standards, limitations, and restrictions. Subject to certain limitations, no license or permit may be issued by a federal agency until a Section 401-required certification has been granted. Further, no license or permit may be issued if certification has been denied. The CWA Section 404 permits and authorizations, described in the next paragraph, are subject to Section 401 certification by the local Regional Water Quality Control Boards (RWQCB).

Section 404 of the CWA is a program that regulates the discharge of dredged and fill material into “waters of the U.S.”, including wetlands. Activities in “waters of the U.S.” that are regulated under this program include fills for development (including physical alterations to drainages to accommodate storm drainage, stabilization, and flood-control improvements); water resource projects (such as dams and levees); infrastructure development (such as highways and airports); and conversion of wetlands to uplands for farming and forestry. The U.S. Environmental Protection Agency (USEPA) and the U.S. Army Corps of Engineers (USACE) have issued Section 404(b)(1) Guidelines (*Code of Federal Regulations* [CFR], Title 40, Section 230) that regulate dredge and fill activities, including water quality aspects of such activities. Subpart C of Sections 230.20–230.25 contains water quality regulations applicable to dredge and fill activities. Among other topics, these guidelines address discharges that alter substrate elevation or contours; suspended particulates and water clarity; nutrients and chemical content; current patterns and water circulation; water fluctuations (including those that alter erosion or sediment rates); and salinity gradients. As discussed in Section 5.7, Biological Resources, approximately 1.8 acres of drainages have been delineated as federally jurisdictional waters by the USACE (see Table 5.7-9, Jurisdictional Wetlands and Waters Summary).

#### *National Pollutant Discharge Elimination System*

The NPDES permit program is authorized by the federal CWA and regulates point sources that discharge pollutants into “waters of the U.S.”. Point sources are discrete conveyances such as pipes or man-made ditches. Examples of pollutants include, but are not limited to, rock, sand, dirt as well as agricultural, industrial, and municipal waste discharged into “waters of the U.S.”. Point sources that discharge into municipal sewer systems (e.g., residential wastewater conveyance pipes) do not require individual permits, but the sewer systems do require an NPDES permit.

In California, responsibility for implementing the NPDES program has been delegated to the State Water Resources Control Board (SWRCB) and the nine RWQCBs acting under the auspices of the state board. The State and regional boards typically issue NPDES permits that

also include waste discharge requirements (WDRs) under State law. The Los Angeles County MS4 permit and the state General Construction Permit have been issued as NPDES permits and as WDRs and are discussed in more detail below.

The MS4 permit program has been implemented in two phases. Phase I, which was initiated in 1990, includes permits for medium (serving between 100,000 and 250,000 people) and large (serving 250,000 people) municipalities. Phase II was implemented as a General Permit for the Discharge of Storm Water from Small MS4s (WQ Order No. 2013-0001-DWQ) and covers smaller municipalities and non-traditional Small MS4s such as military bases, public campuses, prisons, and hospital complexes. The Phase II Small MS4 General Permit regulates discharges from small MS4s with a population density of at least 1,000 people per square mile and a population of at least 10,000.

### ***Executive Order 11198***

In 1977, the President of the United States issued Executive Order 11198 to regulate impacts associated with development within a designated 100-year floodplain. This Executive Order is implemented through FEMA's Floodplain Mapping Program and through federal agency review of projects that may require federal permits or approvals. Under this Executive Order, the USACE is the regulating agency authorized to provide leadership and to take action to:

- Avoid development in the base floodplain unless it is the only practical alternative;
- Reduce the hazard and risk associated with floods;
- Minimize the impact of floods to human safety, health, and welfare; and
- Restore and preserve the natural and beneficial values of the base floodplain.

Flood hazard areas identified on the Flood Insurance Rate Map (FIRM) are identified as Special Flood Hazard Area (SFHAs). SFHAs are areas that will be inundated by a flood event and have a one percent chance of being equaled or exceeded in any given year. The one-percent annual chance flood is also referred to as the "base flood" or "100-year flood". SFHAs are labeled as "Zone A". Moderate flood hazard areas (labeled "Zone B" or "Zone X") are also shown on the FIRM and are the areas between the limits of the base flood and the 0.2-percent-annual-chance (or 500-year) flood. The areas of minimal flood hazard, which are the areas outside the SFHA and higher than the elevation of the 0.2-percent-annual-chance flood, are labeled "Zone C" or "Zone X".

## **State**

### ***California Porter-Cologne Act***

The Porter-Cologne Water Quality Control Act of 1970 (Porter-Cologne Act)(*California Water Code*, Sections 13000 et. seq.) is California's primary statute governing water quality and water pollution issues, including sediment transport and protection of surface waters and groundwater. The Porter-Cologne Act provides the SWRCB and nine Regional Water Quality Control Boards (RWQCBs) the authority to protect water quality and is the primary vehicle for implementing California's responsibilities under the federal CWA. Each RWQCB must formulate and adopt a water quality control plan (commonly referred to as a "basin

plan”) for the region within its jurisdiction. The basin plan must conform to the policies set forth in the Porter-Cologne Act and the State water policy established by the SWRCB. The basin plan establishes beneficial uses for surface and groundwaters in the region and includes narrative and numeric water quality standards to protect those beneficial uses. Each RWQCB is also authorized to include water discharge prohibitions applicable to particular conditions, areas, or types of waste within its jurisdiction. The Act requires that, unless otherwise authorized by a general or other permit, reports of waste discharges to regulated waters of the state must be provided to each RWQCB. The RWQCB may issue discharge permits under State law in response to a report of waste discharge. These permits are commonly referred to as “waste discharge requirements” (WDRs) and are issued by the RWQCBs for activities within each regional board’s jurisdiction.

### **Construction General Permit**

The NPDES program allows for the issuance of general permits that cover specific actions by multiple parties, such as construction activities. Dischargers covered under a general permit must comply with the permit terms and conditions. In 2009, the SWRCB issued the statewide Construction General Permit to regulate discharges or pollutants in storm water associated with construction activities (NPDES No. CAR000002, Water Quality Order 2009-0009-DWQ as amended by 2010-0014-DWQ and 2012-006-DWQ). Dischargers are required to obtain coverage under the Construction General Permit if a project disturbs one or more acres of soil or disturbs less than one acre, but is part of a larger common plan of development that in total disturbs one or more acres.

The Construction General Permit requires that projects implement an SWPPP that includes specific BMPs and establishes numeric effluent limitations to meet water quality and technology-based standards. Major components of the adopted Construction General Permit include the those discussed below.

**Risk-Based Permitting Approach.** The Construction General Permit includes a three-tiered system for discharges (identified as Risk Levels 1, 2, and 3) that is based on the relative risk a project poses to causing water quality impacts. Risk levels are established by calculating two factors: (1) the project’s sediment risk and (2) receiving water risk during periods of soil exposure (i.e., grading and site stabilization) (SWRCB 2012a). Sediment risk is determined by the relative amount of sediment that can be discharged from the construction site given the duration of construction, project location, and other project site details. Receiving water risk is based on whether a project drains to a sediment-sensitive waterbody. A high-risk waterbody has one of the following conditions:

- It is listed as impaired for sediment on the most recent List of Impaired Waterbodies maintained in compliance with CWA Section 303(d);
- It has a USEPA-approved Total Maximum Daily Load implementation plan for sediment; or
- It has been designated in an applicable basin plan for COLD, SPAWN, and MIGRATORY beneficial uses.

Depending on the level of risk identified for a project, the Construction General Permit requirements progressively increase. Certain short-duration projects of less than 5 acres and constructed during one dry season may qualify for a rainfall erosivity waiver under the permit.

**Numeric Action Levels and Numeric Effluent Limitations.** To be covered by the Construction General Permit, dischargers must meet specific Numeric Action Levels (NALs) for hydrogen potential (pH) and turbidity. Exceedance of an NAL does not constitute a permit violation, but does trigger mandatory implementation of additional BMPs and/or corrective actions. In addition, the Construction General Permit requires that Risk Level 3 dischargers with direct discharges to surface waters monitor the receiving water body if an effluent sampling result exceeds receiving water monitoring triggers (i.e., effluent pH outside the range of 6.0 and 9.0 pH units or turbidity exceeding 500 Nephelometric Turbidity Units [NTU]). Where active treatment systems are used, discharges must meet Numeric Effluent Levels (NELs) for turbidity. Exceedances of the Active Treatment System turbidity NEL are considered to be violations of the Construction General Permit.

**Post-Construction Standards.** The Construction General Permit requires that the pre-project water balance (i.e., the volume of rainfall that ends up as runoff) be replicated under post-construction conditions for the smallest storms up to the 85<sup>th</sup> percentile storm event (or the smallest storm event that generates runoff, whichever is larger). In addition, for projects that disturb more than two acres, the post-project time of runoff concentration must be equal to or greater than pre-project time of concentration. Finally, BMPs to reduce pollutants in storm water discharges that are reasonably foreseeable after all construction phases have been completed must be implemented under the permit.

**Best Management Practices.** The Construction General Permit specifies mandatory, minimum BMPs to prevent storm water pollution and post-construction impacts. The required level of BMPs increases with a project's risk level. The minimum BMPs for all projects include site run-on control, perimeter controls, and good housekeeping practices, among numerous other requirements. BMPs must be implemented to meet the Best Available Technology Economically Achievable (BAT)/Best Conventional Pollutant Control Technology (BCT) standard.

**Rain Event Action Plan.** During the rainy season, the permit requires that adequate sediment control materials be available to control sediment discharges in the event of a predicted storm. Risk Level 2 and 3 sites must also develop and implement a Rain Event Action Plan (REAP) designed to protect all exposed portions of the site within 48 hours prior to any likely precipitation event. A written REAP specific for each rain event is required whenever there is a 50 percent or greater chance of receiving precipitation in the project area.

**Monitoring and Reporting Requirements.** In addition to visual monitoring at all sites, the Construction General Permit requires the following:

- Sampling, analysis, and monitoring requirements for non-visible pollutants at all sites;

- Effluent and receiving water monitoring for pH and turbidity for all Risk Level 3 sites;
- Receiving water bioassessment sampling before and after project completion for larger Risk Level 3 sites; and
- Electronic submission of an Annual Report no later than September 1 of each year via the SMARTS website. Each Annual Report must include sampling data, a summary of all exceedances and violations, corrective actions, names of all responsible parties, and training documentations.

### ***California Green Building Standards Code***

In January 2013, the State of California enacted the third revision of the California Green Building Standards Code (CALGreen Code) as part 11 of the California Building Standards Code (Title 24). CALGreen measures are designed to improve public health, safety, and general welfare by utilizing design and construction methods that reduce the negative environmental impact of development and encourage sustainable construction practices.

CALGreen provides mandatory direction to developers of all new construction and renovations of residential and non-residential structures with regard to all aspects of design and construction, including but not limited to site drainage design, storm water management, and water use efficiency. Required measures are accompanied by a set of voluntary standards that are designed to encourage developers and cities to aim for a higher standard of development.

Under CALGreen, all residential and non-residential sites are required to be planned and developed to keep surface water from entering buildings and to incorporate efficient outdoor water use measures. Construction plans are required to show appropriate grading and surface water management methods such as swales, water collection and disposal systems, French drains, water retention gardens, and other water measures that keep surface water away from buildings and aid in groundwater recharge. Plans should also include outdoor water use plans that utilize weather or soil moisture controlled irrigation systems. Non-residential structures are also required to develop an irrigation water budget for landscapes greater than 2,500 square feet that conforms to a local water efficient landscape ordinance or to the state Model Water Efficient Landscape Ordinance (MWELo), per Title 31, Green Building Standards Code, where no local ordinance is applicable. The MWELo was recently updated by the California Governor's Drought Executive Order (B-19-25) on July 15, 2015. The MWELo requirements for the project are discussed in Section 5.18, Water Supply.

## **County of Los Angeles**

### ***Storm Water Permitting (Municipal Separate Storm Sewer System Permit)***

In 2012, the California Regional Water Quality Control Board, Los Angeles Region issued an MS4 permit covering Los Angeles County and several municipalities within the County in accordance with the federal NPDES permit program and WDRs under state law (CAS004001, Order No. R4-2012-0175) (MS4 Permit). In 2013, the County amended Chapter 12.84 of the Los Angeles County Code to require that new development utilize LID BMPs in conformance

with the MS4 Permit. In 2014, the County prepared the LID Standards Manual to provide guidance for new development in meeting the storm water runoff standards in Chapter 12.84 of the County Code and in the MS4 Permit.

### County Low Impact Development Standards

As amended in 2013, Chapter 12.84 requires that new development:

- Mimic undeveloped storm water runoff rates and volumes in any storm event up to and including the “Capital Flood” event (a 50-year storm);
- Prevent pollutants of concern from leaving the development site in storm water as the result of storms, up to and including a water quality design storm event; and
- Minimize hydromodification impacts to natural drainage systems.

To achieve these objectives, Chapter 12.84 requires compliance with the following standards:

1. The project shall retain 100 percent of the Storm Water Quality Design Volume (SWQDv) on site, through infiltration, evapotranspiration, rainfall harvest and use, or a combination thereof, unless the Director of Public Works determines that it would be technically infeasible to do so.
2. If the Director determines that it would be technically infeasible to retain 100 percent of the SWQDv on site, the project shall comply with one of the following alternative compliance measures:
  - a. The project shall provide for on-site biofiltration of 1.5 times the portion of the SWQDv that is not retained on site.
  - b. The project shall include infiltration or bioretention BMPs to intercept the portion of the SWQDv that is not retained on site at an off-site location, as approved by the Director of Public Works. The project shall also provide for treatment of the portion of the SWQDv discharged from the project site, as approved by the Director of Public Works.
  - c. The project shall provide for the replenishment of groundwater supplies that have a designated beneficial use in the Basin Plan.
    - i. Groundwater replenishment projects shall include infiltration or bioretention BMPs to intercept the portion of the SWQDv that is not retained on site at an off-site location, as approved by the Director of Public Works.
    - ii. Groundwater replenishment projects shall also provide for treatment of the portion of the SWQDv discharged from the project site, as approved by the Director of Public Works.
  - d. The project shall include infiltration, bioretention, or rainfall harvest and use BMPs to retrofit an existing development with similar land uses as the project to intercept the portion of the SWQDv that is not retained on site.

- e. The County, independently or in conjunction with one or more cities, may apply to the RWQCB for approval of a regional or sub-regional storm water mitigation program to substitute in part or wholly for the provisions of this chapter for the area covered by the regional or sub-regional storm water mitigation program. If the RWQCB approves the program, provisions of the program shall apply in lieu of any conflicting provisions of this chapter.

Development projects that consist of five or more residential units, or nonresidential development projects, must further comply with the 2014 LID Standards Manual. As required, the excess storm water runoff volume ( $\Delta V$ , defined by the Los Angeles County Department of Public Works [LACDPW] as the post-developed runoff volume minus the pre-developed runoff volume for the 85<sup>th</sup> percentile storm event) from each lot upon which such development is occurring shall be infiltrated at the lot level or in the alternative, the excess storm water runoff volume from the entire development site (including streets and public rights-of-way) shall be infiltrated in sub-regional infiltration facilities built for this specific purpose. The tributary area of a sub-regional infiltration facility shall be limited to five acres, but may be exceeded with approval of the Director of LACDPW. When infiltration of all excess storm water runoff volume is not technically feasible, on-site storage, reuse, or other water conservation uses of the excess runoff volume is required and shall be implemented as authorized by the Director of LACDPW in accordance with the requirements and provisions of the LID Standards Manual.

#### County Low Impact Development Standards Manual

The 2014 LID Standards Manual was prepared by LACDPW and updates and provides a compilation of the following documents:

- Development Planning for Storm Water Management: A Manual for the Standard Urban Storm Water Mitigation Plan (SUSMP Manual, September 2002).
- Technical Manual for Stormwater Best Management Practices in the County of Los Angeles (2004 Design Manual, February 2004).
- Stormwater Best Management Practice Design and Maintenance Manual (2010 Design Manual, August 2010).
- Low Impact Development Standards Manual (2009 LID Manual, January 2009).

The LID Standards Manual also supersedes the water quality portions of the following ordinances and policies:

- Water Quality section of the Los Angeles County Hydrology Manual
- Interim Drainage Policy for Quartz Hill
- Acton Interim Drainage Policy and Guidelines
- Antelope Valley Interim Drainage Policy
- Financing the Cost to Maintain Standard Urban Stormwater Mitigation Plan Devices/Systems

- Permanent Standard Urban Storm Mitigation Plan Devices for No Fee Miscellaneous Transfer Drains, Small Drainage Systems, and Storm Drain Connection Permits
- Interim Peak Flow Runoff Criteria for New Development
- Policy for New Percolation Basin Testing, Design, and Maintenance
- Clarification on the Policy for Financing the Cost to Maintain Standard Urban Stormwater Mitigation Plan (SUSMP) Devices/Systems Constructed by New Development or Other Agencies (LADPW 2014).

The LID Standards Manual requires that “Designated Projects”, which include large scale residential and nonresidential development projects, prioritize the selection of BMPs to retain 100 percent of the SWQDv on site through infiltration, evapotranspiration, storm water runoff harvest and use, or a combination thereof, unless it is demonstrated that it is technically infeasible to do so. BMPs should be implemented in the following order of preference: (1) infiltration and/or bioretention and (2) storm water runoff harvest and use.

Designated Projects that are unable to fully retain the SWQDv on site through retention-based storm water quality control measures must implement alternative compliance measures (e.g., on-site biofiltration, off-site groundwater replenishment, off-site infiltration and/or bioretention, and off-site retrofit). Prior to off-site mitigation, the portion of the SWQDv that cannot be reliably retained on site must be treated to meet effluent quality standards.

The LID Standards Manual indicates site conditions where infiltration may not be possible, including the following:

- Locations where the corrected in-situ infiltration rate is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of retention-based storm water quality control measures for the SWQDv on site.
- Locations where seasonal high groundwater is within 10 feet of the surface.
- Locations within 100 feet of a groundwater well used for drinking water.
- Brownfield development sites or other locations where pollutant mobilization is a documented concern.
- Locations with potential geotechnical hazards.
- Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with the on-site retention requirement.
- Locations where infiltration could cause adverse impacts to biological resources.
- Locations where infiltration would cause health and safety concerns.

The LID Standards Manual also indicates where runoff harvest and use may not be possible:

- Projects that would not provide sufficient irrigation or (where permitted) domestic grey water demand for use of stored runoff due to limited landscaping or extensive use of low-water-use plant palettes in landscaped areas.
- Projects that are required to use recycled water for landscape irrigation.
- Development projects in which the storage and reuse of storm water runoff would conflict with local, State, or federal ordinances or building codes.
- Locations where storage facilities would cause potential geotechnical hazards, as outlined in a report prepared by a licensed geotechnical engineer.
- Locations where storage facilities would cause health and safety concerns.

Chapter 12.84 and the LID Standards Manual establishes requirements for hydromodification, hydrology (flood), and water quality control and require projects to fully mitigate for off-site drainage impacts caused by hydromodification and changes in water quality, flow velocity, flow volume, and the depth/width of flow, as determined by the Director of Public Works, in accordance with the requirements and provisions specified in the LID Standards Manual. If the Director of Public Works determines that it is infeasible for a project to comply with applicable mitigation standards, then the project must obtain written consent to the unmitigated impacts from the owner of every impacted downstream property. In addition, the project must comply with one of the following alternative requirements:

1. The project shall infiltrate on site at least the runoff from a 2-year, 24-hour rainfall event;
2. The runoff flow rate, volume, velocity, and duration for the project's post-development condition shall not exceed the pre-development condition for the 2-year, 24-hour rainfall events; or
3. The erosion potential (Ep), as defined in the LID Standards Manual, in the receiving water channel shall approximate one, as demonstrated by a hydromodification analysis study approved by the Director of Public Works.

### ***Los Angeles County Flood Control Act***

The Los Angeles County Flood Control Act of 1915 (Act) authorized the formation of the Los Angeles County Flood Control District (District or LACFCD) for the purpose of controlling and conserving the district's flood, storm, and other waste waters for beneficial and useful purposes. The Act enables the District to identify projects that would improve conservation and replenishment of water resources. The Act also empowers the District to protect the harbors, waterways, public highways, and property within its jurisdiction from damage from such waters. Providing for recreational use of district facilities and enhancing scenic beauty are also parts of its duties. The District, which is administered by the Los Angeles County Department of Public Works (LACDPW), is also authorized to establish special zones and to acquire and to conserve imported and reclaimed water.

In 1986, the LACDPW issued a memorandum entitled “Level of Flood Protection and Drainage Protection Standards” for all development projects in Los Angeles County (Psomas 2017). This memorandum has served as the County policy concerning flood protection and requires that flood-control facilities in the county be designed to convey the “Capital Flood” (the storm event used by LACDPW for flood-control facility design purposes, which is defined as a 50-year frequency design storm occurring in a previously saturated watershed). The standard method for runoff computations for sizing of flood-control structures accepted by the County is the Los Angeles County Modified Rational Hydrology Method. Design criteria for major drainage facilities require that facilities provide enough capacity for storm water runoff generated by a 50-year return frequency standard hypothetical storm from a burned watershed with consideration of sediment-loaded flows (e.g., burned and bulked flows). County-approved programs for the application of this method are described in the current LACDPW Hydrology Manual (LACDPW 2006).

### ***Antelope Valley Comprehensive Plan of Flood Control and Water Conservation***

The Antelope Valley Comprehensive Plan of Flood Control and Water Conservation (AV Drainage Plan) was adopted by the Los Angeles County Board of Supervisors on June 23, 1987. The AV Drainage Plan objective is to “provide mitigation for the regional flood control needs”. The AV Drainage Plan was proposed “because development in this [Antelope Valley] area has not always adequately addressed the area-wide flood hazards” (LACDPW 1987).

The AV Drainage Plan area covers approximately 1,200 square miles of land in northern Los Angeles County that are tributary to the inland basin dry lake areas in and around the Edwards Air Force Base, including the Oso Canyon and East Drainage areas of the Project site. The AV Drainage Plan requires new development projects to detain the change in peak flow from the predevelopment condition and to percolate the change in volume. Percolation basins are specified as the preferred design concept and are required to be sized on a 25-year rainfall frequency storm event. As discussed below, the Project has been designed to meet the most current County flow and flood-control standards for a 50-year storm event, which is more stringent and provides a greater level of protection than the 25-year rainfall frequency storm event in the AV Drainage Plan.

### ***Los Angeles County Green Building Standards Code***

In 2008, the County adopted the Green Building Program, which included the Drought-Tolerant Landscaping, Green Building, and Low Impact Development Ordinances (the Ordinances), and created an Implementation Task Force and Technical Manual. In November 2013, in response to the mandates set forth in the 2010 CALGreen Code, the Board of Supervisors adopted the Los Angeles County Green Building Standards Code (Title 31 of the Los Angeles County Code). The CALGreen Code and the Ordinances adopted in 2008 comprise the County’s primary green building and low impact development standards.

### ***Los Angeles County Building Code***

The Los Angeles County Building Code (Title 26, Section 110 of the Los Angeles County Code) specifically restricts the construction of buildings and/or structures within designated flood-hazard areas. As stated in Section 110.1.2 of the County Code,

A person shall not perform work for which a building or grading permit is required within the boundaries of an established floodway if such work increases the flood hazard to adjacent properties by either increasing the capital flood water surface elevation, deflecting flows or increasing bank erosion. Such work may be performed within an established floodway, and a building or grading permit therefore may be issued, where provisions are made to the satisfaction of the Building Official to avoid such an increase in the flood hazard.

***Los Angeles County General Plan and Antelope Valley Area Plan***

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, part of the County General Plan, were updated in 2015 and include goals and policies that address hydrology and flood issues in the unincorporated County. The AVAP goals and policies applicable to the analysis of hydrology and flooding with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal LU 1:** A land use pattern that minimizes threats from hazards.

**Policy LU 3.3:** Except within economic opportunity areas, limit the amount of potential development in Flood Zones designated by the Federal Emergency Management Agency, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Goal COS 3:** A clean water supply untainted by natural and man-made pollutants and contaminants.

**Policy COS 1.3:** Limit the amount of potential development in groundwater recharge areas through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Goal COS 2:** Effective conservation measures provide an adequate supply of clean water to meet the present and future needs of humans and natural ecosystems.

**Policy COS 2.3:** Require onsite stormwater infiltration in all new developments through the use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.

**Goal COS 17:** Buildings are sustainable, conserving energy, water, and other resources, and limiting greenhouse gas emissions.

**Policy COS 17.8:** Require onsite stormwater infiltration in all new developments through use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.

**Goal PS 3:** Protection of the public through flood hazard planning and mitigation.

**Policy PS 3.1:** Limit the amount of potential development in Flood Zones designated by the Federal Emergency Management Agency through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy PS 3.2:** Require onsite stormwater filtration in all new developments through use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.

**Policy PS 3.3:** Review the potential local and regional drainage impacts of all development proposals to minimize the need for new drainage structures.

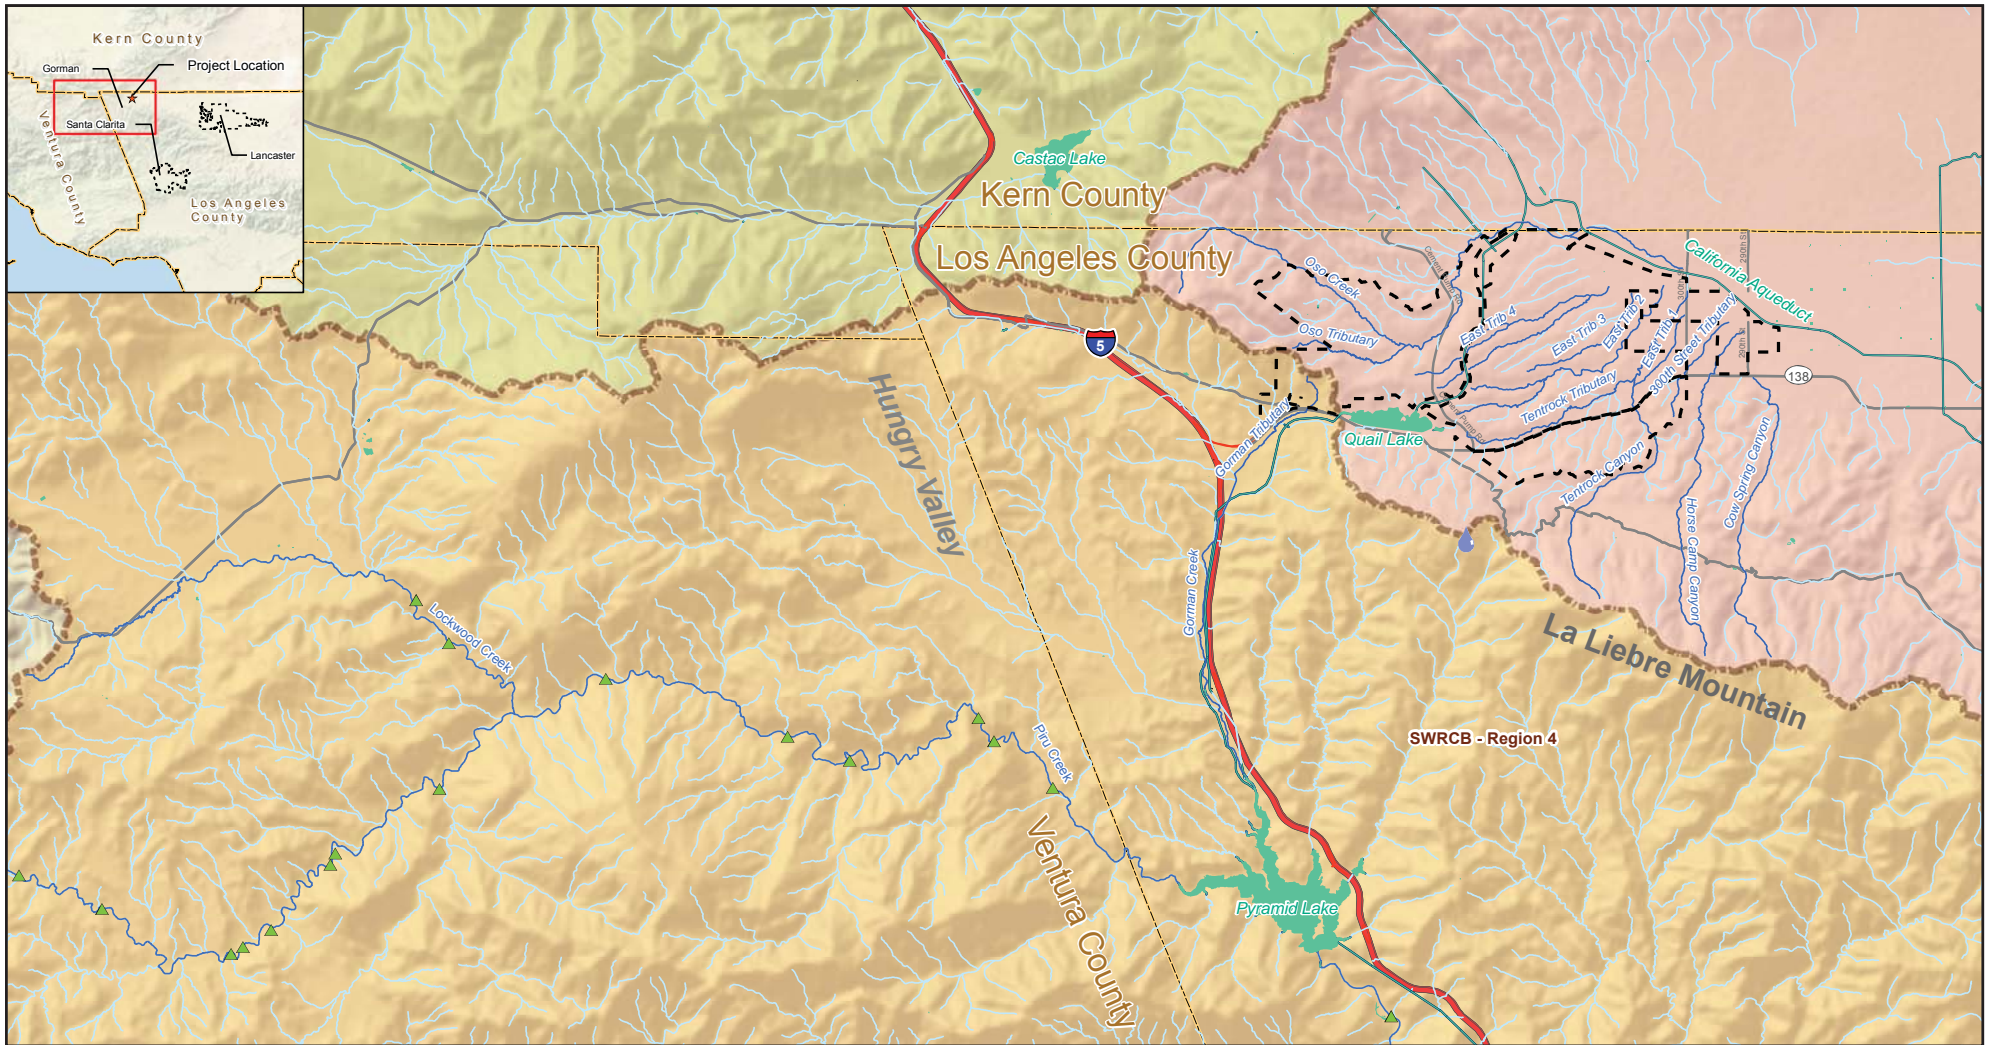

### 5.2.3 ENVIRONMENTAL SETTING

#### On-Site Watercourses and Drainage Areas

Approximately 97.3 percent of the Project site, including locations that will be preserved in open space and remain undeveloped, is located within the Antelope Valley Watershed (95.5 percent of the site) and the much smaller Quail Lake Watershed to the south (1.8 percent of the site), both of which are within the jurisdiction of the Lahontan RWQCB. Approximately 2.7 percent of the site drains to Gorman Creek, which is located about 4.5 miles downstream from the southwestern edge of the Project site. Gorman Creek is within the Santa Clara River Watershed and the Santa Clara-Calleguas Hydrologic Unit, Piru Hydrologic Area as defined in the *Water Quality Control Plan for the Los Angeles Region* (Los Angeles Basin Plan). The Santa Clara River watershed is under the jurisdiction of the Los Angeles RWQCB. Exhibit 5.2-1, Regional Water Quality Control Board Boundaries, shows the jurisdictional boundaries of the Los Angeles and Lahontan RWQCBs relative to the Project site.

As discussed in Section 5.18, Water Supply, in December 2015, the California Superior Court entered an adjudication Judgment and Physical Solution for the consolidated Antelope Valley Groundwater Cases litigation. A copy of the Judgment and Physical Solution is attached as Appendix 5.18-E of this Draft EIR. The adjudication regulates groundwater use in the Antelope Valley basin and surrounding watershed to avoid overdraft conditions and to ensure that future groundwater production is consistent with a total sustainable yield of approximately 110,000 acre-feet per year. Most of the Project site is located within the adjudication area boundary, including the Antelope Valley groundwater basin and its contributing watershed (see Exhibit 5.18-3 in Section 5.18, Water Resources, for a map of the Antelope Valley Adjudication Area as defined in the litigation). The groundwater basin and watershed includes low lying alluvial portions of the Antelope Valley in Los Angeles County and Kern County, which receive flows from drainages that originate in the surrounding mountains and foothills. Most of the surrounding drainages flow only during storm events and are dry during other periods. In general, the valley floor lacks defined natural channels outside the foothills and is subject to unpredictable sheet-flow patterns.

Centennial Project

For more information concerning the Antelope Valley Watershed, please see Section 5.18.3, Environmental Setting (specifically, the subsection entitled “Antelope Valley Groundwater Basin”). For more information regarding site geology, topography, and drainage characteristics, please see Section 5.7, Biological Resources (specifically, Section 5.7.3, Environmental Setting “Characteristics of the Site”).

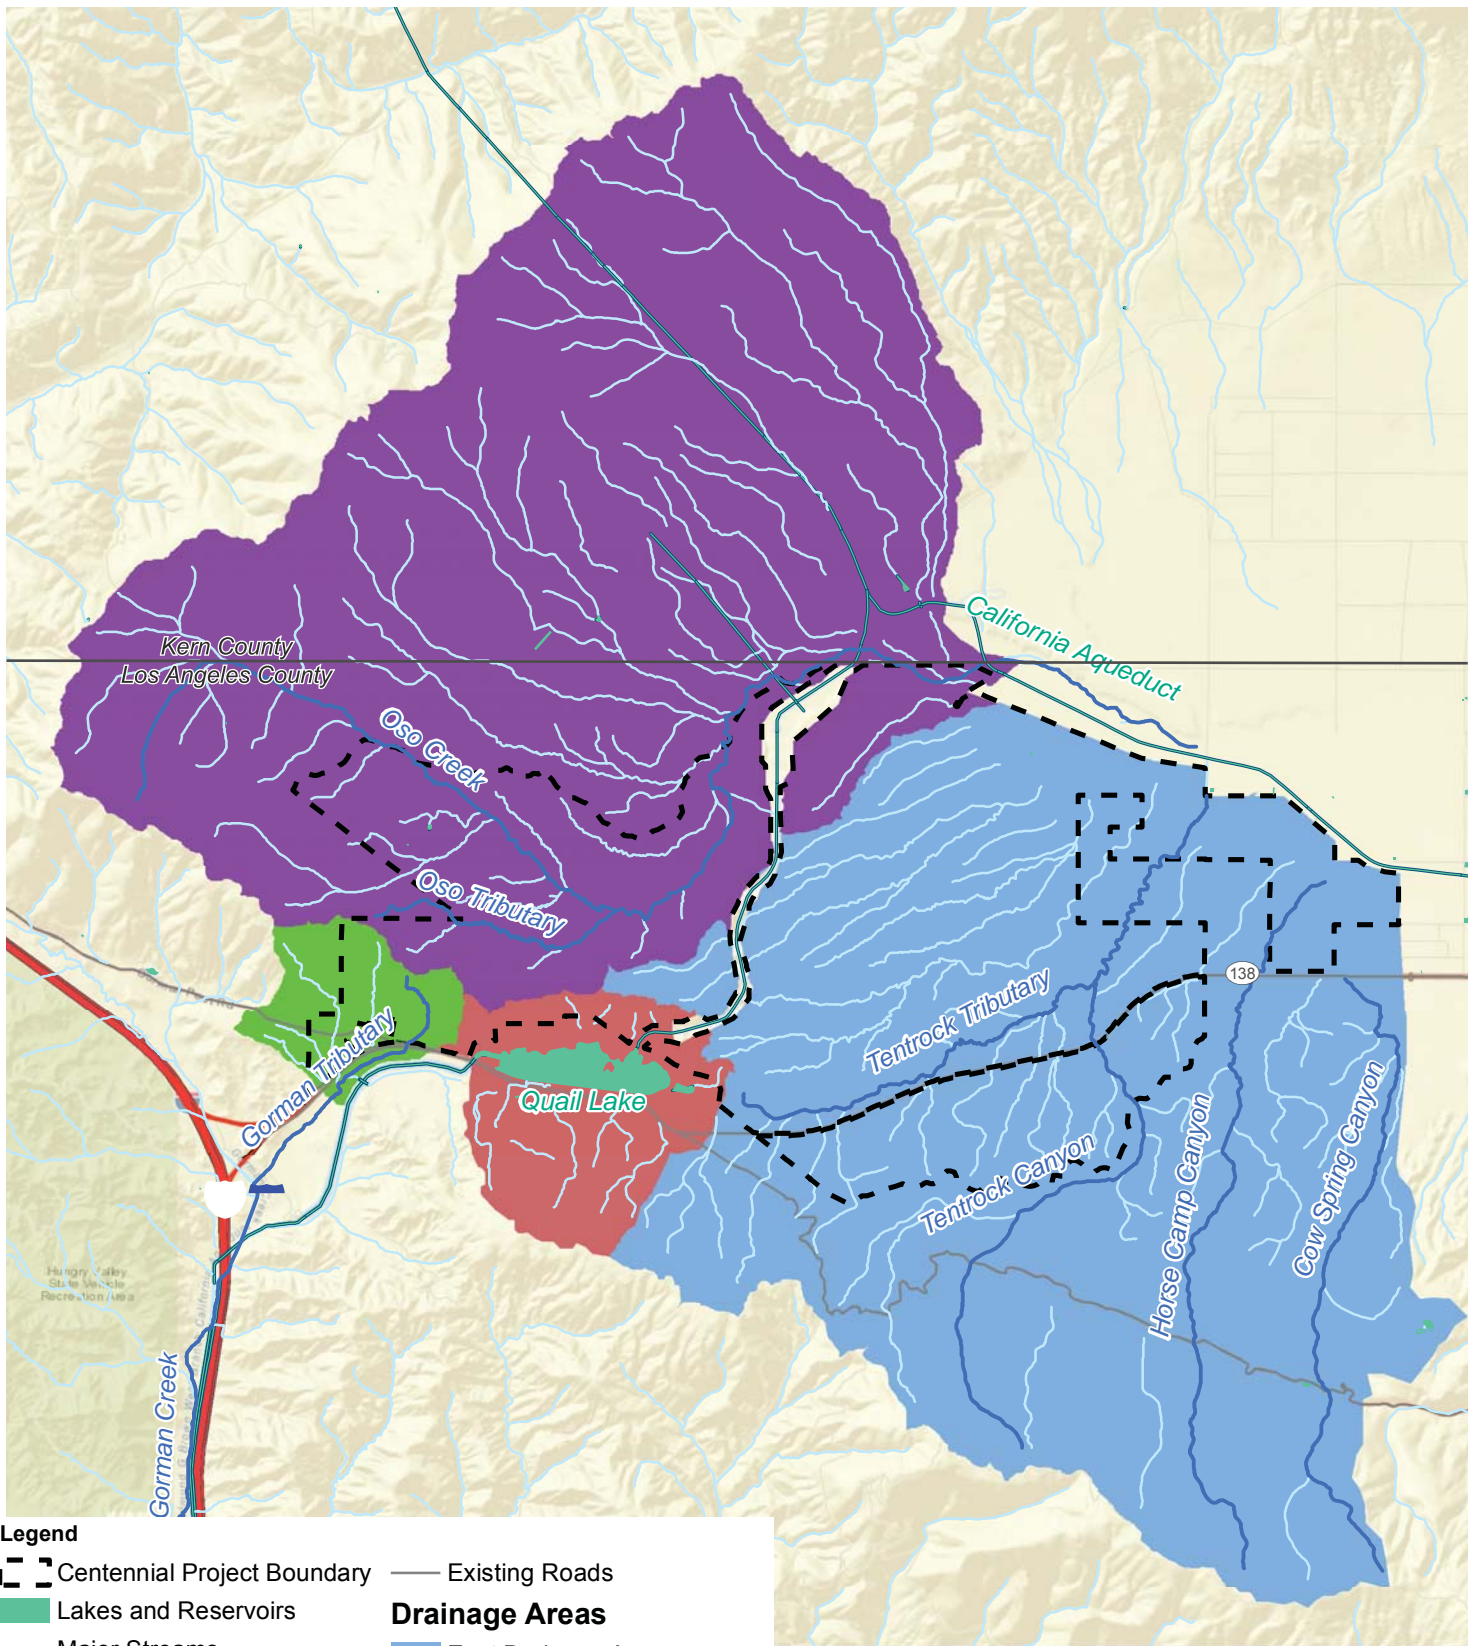

The drainage area of the Project site is within both Los Angeles County and Kern County. As shown on Exhibit 5.2-2, Drainage Areas on the Project Site, four drainage systems extend into portions of the Project site. The two largest systems are the East Drainage Area and the Oso Creek Drainage Area. Portions of the Gorman Creek Drainage Area and the Quail Lake Drainage Area also extend into the west and southwest portions of the site. Larger canyons that have flows in the Project area include Oso Canyon and Tentrock Canyon. As shown on Exhibit 5.2-3, Existing Watershed and Drainage Nodes, Little Sycamore Creek and Los Alamos Creek are tributary to Oso Creek and traverse through a small portion of the site from the north.

There are 15 larger tributary systems within the Project site, including 12 within the East Drainage Area, as listed in Table 5.2-1 below.

## Existing Watershed and Drainage Nodes

## Exhibit 5.2-3

Centennial Project

Exhibit 5.2-4, Proposed Infiltration Basin Locations, shows the locations of the proposed development areas and the 28 regional detention and retention basins that comprise the primary hydromodification and hydrology BMPs that will be implemented for the Project. As discussed in Section 5.2.5 below and in Section 5.7 Biological Resources (specifically, Threshold 7-3) and as shown in Exhibit 5.2-5, Receiving Channels of Concern and 100-Year Floodplain, the Project will avoid most of the watercourses and watershed areas in the Gorman Creek, Quail Lake, and Oso Creek Drainage Areas. Approximately 18 percent of the proposed development would occur west of the West Branch of the Aqueduct, and drainage impacts in this area would primarily affect Oso Creek tributaries flowing north from the south side (i.e., the northerly face) of Oso Canyon. Drainage impacts in the Gorman Creek Drainage Area would largely be avoided. No drainage impacts will occur in the Quail Lake Drainage Area.

Approximately 88 percent of the proposed development would occur east of the West Branch of the Aqueduct. As discussed in Section 5.2.5 below and in Section 5.7 Biological Resources (Threshold 7-3) and as shown on Exhibit 5.2-2, most of the Project impacts to existing drainages would occur in the East Drainage Area. Smaller drainages in this location would generally be integrated with the Project's storm drain system. Flow patterns associated with several existing larger tributary systems, including East Tributary systems and the Cow Spring Canyon, Horse Camp Canyon, the 300<sup>th</sup> Street Tributary systems, will largely be maintained by avoiding or constructing flow controls in existing channels or by recreating existing channels after site grading. Flow, LID, and hydromodification management facilities (e.g., detention and retention basins) will be constructed adjacent to channels, primarily in downstream reach locations. Approximately 17 basins would be at the elevation of the development pads, 3 would be adjacent to a channel, and 8 would be within a channel.

The following sections provide additional information about existing conditions in the four drainage areas that extend into the Project site, as shown on Exhibit 5.2-2.

### ***East Drainage Area***

The East Drainage Area includes approximately 18,900 acres, of which 41 percent is within the Project site. Flows in the drainage that are conveyed through the East Tributary systems originate just west of the West Branch of the Aqueduct where flows are conveyed under the Aqueduct via existing culverts. All watersheds contributing runoff to the East Tributaries are located on the Project site and within areas of proposed development. Flows from the north-facing slopes of La Liebre Mountain are conveyed to the north and east under State Route (SR) 138 through Cow Spring Canyon, Horse Camp Canyon, the 300<sup>th</sup> Street Tributary, Tentrock Canyon, and lower-lying tributaries. Ground elevations within the East Drainage Area range from 2,960 feet above sea level (msl) to 5,800 feet above msl. Flows from the East Drainage Area reach the East Branch of the Aqueduct to the east of the Project boundary and are conveyed by crossings at 292<sup>nd</sup> Street and 286<sup>th</sup> Street. In low-flow conditions, East Drainage Area flows are infiltrated in the valley floor prior to reaching the Aqueduct crossings.

# Receiving Channels of Concern and 100-Year Floodplain

# Exhibit 5.2-5

Centennial Project

### ***Oso Canyon Drainage Area***

The Oso Canyon Drainage Area drains approximately 20,040 acres, of which approximately 16 percent is located on the Project site. Ground elevations in the drainage range from 3,000 feet above msl to 4,500 feet above msl. The primary watercourse in the Oso Canyon Drainage Area is Oso Canyon Creek (Oso Creek), which originates in the Tehachapi Mountains to the northwest of the site. Oso Creek drains northwest to east through the northern part of the site and merges with Los Alamos Creek at the eastern site boundary. The flows are conveyed across the West Branch of the California Aqueduct; reenter the extreme eastern portion of the site; and then merge with flows from Little Sycamore Canyon off site after crossing the East Branch of the Aqueduct. Flows in the main stem of Oso Creek are typically ephemeral in the Project area and generally infiltrate when they reach the valley floor under low-flow conditions.

### ***Quail Lake Drainage Area***

The Quail Lake Drainage Area encompasses approximately 2,026 acres, of which approximately 17 percent is on the Project site. Ground elevations in the drainage range from 3,320 feet above msl at Quail Lake to approximately 3,600 feet above msl. Quail Lake is 1 of 29 storage facilities used to convey water in the State Water Project (SWP) and is managed by the California Department of Water Resources (DWR). The SWP conveyance system, which includes Quail Lake, is used to provide imported water for urban and agricultural uses throughout California, including Southern California. The lake was historically a sag pond along the San Andreas Fault and was expanded to store approximately 7,500 acre-feet of imported water from the West Branch of the Aqueduct. The SWP system conveys water from Quail Lake south to Pyramid Lake and further downstream to Castaic Lake, which is the southern terminus of West Branch of the California Aqueduct. Pyramid Lake stores SWP water for delivery to Southern California; provides regulated storage for the Castaic power plant; and provides flood protection along Piru Creek. Downstream of Pyramid Lake, Piru Creek flows south approximately 19 river miles to Piru Lake (which is formed by the Santa Felicia Dam) and then flows for approximately 6 miles below the Santa Felicia Dam southward to join Reach 4 of the Santa Clara River. The point of confluence with the Santa Clara River is located approximately 40 miles south of the Project site.

### ***Gorman Drainage Area***

The Gorman Drainage Area encompasses approximately 963 acres, of which approximately 55 percent is within the Project site boundaries. The primary direction of surface water flow is westerly along SR-138. Ground elevations range from 3,100 feet above msl at the outlet to Gorman Creek to 3,600 feet above msl in the drainage. As shown in Exhibit 5.2-2, the Gorman Tributary flows into Gorman Creek about 1.5 miles downstream from the Project boundary. Gorman Creek flows to Cañada de los Alamos in the Lower Hungry Valley before discharging to Pyramid Lake about six miles downstream from the Project boundary.

## **Existing Drainage Geomorphic Conditions**

The dominant factors influencing existing drainage channels on the Project site are hydrology, channel geometry, bed and bank material, and sediment supply.

The Project site is predominately undeveloped with localized changes related to ongoing livestock grazing and agriculture. Most of the Project site is currently used for cattle grazing, which has occurred for over 150 years. Portions of the eastern half of the site are used for agriculture. A few residential dwellings are located near the center of the northern property line, including single-family units and several trailers used in support of grazing and property caretaking activities. An inactive hunters' camp, located in the western portion of the site, consists of six trailers, a shooting range, and two outhouses. The site contains two aboveground water storage tanks and a water well (Geosyntec 2016).

Several unpaved roads exist on the Project site. Paved roadways also traverse portions of the site and provide access to the National Cement Plant located to the north, facilities associated with the Aqueduct, and agricultural operations. SR-138 traverses through the southern portion of the Project site and 300<sup>th</sup> Street West runs north from SR- 138. Several siphons and culverts have been installed in conjunction with the Aqueduct to convey flows from existing drainages over or under the Aqueduct. Minor agricultural drainage ditches have also been constructed in certain locations (Geosyntec 2016).

The existing site channel network is generally a dynamic (i.e., changing) system originating locally in the foothills of the Tehachapi Mountains to the west and north of the site and the La Liebre Mountains to the south. Uplift along the San Andreas Fault has tipped the valley floor down toward the north causing drainage channels to trend along south-facing hill slopes. Sediment production is highest in the upgradient portions of the Oso Canyon and East Drainage Areas. In the downstream and eastern portions of the Oso Canyon and East Drainage Areas, the alluvial valley floor is broader; the longitudinal slope is flatter; sediment supply is high relative to sediment transport capacity; and the bed and banks consist of unconsolidated sands and fine gravel that promotes infiltration. East of the West Branch of the Aqueduct, and outside the Project's northeastern boundary, the channels become less defined and Oso Creek and the Eastern Drainage Area channels disappear into flat agricultural areas associated with the western portion of Antelope Valley (Geosyntec 2016).

Certain channels on the site consist of a primary (bankfull) channel situated in a wider, alluvial valley corridor and a compound channel morphology that consists of a low flow channel within a primary channel and a larger overbank channel which is then contained within an alluvial valley corridor. Bed material on the site consists predominantly of sand, with some intermixed gravel and localized cobbles and boulders. Sparse grass was observed in certain drainages but not in amounts that would provide added strength to the channels. Most of the existing channel reaches are live-bed alluvial channels in which the bed material is composed of sediments produced and transported from upstream locations and are sensitive to perturbations in bed sediment supply. Bank material consists predominantly of silty sand to sandy loam. Bank material in the broad valley floor is generally loosely consolidated alluvial silts, sands, and gravels. Bank vegetation consists of grasses and shrubs, with some trees in the upper reaches of Oso Creek. Root density of the more prevalent grasses and shrubs is low to moderate and does not appear to add significant strength to the bank material. Silty sand to sandy loam materials comprise the bed and bank in many of the more eroded channels. This uniformity in channel material is a function of historic channel incision into the relatively homogenous native alluvium (Geosyntec 2016).

Existing sediment supply has been affected by prior land uses. Cattle grazing reduced vegetation cover in canyon bottoms, which has increased surface rill and gully erosion. Cattle access to active channels and bank vegetation grazing has disturbed stream channel banks and bed and increased in-channel sediment supplies (Geosyntec 2016).

The Sediment Yield Map for the Western United States published by the National Resources Conservation Service (NRCS; formerly Soil Conservation Service) indicates three ranges of sediment yield apply to the Project site's drainage areas. A sediment yield rate of 0.5 to 1.0 acre-foot per square mile per year (af/mi<sup>2</sup>/yr) applies to mountainous terrain south of the site within the La Liebre Mountain Range, with 40 percent of that rate generated from out-of-stream sources (i.e., sheet and rill erosion) and 60 percent from in-stream sources (i.e., channel and gully erosion). A sediment yield rate of 0.2 to 0.5 af/mi<sup>2</sup>/yr applies to the undulating hills on the Project site and the Tehachapi Mountain Range north and west of the site, with 60 percent of that rate generated from out-of-stream sources and 40 percent from in-stream sources. A sediment yield rate of 0.1 to 0.2 af/mi<sup>2</sup>/yr applies to the flat alluvium associated with the Antelope Valley floor within and east of the Project site, with 60 percent of that rate generated from out-of-stream sources and 40 percent from in-stream sources (Geosyntec 2016).

## **Floodplains**

As shown in Exhibit 5.2-5, Receiving Channels of Concern and 100-Year Floodplain, the Federal Emergency Management Agency (FEMA) has identified the 100-year floodplain for the Oso Creek drainage. Northern portions of the Project site are also identified as within a 100-year floodplain and as flood-prone areas on the *Flood Hazard Zones Policy Map* of the *Los Angeles County General Plan (Figure 12.2)* (DRP 2015). As discussed in Thresholds 2-6 and 2-7 below, no habitable residential, school, administration, or commercial structures will be constructed in these locations.

## **Existing Runoff Conditions**

The hydrology calculations for the Project were prepared using the Los Angeles County Department of Public Works' methodology as outlined in their Hydrology Manual (January 2006). Where soils and rainfall data were not available (area south of County line) in the Manual and for areas in Kern County, data was obtained from the National Oceanic and Atmospheric Administration (NOAA) Rainfall Atlas. Soil classifications were obtained from NRCS data and then compared to Los Angeles County soil types for areas within Los Angeles County (where there were overlapping soil groups). The dominant Los Angeles County soil classification number was then assigned to the NCRS classification.

In 2013, County LID standards were amended to require that new development mimic undeveloped storm water runoff rates and volumes for a 50-year storm event. The County method for analyzing a project site's pre-and post-development storm water runoff rates and volumes includes the preparation of an existing conditions hydrologic and hydraulic model using a hydrology module developed by the County for use within the XPSWMM analysis program (LACDPW 2006). The proposed development will result in an increased amount of impervious surfaces in the Project area and increase the volume of storm water flowing from

currently undeveloped locations. The XPSWMM program is utilized to estimate post-development conditions with proposed flow-control measures; to compare the results with preconstruction conditions; and to verify compliance with the County's storm water runoff rate and volume performance standards.

To implement the XPSWMM analysis for existing site conditions, on-site watersheds were mapped in accordance with County criteria and 9 "cross sections" were identified at downstream (outbound flow) locations along the Project boundary. The analysis methodology is described in more detail in Threshold 2-2 below and in Appendix 5.2-A (Psomas 2017). The locations of the cross sections under existing conditions are shown on Exhibit 5.2-3, Existing Watersheds and Cross Sections. Rainfall rates associated with a 50-year storm were estimated for areas within Los Angeles County, based on the design rainfall isohyets in the Los Angeles County Hydrology Manual where the data is available and, where data was not available and for areas in Kern County, the NOAA Atlas 14 data was used (see Appendix 5.2-A). Runoff into existing watercourses generated by the precipitation was calculated using the existing levels of impervious and pervious surfaces on the site (Psomas 2017). Table 5.2-2, Existing Runoff Discharge Rates and Volumes, 50-Year Storm Event, Cross Sections Along Project Boundaries, summarizes the peak flow rate (also called the "Q" rate) and volume of storm water runoff at each of the 16 nodes during a 50-year storm event under existing conditions and utilizing the County analysis methodology. These nodes are depicted on Exhibit 5.2-3, Existing Watershed and Drainage Nodes.

## 5.2.4 PROJECT DESIGN FEATURES

**PDF 2-1** The Project will implement a comprehensive system of site design, source control, low impact development, and hydromodification Best Management Practices that meets or exceeds the hydrology (storm water runoff) standards

for new development in the County LID standards (Los Angeles County Code, Section 12.84) and the County LID Standards Manual which were adopted and prepared by the County of Los Angeles Department of Public Works to comply with the revised Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175).

**PDF 2-2** The Project will incorporate a Floodplain Safety Overlay that applies to on-site locations that have been designated as Federal Emergency Management Agency (FEMA) Zone A floodplain zones. No habitable residential, commercial, school and institutional building construction will occur in Project site locations subject to the Floodplain Safety Overlay.

### 5.2.5 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

**Threshold 2-1** Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site.

**Threshold 2-2** Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site.

**Threshold 2-3** Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff.

**Threshold 2-4** Conflict with the Los Angeles County Low Impact Development Ordinance (L.A. County Code, Title 12, Ch. 12.84).

**Threshold 2-5** Create drainage system capacity problems, or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

**Threshold 2-6** Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map, or within a floodway or floodplain.

**Threshold 2-7** Place structures, which would impede or redirect flood flows, within a 100-year flood hazard area, floodway, or floodplain.

- Threshold 2-8** Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.
- Threshold 2-9** Place structures in areas subject to inundation by seiche, tsunami, or mudflow.
- Threshold 2-10** Add water features or create conditions in which standing water can accumulate that could increase habitat for mosquitoes and other vectors that transmit diseases such as the West Nile virus and result in increased pesticide use.

## 5.2.6 ENVIRONMENTAL IMPACTS

The analysis of potential Project impacts associated with Thresholds 2-1 to 2-10 is primarily based on the *Centennial Master Plan Hydrology* study prepared by Psomas (Appendix 5.2-A) and the *Centennial Project Hydromodification Technical Report* prepared by Geosyntec (Appendix 5.2-B).

- Threshold 2-1** **Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?**

The Hydromodification Technical Report prepared by Geosyntec evaluates impacts to natural streams using the Ep methodology that is an alternate methodology identified in the County LID Manual. This evaluation is summarized below to demonstrate how the Centennial Master Plan Hydrology analysis results in no increases in downstream flow conditions and therefore does not result in hydromodification impacts. Per the requirements of MM 2-1, the Project will be designed to meet the requirements of Section 8 – Hydromodification Impacts of the County LID Standards Manual, which will be confirmed through the preparation of a Drainage System Engineering and Planning Report to be submitted with each Project tract map application.

Changes in runoff patterns caused by introducing development-related impervious surfaces and drainage infrastructure can modify natural watershed and stream hydrologic (water flow) and geomorphic (landform) processes. These potential channel changes are commonly referred to as hydromodification impacts and can cause channel erosion, migration, or sedimentation unless managed and controlled. The Project hydromodification impact analysis includes geomorphic field assessments conducted by Geosyntec from August 31 and September 1, 2015. The analysis also utilizes relevant data and reports, including but not limited to, aerial photography; NRCS soils and sediment yield rate data; the Los Angeles and Lahontan RWQCB Basin Plans that include the Project site; scientific and/or academic publications related to hydromodification; laboratory analysis of grain size distribution from soil samples collected on site; and an assessment of the potential hydromodification impacts of the Project under post-development conditions and with planned BMPs (Geosyntec 2016).

One method for predicting the likelihood of channel changes due to watershed and channel hydrologic and geomorphic variables and for sizing and situating hydromodification BMPs and other controls utilizes the concept of erosion potential (Ep). Ep is defined as the ratio of post-project long-term effective work or sediment transport capacity within a channel boundary compared with pre-project conditions (i.e., post-project conditions/pre-project conditions). This ratio is affected by changes in hydrology, channel geometry, and bed and bank material due to land use alterations. Recent studies that have analyzed and further developed the Ep methodology include the Southern California Coastal Water Research Project's Technical Report 753, which documents an empirical relationship between Ep and stream instability in the Southern California region (i.e., a 2007 report by Palhegyi and Rathfelder) that identifies a widely accepted method of quantitatively accounting for sediment supply changes without replacing bed sediment sources and the derivation of upper-end Ep values in Southern California.

The County MS4 permit, LID standards per Chapter 12.84 of the County Code, and the LID Standards Manual require that projects discharging to natural drainage systems implement hydrologic control measures to prevent accelerated downstream erosion and to protect stream habitat. New development must minimize hydromodification impacts to natural drainage systems, and the LID standards per Chapter 12.84 of the County Code requires full on-site mitigation for off-site drainage impacts caused by hydromodification (Geosyntec 2016).

In order to avoid significant environmental impacts related to erosion/siltation, the Project will be designed to meet the requirements of Section 8 – Hydromodification Impacts of the County LID Standards Manual.

Receiving channels of concern for hydromodification impacts were identified with a desktop assessment and supported by a geomorphic field assessment. Per the Los Angeles County MS4 Permit, receiving waters that are not susceptible to hydromodification impacts include lakes, sumps, tidally influenced water bodies, large rivers, and modified engineered conveyances (LARWQCB 2012). Receiving waters that are considered susceptible to hydromodification impacts are the remaining natural stream channels. In addition to being susceptible channels, the Project's receiving channels of concern for hydromodification are limited to State and federal jurisdictional drainage features and drainages downstream of Project development (e.g., via outfalls). Existing tributary systems that would not be subject to Project development area runoff discharges under post-development conditions were determined to not be receiving channels of concern for hydromodification, many of which will be graded with drainage features incorporated into the proposed storm drainage system.

Such tributary systems include East Tributary 6, for which the existing channels will be removed entirely by the Project; East Tributaries 7, 8, and 9, which do not have defined channels in either the existing or proposed condition; East Tributary 1, 300<sup>th</sup> Street Tributary, and several side channels throughout the Project site, which will have reduced drainage area due to diversion of runoff to downgradient outfalls; and Horse Camp Creek and Cattle Camp Creek, for which the susceptible channels are all upgradient of the Project outfalls. All other existing susceptible tributary systems and tributary reaches that could

potentially receive Project development area runoff discharges under developed conditions were identified as receiving channels of concern for hydromodification impacts, which are listed in Table 5.2-3 and generally include state jurisdictional drainage features in the East, Oso Creek, and Gorman Drainage Areas. No receiving channels will receive Project development area runoff discharges under developed conditions in the Quail Lake Drainage Area.

**TABLE 5.2-3  
RECEIVING CHANNELS OF CONCERN FOR HYDROMODIFICATION**

Drainage Area	Watershed	Reach	Percent Impervious
East Drainage Area	Tentrock Canyon	Tentrock Canyon	1.1
		Tentrock Tributary	
	East Tributary 2	East Tributary 2	1.0
		East Tributary 2a	
		East Tributary 2b	
	East Tributary 3	East Tributary 3	1.0
	East Tributary 4	East Tributary 4	1.0
		East Tributary 4a	
		East Tributary 4b	
		East Tributary 4c	
Oso Canyon Drainage Area	Oso Creek	Oso Creek	0.4
Gorman Drainage Area	Gorman Tributary	Gorman Tributary	3.6
Source: GeoSyntec 2016 (Appendix 5.2-B)			

Discharge locations from the East Drainage Area associated with drainage crossings of the East Branch of the Aqueduct at approximately 292<sup>nd</sup> Street and 286<sup>th</sup> Street were not considered jurisdictional features and were not identified as receiving channels of concern. Surface water runoff is only expected to occur at these discharge locations during high magnitude, low frequency storm events. Potential hydrology and flood impacts at these locations are considered in Threshold 2-2.

### **Construction Impacts**

The primary hydromodification concern during construction is potential erosion and sedimentation caused by soils carried in runoff flows that could physically alter receiving channels. As discussed in Section 5.2.2 above, the Project must comply with the state General Construction Permit, which requires that construction period BMPs be implemented in accordance with an impact risk assessment. A SWPPP must be prepared and implemented that includes BMPs that meet or exceed the permit requirements applicable to the level of construction risk. Hydromodification construction period BMPs may include erosion controls that prevent erosion and sediment controls that trap sediment carried in runoff in basins or other facilities. The permit requires that BMPs incorporate the best available

technology economically achievable and best conventional pollutant control technology. BMP implementation must be based on the phase of construction and current weather conditions to control erosion and sediment. A Construction Site Monitoring Program that identifies monitoring and sampling requirements during construction is a required component of the SWPPP.

Project construction is anticipated to be classified as Risk Level 2 as defined in the General Construction Permit. Hydromodification erosion, sediment and other applicable BMPs will be implemented in response to the risk assessment (Geosyntec 2016). Additional information concerning the implementation of the Construction General Permit during Project construction is provided in Section 5.4, Water Quality, of this EIR. Through implementation of all requirements of the Construction General Permit, construction period hydromodification impacts related to erosion and other discharges of sediment in runoff would be less than significant and no additional mitigation is required.

### ***Operational Impacts***

Potential operational hydromodification impacts could occur if the post-Project long-term effective work or sediment transport capacity in a channel is greater than existing levels (i.e., Ep greater than 1.0 or other applicable level as described in the County LID standards per Chapter 12.84 of the County Code. Additional runoff from developed impervious surfaces could mobilize sediment and physically alter receiving channels. As discussed above, all existing tributary systems on the Project site that could receive runoff from developed areas were classified as receiving channels of concern for hydromodification impacts (see Table 5.2-3). Impacts to these channels could be significant if post-development runoff conditions are not controlled to meet the requirements in Section 8 – Hydromodification Impacts of the County LID Standards Manual, as required by MM 2-1.

The Project will meet the requirements in Section 8 – Hydromodification Impacts of the County LID Standards Manual in MM 2-1 by implementing nonstructural and structural site design measures that reduce erosion and sedimentation risks; on-site distributed and parcel-based LID measures that capture and avoid runoff and sediment mobilized by runoff; and by constructing a regional runoff retention and detention system that includes 28 basins distributed throughout the site (see Exhibit 5.2-4). The following sections describe these measures in more detail.

### **Non-Structural Site Design Measures**

#### ***Minimize Impervious Areas/Preservation of Open Spaces***

Project design to minimize impervious areas and reduce increases in runoff volumes and rates associated with development. Undeveloped areas with uncompacted soils also provide opportunities for infiltration of runoff in impervious areas and help to preserve pre-development infiltration, evapotranspiration, percolation, subsurface flow, groundwater recharge, and surface runoff conditions. The Project includes preserved open spaces of approximately 5,787 acres (approximately 47 percent) of the 12,323-acre Project site proposed for active and passive recreational use in the form of parks (i.e., 163 acres of Park Overlay) or natural resource protection (i.e., 5,624 acres of Open Space).

*Prioritize Soils for Development and Infiltration*

Development on the Project site is generally located on existing poorly infiltrating soils, and avoids soils with higher infiltration rates for flow and volume management and groundwater recharge. Distributed and parcel-based LID and regional BMPs will be implemented to provide infiltration capacity for developed areas that affect locations with higher infiltration rates.

*Establish Riparian Buffer Zones*

Riparian buffer zones are included in the Project design to prevent changes to channel geometry (i.e., narrowing of the floodplain width) or bed and bank materials that can contribute to increased erosion independent of upstream flow changes; sustainably support existing flora and fauna; to maintain existing native wood and leaf debris input into the drainage system; to filter storm water runoff before it enters a receiving channel; and to maintain the hydrologic connectivity between channels and floodplains. Existing riparian corridor widths will be conserved while avoiding in-stream constrictions (i.e., culverts, bridges, and at-grade crossings) to the extent possible.

*Prohibit Disturbance within Riparian Corridors*

In addition to riparian buffers, riparian corridors on the Project site will be protected by prohibiting cattle grazing and other significant erosion-inducing activities, such as off-highway vehicle use. These activities adversely affect channel vegetation and erosion; decrease the resistance of channel bed and banks; and increase the risk of further erosion when water is flowing.

*Avoid Significant Bed Material Supply Sources in Site Design*

The Project will reduce changes in bed sediment supply associated with hydromodification impacts by avoiding development in locations and channels that are significant contributors of bed material load. Where feasible, development is located outside natural channels and on existing soils that have a lower potential to contribute bed material to a receiving channel.

*Pass Through Sediments from Natural Open Space*

Drainage pathways for open spaces upstream of development have been designed to pass coarse bed sediments from natural areas and channels to alluvial receiving channels of concern. Maintaining natural bed sediment supplies to channels reduces the potential for excess erosion in alluvial channels.

Structural Site Design Measures

*Distributed Volume and Flow Management*

The Project includes volume and flow management structural measures that achieve the following hydromodification control objectives:

- Detain runoff in basins or similar facilities for release in a controlled way that mimics pre-development in-stream sediment transport capacity.

- Manage excess runoff volumes through infiltration; evapotranspiration; storage and use; discharge at a rate below the critical low-flow rate; or by downstream discharge to a conveyance system and locations that are not susceptible to hydromodification.

Distributed facilities are smaller-scale facilities typically treating runoff from one or a few parcels, including LID BMPs and hydromodification-control detention facilities such as underground vaults and pipes. Exhibit 5.4-2, Low Impact Development (LID) Drainage Areas Within Project, shows the locations of the primary distributed LID management measures that will be implemented for portions of the Project site. As discussed in Threshold 2-2 below and Section 5.4, Water Quality, these measures provide flood and water quality controls in addition to hydromodification control. Distributed and parcel-based measures will meet the LID performance standard incorporated into MM 4-1 (see Section 5.4, Water Quality).

#### *Regional Detention and Retention Basins*

Regional detention and retention basins are storm water management facilities designed to detain or infiltrate runoff from multiple parcels or project areas. The basins are typically shallow with flat, vegetated bottoms. Regional basins are constructed by either excavating a depression or building a berm to create aboveground storage. Runoff is stored in the basin and in the pore spaces of the underlying surface soils. Storm water treatment measures such as swales, filter strips, and sedimentation forebays that intercept runoff prior to reaching the basins minimize fine sediment loads and reduce basin maintenance requirements. Basin outlet structures are designed to mimic pre-development in-stream sediment transport capacity. As discussed in Threshold 2-2 below, and in Section 5.4, Water Quality, the regional detention and retention basin system has been sized and designed to also meet applicable flood control and water quality requirements.

The regional infiltration detention system for the Project includes 28 basins that will provide both hydromodification and flow control and water quality treatment for the majority of the proposed development area. The locations of the basins are shown on Exhibit 5.2-4. Normalized sizing charts were applied to the proposed development areas that are tributary to each basin to identify the flow retention and duration volumes required to match the pre-development flow conditions based on site soils and geology, infiltration rates, and stream channel resiliency (i.e., critical shear stress values). The hydromodification control volumes required to meet the performance standard and the total volume provided for hydromodification, as well as flood and water quality control at each basin location, are listed in Table 5.2-4.

**TABLE 5.2-4  
SUMMARY OF REGIONAL RETENTION AND DETENTION  
FOR HYDROMODIFICATION CONTROL**

Regional Basin Number	Receiving Channel	Discharges to a Receiving Channel of Concern for Hydromodification (Y/N)	Tributary Area	Tributary Percent Impervious	Required LID Retention Volume	Total Retention Volume Provided	Total Basin Volume Provided

As shown in Table 5.2-4, no receiving channels of concern would potentially be affected by development area discharges from Basin 1 and Basins 21 through 25, and no hydromodification control volumes are required at these locations. The total volumes for Basin 1 and Basins 21 through 25 (see the last column of Table 5.2-4) represent capacity provided for flood and water quality control. Basin 0 and Basins 2 through 20 would discharge to receiving channels of concern. Table 5.2-4 shows that the detention and retention volumes required to meet the hydromodification control standard has been provided at these locations.

### *In-Channel Controls and Channel Restoration*

To provide additional hydromodification control, the Project includes in-channel measures that protect or restore receiving channel hydraulic properties and bed and bank material resistance to control runoff and sediment. In general, in-channel measures are most effective in locations where a receiving channel of concern has previously been impacted by erosive flows and excessive sediment, erosion or deposition or where it is a hardened channel. As discussed in Section 5.7, Biological Resources, the receiving channels of concern for hydromodification impacts are regulated by the California Department of Fish and Wildlife (CDFW) or the Los Angeles or Lahontan RWQCBs. A small portion of the on-site channels in the western portions of the Project site is subject to federal jurisdiction. Any in-channel measures within State or federal jurisdictional waters will not be constructed until all required permits and approvals have been obtained from the appropriate State and federal agencies.

In-channel measures used to reduce hydromodification risks are discussed in more detail in Appendix 5.2-B (Geosyntec 2016). The Project's proposed in-channel hydromodification measures include grade-control structures, bed and bank reinforcement, and flow diversions.

Grade-control structures maintain the existing channel slope while allowing for minor amounts of local scour. These control measures consist of a narrow trench across the width of the channel that is backfilled with concrete or similar material and a constructed "plunge pool" consisting of boulders and vegetation. Grade-control structures are proposed within portions of the East Tributary system, including East Tributary Reaches 2, 2a, 2b, 4a, 4b, 4c, and 4d (Geosyntec 2016).

Bed and bank reinforcement measures control erosion by stabilizing bed and bank surfaces and by re-establishing native plant communities. Receiving channels of concern within the lower alluvial portions of the site have often abandoned older channels and created new flow paths as a result of the high level of sediment production that occurs within the Tehachapi and La Liebre Mountain Watersheds. Sediment from the upper reaches of the watersheds accumulates in alluvial locations and diverts channel flows. Buried bank stabilization will be provided as necessary along the edges of proposed channels adjacent to development that are susceptible to movement from sediment deposition, including most or all of the receiving channels of hydromodification concern (Geosyntec 2016).

Flow-diversion measures redirect runoff to channels that are susceptible to hydromodification impacts to other watercourses or receiving facilities that are not susceptible to hydromodification effects. Storm water diversions to non-susceptible receiving facilities will be implemented for the 300<sup>th</sup> Street tributary and its smaller side channels as well as East Tributary 1 to decrease tributary areas and to reduce flow volumes.

### *Design for Stream Constrictions*

In-channel hydraulic constrictions (e.g., culverts and bridge crossings) may be unavoidable in certain situations and could potentially create backwater effects upstream and higher shear stresses near piers and abutments. These localized effects will be managed with

proper in-stream energy dissipation; design of in-stream structures for anticipated toe down scour without undermining infrastructure; and stream crossings with spans that are long enough to limit reductions in cross-sectional flow area. Stream constriction measures will be implemented where new road crossings intersect with channels, including along the Tentrock Tributary, within Tentrock Canyon, along Oso Creek, and along East Tributary Reaches 2a, 2b, 2, 3, 4a, 4b, 4c, and 4d.

#### *Dissipate Flow Energy at Outfalls*

Energy dissipation at the Project drainage system outfalls will be required to minimize localized scour in the receiving channels and to reduce the potential for in-channel sharp changes in channel slope resulting from the formation of scour holes caused by concentrated flows of concern. Energy dissipation measures used to reduce hydromodification risks are discussed in more detail in of Appendix 5.2-B (Geosyntec 2016).

#### *Replace Significant Bed Material Sources*

As shown on Exhibit 5.2-4, the proposed on-site regional detention and retention basins would generally be located adjacent to post-development channels. If in-channel basins are required due to topographic or hydrological constraints, bed material sources at in-channel basin outfalls will require replacement as a result of sediment accumulation at these locations. If required, replacement bed material sources would be selected to approximate the same grain size distribution as the receiving channel and would not contain a significant amount of fine sediment. Natural bed sediment deposited in on-site locations would be utilized to the extent feasible to replace bed material. Further information concerning the criteria and methods for replacing bed material is provided in Appendix 5.2-B (Geosyntec 2016).

As discussed in Section 5.18, Water Resources, the Project's potable and recycled water infrastructure, including potable and recycled water treatment, delivery, metering and monitoring, will be managed by a water district or public utility district (PUD) that will serve the Project (the "Project Water Purveyor"). The Project Water Purveyor could also operate and maintain non-construction hydromodification BMPs on the site, and would be responsible for BMP inspections, monitoring, maintenance, and enforcement. Until the Project Water Purveyor or a similar BMP management agency is established, the Project Applicant/Developer will be responsible for all hydromodification BMPs, including design, permitting, construction, operations, and maintenance.

Implementation of the Project's structural and non-structural measures summarized above, including distributed and parcel-specific LID measures and the regional runoff retention and detention basin system, will meet the requirements in Section 8 – Hydromodification Impacts of the County LID Standards Manual, as required in MM 2-1. LID measures will also meet or exceed County LID performance standards as required by MM 4-1 (see Section 5.4, Water Quality). Pursuant to MM 2-1, the effectiveness of Project hydromodification controls will be confirmed during the County tract map approval process. A Drainage System Engineering and Planning Report must be submitted with each tract map application to demonstrate that the proposed BMPs will meet the requirements in Section 8 – Hydromodification Impacts of the County LID Standards Manual for all applicable receiving

channels of concern (see MM 2-1). With mitigation, potential operational hydromodification impacts will be less than significant.

## Off-Site Impacts

Proposed off-site Project facilities are described in Section 4.0, Project Description, and include intersections with SR-138, utility connections, water wells, and Aqueduct crossings. None of these smaller locations would generate runoff volumes and silt or sediment flows in amounts that could cause significant hydromodification impacts under post-development conditions. Runoff from new impervious surfaces related to intersection improvements along SR-138, utility connections, and Aqueduct crossings would be controlled and distributed to parcel-specific LID facilities or to the proposed regional detention and retention basin system (see Exhibit 5.4-2).

Off-site well installation would result in a nominal increase in impervious surface area of up to approximately 312 square feet per well. Storm water runoff from the proposed off-site well locations currently drains as sheet flow, and the installation off-site well impervious surfaces would not create additional runoff volumes that could generate significant hydromodification impacts. All off-site well locations will implement parcel-specific hydromodification and other flow or water quality controls as required by the County LID Ordinance. Potential impacts would be less than significant.

***Impact Summary:*** The Project will implement a comprehensive system of site-design, source-control, LID, and hydromodification BMPs that will meet or exceed the hydromodification control requirements of the County MS4 Permit, the LID standards per Chapter 12.84 of the County Code, and the LID Standards Manual. MM 2-1 requires compliance with County requirements for hydromodification control. All distributed and parcel-specific LID control facilities will comply with the LID performance standard in MM 4-1 (see Section 5.4, Water Quality), consistent with County requirements. Project compliance with the requirements in Section 8 – Hydromodification Impacts of the County LID Standards Manual will be confirmed by the County during the tract map application and review and approval process. Runoff from most off-site locations will be controlled in the proposed regional or distributed, parcel-specific LID facilities. Off-site water wells will comply with all applicable LID requirements. During construction, the Project will comply with the Construction General Permit and will implement hydromodification BMPs based on the level of risk determined for the site in accordance with an SWPPP. With the implementation of MM 2-1, MM 4-1, and compliance with all laws and regulations, including the LID standards per Chapter 12.84 of the County Code and the Construction General Permit, potential impacts from existing drainage pattern alterations that could result in substantial erosion or siltation on or off the site will be less than significant.

**Threshold 2-2      Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?**

As discussed in Section 5.2.3 above, Project development will alter portions of the existing drainage pattern, primarily in the East Drainage Area, and will introduce new impervious surfaces into the site. These changes could result in on- or off-site flooding unless managed with flow controls and a storm drain system.

Potential Project on- and off-site hydrology and flooding impacts were analyzed by comparing post-development peak runoff rates and volumes, including the implementation of flow-control measures such as detention and retention basins, with predevelopment levels. The County LID Standards Manual includes the following hydrology analysis methodological requirements and performance standards (Psomas 2017):

- A 50-year design storm event must be used to design storm water conveyance facilities.
- There must be no increase in peak discharges off site (50-year design storm event).
- There must be no increases in runoff volume off site (50-year design storm event).
- Design flows must be adjusted for burned and bulked scenarios.
- Individual watershed areas within the site must average 40 acres and shall not exceed approximately 60 acres.
- The hydrologic analysis must use the Modified Rational Method (also referred to as MODRAT), as defined by the County and an approved computer program.
- BMPs must be utilized to meet flow, storm water quality, and LID requirements.

The analysis of potential Project hydrology impacts was performed by using the County's Modified Rational Hydrology Method and the XPSWMM computer program with a Los Angeles County module as described in the LACDPW Hydrology Manual (LACDPW 2006). The LACDPW was also consulted on the selection of the software used for the Project analysis. The County's most current requirement that peak discharges and volumes match pre-development conditions for a 50-year storm event represents the most stringent hydrology standard utilized by the County and significantly exceeds previous standards based on a 25-year storm event or other, less intensive design flow criteria. The 50-year post-development peak and volume discharge control requirement has been incorporated into MM 2-2.

Data required for developing the hydrologic parameters used in the analysis for each watershed were collected from multiple sources, including the County, the National Oceanic and Atmospheric Administration (NOAA), the National Resource Conservation Service (NRCS), and the U.S. Geological Service (USGS). Table 5.2-5, Summary of Hydrologic Data

Sources, summarizes the data sources and methodologies used for the Project hydrologic analysis.

**TABLE 5.2-5  
SUMMARY OF HYDROLOGY DATA SOURCES**

<b>Parameter</b>	<b>Source or Method</b>
Watershed Characteristics (areas, slope, length)	USGS National Elevation Data Set Digital Elevation Model
Rainfall Depths	Los Angeles County (for LA County where available) and NOAA Atlas 14 (for LA County area where data was not available and for Kern County)
Rainfall Distribution	MODRAT
Runoff	MODRAT
Soils Data	Los Angeles County Shapefiles (GIS)
USGS: U.S. Geological Survey; NOAA: National Ocean and Atmospheric Administration; MODRAT: Modified Rational Method; GIS: Geographic Information Systems	
Source: Psomas 2017 (Appendix 5.2-A)	

Existing and post-development hydrologic conditions were analyzed by using ARC GIS software and the XPSWMM program to process the watershed data and to perform all calculations. Existing site conditions were analyzed by initially using the ARC GIS system to develop the following information:

- Determine all reaches with a contributing area of approximately 40 acres or more.
- Delineate watersheds.
- Determine the longest flow path, length, and slope for each watershed.
- Determine the centroid and rainfall depth of each watershed.
- Assign rainfall depth and soil type data to each watershed.

The ARC GIS data was imported into the XPSWMM program (with the Los Angeles County module) to perform the following functions and hydrologic calculations for the site:

- Assign Los Angeles County nomenclature to each watershed.
- Calculate the time of concentration for each watershed.
- Calculate the peak discharge from and generate a hydrograph for each watershed.
- Route runoff from each watershed downstream.

As shown in Exhibit 5.2-3 and summarized in Table 5.2-2, existing condition peak flows and volumes for a 50-year storm event were analyzed at 16 existing locations or “nodes” at upstream and downstream points along the Project boundary. Post-development hydrologic conditions were evaluated by modifying the existing conditions model, including the following methods:

- Proposed land uses were imported into the XPSWMM program and existing watershed boundaries were removed from areas of proposed development.
- Post-development watersheds were delineated manually based on the proposed Project land uses and on-site detention retention and LID facilities, including 28 regional basins.
- A conservative single rainfall value was assumed for each post-development watershed.
- Post-development flow lengths were estimated and proposed graded slopes were assigned to each watershed.
- The proposed Project storm drain system and post-development drainage channel alignment properties were determined.
- The time of concentration in each watershed was calculated.

Post-development storm water runoff volumes will be affected by the amount of impervious area introduced into each watershed. The Project hydrology analysis integrated pre- and post-development impervious surface data into the delineation of each watershed based on proposed land uses and the proposed grading plan. Post-development watersheds were further subdivided as necessary to meet the County 40- to 60-acre analysis size requirement (LADPW 2006). The hydrology analysis method is described in more detail in the *Centennial Master Plan Hydrology* study attached as Appendix 5.2-A of this EIR (Psomas 2017). Appendix 3 of the study provides representative maps of the pre-development watersheds, subareas, channel reaches, and flow analysis points used in the analysis. Appendix 4 of the study provides representative maps of the post-development (proposed conditions) watersheds, subareas, channel reaches, and flow analysis points.

### ***Construction Impacts***

The primary hydrology concern during Project construction is that construction activities could substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off the site. As discussed in Section 5.2.2 above, the Project must comply with the state General Construction Permit, which requires the implementation of construction period BMPs in accordance with an impact risk assessment for the Project. An SWPPP must be prepared and implemented that includes BMPs that meet or exceed the permit requirements applicable to the level of construction risk. Hydrology construction period BMPs may include on-site flow retention controls that prevent runoff and/or catchments or basins that collect and control runoff. The permit requires that BMPs incorporate the best available technology economically achievable and best conventional pollutant control technology. BMP implementation must be based on the phase of construction and current weather conditions to control erosion and sediment. A Construction Site Monitoring Program that identifies monitoring and sampling requirements during construction is a required component of the SWPPP.

Project construction is anticipated to be classified as Risk Level 2, as defined in the General Construction Permit. Other applicable BMPs will be implemented in response to the risk assessment (Geosyntec 2016). Additional information concerning the implementation of the

Construction General Permit during Project construction is provided in Section 5.4, Water Quality, of this EIR. Through implementation of all requirements of the Construction General Permit, construction period hydrology and flood impacts would be less than significant and no additional mitigation is required.

### ***Operational Impacts***

Potential operational flood and hydrology impacts could occur if the peak rate or amount of surface runoff under post-project condition increases above pre-development levels and results in flooding on or off the site. The Project will increase the amount of impervious surfaces, and runoff would increase from new, impervious locations on the site, which could result in significant flooding impacts. As discussed above, the County MS4 permit, the LID standards per Chapter 12.84 of the County Code, and the LID Standards Manual require flow-control measures designed to ensure that upstream or downstream flooding will not occur during a 50-year storm event. MM-2-2 requires that the Project comply with this hydrology performance standard.

To achieve these objectives, the Project will implement a 28-basin regional flow-control system with sufficient capacity to reduce peak runoff flow rate and volumes from a 50-year storm event to levels consistent with or below pre-development conditions. As discussed in Threshold 2-1 above and in Section 5.4, Water Quality, other on-site measures (e.g., break structures and parcel-based BMPs) also provide hydrology and flood controls. The Project hydrology analysis conservatively assumes that the required level of development flow control is achieved by utilizing the proposed regional basin system and does not consider the additional peak and total runoff volume attenuation that would be provided by other proposed measures (Psomas 2017).

The 28 regional detention and retention basins are storm water management facilities that are designed to detain or infiltrate runoff. The basins impound water at depths of approximately six to eight feet to promote higher infiltration rates and to minimize evaporation losses; they are designed to allow for regular maintenance and monitoring of infiltration rates to ensure optimum operating efficiency. Basin outlet structures are designed to mimic pre-development runoff peak flow rates and volumes for a variety of storm events with recurrence intervals from 2 years to the 50-year design storm. The regional runoff retention and detention system for the Project includes 28 basins that will provide runoff, hydromodification and water quality controls for the majority of the proposed development area. The locations of the 28 basins are shown on Exhibit 5.2-4. The volume of flood control required and the total volume capacity provided for each basin are listed in Table 5.2-6. As shown in Table 5.2-6, all basins have been sized to meet and exceed the required storage volume for a 50-year storm event and therefore will meet and exceed volume requirements from storm events with a more frequent recurrence interval.

Consistent with LACDPW policy, storm event flow rates are based on “clear” flow that does not include a bulking factor that will result from debris flows generated from natural hillside areas in either a natural condition or a burned condition that would exist after a fire burns the natural vegetation. This bulking factor has the effect of increasing the peak flow rates. To manage this effect, debris-carrying channels and debris basins will be designed as part of the construction permit plans to intercept and manage the debris flows so that the storm water

discharge from the debris basins will meet the design “clear” flow rates to the regional detention and retention basins.

**TABLE 5.2-6  
SUMMARY OF REGIONAL RETENTION AND DETENTION BASINS  
FOR FLOOD CONTROL**

<b>Regional Basin Number</b>	<b>Flood Control Retention Volume Provided (acre-feet)</b>	<b>Total Basin Volume Provided (acre-feet)</b>

As discussed in Section 5.2.3, peak runoff rates and volumes for a 50-year storm event under existing conditions were estimated at 9 existing locations or “cross sections” at downstream locations along the Project boundary utilizing the County’s methodology. The locations of the cross sections under existing conditions are shown on Exhibit 5.2-3. Table 5.2-2, Existing Runoff Discharge Rates and Volumes summarizes the peak flow rate (also called the “Q” rate)

and volume of storm water runoff at each of the 9 nodes during a 50-year storm event under existing conditions.

The existing condition nodes were relabeled to conduct the post-development analysis and are located at the same points along the Project boundary. The locations and identification labels for the post-development nodes are shown in Exhibit 5.2-6, Location and Designation of Storm Water Runoff Discharge Cross Sections with Project.

Table 5.2-7, Summary of Pre- and Post-Development Peak Discharge Rates for the 50-Year Storm Event, and Table 5.2-8, Summary of Pre- and Post-Development Runoff Volumes for the 50-Year Storm Event, summarize the rate (Q) of peak discharge and runoff volume at the same discharge nodes under existing and post-development conditions for a 50-year storm event. The tables show that post-development peak flow rates and volumes during the 50-year design storm event will either be unchanged from existing conditions or will be lower than under existing conditions. Consequently, post-development conditions in all locations will meet or exceed the County flood and hydrology control standards.

As discussed in Section 5.18, Water Resources, the Project's potable and recycled water infrastructure, including potable and recycled water treatment, delivery, metering and monitoring, will be managed by a water district or PUD that will serve the Project (the "Project Water Purveyor"). The Project Water Purveyor could also operate and maintain the flood and hydrology BMPs within the site, and would be responsible for BMP inspections, monitoring, maintenance, and enforcement. The Project Water Purveyor will be funded through a rate-payer system and fees. Until the Project Water Purveyor or a similar BMP management agency is established, the Project Applicant/Developer will be responsible for all hydrology BMPs, including design, permitting, construction, operations, and maintenance.

The implementation of the proposed flood-control measures summarized above, including the regional runoff retention and detention basin system, will meet or exceed the hydrology performance standard required by the County based on a 50-year storm event and incorporated in MM 2-2. These results are conservative because the development conditions analysis does not include flow attenuation effects that would be achieved by parcel-specific or distributed BMPs that will also be implemented on the site. Pursuant to MM 2-2, the effectiveness of Project hydrology controls will be confirmed during the County tract map approval process. A Drainage System Engineering and Planning Report must be submitted with each tract map application to demonstrate that the proposed BMPs will achieve the

hydrology performance standard for a 50-year design storm event (see MM 2-2). With mitigation, potential operational hydrology and flood impacts will be less than significant.

## Off-Site Impacts

Proposed off-site Project facilities are described in Section 4.0, Project Description, and include intersections with SR-138, utility connections, water wells, and Aqueduct crossings. None of these smaller locations would generate peak flow rate or volumes that could cause significant flooding impacts under post-development conditions. Runoff from new impervious surfaces related to intersection improvements along SR-138, utility connections, and Aqueduct crossings would be controlled in the proposed regional detention and retention basin system or in distributed or parcel-specific LID facilities as necessary to meet LID requirements (see Exhibit 5.4-2).

Off-site well installation would result in a nominal increase in impervious surface area of up to approximately 312 square feet per well. Storm water runoff from the proposed off-site well locations currently drains as sheet flow, and the installation of off-site well impervious surfaces would not create additional peak flow and total runoff volumes that could generate significant flood impacts. All off-site well locations will implement parcel-specific flow or other hydromodification and water quality controls as required by the County LID requirements. Potential impacts would be less than significant.

**Impact Summary:** The Project will implement a comprehensive system of site design, source control, LID, and hydromodification BMPs that will meet or exceed the hydrology and flood control requirements of the County MS4 Permit, the LID standards per Chapter 12.84 of the County Code, and the LID Standards Manual. MM 2-2 requires compliance with the County 50-year storm event hydrology and flood-control standards. The analysis of pre- and post-development runoff utilizing the County's methodology shows that the post-development 50-year storm event peak flow rates and runoff volumes will be the same or lower than under existing conditions. Project compliance with the hydrology and flood-control performance standards will be confirmed by the County during the tract map application and review and approval. Runoff from most off-site locations will be controlled in the proposed regional facilities. Other off-site facilities, such as water wells, will comply with all applicable LID requirements. During construction, the Project will comply with the Construction General Permit and will implement hydrology and flood-control BMPs based on the level of risk determined for the site in accordance with an SWPPP. With the implementation of MM 2-2 and compliance with all laws and regulations, including the LID standards per Chapter 12.84 of the County Code and the Construction General Permit, potential impacts from existing drainage pattern alterations or changes in peak flow rates and volumes that could cause flooding on or off the site will be less than significant.

**Threshold 2-3**      **Would the project create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?**

### **On-Site Impacts**

Potential construction-related storm water runoff impacts are addressed above under Threshold 2-1 and Threshold 2-2 and will be less than significant due to compliance with the state's General Construction Permit. Potential on-site water quality impacts related to substantial additional sources of polluted runoff are discussed in Section 5.4, Water Quality, and will be less than significant with mitigation.

As discussed in Threshold 2-2 and Section 5.4, Water Quality, and as required by MM 2-2 and MM 4-1, the Project will construct and maintain distributed and parcel-specific LID and regional flood, flow, and water quality facilities that will meet or exceed applicable County, State, and federal hydrology and water quality control requirements. The locations of the primary distributed and parcel-specific LID facilities are shown in Exhibit 5.4-2. The locations of the 28 runoff detention and retention basins that comprise the region control system are shown in Exhibit 5.2-4. Each basin has been sized to provide sufficient capacity to meet hydrology and flood, hydromodification, and water quality protection requirements.

As shown in Tables 5.2-7 and 5.2-8, runoff peak flow rates and volumes under developed conditions for a 50-year storm will be the same or lower than under existing conditions. The control capacity of the distributed and regional facilities will be further confirmed in accordance with MM 2-1 (hydromodification controls), MM 2-2 (hydrology and flood controls), and MM 4-1 (LID and water quality controls, see Section 5.4, Water Quality) during the County tract map review and approval process for the Project. With implementation of the Project storm water management BMPs and compliance with MM 2-1, MM 2-2 and MM 4-1, potential impacts related to the creation or contribution of runoff water that exceeds the capacity of existing or planned storm water drainage systems will be less than significant.

### **Off-Site Impacts**

Potential Project off-site hydromodification impacts are discussed in Threshold 2-1, and potential off-site hydrology and flood impacts are discussed in Threshold 2-2 and will be less than significant. None of the Project's off-site facilities will generate storm water in amounts that exceed planned drainage facility capacity. Runoff from off-site locations will be controlled in the proposed regional detention and retention basin system or in distributed or parcel-specific LID facilities as necessary to meet LID requirements (see Exhibit 5.4-2, Low Impact Development [LID] Drainage Areas with Project). Potential off-site water quality impacts related to substantial additional sources of polluted runoff are discussed in Section 5.4, Water Quality, and will be less than significant with mitigation.

***Impact Summary:*** As discussed above, the Project includes distributed and regional runoff-control BMPs that are sufficient to control peak and volumetric flows from a 50-year storm event to meet all applicable County standards. Project development, including off-site facilities, will not generate runoff water in amounts that will exceed the capacity of planned storm water drainage systems, including regional and distributed or parcel-specific controls. Potential impacts related to the creation or contribution of runoff water that exceeds the capacity of existing or planned storm water drainage systems will be less than significant with implementation of MM 2-1, MM 2-2, and MM 4-1. Potential impacts related to the creation or contribution of runoff water that could provide substantial additional sources of polluted runoff are discussed in Section 5.4, Water Quality, and would also be less than significant with mitigation.

**Threshold 2-4**      **Would the project conflict with the Los Angeles County Low Impact Development Ordinance (L.A. County Code, Title 12, Ch. 12.84)?**

### **On-Site Impacts**

As discussed above and in Section 5.4, Water Quality, the Project has been designed to meet LID requirements for hydrology and flood, hydromodification, and water quality control. MM 2-1 requires compliance with the requirements in Section 8 – Hydromodification Impacts of the County LID Standards Manual. MM 2-2 requires compliance with the County hydrology and flood control standards. MM 4-1 requires compliance with the County LID performance standards (see Section 5.4, Water Quality). Compliance with each of these LID requirements will be further confirmed in accordance with MM 2-1, MM 2-2 and MM 4-1 during the County tract map review and approval process for the Project. The Project will not conflict with the County LID standards per Chapter 12.84 of the County Code.

### **Off-Site Impacts**

Proposed off-site Project facilities are described in Section 3.0, Project Description, and include intersections with SR-138, utility connections, water wells, and Aqueduct crossings. Runoff from new impervious surfaces related to intersection improvements along SR-138, utility connections, and Aqueduct crossings would be controlled in the proposed regional detention and retention basin system or in distributed or parcel-specific LID facilities as necessary to meet LID requirements (see Exhibit 5.4-2). Runoff from off-site water well installations will be controlled by implementing all applicable parcel-specific LID BMPs at these locations. All off-site Project facilities will be consistent with the LID requirements.

***Impact Summary:*** The Project's comprehensive system of site-design, source-control, LID, hydrology and flood, hydromodification, and water quality BMPs will be consistent and will not conflict with the County LID requirements. Potential impacts will be less than significant with the implementation of MM 2-1, MM 2-2 and MM 4-1.

**Threshold 2-5**      **Would the project create drainage system capacity problems, or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?**

### **On-Site and Off-site Impacts**

Threshold 2-3 discusses potential impacts from Project-related runoff that could exceed the capacity of planned or existing storm water drainage systems. The Project will meet or exceed County hydrology and flood performance standards, including the control of peak and total volume runoff from a 50-year storm to levels that are the same or lower than under existing conditions. Runoff from off-site intersection improvements along SR-138, utility connections, Aqueduct crossings, and water wells will be controlled within the proposed regional detention and retention system or in distributed or parcel-specific facilities consistent with the LID requirements in more isolated locations. The effectiveness of the proposed hydrology controls will be confirmed during the County tract map approval process (see MM 2-1, MM 2-2, and MM 4-1). As discussed in Threshold 2-3, the Project will not result in drainage system capacity problems, and potential impacts associated with drainage capacity will be less than significant.

As discussed in Threshold 2-1, Threshold 2-2, and in Section 5.4, Water Quality, the Project will construct distributed or parcel-specific LID and regional hydrology, hydromodification, and water quality controls and storm water drainage facilities that will be sized to meet or exceed County requirements. Potential impacts associated with the construction of these facilities are considered in the analysis of Project impacts in the topical sections of this EIR, including Section 5.7, Biological Resources; Section, 5.11, Air Resources; Section 5.18, Water Resources; and Section 5.21, Climate Change. No additional construction or expansion of storm water drainage facilities other than the proposed and planned facilities considered in the substantive sections of this EIR will be required. No significant environmental effects would be caused by the construction of any such additional storm water drainage facilities.

***Impact Summary:*** The Project will not cause drainage capacity problems and includes the construction of storm water drainage facilities that have been sized to meet and exceed all applicable County requirements. No additional construction of new or expanded storm water drainage facilities will be required for the Project, and impacts will be less than significant.

**Threshold 2-6**      **Would the project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map, or within a floodway or floodplain?**

### **On-Site and Off Site Impacts**

As shown in Exhibit 5.2-5, portions of the Project site in the Oso Creek drainage along the northern boundary and certain drainages along the eastern boundary of the site are within a 100-year floodplain mapped by FEMA. County flood risk maps for the site include the same

locations. The Project requires that a Floodplain Safety Overlay be implemented for the mapped floodplain portions of the site that precludes the placement of housing within a 100-year floodplain (see Exhibit 4-6, Centennial Project – Safety Overlay Districts). This requirement has been incorporated in MM 2-3. No housing will be placed in a 100-year floodplain, or other floodway or floodplain identified on other hazard delineation map. No off-site housing will be constructed with implementation of the Project.

***Impact Summary:*** With implementation of MM 2-3 and the Floodplain Safety Overlay, potential impacts from the placement of housing within a 100-year floodplain or other floodway or floodplain identified on other hazard delineation map will be less than significant.

**Threshold 2-7**      **Would the project place structures, which would impede or redirect flood flows, within a 100-year flood hazard area, floodway, or floodplain?**

### **On-Site Impacts**

As shown in Exhibit 5.2-5, portions of the Project site in the Oso Creek drainage along the northern boundary and certain drainages along the eastern boundary of the site are within a 100-year floodplain mapped by FEMA. County flood risk maps for the site include the same locations. The Project includes a Floodplain Safety Overlay that precludes the placement of habitable residential, commercial, school, and institutional buildings within a 100-year floodplain (see Exhibit 4-6, Centennial Project – Safety Overlay Districts). This requirement has been incorporated in MM 2-3. No habitable residential, commercial, school, or institutional buildings will be placed in a 100-year flood hazard area, floodway, or floodplain.

Certain proposed Project utility infrastructure, including a water treatment facility in the northwest portion of the site and utilities located along the eastern boundary of the site, could be located in a mapped 100-year floodplain. MM 2-3 requires that, prior to the recordation of any tract map that would locate any structure within a mapped 100-year floodplain, the floodplain boundaries must be more precisely determined and an engineering study must be conducted to identify applicable flood-control and floodplain development protection measures. The study must demonstrate that all applicable FEMA and County of Los Angeles floodplain flood flow and development standards will be met after the proposed construction has been completed. MM 2-3 requires that a conditional letter of map revision (CLOMR) be obtained from FEMA indicating that any proposed facility that would modify a mapped floodplain would be recognized by FEMA if built as proposed. The floodplain map would subsequently be revised based on as-built conditions in accordance with FEMA and County floodplain map revision requirements. With the implementation of MM 2-3, potential impacts from on-site structures that could impede or redirect flood flows within a 100-year flood hazard area, floodway, or floodplain would be less than significant.

### **Off-Site Impacts**

Most of the off-site Project facilities, including intersections with SR-138, utility connections, and Aqueduct crossings, would not be located within a 100-year floodplain. Certain off-site

well locations and portions of proposed water pipelines could be located within or near a designated 100-year floodplain. As discussed above, off-site wells would result in minute changes to existing runoff conditions and would not have the potential to significantly impede or redirect flood flows. Proposed pipeline facilities would be located underground and would have no effect on existing flood flows. Potential impacts from off-site structures that could impede or redirect flood flows within a 100-year flood hazard area, floodway, or floodplain would be less than significant and no mitigation is required.

***Impact Summary:*** The Project incorporates a Floodplain Safety Overlay to ensure that habitable residential, commercial, school, and institutional structures will not be developed in mapped 100-year floodplain areas. MM 2-3 requires an engineering analysis and a CLOMR approved by FEMA prior to other potential construction in a mapped 100-year floodplain. The engineering study and CLOMR process must demonstrate that, under post-construction as-built conditions, affected flood flows and the resulting development comply with all applicable FEMA and County requirements. With implementation of MM 2-3, potential impacts related to structures that could impede or redirect flood flows within a 100-year flood hazard area, floodway, or floodplain would be less than significant.

**Threshold 2-8**      **Would the project expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?**

### **On-Site and Off-Site Impacts**

As discussed in Threshold 2-6 and Threshold 2-7, the Project incorporates a Floodplain Safety Overlay to ensure that habitable residential, commercial, school, and institutional structures will not be developed in mapped 100-year floodplain areas. MM 2-3 requires an engineering analysis and a CLOMR approved by FEMA prior to potential utility construction in a mapped FEMA 100-year floodplain. The engineering study and CLOMR process must demonstrate that, under post-construction as-built conditions, affected flood flows and the resulting development comply with all applicable FEMA and County requirements.

Most of the Aqueduct (West Branch that flows through Centennial to Quail Lake) is in a cut condition (i.e., below-ground elevation) and therefore poses no risk of inundation to the Project site due to failure. There are two areas that are built on fill materials in existing canyons where culverts convey storm flows from the west side to the east side. If there was a failure of one side of the Aqueduct channel, any water flows would discharge along the existing canyon watercourses where discharging storm flows already occur and would be directed to flood-control basins in the buildout condition. Therefore, these areas would not result in an inundation of developed areas should failure of the Aqueduct channel occur. For the East Branch of the Aqueduct, which runs east/west along the northern boundary of the Project site, there is no risk of inundation because the channel is cut into the existing ground and there is no embankment or levee that could fail. Therefore, the potential for inundation and flooding from a dam or levee failure would be less than significant.

**Impact Summary:** With the implementation of MM 2-3, potential impacts from exposing people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam, would be less than significant.

**Threshold 2-9**      **Would the project place structures in areas subject to inundation by seiche, tsunami, or mudflow?**

### **On-Site and Off-Site Impacts**

The Project site is physically isolated by several miles from large waterbodies, such as the Pacific Ocean, that could be subject to tsunamis. Seiches are waves within smaller waterbodies, such as lakes, and are typically caused when strong winds and rapid changes in atmospheric pressure push water towards one end of a waterbody. When the winds cease or air pressure equalizes, the displaced water rebounds, a process that can cause waves and damage adjacent land and shorelines. There are no waterbodies of sufficient size to pose a significant risk of seiche on the Project site. Quail Lake is located to the south of the Project (outside the site) and is lower in elevation than adjacent proposed development areas, including an access road and a commercial area to the west of the lake. As a result, the Project is not subject to significant tsunami or seiche inundation risks.

Mudflows are rivers of liquid and flowing mud on the surface of normally dry land, often caused by a combination of brush loss and subsequent heavy rains. Mudflows can develop when water saturates the ground, such as from rapid snowmelt or heavy or long periods of rainfall, causing a thick liquid downhill flow of earth (National Flood Insurance Program 2015). As discussed in Threshold 2-1 and Threshold 2-2, the Project will implement a comprehensive system of distributed, parcel-specific, and regional BMPs, including 28 detention and retention basins and storm drainage and conveyance facilities, that will control runoff and its associated sediment flows. Flow and sediment controls will also prevent and contain mudflows on the site and in off-site flow discharge locations. Potential mudflows that could originate from off-site upland slopes would drain into on-site storm drainage infrastructure, including basins and engineered and natural stream channels, which would reduce potential impacts.

As discussed in Section 5.1, Geotechnical, topographic alterations in areas with slopes over 25 percent, which would be most prone to generate mudflows, must comply with applicable geotechnical recommendations; County subdivision and building code requirements; and grading standards adopted for the Project. With the implementation of these requirements, steeper slope alterations would not generate significant development hazards or adversely affect human health and safety, including the generation of significant mudflow risks. In addition, most of the steeper topography on the Project site is located west of the West Branch of the Aqueduct where 18 percent of the proposed Project development would occur. Potential mudflow risks will be further attenuated by siting most of the proposed development in flatter locations and avoiding steeper topography.

**Impact Summary:** The Project site is not subject to tsunami or seiche risks. The Project will avoid steeper topography associated with higher mudflow risks where feasible. MM 2-1, MM 2-2 and MM 4-1, require the implementation of flow and sediment-control facilities that will also capture and control mudflows should it occur on the site. With mitigation, potential impacts from mudflows will be less than significant.

**Threshold 2-10** **Would the project add water features or create conditions in which standing water can accumulate that could increase habitat for mosquitoes and other vectors that transmit diseases such as the West Nile virus and result in increased pesticide use?**

### On-Site Impacts

As shown in Exhibit 5.2-4, the Project would include 28 regional retention and detention basins, modifications to some existing stream channels, storm drain pipes, catch basins, distributed and parcel-specific detention facilities, and other structural BMPs that would temporarily retain wet- or dry-weather runoff. The California Department of Public Health (CDPH) has developed BMPs for mosquito control in storm water management facilities, including the full discharge of captured water in 96 hours (4 days) or less (CDPH 2012), which is the minimum time necessary for mosquito development. All soft-bottom drainage facilities—including regional and distributed basins and stream channels—would be designed to fully drain or infiltrate captured water in less than four days and avoid the creation of mosquito vectors. This drainage or infiltration management requirement is incorporated into MM 4-2 (see Section 5.4, Water Quality).

On-site wastewater and recycled water facilities will include percolation, storage, and treatment ponds in which standing water may accumulate. As discussed in Section 5.19, Wastewater, MM 19-5 requires that CDPH-recommended vector-control measures for wastewater treatment facilities be implemented for these ponds.

The vector-control BMPs developed by the CDPH include the implementation of an Integrated Pest Management (IPM) program appropriate to proposed Project land uses. The IPM program achieves long-term prevention or suppression of pest problems (i.e., insects and diseases) through a combination of techniques, including using pest-resistant plants; biological controls; cultural practices; habitat modification; and the judicious use of pesticides according to treatment thresholds, when monitoring indicates pesticides are needed because pest populations exceed established thresholds. As discussed in Section 4.0, Project Description, and Section 5.4, Water Quality, the Project includes IPM BMPs that are consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program (see PDF 4-2). These requirements are incorporated in MM 4-2, which also requires that the effectiveness of the IPM BMPs be further verified during the County tract map review and approval process. The proposed land uses associated with the Project are typical of a developed urban area, and would not involve the unusual accumulation of standing or otherwise stagnant water that

could increase habitat for mosquitos or other insect vectors. With the implementation of MM 4-2 and MM 19-5, potential impacts related to insect vectors would be less than significant.

## Off-Site Impacts

None of the off-site Project features, including intersections with SR-138, utility connections, water wells, and Aqueduct crossings, would involve the capture or other collection of water that could create habitat for mosquitos or other insect vectors. There would be a less than significant impact and no mitigation is required.

***Impact Summary:*** MM 4-2 requires that all soft-bottom drainage facilities fully drain or infiltrate captured water in less than four days, consistent with BMPs for mosquito control published by the CDPH. MM 4-2 also requires the implementation of IPM BMPs consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. The IPM BMPs will be further confirmed prior to the issuance of building permits and during the County tract map review process. MM 19-5 requires the implementation of recommended CDPH BMPs for Project wastewater treatment facilities. Proposed Project land uses would not result in unusual standing or otherwise stagnant water accumulation that could increase habitat for mosquitos or other insect vectors. Off-site Project facilities will not result in standing or otherwise stagnant water that could support mosquitos or other vectors. With the implementation of MM 4-2 (from Section 5.4, Water Quality) and MM 19-5 (from Section 5.19, Wastewater) potential Project impacts related to insect vectors would be less than significant.

### 5.2.7 MITIGATION MEASURES

**MM 2-1** The Project shall implement hydromodification-control Best Management Practices (BMPs) that will meet the requirements of Section 8 – Hydromodification Impacts of the County LID Standards Manual, as confirmed by the County based on a Drainage System Engineering and Planning Report to be submitted with each Project tract map application. This Drainage System Engineering and Planning Report shall describe applicable hydromodification-control BMPs and shall utilize approved Los Angeles County methods to demonstrate compliance with the County LID Standards Manual.

**MM 2-2** The Project shall implement hydrology and flood-control BMPs that will achieve the following hydrology and flood performance standards:

All project water conveyance facilities must be designed to provide capital flood protection. BMPs must be implemented to ensure that, for the capital event, there is no increase in peak

discharge rates and no increase in runoff volume offsite compared with peak discharge rates and runoff volumes under existing, pre-development conditions. Compliance with the hydrology and flood performance standard shall be demonstrated by using a methodology approved Los Angeles County Department of Public Works for comparing project site pre- and post-development peak discharge rates and runoff volumes.

Compliance with the hydrology and flood performance standards shall be further confirmed by the County, based on a Drainage System Engineering and Planning Report submitted with each Project tract map application. The Drainage System Engineering and Planning Report shall describe applicable hydrology and flood-control BMPs and utilize approved Los Angeles County methodologies to demonstrate compliance with the hydrology and flood performance standards.

- MM 2-3** Each Project Tentative Map shall depict, the 100-year floodplain mapped by the Federal Emergency Management Agency (FEMA). The placement of habitable residential, commercial, school and institutional buildings shall be precluded within any mapped 100-year floodplain. All applications for Project tract maps that would locate any structures within a mapped 100-year floodplain must include an engineering report that provides a detailed description of the floodplain boundaries and demonstrates that as-built conditions comply with all applicable FEMA requirements. If required, a conditional letter of map revision (CLOMR) shall be obtained from FEMA prior to construction within a mapped 100-year floodplain.

## 5.2.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

The Project's impacts would be reduced to levels that are less than significant with incorporation of MM 2-1, MM 2-2, MM 2-3; MM 4-1 and MM 4-2 from Section 5.4, Water Quality; and MM 19-5 from Section 5.19, Wastewater.

## 5.3 HAZARDS AND FIRE SAFETY

This section addresses potential hazards and hazardous materials from historic uses on and near the Project site (including Valley Fever) and wildfire hazards. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

### 5.3.1 INTRODUCTION

#### **Purpose**

Appendix G of the California Environmental Quality Act (CEQA) Guidelines requires that both hazards and hazardous materials and fire safety issues be evaluated as part of the environmental documentation process. Analyses of geotechnical hazards and provision of fire protection services are discussed in Sections 5.1 (Geotechnical) and 5.16 (Fire and Law Enforcement Services), respectively.

#### **Summary**

##### ***Hazards and Hazardous Materials***

There would be less than significant impacts related to Valley Fever with implementation of mitigation measure (MM) 3-1 related to dust control during construction; MM 3-2 related to aiding the prevention of Valley Fever among construction workers; with project design feature (PDF) 3-1 related to resident notice of temporary Valley Fever risk during construction and other earth-moving activities; and implementation of Rule 403 dust control measures, as described further in Section 5.11, Air Resources.

There would be less than significant impacts related to environmental hazards, including hazardous materials from current or historic land uses with implementation of MM 3-4 related to historic dry well re-abandonment and MM 3-5 related to permanent closure of the abandoned mine/tunnel.

Operations at the Quail Lake Skypark Airport would not have a significant impact for any portion of the Project site. The Project would result in less than significant impacts related to impairment or interference with an emergency response or evacuation plan with implementation of MM 3-7, requiring preparation of an emergency response plan for the Project.

##### ***Fire Safety***

With adherence to requirements for fuel modification zone management (MM 3-9) and emergency access (MM 3-7), the Project's potential impact related to wildfires would be less than significant. MM 3-9 requires property owner notification of their responsibilities for maintaining the fuel modification zone(s) on their property. The Project would not result in significant impacts related to proximity of a land use representing a potential fire hazard.

---

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0 for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Hazards and Hazardous Materials
  - Relevant Plans, Policies, and Regulations
  - Environmental Setting
  - Project Design Features
  - Threshold Criteria
  - Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
    - On-Site Impacts
    - Off-Site Impacts
  - Mitigation Measures
  - Level of Significance After Mitigation
- Fire Safety
  - Relevant Plans, Policies, and Regulations
  - Environmental Setting
  - Project Design Features
  - Threshold Criteria
  - Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
    - On-Site Impacts
    - Off-Site Impacts
  - Mitigation Measures
  - Level of Significance After Mitigation
- References

## References

Although all references cited for preparation of this analysis are listed in Section 5.3.4, the primary technical references for this section are listed below.

1. Converse Consultants. 2015a (August 31). *Phase I Environmental Site Assessment Report: Assessor's Parcel Numbers 3275-007-014, 3275-006-006 and 3275-008-001, Los Angeles County, California*. Costa Mesa, CA: Converse Consultants (Appendix 5.3-A).

4. Converse Consultants. 2008 (November). *Limited Phase II Environmental Site Assessment – Drum Sampling: Centennial Park Site, Lot 1760, VTTM 60023, State Highway 138 and Quail Lake, Los Angeles County, California*. Costa Mesa, CA: Converse Consultants (Appendix 5.3-D).

Reference 1 encompasses the portion of the site located east of 300<sup>th</sup> Street West. Between 1999 and 2007, four previous Phase I Environmental Site Assessments (ESAs) and an updated hazardous material database search were performed for the Project site areas located west of the 300<sup>th</sup> Street West. References 2 and 3 above compile and update, where applicable, the findings of these reports. The previously completed environmental site assessment studies prepared for the Project site and referenced in the 2015 Converse Consultants Phase I ESA Report, are listed in the Report's List of References Appendix (see Appendix 5.3-A).

Exhibit 5.3-1, Locations of Phase I Findings, shows the four different areas surveyed as part of preparation of References 1 through 4 listed above. These reports can be found in Appendices 5.3-A through 5.3-D.

In addition to the environmental safety and man-made hazards evaluated in References 1 through 3, this section also discusses potential hazards that could result from aircraft operations in the immediate vicinity; pesticide use during historical and current agricultural activities in the area; exposure to San Joaquin Valley Fever; and the potential for wildfires.

### 5.3.2 HAZARDS AND HAZARDOUS MATERIALS

#### Relevant Plans, Policies, and Regulations

Since hazards and hazardous materials covers many diverse topics, for ease of readability this section is organized by topic rather than by jurisdiction.

## **General Plans**

### **Los Angeles County General Plan and Antelope Valley Area Plan**

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, part of the County General Plan, includes goals and policies that address hazards issues, limited to emergency response, in the unincorporated County. The AVAP goal and policies applicable to the analysis of hazards with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal PS 6:** Government officials work with community members to promote community safety.

**Policy PS 6.1:** Ensure safety information is available at local public areas.

**Policy PS 6.2:** Encourage residents and business owners to create an evacuation plan and maintain emergency supplies.

**Policy PS 6.3:** Promote the formation and coordination of Certified Emergency Response Teams.

**Policy PS 6.4:** Provide assistance to local communities that wish to create a local emergency evacuation plan.

**Policy PS 6.5:** Strengthen coordination and collaboration between citizens, public agencies, and non-profit groups to plan for disaster response.

**Policy PS 6.6:** Develop an inclusive master emergency plan that designates evacuation routes, emergency relief centers, emergency animal keeping shelters, and information centers in every Antelope Valley community.

## **Asbestos Regulations**

The United States Environmental Protection Agency (USEPA) has identified asbestos as a hazardous air pollutant pursuant to Section 112 of the Federal Clean Air Act. Further, the California Air Resources Board (CARB) has identified asbestos as a Toxic Air Contaminant (TAC) pursuant to the *California Health and Safety Code* (Sections 39650 et seq.). Asbestos is also regulated as a potential worker safety hazard under the authority of the Occupational Safety and Health Administration (OSHA). These federal and State regulations prohibit emissions from asbestos-related demolition or construction activities; require medical examinations and monitoring of employees engaged in activities that could disturb asbestos; specify precautions and safe work practices that must be followed to minimize the potential for release of asbestos fibers; and require notice to federal and local government agencies prior to beginning renovation or demolition that could disturb asbestos.

In California, asbestos abatement must be performed and monitored by contractors with appropriate certifications from the California Department of Industrial Relations, Division of Occupational Safety and Health (CalOSHA). In addition, CalOSHA has regulations concerning the use and management of hazardous materials and enforces the hazard communication program regulations. All demolition that could result in the release of asbestos must be

conducted according to CalOSHA standards. These standards have been developed to protect construction workers and the general population from hazards associated with exposure to these materials. Young children, the elderly, and people in poor health may be more susceptible to adverse health effects from exposure to asbestos released into the environment.

### ***Pesticide and Chemical Regulations***

Pesticides are regulated by the Federal Government under the 1947 Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). FIFRA establishes registration and labeling requirements for pesticides, herbicides, and other economic poisons. Registration requires documentation stating that the pesticide will not damage human health or the environment if used as intended. FIFRA prohibits the sale of any economic poison that has not been registered by the USEPA. The California Department of Food and Agriculture (CDFA) is the principal agency responsible for regulating pesticide sales and pesticide use in the state. Specifically, it registers and classifies pesticides; licenses professional agricultural pest-control operations and advisors; monitors pesticide residues in food samples; and promulgates pesticide use and worker safety regulations. Section 11501 of the *California Food and Agriculture Code* requires pesticide applications to be confined to their target in order to avoid contamination of non-target properties; violations can result in either civil penalties or a revocation of a pesticide-use permit.

The California Department of Health Services (DHS) has an advisory role with respect to pesticide use and exposure. It conducts studies and investigates cases of pesticide exposure; conducts toxicological evaluations and risk assessments; and provides educational programs for physicians on diagnosing and treating pesticide poisonings. On a local level, if the USEPA determines that a pesticide has the potential to cause human injury or environmental damage, its use is restricted and a permit from the local Agricultural Commissioner is required for its purchase and use. Furthermore, restricted pesticides are only available for sale and for use by Certified Applicators or persons under their direct supervision for those uses covered by the Certified Applicator's certification.

Pesticides may be applied either by broadcast spraying (spraying a fine mist over the target, usually from an aircraft or a land vehicle) or by topical application (placing the pesticide directly on or in the vicinity of the target). Broadcast spraying can result in the dispersion of pesticides into adjacent non-target areas (especially during windy conditions); therefore, some pesticides that are applied in this manner are strictly regulated.

The Proposition 65 initiative (approved by California voters in 1986) addresses exposure to toxic chemicals, including but not limited to pesticides. Also known as the Safe Drinking Water and Toxic Enforcement Act of 1986, Proposition 65 requires the State to publish a list of chemicals known to cause cancer, birth defects, or other reproductive harm. This list, which must be updated at least once a year, has grown to include approximately 750 chemicals since it was first published in 1987. According to Proposition 65, businesses must provide a "clear and reasonable" warning before knowingly and intentionally exposing anyone to a listed chemical (OEHHA 1986).

## Environmental Setting

### *Phase I Environmental Site Assessment Results*

To determine the presence of and potential for hazardous materials and/or waste contamination on the Project site from existing and historic on- and off-site uses and/or from recognized environmental conditions (RECs), Phase I ESAs have been prepared, and updated where applicable, to collectively encompass the entire Project site. The work performed for the Phase I ESAs was completed in conformance with the scope and limitations of the American Society of Testing and Materials (ASTM) Practice E 1527-13 and consisted of interviews with the property owners' representatives; site and vicinity reconnaissance; reviews of regulatory agency records, descriptions of the physical setting, and historical documentation; and interviews with public agency personnel. A complete listing of databases reviewed as part of the Phase I ESAs is provided in Appendices 5.3-A and 5.3-B of this EIR. On-site and surrounding land uses relevant to the site assessment are described below and are illustrated on Exhibit 5.3-1.

#### On-Site Uses

During the site reconnaissance, California Registered Environmental Assessors (REA) assessed current site utilization and examined the Project site for evidence of release(s) of hazardous materials and petroleum products; they also identified RECs present on the site, which are identified on Exhibit 5.3-1. Currently, the Project site is primarily open space and ranchland. The 12,323 acres of land that comprise the Project site have primarily been used for open cattle grazing over the last 150 years. In addition to cattle grazing, the Tejon Ranch Company owns and cultivates approximately 1,000 acres in the eastern portion of the Project site as pivot fields.<sup>1</sup> These 1,000 acres include 5 separate pivot fields that correlate with the approximately 652 acres of Prime Farmland on the site that are currently under cultivation for the production of alfalfa and three-way forage mix (e.g., barley, oats, sudan grass). The Phase I ESAs also documented the following physical features or uses on the Project site at the time each Phase I ESA was completed:

- Dry creeks were noted throughout the property, which sometimes contained debris including barbed wire, wood, and metal.
- Residential dwellings are located near the center of the northern property line (currently one residence is present and is occupied).
- Concrete-lined metal pipes and telephone poles were observed near the northern portion of the site. Also near the northern portion of the site, a pile of asphalt and metal pipes, which appeared to be irrigation pipes, was observed. Stained soil was observed in the area of the asphalt, which Tejon Ranch Company reports is planned to be removed in the future.
- An inactive portion of a hunter's camp is located in the western portion of the Project site. At the time of the survey, the camp consisted of six trailers, a shooting range, and

---

<sup>1</sup> A "pivot field" is a circular agricultural field with a centralized "pivot" irrigation system.

D:\Projects\CEN\Centennial\MXD\EIR\Ex\_p1\_findings\_20150810.mxd

### Locations of Phase 1 Findings

### Exhibit 5.3-1

Centennial Project

two outhouses. Associated with the camp was a generator and two gasoline cans. No leaks, stains, or odors were observed or detected.

- An apparent mine shaft, whose entrance was covered in soil, was observed near the southern access point to the Project site. The non-producing, abandoned mine shaft is now a small drift tunnel (approximately four feet high by five feet wide at the entrance) that extends approximately eight feet into the side of a hill near Quail Lake (Metzger 2007; Grant 2008a).
- An aboveground water storage tank, which has a capacity of 2,000 gallons, was observed in the southwestern portion of the Project site. This tank was rusted, but no odors, stains, or leaks were detected or observed.
- In an area in the southwestern portion of the Project site, discolored soil, gravel, and cleared vegetation were observed, and soil samples were collected. The results of the soil sampling, performed as part of the Phase I ESA, are discussed further below.
- In an area in the central portion of the Project site formerly used as a homestead, a water well and three 55-gallon metal drums were observed. One of the drums had a black tar-like substance leaking from it, and the ground surface beneath the drum was stained. No leaks, stains, or odors were noted for the other two drums. In November 2008, a Phase II ESA, a second level of investigation performed after a Phase I ESA, involving laboratory testing of shallow soil samples taken from the area of the 55-gallon drums, was performed (Converse Consultants 2008). The results of the Phase II ESA are discussed further below.
- A trough-like structure constructed out of cinder blocks and surrounded by chain-link fence was observed in the approximate center of the Project site. Plywood, a five-gallon bucket, and siding were present in the structure. The use of the structure was unknown during reconnaissance but may have been used for storage of hazardous materials. The Phase I ESA does not report evidence of a release, such as stained soil, leaks, or odors.
- An equipment yard was located at the northwest corner of the Project site to the east of 300<sup>th</sup> Street West. Diesel fuel aboveground storage tanks (ASTs), drums, and other containers of hazardous materials (e.g., pesticides, oil), tires, and heavy equipment were observed in the equipment yard. During initial reconnaissance, surface staining was observed in the bermed, concrete-floored (i.e., not ground surface) diesel fuel storage area. During subsequent reconnaissance as part of the Phase I ESA (August 2015), the bermed area was cleaned and no staining was observed.

### Surrounding Uses

The Project site is generally surrounded by undeveloped or agricultural land, with scattered single-family residences located near the southeast portion of the site. In addition, the following physical structures are located adjacent to or within the immediate vicinity of the Project site:

- The West Branch (Quail Lake Canal) of the State Water Project's California Aqueduct generally bisects the Project site in a north-south direction; it empties into Quail Lake,

which is 1 of the State Water Project's (SWP's) 29 storage facilities. The East Branch of the California Aqueduct is located immediately north of the Project site's northern boundary. These features are maintained and operated by the California Department of Water Resources (DWR).

- The Quail Lake Reservoir, an unlined water storage facility, is located immediately to the south along the southwestern border of the Project site.
- The Oso Pumping Plant, part of the SWP's aqueduct system, is located proximate to the West Branch of the Aqueduct near the north-central portion of the Project site.
- The Quail Lake Skypark Airport, a single strip, private airstrip is located east of Quail Lake and south of the Project site. This airport is discussed in detail later in this section under "Aircraft Operations".
- The National Cement Plant (Cement Plant), a limestone mining operation, is located in Kern County adjacent to the Kern/Los Angeles County boundary; it is located approximately 1 mile north of the Project site on a leased area of approximately 2,500 acres, of which approximately 300 to 400 acres are actively utilized for Cement Plant operations. The location is shown on Exhibit 5.3-1.
- A north-south access road to the National Cement Plant bisects the Project site west of the California Aqueduct.
- State Route (SR) 138 bisects the southern portion of the Project site.

#### Sites Included on Agency Lists

A search of federal, State, local, tribal, and other databases was performed by Converse Consultants to identify sites with known or potential environmental issues related to hazardous materials or wastes within a one-mile radius of the Project site. An updated database search for a five-mile radius from the approximate center of the Project site was conducted in 2015. The complete list of databases searched and identified sites can be found in Appendix 5.3-B of this EIR. Listed sites include both permitted facilities whose operations use, produce, or transport hazardous materials and the locations of reported releases and/or cleanup operations (remediation). A single site can be listed in multiple databases. In particular, CEQA requires the Lead Agency to consult the lists compiled by the State of California, pursuant to Section 65962.5 of the *California Government Code*; this is also known as the "Cortese List" (*California Public Resources Code* [PRC], Section 21092.6). The Cortese List is one of the databases included in the database search.

The Project site itself was not identified on any hazardous materials database, including the Cortese List. Off-site locations of potential concern were reviewed, which were determined to include underground storage tank (UST) sites, hazardous waste generators, air emission sites, and case closed (i.e., remediation completed) sites; there is one spill/leak site—the National Cement Company. UST sites, hazardous waste generators, and air emission sites are listed to track permitted facilities, and the case closed listing is, as the name suggests, no longer an active cleanup location. Therefore, these types of listings do not represent an environmental hazard to the Project site. The remediation activities at the National Cement Plant are discussed below.

The National Cement Plant—also known as the Los Robles Cement Plant—is located in Kern County approximately one mile north of the Project site; its location is shown on Exhibit 5.3-1. Raw materials quarried at the site are the primary ingredients in Type II Portland Cement. During the 1990s, several locations were discovered where on-site cement manufacturing operations and waste handling practices had, over the years, impacted the quality of soil and groundwater on the Cement Plant site. The waste discharge sources of the Cement Plant site include solid waste disposal to on-site landfills located to the east of the plant structures; liquid waste storage in a belowground waste oil tank located at the southeastern portion of the plant; chemical storage at a drum storage area in the plant's maintenance area at the southeastern portion of the plant; diesel fuel transfer in an underground pipeline in the plant operating area; and cement kiln dust disposal in large piles located to the west of the plant structures. These source areas are commonly referred to as “the Industrial Landfill Area”, “the Maintenance Shop Area” (combines the Waste Oil Tank Area and the Drum Storage Area), “the Diesel Pipeline Area”, and “the Cement Kiln Dust Piles”, respectively. The Cement Plant is not a State or federal Superfund site.

Each source area has undergone specific site-characterization processes to identify the nature and extent of the unauthorized releases. In each source area, the known cause of the unauthorized release has been removed, as required by the regulatory agency with oversight authority. However, in some source areas, approved levels of contaminants remain in the soil. In addition, groundwater quality beneath all source areas was impacted to varying degrees. As a result, the California Regional Water Quality Control Board, Lahontan Region (Lahontan RWQCB) has issued waste discharge requirements (WDRs) and/or cleanup and abatement orders (CAOs) for each of these source areas that required installation of groundwater treatment systems; that prescribe groundwater monitoring in order to ascertain the rate at which pollutant levels are declining; and that allow for corrective action (where necessary) based on the monitoring results to clean up contaminated groundwater.

The groundwater contamination from the Maintenance Shop Area had migrated at shallow depths off the Cement Plant site and under parts of Tejon Ranch adjacent to the southeastern corner of the Cement Plant site. To address groundwater contamination under Cleanup and Abatement Orders 6-90-59A3 and 6-94-90A3, a long-term groundwater pump and treatment system went into operation in July 2003. Quarterly Groundwater Monitoring Reports are prepared for the Lahontan RWQCB (copies of which are available with the County of Los Angeles Department of Regional Planning) to demonstrate containment of the plume and to track the success level in remediating the contaminants of concern (primarily halogenated volatile organic compounds [HVOCs]). Groundwater that is treated to potable water standards is now intermittently discharged into the incised channel in approximately the same area where the groundwater previously discharged naturally. Since the implementation of this groundwater treatment system, HVOCs have not been detected in the surface waters of the incised channel. It is noted that, prior to implementation of the treatment system, the HVOCs were detected at low concentrations and for a short distance before they volatilized. Therefore, this source area poses no threat to the Project site because the limits of surface and groundwater contamination are distant from the Project site and its water supply sources.

The groundwater contamination from the Industrial Landfill Area, Diesel Pipeline Area, and Cement Kiln Dust Piles is contained in perched groundwater lying entirely within the Cement Plant site and is at a considerable distance from the Project site (approximately one mile). There is no connection between the affected groundwater and the groundwater sources available to the Project site.

The Lahontan RWQCB is also the lead oversight agency for ongoing and future environmental activities at the Cement Plant to monitor groundwater quality and required remediation activities. The Lahontan RWQCB works closely with the responsible parties (with the former and current owners of the Cement Plant that have active responsibilities, and the property owner who has backup liability) to ensure that all environmental concerns are adequately identified and addressed in a timely manner. The CAOs charge the responsible parties with long-term remediation and containment actions to clean up and abate the effects of unauthorized waste discharges. The WDRs establish the discharge limitations for the constituents of concern (COC) and outline the monitoring and reporting requirements.

In addition to the source areas discussed above, the Cement Plant site includes a former hazardous waste resource (energy) recovery facility that is located to the west of the plant structures; it was previously operated by Systech Environmental Corporation. The State of California Department of Toxic Substances Control (DTSC) is the lead regulatory agency, and DTSC issued a “closure certification” letter on March 29, 2007, for the Systech site (DTSC 2007). This certification indicates that DTSC considers the site fully remediated and the facility formally closed.

Additional information regarding the National Cement Plant is provided in Section 5.4, Water Quality; Section 5.11, Air Resources; and Section 5.18, Water Resources, respectively, of this EIR.

#### Historic Non-Producing Oil Wells (Dry Holes)

There are two historic, plugged and abandoned dry holes (non-producing wells), identified as Tejon Ranch Oil Company Well #1 and Kinsey #1, on the Project site. These are located in Section 14, Township 8N, Range 18W according to the California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR), and are shown on Exhibit 5.3-1, Locations of Phase I Findings. Based on testing and review of records, these oil wells were abandoned in accordance with applicable regulations. However, according to the DOGGR, the wells would need to be re-abandoned prior to grading in accordance with current DOGGR guidelines. In accordance with Section 3208 of the *California Public Resources Code*,

A well is properly abandoned when it has been shown, to the satisfaction of the supervisor, that all proper steps have been taken to isolate all oil-bearing or gas-bearing strata encountered in the well, and to protect underground or surface water suitable for irrigation or farm or domestic purposes from the infiltration or addition of any detrimental substance and to prevent subsequent damage to life, health, property, and other resources.

### Asbestos-Containing Samples

Asbestos, a naturally occurring fibrous material, was used for years in many building materials for its fire-proofing and insulating properties. Any activity that involves cutting, grinding, or drilling during demolition could release friable (easily crumbled) asbestos fibers unless proper precautions are taken. Inhalation of airborne fibers is the primary mode of asbestos entry into the body, making friable materials the greatest potential health risk. During site reconnaissance conducted in 1999 by Converse Consultants for a previous Phase I ESA, materials potentially containing asbestos were observed on site. Four samples were taken to be analyzed for asbestos content from location number "6" shown on Exhibit 5.3-1. One sample was found on wood siding located in a small debris pile in an area that was formerly used as a homestead; the sample appeared to be cloth. The remaining samples were from a water trough and appeared to be tar or mastic. The cloth sample contained 70 to 80 percent asbestos. The other samples did not contain asbestos.

### Soil Sampling

As noted above, during site reconnaissance in 1999, Converse Consultants observed discolored soil, gravel, and cleared vegetation in an area in the southwestern portion of the Project site, from an unknown origin, and performed limited Phase II testing. Four surface soil samples were collected from the immediate area and are noted as location number "7" on Exhibit 5.3-1. Three of the samples were analyzed using the following USEPA test methods:

- USEPA method 8015M for Total Petroleum Hydrocarbons (TPH) as gasoline.
- USEPA method 8015M for TPH as diesel and heavy oil range organics.
- USEPA method 8260 for Volatile Organic Compounds (VOCs).
- Title 22 Metals.

The background soil sample was not analyzed. No contaminants were detected above the method detection limits for TPH as gasoline, TPH as diesel/heavy oil range organics, or VOCs. Various metals were detected in the soil (e.g., arsenic, barium, lead); however, the concentrations were ten times below the Soluble Threshold Limit Concentrations and the Total Threshold Limit Concentrations, and were therefore determined to not represent a hazard.

As noted above, a former homestead area was observed near the central portion of the Project site and was noted that one of the drums appeared to have leaked a black, tar-like substance, though no odor (such as from petroleum hydrocarbons) emanated from the substance. Therefore, in November 2008, a Phase II ESA was performed in the area near the 55-gallon drums. For the Phase II ESA performed in the drum area, a total of four soil samples were collected at two depths: six inches and two feet below ground surface (bgs), from each of two soil boring locations (D1 and D2) in close proximity to the drums. The two samples collected at a depth of six inches bgs were analyzed for total petroleum hydrocarbons, carbon

chain (TPH-cc), and Title 22 metals;<sup>2</sup> the two samples collected at two feet bgs were analyzed for VOCs. In addition, all soil samples collected were field-screened for VOCs using a photoionization detector (PID).<sup>3</sup> All PID readings were 0.0 parts per million (ppm). All soil samples collected as part of the Phase II ESA in the drum area were laboratory tested using the appropriate USEPA Method for the constituents being analyzed.

TPH-cc and VOCs were not detected in either soil sample submitted for these constituents. A total of eight metals were detected in one or both samples tested for Title 22 metals. Of these, arsenic was the only metal detected above its respective USEPA Region IX Screening Level (i.e., 0.39 milligram per kilogram [mg/kg] for arsenic) or the California Environmental Protection Agency's (CalEPA's) California Human Health Screening Levels (CHHSLs)(0.07 mg/kg for arsenic) for residential property. Specifically, the average arsenic concentration for the two samples collected for Title 22 metals analysis was 3.08 mg/kg (D1=3.75 mg/kg; D2=2.40 mg/kg). However, the USEPA and CalEPA screening levels and the average arsenic concentration measured in the drum area are below both the average background concentration of arsenic naturally occurring in California soil (3.5 mg/kg) and the DTSC's established arsenic cleanup level of 12 mg/kg for proposed school sites. Therefore, the Phase II ESA concludes that the arsenic levels detected in the soil around the drums are natural in origin, rather than anthropogenic (man-made), and do not represent an environmental concern (Converse Consultants 2008).

### ***Pesticide Use***

As detailed in Section 5.5, Land Resources, areas in the northeastern corner of the Project site and surrounding off-site areas have been and are currently used for agricultural purposes. During farming activities, pesticides are commonly used for pest control. A pesticide is any substance used to kill crop pests (such as insects, rodents, weeds, and fungi). Pesticides are inherently toxic and, when used improperly, can have adverse effects on human health and the environment. Pesticides exert adverse effects on living organisms, including non-target organisms such as non-pest plants and animals in or near a treated area. The four variables that determine the degree to which a non-target organism is affected include the chemical and physical properties of pesticides; their mode of application; their route of entry into the non-target organism; and their rate of absorption into the blood stream. The list of pesticides used on the site can be found in Table 5.3-1, Pesticides Used on the Centennial Project site.

The chemical and physical properties of a pesticide determine the potential toxic effects it can have on humans. The USEPA examines the toxicity, intended use, and environmental impact of every pesticide as part of the pesticide registration process. A pesticide listed for general use is considered to present little or no danger to either the applicator or the environment if it is used as directed. Based on the Proposition 65 Chemical List effective June 1, 2007, and as noted in Table 5.3-1, none of the pesticides known to be used on the Project site are regulated by Proposition 65, which regulates toxic chemical exposure for chemicals known to cause cancer, birth defects, or other reproductive harm. Therefore, all of

---

<sup>2</sup> Refers to the 16 metals listed in Title 22 of the *California Code of Regulations* ("Title 22 metals").

<sup>3</sup> A photoionization detector is a portable vapor and gas detector that detects a variety of organic compounds.

these pesticides are listed for general use. Please refer to Section 5.4, Water Quality, for more information on pesticide use as it relates to water quality.

<sup>a</sup> None of the pesticides listed in this table are regulated by Proposition 65 (OEHHA 2015). <sup>b</sup> Atkinson 2005. <sup>c</sup> Tejon Ranch Company 2008.	

### ***Quail Lake Skypark Airport***

The Quail Lake Skypark Airport, a single-strip, private airport, is located east of Quail Lake and south of the Project site. The airport is 1 of 68 Special-Use Airports in California (Caltrans Aeronautics 2017), which is defined by the *California Code of Regulations* (CCR, specifically Title 21, Part 3527[w]) as “an airport not open to the general public, access to which is controlled by the owner in support of commercial activities, public service operations and/or personal use”. A total of six aircraft are based out of the Quail Lake Skypark Airport, including five single-engine aircraft and one multi-engine aircraft (GCR and FAA 2015). The Skypark facilities are limited to a single 40-foot-wide airstrip totaling 3,100 feet in length (GCR and FAA 2015). The total number of flights out of the Quail Lake Skypark Airport is not known; however, given the private airport status and a limited number of locally based craft, the total number of flights is expected to be minimal.

### ***Valley Fever***

Valley Fever is the common name (formally known as *Coccidioidomycosis*) for a fungal disease caused by inhalation of *Coccidioides immitis* spores that are carried in dust; it is found in parts of the southwestern United States, Mexico, and South America (LADPH 2017). In California, the highest incidence of Valley Fever occurs in the San Joaquin (Central) Valley, with over 75 percent of reported cases (CDPH 2016a). Valley Fever tends to occur in areas with dry dirt and desert-like weather conditions that can allow the fungus to grow. The fungus is found throughout Los Angeles County, with the highest rates in the San Fernando Valley and Antelope Valley (LADPH 2017).

The fungus can become airborne when soil that contains *C. immitis* spores is disturbed, either by natural or anthropogenic (man-made) means, including wind, farming, and construction. Valley Fever is diagnosed by a blood test, a chest x-ray, and other tests, and it can be treated with anti-fungal medications. Approximately 60 percent of people exposed to Valley Fever spores develop no symptoms. If symptoms develop, those individuals generally develop a mild respiratory illness with flu-like symptoms that can last a month or more. Rarely, individuals develop a severe illness such as pneumonia, meningitis, or dissemination when the fungus spreads to other parts of the body. At highest risk for exposure to Valley Fever

are farmers, construction workers, military personnel, archaeologists, and others who are likely to engage in activities that actively disturb soils in areas where Valley Fever may be present. Persons at the highest risk of developing severe Valley Fever include the very young (under 5 years old); older adults (over 60 years old); immunocompromised individuals and those with diabetes; pregnant women; and certain ethnic groups, including African-Americans, Latinos, and Filipinos (LADPH 2016; CDPH 2016b).

Between 2011 and 2015, the annual incidence of Valley Fever in Los Angeles County has ranged from 3.2 (2011) to 5.5 (2015) cases per 100,000 persons, or 316 cases and 557 cases, respectively. During this period, the Statewide incidence of Valley Fever varied from 5.9 (2014) to 13.9 (2011) cases per 100,000 persons, with the highest rate of cases reported in Kern County (CDPH 2016b). In California, the annual number of Valley Fever cases has been on the rise since 2000. It is believed that contributing factors may include changes in climate and rainfall patterns; construction activities that disturb soil; an increase in susceptible persons moving to endemic areas; and heightened awareness and diagnoses (Sondermeyer et. al. 2013). The Los Angeles County Department of Public Health (DPH) divides the County into Service Planning Areas (SPA) for the purposes of tracking and reporting trends of many diseases in Los Angeles County. The Antelope Valley is included within SPA1, which reported the highest incidence rate of reported cases of Valley Fever in Los Angeles County in 2014, at 26.2 cases per 100,000 people. The Centennial Project site is within the farthest western portion of SPA 1, and is adjacent to SPA 2 (San Fernando Valley), which had a lower incidence rate of 5.7 cases per 100,000 people (LADPH 2016).

## Project Design Features

**PDF 3-1** Prior to sale, lease, or rental of any residential structure or portion thereof on the Centennial Project site, the Project Applicant/Developer shall provide to each prospective purchaser or tenant a notice and statement of acknowledgment that shall be executed (i.e., read and signed) by the prospective purchaser, lessee, or tenant that the property within Centennial may present a temporary risk of exposure to Valley Fever spores during construction or other earth-moving activities. The form shall include strategies to reduce potential exposure to Valley Fever spores. The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the County.

## Threshold Criteria

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

**Threshold 3-1** Create a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials.

**Threshold 3-2** Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment.

- Threshold 3-3** Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter-mile of sensitive land uses.
- Threshold 3-4** Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.
- Threshold 3-5** Result in a safety hazard for people residing or working in the project area for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport.
- Threshold 3-6** Result in a safety hazard for people residing or working in the project area for a project within the vicinity of a private airstrip.
- Threshold 3-7** Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

### **Environmental Impacts**

- Threshold 3-1** **Would the project create a significant hazard to the public or the environment through the routine transport, storage, production use, or disposal of hazardous materials?**
- Threshold 3-2** **Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment?**
- Threshold 3-3** **Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter-mile of sensitive land uses?**

### ***On-Site Impacts***

The following analysis addresses the potential for hazardous materials handling, pesticides, and Valley Fever to affect construction and/or operation of the Project. Section 5.11, Air Resources, includes the analysis of toxic air contaminant emissions from proposed stationary sources on the Project site.

### **Hazardous Materials Handling**

Construction of the Project would involve the limited transport, storage, use, and/or disposal of common construction-related hazardous materials, including oil and grease, solvents, diesel fuel, and other chemicals in vehicles, trucks, and heavy equipment. These materials could be released into the environment in small amounts in the event of an accident. Construction of the Project would not require the use of acutely hazardous materials or substances. To prevent environmental hazards, the handling of hazardous materials used in construction equipment would have to be conducted in accordance with existing regulations.

These regulations include the transport of hazardous materials; on-site storage and use of hazardous materials; and procedures to implement in the event of a spill.

Implementation of the Project would result in the on-site handling of hazardous materials that are common in urban environments. This includes the development of residential land uses, at varying densities, along with commercial/retail, business park, education, utility, and institutional/civic land uses. The Business Park land use designation may include a hospital or other medical-related facilities and light industrial facilities; the Utility, Business Park (conditional), and Institutional/Civic (conditional) land use designations would have the option to construct a Materials Recycling Facility (MRF). These types of facilities are, again, typical of urban development and a myriad of specialized regulations are applicable to medical and industrial land uses, as appropriate. The proposed Business Park land use areas are situated entirely along the south side of SR-138, and the proposed public facilities land use areas where the MRF could be located are situated along the northeast boundary. These are “edge” areas of the Project site, rather than being intermixed with residential and other land uses. The materials that would be expected to be used on the Project site include commercial cleansers, solvents, and other janitorial or industrial-use materials; paints; landscape maintenance materials; pressurized gases; chlorine for pools; petroleum products at gas stations; and others. The handling, storage, and usage of these materials would be subject to applicable local, State, and/or federal regulations. While many such common materials are technically labeled “hazardous”, the presence of such materials is common in a mixed-use urban environment, and their use on the Project site would not pose an unusual or uncommon threat to the health or safety of the future population of the Project site. In addition, any hazardous materials used during construction would also be transported, used, stored, and disposed of according to any applicable local, State, and/or federal regulations.

### Pesticides

Pesticides (insecticides, herbicides, and fungicides) are used for current agricultural operations on the Project site and in the pivot fields located east of 300<sup>th</sup> Street West. As indicated previously in Table 5.3-1, Pesticides Used on the Centennial Project Site, no pesticides are currently used that are subject to Proposition 65 restrictions. It is anticipated that use of pesticides would continue as long as these areas remain under agricultural use. It is also expected that these pesticides would continue to be applied according to federal, State, and local requirements and manufacturer recommendations, such as concentration and method of application. Agricultural production will continue in the eastern portion of the Project site while early phases of Project construction and occupation of the developed land uses occur incrementally over time. As such, the Project will introduce new land uses and residents onto the Project site while current pesticide use continues.

Federal, State, and local requirements and manufacturer recommendations are specific to each pesticide and are intended to ensure that acute overexposure or chronic exposure to these materials by either the farmers or adjacent resident populations does not occur. Therefore, there would be less than significant impacts during construction and operation of the Project.

Regarding future on-site pesticide use, such materials would be used in the maintenance of public and private landscaped areas on the Project site. Please refer to Section 5.4, Water

Quality, for a discussion of pesticide use as it relates to water quality as a result of Project operation. The small volume of on-site pesticide use for landscaped areas would also be applied in accordance with federal, State, and local requirements as well as manufacturer recommendations. Therefore, it is anticipated that future residents of the Project would not be exposed to types or concentrations of pesticides or frequency of application that would result in adverse health effects. Therefore, impacts would be less than significant.

### Valley Fever

As discussed above, Valley Fever spores have the potential to be found in soils of the Antelope Valley. The site is currently a large expanse of undeveloped land, which experiences periodic high winds and supports widespread grazing and some agricultural activity. These conditions would result in (1) disturbance of existing soils on the site; (2) dust formation associated with this disturbance; and (3) a resultant risk of Valley Fever for residents in the Project area. However, grading required for site development would have a more intensive surface disturbance and, as such, would increase the risk of Valley Fever exposure if spores are present on the Project site and become airborne in fugitive dust.

The control of fugitive dust is the key to preventing exposure to Valley Fever spores during ground-disturbing construction activities. Even if Valley Fever spores are present on site and are disturbed during grading, if they do not become airborne they do not have the potential to be inhaled and result in illness. Section 5.11, Air Resources, describes fugitive dust control measures that would be required and implemented on the Project pursuant to the Antelope Valley Air Quality Management District's (AVAQMD's) Rule 403, Fugitive Dust, and South Coast Air Quality Management District's (SCAQMD's) Rule 403, Fugitive Dust. Both these rules require that dust be controlled so as not to be visible beyond the property line and are monitored and enforced by the AVAQMD and SCAQMD, depending on the location of construction activities (CARB 1976). AVAQMD Rule 403 and SCAQMD Rule 403 control measures include watering exposed surfaces and haul roads three times daily; replacing ground cover in disturbed areas quickly; covering stock piles with tarps; and limiting speeds on unpaved roads to 15 miles per hour. The rules include comprehensive sets of best available control measures that reduce fugitive dust generation and are required for all projects within the AVAQMD's and SCAQMD's jurisdictions. The Rule 403 measures would minimize the potential for exposure and inhalation of Valley Fever spores to the maximum extent feasible.

SCAQMD Rule 403 also requires that each large project identify a Dust-Control Supervisor that is employed by or contracted with the Property Owner/Developer and is on the site or within 30 minutes of the site during working hours; has the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule requirements; and has both completed the SCAQMD Fugitive Dust Control Class and been issued a valid Certificate of Completion for the class. Mitigation measure (MM) 3-1 ensures that the requirement for a trained Dust-Control Supervisor is implemented during all phases of Project construction.

The Project's construction workers would be at the highest risk for Valley Fever exposure, and there would be an increased risk to the existing population in the immediate Project area. However, because of the large size of the Project site, the potential generation of dust

from grading and construction would primarily be localized within the site and would not affect neighboring populations due to distance. This is because fugitive dust must be entrained in wind and, just like sediment in water, particles in the wind drop out during transport. Therefore, due to the great distance between the majority of on-site grading areas and the existing residences in the area, any fugitive dust generated after implementation of dust-control measures (MM 3-1) would settle out of the wind transporting the dust before they could reach off-site areas. Rule 403 requirements stipulate that dust be controlled so as not to be visible beyond the property line. Therefore, the majority of dust generated during grading would remain on the Project site itself and, as mentioned above, would be most likely to affect construction workers. To help prevent construction workers from contracting Valley Fever on the Project site, MM 3-2 describes measures such as requiring that respirators or masks be worn; and completing other means of reducing the spread and/or inhalation of Valley Fever spores, if present.

While construction workers would be at highest risk, on-site populations would also be at risk for exposure during interim phases of development, depending on the proximity to on-site construction activities. As described in PDF 3-1 and ensured by MM 3-3, all residents would be provided with a notice disclosing this potential risk and describing strategies to avoid potential exposure to Valley Fever spores during construction or other earth-moving activities prior to sale, lease, or rental of any property.

Therefore, with implementation of PDF 3-1 and MMs 3-1 through MM 3-3, the potential for exposure to Valley Fever spores from construction of the Project would be less than significant.

At the completion of construction activities, risks of exposure to Valley Fever would be reduced for those living on the Project site and adjacent to the Project site due to the replacement of undeveloped land with urban development, irrigated landscaping, and paved areas, that would have reduced risks of fugitive dust generation and the associated risk of Valley Fever. Valley Fever spores have a reduced chance of becoming airborne in areas that are irrigated, vegetated with groundcover, covered with hardscapes or pavement, or urbanized with relatively little undisturbed soil (KCPHSD 2015). Therefore, once the Project is completed and the landscaping is established, residents and visitors on the Project site would not have an increased risk of exposure to Valley Fever when compared to the existing conditions. This would be no different than any other development in the Los Angeles County region adjacent to undeveloped land, and there would be a less than significant impact.

### ***Off-Site Impacts***

Proposed off-site features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, would not involve habitable structures, recreational areas, or other land uses that would introduce a new population into an area that could potentially be exposed to environmental hazards, such as hazardous materials, pesticides and Valley Fever. Grading and other construction activities would disturb soils that could result in exposure to Valley Fever, as discussed above for on-site Project development. As such, implementation of off-site Project features would be subject the same requirements (i.e., MM 3-1 and MM 3-2) as on-site development. With implementation of these measures, there would be less than significant impacts.

**Impact Summary:** There would be less than significant impacts related to environmental hazards including hazardous materials handling, pesticides, and Valley Fever with implementation of PDF 3-1 and MMs 3-1 through 3-3.

In accordance PDF 3-1 and ensured by MM 3-3, all residents would be provided with a notice disclosing this potential risk and describing strategies to avoid potential exposure to Valley Fever spores during construction or other earth-moving activities prior to sale, lease, or rental of any property. With implementation of AVAQMD Rule 403 and SCAQMD Rule 403 fugitive dust control measures and additional measures to minimize Valley Fever exposure during construction (MM 3-1 and MM 3-2), the risk of exposure by construction workers and nearby residents during construction would be reduced to levels less than significant.

**Threshold 3-4** **Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?**

### ***On-Site Impacts***

As discussed previously, Phase I ESAs have been prepared, and updated where applicable, to collectively encompass the entire Project site. Phase I ESAs include a database review of properties having potential environmental concerns in the vicinity of the Project site (i.e., “listed sites”); review of records, aerial photographs, and other documentation that illustrate the history of site use; and site reconnaissance. The Phase I ESAs determine that listed sites and/or current or historic land uses in the Project vicinity would be unlikely to adversely affect site development and the future population on the site. Specific on- and off-site land uses discussed in the Phase I ESAs are described below.

### **Historic Dry Wells**

Two historic dry (non-producing) oil wells are present on the Project site generally north of Quail Lake (Exhibit 5.3-1). Based on testing and review of records from the DOGGR, the oil well and drill sites were abandoned with appropriate notice provided to DOGGR and no seepage or hazardous conditions are present. However, the DOGGR regulates development over abandoned oil wells. As part of the Project, the wells would need to be re-abandoned according to current DOGGR guidelines as required by MM 3-4. There would be less than significant impacts related to the presence of re-abandoned historic dry wells with implementation of mitigation.

### **Abandoned Mine Shaft**

A small (approximately four-foot-high) tunnel was dug in the side of a hill as an attempted gold mine located near the southern access point to the Project site (Exhibit 5.3-1). However, available information indicates that no gold or other mineral resources were discovered and the mine shaft was abandoned (Converse Consultants 2015b). Therefore, the mine does not represent a potential health hazard related to contaminated runoff or other environmentally

adverse conditions that can result from mining operations. However, the mine may be attractive to children and other new residents, and the current stability of the small tunnel is unknown. To eliminate potential risks from the abandoned mine shaft and to prevent any future accessibility into the tunnel, prior to approval of construction permits the tunnel shall be permanently closed in accordance with applicable regulations, as directed by the California Department of Conservation Office of Mine Reclamation, as described in MM 3-5. There would be less than significant impacts with implementation of MM 3-5.

#### Homestead Area

As part of the Project, the drums and the limited areas of identified asbestos and/or other debris in the area of the former homestead site would be removed in accordance with all applicable regulatory standards, which are determined based on the quantity, type, and media (i.e., soil, groundwater) of the identified contamination as encountered at the time of site development. If hazardous materials are encountered in the homestead area or anywhere else on the Project site, activities in the immediate area shall be halted until consultation with the appropriate agencies (e.g., DTSC, State Water Resources Control Board, Los Angeles County Fire Department [LACFD]) is performed and the method of removal is determined (MM 3-6).

In addition, the former water well would be backfilled and compacted during grading operations in accordance with California Department of Water Resources Water Wells Standards regulations, including Chapter II (Standards), Part III (Destruction of Wells), Section 23 (Requirements for Destroying Wells), which prescribe the appropriate steps for destroying inactive water wells, including, but not limited to, preliminary work, filling and sealing conditions, placement of fill or sealing materials, the requirements for sealing and fill materials, additional requirements for wells in urban areas, and temporary cover requirements. Remediation and/or removal of identified hazardous materials and contaminated soils would be completed in compliance with applicable governmental regulations and agency requirements during Project construction. Therefore, there would be no impacts to proposed future land uses on the Project site because the limited and common type of contaminated materials that would likely be encountered on the site would be fully resolved during site development activities and prior to occupancy of future land uses. There would be a less than significant impact.

#### National Cement Plant

As discussed in detail previously, the National Cement Plant is located in Kern County approximately one mile north of the Project site (Exhibit 5.3-1), and groundwater contamination had resulted from historic activities of this facility. Accordingly, there has been agency oversight by DTSC and the Lahanton RWQCB (lead oversight agency) related to continuing remediation efforts. As described fully above in the Environmental Setting section, the contaminant source areas pose no threat to the Project site and its water supply sources due to distance; lack of connectivity between the shallow groundwater impacted by historic releases and Tejon Ranch water supplies; and the results of ongoing groundwater remediation. Finally, as part of the Water Quality Technical Report prepared for the Project, the National Cement Plant was reported to have been in compliance with regulatory permitting and related requirements (Geosyntec 2016). Further, in March 2007, the DTSC

issued a closure letter for the Systech site, which indicated to the Tejon Ranch Company that the Systech site had been fully remediated (DTSC 2007). Therefore, this land use would result in no impacts to the Project site.

The Cement Plant is also engaged in an alternative-fuel source project (the National Cement Plant Tire-Derived Fuel project). Air emissions from operations at the National Cement Plant are discussed in Section 5.11, Air Resources.

In addition to considering Cement Plant operations on the National Cement Plant property site, the vehicular access from SR-138 to the Cement Plant is germane to the Project. The southern half of the existing National Cement Plant Road within the Project site would be realigned to the west of its current location. As in the existing condition, the realigned roadway would be a private-use facility with clearly marked signs prohibiting public access and would not be part of the Project's proposed circulation system. The Project would incorporate the current bridge crossing over the West Branch of the Aqueduct (currently used for cement trucks) as one of the primary connectors between the east and west sides of the Project site. Therefore, potential direct conflicts with existing traffic on the National Cement Plant Road and future vehicular and other traffic (pedestrian, bicyclists) introduced by the Project would be eliminated because the two streams of traffic would be fully separated.

The National Cement Plant Road, as a dedicated drive for the National Cement Plant facility only, would carry less traffic than the Project roadways. Additionally, the operations of the National Cement Plant do not involve the transport of materials classified as hazardous under State and federal regulations (Grant 2008b). Materials routinely transported to and from the National Cement Plant facility are comprised of inert, non-hazardous materials such as quarried limestone and cement. Finally, urban land uses have been developed in proximity to heavily traveled roadways that carry much higher volumes of traffic than would be expected on the National Cement Plant Road. Therefore, for the reasons described above, proposed land uses in varying proximity to the National Cement Plant Road would not be adversely affected by continuing operations on this roadway.

In summary, there is no evidence that either historic or regular operations at the National Cement Plant or on the realigned National Cement Plant Road have or would adversely impact the Project.

### ***Off-Site Impacts***

Off-site Project features (intersections with SR-138, utility connections, water wells, and California Aqueduct crossings) are not, by themselves, population-generating uses and also would not create hazards or use hazardous materials. Only potable and recycled water would cross the Aqueduct at one or more of the three crossings. Wastewater would be collected and treated in two treatment plants; there would be one treatment plant located on each side of the Aqueduct, and wastewater would therefore not cross the Aqueduct. Also, as part of the 2015 Phase I ESA, Converse conducted site reconnaissance of the off-site Project features. The water bank area is a parcel of land measuring approximately 2,640 feet by 2,640 feet (0.5 mile by 0.5 mile). Various dirt/concrete/asphalt berms are located within the boundaries of the water bank, and no surface staining was observed. Converse drove along

the roads that form the Property boundaries: SR-138, 300<sup>th</sup> Street West, and 290<sup>th</sup> Street West. These roads were all asphalt paved and were generally in good condition; easements along the highways/roads were unpaved. During the second reconnaissance conducted for the Phase I ESA, Converse re-inspected the general areas along the California Aqueduct located on Tejon Ranch property through the chain-link fencing that surrounds the structure. No environmental concerns were observed during the reconnaissance of off-site Project features. Therefore, these features would not result in impacts related to a new population's proximity to listed properties and/or historic and current land uses of concern.

As discussed in Section 4.0, Project Description, the California Department of Transportation (Caltrans) is preparing environmental clearance documents in support of improvements to the SR-138 in the Project area that including the area proximate to the Project site shown as "study area" on Exhibit 4-9, Centennial Project – Caltrans Study Area. This documentation would include a Caltrans-compliant Phase I ESA and soil testing, as performed for all Caltrans projects. As such, it is assumed the environmental clearance document prepared under Caltrans' direction will identify, assess, and, if needed, remediate any contaminants found in the Caltrans right-of-way, which includes the off-site portions of the five intersections with SR-138.

**Impact Summary:** The Phase I and Phase II ESAs conducted for the Project conclude that Project implementation would not result in significant impacts related to exposure to hazardous materials from historic and current land uses through compliance with requirements for handling hazardous materials, implementation of MM 3-6 related to encountering unanticipated hazardous materials during construction; MM 3-4 related to documentation of re-abandonment of the historic oil wells on site; and MM 3-5 related to mine closure.

**Threshold 3-5** For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

**Threshold 3-6** For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

### ***On-Site Impacts***

As described above, the Quail Lake Skypark Airport, located east of Quail Lake and south of the Project site, is a small, single-strip, general aviation (i.e., non-jet) private airport. As Quail Lake Skypark has one runway and no Federal Aviation Administration (FAA) control tower, no operational data is recorded. However, because the Quail Lake Skypark is privately owned and only has six locally based aircraft, the number and frequency of flights is expected to be minimal. Any additional flights or activity at the airport would be subject to the approval of the airport owner because the facility is not available to the general public.

Caltrans Division of Aeronautics reports the facility operates under a Special-Use Airport Permit that was issued in November 2002. Airports that are permitted as "Special-Use" are

not open to the general public and access to the airport is at the discretion of the owner. While the permit does not specify a maximum number of daily flights, the Skypark is permitted to operate during daylight hours only (Miles 2016).

Also, the permit requires application for an Amended/Corrected Airport Permit prior to making physical or operational changes at the airport. Caltrans' Aviation Safety Officer for Los Angeles and Riverside Counties was consulted regarding the potential for expansion of activities at the Quail Lake Skypark; based on permit conditions and limited airport infrastructure, it was concluded to be "very unlikely that there would be any significant increase in flight activity in the future" (Miles 2016). Therefore, implementation of the Project would not increase or otherwise affect air traffic at Quail Lake Skypark such that a hazard would result. As discussed in Section 4.0, Project Description, the California Department of Transportation (Caltrans) is preparing environmental clearance documents in support of improvements to the SR-138 in the Project area. The Quail Lake Skypark would be permanently closed in the event the SR-138 improvements are implemented by Caltrans. As such, the potential for exposure of persons to hazards associated with aircraft operations at Quail Lake Skypark Airport would be less than significant.

### ***Off-Site Impacts***

Proposed off-site Project features (intersections with SR-138, utility connections, water wells, and California Aqueduct crossings) are not, by themselves, population-generating uses. Therefore, these features would not result in impacts related to exposure of a new population to hazards from aircraft operations.

***Impact Summary:*** The potential for exposure of persons to hazards associated with aircraft operations at Quail Lake Skypark Airport would be less than significant.

**Threshold 3-7**      **Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?**

### ***On-Site Impacts***

Section 5.10, Traffic, Access and Circulation, includes an analysis of whether traffic generated by the Project and the proposed circulation plan would result in inadequate emergency access for emergency vehicles as well as residents and employees in the area. The traffic analysis determined that the Project would have adequate intersection levels of service (LOS) for all points of access into the Project site and for the internal circulation system.

Additionally, the Project includes locations for up to four new fire stations and a new Sheriff's substation; these amenities would contribute to improved emergency and evacuation response in northern Los Angeles County. Please refer to Section 5.16, Fire and Law Enforcement Services, for a complete discussion of these proposed facilities. In 2012, the *Los Angeles County Operational Area Emergency Response Plan* (OAERP) was adopted by the County Board of Supervisors. The objective of the OAERP is to integrate County resources to be an efficient organization capable of responding to emergencies using the National Incident Management System (NIMS), the California Standardized Emergency Management

System (SEMS), mutual aid, and other appropriate response procedures. The OAERP is an extension of the State of California Emergency Plan (LACOEM 2012).

To ensure that future Centennial residents would be informed regarding evacuation routes and other aspects of an emergency response specific to the Project site, the Project Applicant has had an Emergency Response Plan prepared for the Project, which will be updated with each new tract map in accordance with MM 3-7 and be reviewed and approved by the County of Los Angeles Department of Regional Planning, who would facilitate review by the LACFD and the County of Los Angeles Sheriff's Department. This review would ensure that the Project's Emergency Response Plan does not conflict with or otherwise impair the OAERP, and provides a comprehensive emergency response planning effort. The Emergency Response Plan would be distributed to each property tenant or purchaser in accordance with MM 3-7. Therefore, Project development would not impair implementation of or physically interfere with emergency response or evacuation activities of the LACFD, the County of Los Angeles Sheriff's Department, or any other agency mobilized during an emergency response. There would be a less than significant impact after mitigation.

The Project roadways would be built to County of Los Angeles standards and would be designed to ensure that proper access for emergency ingress and egress would be accomplished for evacuation as well as for emergency vehicle access. The Project includes an extensive backbone vehicular circulation system and would provide four points of access to the site via SR-138 (excluding the re-aligned National Cement Plant Road). The proposed bridge over the West Branch of the Aqueduct would be constructed from reinforced concrete or steel girders with concrete or asphalt road decks and would be constructed in compliance with all applicable seismic and engineering codes and standards. In the unlikely event (either man-made or natural) of the failure of one or both bridges over the California Aqueduct, there would be opportunities for emergency ingress and egress to and from both sides of the Project site (i.e., east and west of the Aqueduct) via the Project's extensive roadway system and via the re-aligned National Cement Plant Road (refer to Exhibit 4-8, Centennial Project – Circulation Plan). Consequently, ingress and egress would be maintained throughout the Project site via multiple access points with many possible routes of travel in the event of an emergency. No significant access-related impacts associated with emergency ingress and egress would be expected to occur as a result of the Project.

As discussed above under Relevant Plans, Policies, and Regulations, the AVAP goal and policies related to hazards are limited to emergency response. The Project would be consistent with those policies that are under the purview of individual, private projects and consistent with the intent of those policies under the purview of the County. As discussed, Project implementation would involve continued preparation of an Emergency Response Plan, which would be distributed to each property tenant or purchaser (Policies PS 6.1 through PS 6.4). The Emergency Response Plan, which would be updated as each new tract map is prepared, would be reviewed by the County Department of Regional Planning, the LACFD, and the County Sheriff's Department. As discussed further in Section 4.0, Project Description, a temporary, storefront, Sheriff's station would be developed and fully operational prior to approval of the first certificate of occupancy and would be closed subsequent to development of the permanent on-site Sheriff's station. Similarly, the Project includes conceptual site locations for up to four new fire stations; one fire station is proposed

in Village 1 and would be operational no later than the time the 1,000<sup>th</sup> dwelling unit is built (MM 16-3). The LACFCD would approve the final fire station site locations, and the Project Applicant/Developer would construct and equip the fire stations. These facilities would provide emergency response and evacuation services to the residents, employees, and visitors on the site (Policy PS 6.5). The Emergency Response Plan also supports the County's intent to development a master emergency plan that encompasses every Antelope Valley community (Policy PS 6.6).

Therefore, with the implementation of MM 3-7, the Project would not impair implementation of or physically interfere with emergency response or evacuation activities of the LACFD, the County of Los Angeles Sheriff's Department, or any other agency mobilized during an emergency response.

### ***Off-Site Impacts***

The off-site Project features (intersections with SR-138, utility connections, water wells, and California Aqueduct crossings) would not adversely affect traffic circulation or otherwise affect emergency response or evacuation. The proposed backbone circulation system, including connections with SR-138, would be constructed prior to occupancy of developed land uses. The five SR-138 intersections would include acceleration/deceleration lanes to ensure safe and efficient ingress and egress from the site on the highway, including during emergencies. During construction of the SR-138 intersections in the public right-of-way, the Project Applicant/Developer would be required to prepare and implement a Traffic Control Plan in compliance with California MUTCD standards, which would be ensured with implementation of MM 3-8. After mitigation, there would be a less than significant impact.

***Impact Summary:*** The anticipated traffic generation was determined not to adversely affect emergency access or evacuation routes. Also, the Project includes conceptual locations for up to four new fire stations that will improve emergency and evacuation response for the Project site and for northern Los Angeles County. Further, the Project Applicant/Developer would continually update the Emergency Response Plan prepared for the Project in accordance with MM 3-7. During construction in the Caltrans right-of-way for new Project intersections, the Project Applicant/Developer would be required to prepare a California MUTCD-compliant Traffic Control Plan for County and Caltrans approval, and ensured with implementation of MM 3-8, reducing the potential for impacts to emergency access and circulation during activities in the roadway. Therefore, after mitigation, the Project would result in less than significant impacts related to impairment or interference with the emergency response or evacuation activities of the LACFD, the County of Los Angeles Sheriff's Department, or any other agency mobilized during an emergency response.

## Mitigation Measures

**MM 3-1** The Project Applicant/Developer shall employ a Dust-Control Supervisor who will be on the site within 30 minutes of the start of work taking place each morning; will have the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Antelope Valley Air Quality Management District (AVAQMD) Rule 403 and South Coast Air Quality Management District (SCAQMD) Rule 403 requirements; and will have completed the SCAQMD Fugitive Dust Control Class and has been issued a valid Certificate of Completion for the class. Contact information for the Project's Dust Control Supervisor shall be posted on-site to ensure that the public has a means of providing complaints regarding fugitive dust. The Dust Control Supervisor shall be responsible for tracking complaints, conducting corrective action, as necessary, and for maintaining an up-to-date log of complaints and responses for periodic County review.

**MM 3-2** To aid in the prevention of Valley Fever among construction crews on the Project site, the following measures shall be implemented by the Construction Contractor during all construction activities:

- Hire crews from Los Angeles and/or Kern County populations, or other areas where Valley Fever is endemic, where possible, since it is more likely that they have been previously exposed to the fungus and are therefore immune.
- Prior to Project construction initiation, and for any personnel additions after initial Project construction initiation, the following California Department of Public Health (CDPH) materials on Valley Fever (or the most updated materials applicable to Los Angeles County) shall be distributed to worksite supervisors:
  - CDPH pamphlet entitled "Preventing Work-Related Coccidioidomycosis (Valley Fever)" available at: <http://www.cdph.ca.gov/programs/hesis/Documents/CocciFact.pdf>. (CDPH 2013a)
- Prior to Project construction initiation, and for any personnel additions after initial Project construction initiation, the following CDPH materials on Valley Fever (or the most updated materials applicable to Los Angeles County) shall be distributed to construction workers:
  - CDPH pamphlet entitled "Valley Fever Fact Sheet" available at: <http://www.cdph.ca.gov/HealthInfo/discond/Documents/VFGeneral.pdf>. (CDPH 2013b)
  - CDPH pamphlet entitled "Hoja de datos de la Fiebre del Valle (Valley Fever Fact Sheet in Spanish)" available at:

<http://www.cdph.ca.gov/HealthInfo/discond/Documents/HojaDeDatosDeLaFiebreDelValle.pdf> (CDPH 2013c).

- CDPH pamphlet entitled “Fact Sheet Valley Fever (Valley Fever Fact Sheet in Tagalog),” available at: <http://www.cdph.ca.gov/HealthInfo/discond/Documents/TagalogGeneralValleyFeverFactSheet.pdf> (CDPH 2013d).
- Require crews to use masks or respirators that are adequate to restrict inhalation of particulates during Project clearing, grading, and excavation operations in accordance with California Division of Occupational Safety and Health regulations.
- During rough grading and construction, the access way into the Project site from adjoining paved roadways shall be paved or treated with environmentally safe dust-control agents.

**MM 3-3** The Project Applicant/Developer shall provide to each prospective property purchaser or tenant a notice and statement of acknowledgment that shall be executed (i.e., read and signed) by the prospective purchaser, lessee, or tenant that the property within Centennial may present a risk of exposure to Valley Fever spores during construction or other earth-moving activities. The form shall include strategies to reduce potential exposure to Valley Fever spores. The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the County.

**MM 3-4** The Project Applicant/Developer shall coordinate with the California Department of Conservation, Division of Oil, Gas and Geological Resources (DOGGR) to facilitate re-abandonment of the two on-site historic dry oil wells in accordance with current DOGGR specifications. The Project Applicant/Developer shall present documentation that it has complied with the DOGGR requirements for re-abandonment of the two on-site wells.

**MM 3-5** The Project Applicant/Developer shall provide documentation to the County that the abandoned mine shaft is permanently closed in accordance with applicable regulations, as directed by the California Department of Conservation Office of Mine Reclamation, to prevent future access and potential ground instability issues.

**MM 3-6** If unanticipated hazardous materials or waste is encountered during construction, all work in the immediate vicinity of the suspect hazardous material shall be halted and the applicable oversight agency(ies) shall be notified. The applicable agency(ies) are determined based on the type and extent of the material encountered, and may include the California Department of Toxic Substances Control (DTSC), the State Water Quality Control Board, and/or local agencies, such as the County of Los Angeles Fire Department. The Project Applicant/Developer shall coordinate with appropriate agency(ies) on the appropriate means to address the suspect hazardous material/waste. All environmental investigation and/or

remediation shall be conducted under a Workplan approved by the primary oversight agency(ies) and construction in the affected area shall not proceed until clearance has been issued by the applicable agency(ies).

**MM 3-7** The Project Applicant/Developer shall prepare an Emergency Response Plan for the Project, which shall be updated as needed for each Tentative Map, and shall be submitted to the County for review and approval. The Project Applicant/Developer shall be responsible for distributing the current Emergency Response Plan to each purchaser or tenant of each property within Centennial, and shall distribute the Plan to all landowners through the Transportation Management Agency (TMA).

**MM 3-8** The Project Applicant/Developer shall prepare a Traffic Control Plan in accordance with the California Manual on Uniform Traffic Control Devices (MUTCD). The Traffic Control Plan shall be reviewed and approved by the California Department of Transportation (Caltrans), and all construction activities in the public right-of-way shall comply with the approved Traffic Control Plan to the satisfaction of Caltrans. Documentation of Caltrans approval shall be provided to the County for any Tentative Map involving construction within State Route 138 right-of-way.

### **Level of Significance after Mitigation**

Impacts related to hazards and hazardous materials would be less than significant with implementation of the MM 3-1 through MM 3-8 described above.

### **5.3.3 FIRE SAFETY**

This section analyzes wildland fire hazards that could occur in the vicinity of the Project site. Analysis of fire protection service can be found in Section 5.16 (Fire and Law Enforcement Services). The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

### **Relevant Plans, Policies, and Regulations**

#### ***Federal***

No federal plans or policies have been identified that relate to fire safety.

#### ***State***

##### **California Fire Plan**

In a collaborative effort between the State Board of Forestry and the California Department of Forestry and Fire Protection (CAL FIRE), the *2010 Strategic Fire Plan for California* (Fire Plan), last revised in April 2016, was prepared to address the protection of lives and property from California wildfires while recognizing that wildfires are a natural phenomenon and can

have beneficial effects, particularly on ecosystem health. The Fire Plan is a comprehensive update to the *California Fire Plan* prepared in 1996, the first such collaborative statewide wildfire planning document. The overarching vision of the Fire Plan is to have “A natural environmental that is more resilient and man-made assets which are more resistant to the occurrence and effects of wildland fire through local, state, federal and private partnerships” (CAL FIRE 2016). This vision is supported by seven goals and related objectives, and the application of adaptive management as a fundamental strategy of Fire Plan implementation. The purpose of applying adaptive management is to allow for changing conditions, and to better meet environmental, social and economic goals; increase scientific knowledge regarding wildfires; and foster understanding among stakeholders over time. The following are the Fire Plan’s seven goals to support the vision of “A natural environmental that is more resilient and man-made assets which [sic] are more resistant to the occurrence and effects of wildland fire through local, state, federal and private partnerships” (CAL FIRE 2016). The Fire Plan states that each sequential goal is meant to build upon the accomplishment of the previous goal.

1. Identify and evaluate wildland fire hazards and recognize life, property and natural resources assets at risk, including watershed, habitat, social and other values of functioning ecosystems. Facilitate the sharing of all analyses and data collection across all ownerships for consistency in type and kind.
2. Articulate and promote the concept of land use planning as it relates to fire risk and individual landowner objectives and responsibilities.
3. Support and participate in the collaborative development and implementation of wildland fire protection plans and other local, County, and regional plans that address fire protection and landowner objectives.
4. Increase awareness, knowledge and actions implemented by individuals and communities to reduce human loss and property damage from wildland fires, such as defensible space and other fuel reduction activities, fire prevention, and fire safe building standards.
5. Develop a method to integrate fire and fuels management practices with landowner priorities and multiple jurisdictional efforts within local, State, and federal responsibility areas.
6. Determine the level of fire suppression resources necessary to protect the values and assets and risk identified during planning processes.
7. Address post-fire responsibilities for natural resource recovery, including watershed protection, reforestation and ecosystem restoration (CAL FIRE 2016).

### California Building Code

Chapter 7A, “Materials and Construction Methods for Exterior Wildfire Exposure”, of the 2016 California Building Code (CBC), adopted and amended in Title 26 “Building Code” of the Los Angeles County Code, applies to new and existing buildings located in any Fire Hazard Severity Zone or Wildland-Urban Interface (WUI) Fire Area designated by the LACSD.

These codes establish minimum standards for materials, systems, and/or assemblies that can provide a reasonable level of exterior wildfire exposure protection for buildings through construction with ignition-resistant materials and design to resist the intrusion of flame or burning embers projected by a vegetation fire (i.e., wildfire exposure).

### ***County***

#### Los Angeles County General Plan and Antelope Valley Area Plan

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, part of the County General Plan, includes goals and policies that address wildfire issues in the unincorporated County. The AVAP goal and policies applicable to the analysis of fire safety with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies, and regulations.

**Goal PS 1:** Protection of the public through fire hazard planning and mitigation.

**Policy PS 1.1:** Limit the amount of potential master-planned development in Very High Fire Hazard Severity Zones through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy PS 1.2:** Require that all new developments provide sufficient access for emergency vehicles and sufficient evacuation routes for residents and animals.

**Policy PS 1.3:** Promote fire prevention measures, such as brush clearance and the creation of defensible space, to reduce fire protection costs.

**Policy PS 1.4:** Provide strict enforcement of the Fire Code and all Fire Department policies and regulations.

#### Los Angeles County Fire Department

The Los Angeles County Fire Department (LACFD) provides fire services to the Project area. The Regional Fire Prevention Unit Section II serves the areas of Los Angeles County designated as a Fire Hazard Severity Zone in a State Responsibility Area, including the Antelope Valley area. This office inspects and approves all single-family dwelling units located in wildland areas. Because the Project site is located in the area designated as a Fire Hazard Severity Zone, the area is considered to have a high fire potential.

#### *Fuel Modification Planning*

The Fire Hazard Severity Zones in State Responsibility Areas are defined in Appendix M of the County of Los Angeles Code's Title 32 (Fire Code). Title 32 is intended to provide minimum standards to safeguard the public's safety and welfare, and Section 4908.1 describes requirements for fuel modification plans in Fire Hazard Severity Zones. The section states the following:

A fuel modification plan shall be submitted and have preliminary approval prior to any subdivision of land and have final approval prior to the approval

of a permit for any permanent tent, yurt, trailer, or other structure used for habitation, to the approval of a permit for any structure that changes occupancy classification from a non R to R type occupancy, and new construction, remodeling, modification, or reconstruction of: (1) any enclosed structure over 120 square feet; (2) any structure enclosed on three sides or more and greater than or equal to 200 square feet; and (3) any structure greater than or equal to 400 square feet, where such remodeling, modification, or reconstruction increases the square footage of the existing structure or footprint by 50 percent or more within any 12-month period, and where the tent, yurt, trailer, structure, or subdivision is located within areas designated as a Fire Hazard Severity Zone within the State Responsibility Areas or Very High Hazard Severity Zone within the Local Responsibility areas, applicable Hazard Zone maps, and Appendix M of this code at the time of application. Every fuel modification plan shall be reviewed by the forestry division of the fire department for defensible space, reasonable fire safety, and compliance with Sections 325.2.1, 325.2.2, 325.10, and 503.2.1 of this code, the Fire Department's Fuel Modification Guidelines, and California Code of Regulations Title 14, Division 1.5, Chapter 7, subchapter 2. After such final plan has been approved by the forestry division of the fire department, a signed and notarized copy of the provided Covenant and Agreement and or previously reviewed and approved association CC&R's [Covenants, Conditions, and Restrictions] that include the necessary fuel modification information shall be recorded at the registrar-recorder/County clerk's office and a copy given to the Fuel Modification Unit prior to site inspection and release. The fuel modification inspection ensures compliance with applicable requirements of this code, the Building Code, Section 701A.5 (Vegetation management compliance), and the Residential Code, Section R327.1.5 (Vegetation management compliance). An on-site inspection must be conducted by the forestry division of the fire department and a final release issued by the forestry division prior to a certificate of occupancy being granted by the building code official.

The County Fire Department's Forestry Division (Forestry Division) provides several fire prevention services, including vegetation management services and fuel modification planning. The purpose of fuel modification is to provide defensible space between structures and wildlands. The Fuel Modification Plan Guidelines, last revised in 2011, were created by the Forestry Division to help the public understand the process of fuel modification plan review and approval as well as set forth landscape design criteria for applicable properties located in Fire Hazard Severity Zones (LACFD 2015).

A fuel modification plan consists of three sequential zones where combustible native or ornamental vegetation has been modified and/or partially or totally replaced with drought-tolerant, low-fuel-volume plant species. Fuel modification zones are designed to protect homes from wildfire by limiting and reducing the amount of fuel available for a wildfire. The reduction in available fuel affects the flame lengths and amount of heat produced by the fire and eliminates landscape areas where embers can ignite vegetation. Each zone should be designed so that the amount of fuel is reduced and the moisture in the plants is increased the

closer to a structure. The details of fuel modification plans vary in complexity and reflect the fire history; the amount and type of vegetation; the arrangement of the fuels; the topography; the local weather patterns; and the construction, design, and placement of structures (LACFD 2015). The following is a generalized fuel modification plan and associated zones (LACFD 2011):

**Zone A** is a minimum 20-foot setback zone from the edge of any structures; it is adjacent to structures and should offer protection from intense flames through either properly maintained, irrigated plants with high moisture content, or through walkways, gravel, stone, paved surfaces, or water features to create breaks in the fire's path.

**Zone B** is the irrigation zone/transition zone that extends from the edge of Zone A up to 100 feet from structures; a large percentage of existing vegetation may be removed and replaced with irrigated, fire- and drought-resistant plants. It may have detached structures and may contain some native vegetation if spaced according to the planting guidelines that create a transition to the native brush and thinning zone (Zone C).

**Zone C** is the native brush thinning zone and, if applicable, extends from the edge of Zone B up to 200 feet from structures. Vegetation will consist mainly of native plants with appropriate thinning and spacing; adequately spaced ornamental shrubs and trees are allowed (if approved by LACFD) but generally not recommended due to water conservation goals. The objective of this zone is to slow the rate of fire spread, reduce flame lengths, and minimize the intensity of the fires prior to reaching irrigated zones (i.e., Zones A and B) or the structure.

Planting proposed as part of a project along any public or private roadway that may be used for emergency access will also be reviewed to ensure compliance with applicable fire code requirements and safety as part of the Fuel Modification Plan review. Fuel modification distances are site specific, designed for severe fire weather scenarios, and are not intended to be a blanket requirement for all sites. The Zone A and Zone B irrigated zones encompass the minimum 30 to 50 feet of required removal of all highly flammable brush required by the Fire Code. Zone C will typically coincide with the requirement to thin from 30 to 200 feet from any structure. Also, a wide variety of conditions may result in the required fuel modification not being fully achieved within the property boundaries. Property owners are not required to extend their fuel modification on to adjacent property (i.e., off-site). However, they are encouraged to collaborate with adjacent private landowners and public agencies/landowners to find ways to extend fuel modification or brush clearance activities in ways that benefit everyone in the community. Where the desired zones are not capable of being implemented, alternatives to the typical requirements may be substituted. The installation of a wall made of cinderblock or other fire retardant material may be required as part of the Fuel Modification Plan (LACFD 2011).

### *Development Standards*

The County of Los Angeles' standards related to development in areas designated as Fire Hazard Severity Zones in a State Responsibility Area and that would be applied to the Project are specified in the Chapter 7A. "Materials and Construction Methods for Exterior Wildfire Exposure" of the Building Code (Title 26) and in the Fire Code (Title 32); these standards include, but are not limited to the following:

- All roof coverings shall be of fire retardant Class A materials. Wood-shingle and wood-shake roofs are prohibited in Very High Fire Hazard Severity Zones (VHFHSZs) regardless of classification (Section 704A.1.2).
- Where the roof profile allows a space between the roof covering and roof decking, the spaces shall be constructed to prevent the intrusion of flames and embers; shall be firestopped with approved materials; or shall have one layer of No. 72 American Society of Testing and Materials (ASTM) cap sheet installed over the combustible decking (Section 704A.1.2).
- Ventilation openings shall be constructed on the underside of eaves and cornices. The Building Official may accept or approve special eave and cornice vents that resist the intrusion of flame and burning embers (Section 706A.3 et. seq.).
- Exterior windows, window walls, glazed doors, and glazed openings in exterior doors shall be multi-pane glazing units with a minimum of one tempered pane, or glass block units, or have a fire-resistance rating of not less than 20 minutes, when tested according to ASTM E 2010, or they shall conform to the performance requirements of the Office of the State Fire Marshall (SFM) 12-7A-2 (Section 704A.3.2.2).
- Spark arresters constructed with heavy wire mesh or other noncombustible material with openings not to exceed ½ inch shall be provided in chimneys of any fireplace, barbecue, incinerator, or any heating appliance in which solid or liquid fuel is used (Section 326.12.2).
- Clearance of brush and vegetative growth shall be maintained (Section 325.2).

## Environmental Setting

The Project site is generally surrounded by undeveloped or agricultural land, with scattered single-family residences located near the southeast portion of the site. CAL FIRE and the LACFD designate lands within Los Angeles County that are determined to be highly vulnerable to wildfire as being “Fire Hazard Severity Zones” (Los Angeles County Code, Title 32). This designation replaces the previous County wildfire risk rating (i.e., Fire Zones 1 through 4) (Lopez 2006). Adoption of and revisions to Fire Hazard Severity Zone designations are made by the Los Angeles County Board of Supervisors. The Fire Hazard Severity Zone designation is based on evaluation of numerous interrelated criteria including fuels, topography, dwelling density, weather, infrastructure, building materials, brush clearance, and fire history. The County Fire Chief periodically reviews Fire Hazard Severity Zone areas and makes recommendations to the Board of Supervisors to revise the limits of these areas based on changes in any of the evaluation criteria.

Portions of the Project site are designated as a VHFHSZ and portions are designated as a HFHSV (LACDRP 2015). CAL FIRE classifies a zone as having a moderate, high, or very high fire hazard based on a combination of how a fire will behave and the probability of flames and embers threatening buildings. Project site characteristics that contribute to these designations include (a) access, (b) lack of existing adequate fire flows, (c) topography, and (d) vegetative cover. Typically during the spring months, vegetation begins to lose its moisture content. By the fall, when Santa Ana wind conditions begin occurring, wildland fire

conditions become extremely high. CAL FIRE, which also incorporates City and County records, recorded a total of 31 wildfires over 100 acres in size within approximately 5 miles of the Project site from 1964 through 2015. Of these, four fires occurred within Project site boundaries: the Liebre fire, which burned approximately 48,565 acres in 1968 (approximately 0.2 acre on site); Cement Fire No. 1 and Cement Fire No. 2, which burned a combined total of approximately 747 acres in 1994 (approximately 601 acres on site); the Pine fire, which burned approximately 16,272 acres in 2004 (approximately 65 acres on site); and the Hwy 138 and 300 West fire, which burned approximately 193 acres in 2006 (approximately 135 acres on site) (CAL FIRE 2016b). The effect of climate change on wildland fires has been addressed in Section 5.21, Climate Change.

When chaparral and coastal sage growth is young, it is more succulent and has few dead or dying branches and provides less horizontal fuel continuity; as a result, it has higher than average fuel moisture content and is usually more fire retardant. As these plant species reach 20 or more years of maturity, the dead-to-live fuel ratio increases, which creates more available fuel to sustain fires that have very high intensities and energy releases. Generally, fire-prevention tactics for urban development in wildland fire hazard areas focus on (1) restricting the types of building materials used; (2) appropriate building design; and (3) incorporating setbacks, including fuel-modification zones. All developments within a VHFHSZ and HFHSV are required to meet the building construction requirements specified in the County Code for these areas, as discussed above. Refer to Section 5.16, Fire and Law Enforcement Services, for a discussion of fire-protection service levels for the Project site.

### **Project Design Features**

No project design features are identified for Fire Safety.

### **Threshold Criteria**

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

**Threshold 3-8** Expose people or structures to a significant risk of loss, injury, or death involving fires, because the project is located:

- i. within a Very High Fire Hazard Severity Zone (Fire Zone 4).
- ii. within a high fire hazard area with inadequate access.
- iii. within an area with inadequate water and pressure to meet fire flow standards.
- iv. within proximity to land uses that have the potential for dangerous fire hazard.

**Threshold 3-9** Constitute a potentially dangerous fire hazard.

## Environmental Impacts

**Threshold 3-8**      **Would the project expose people or structures to a significant risk of loss, injury, or death involving fires, because the project is located:**

- i.    **within a Very High Fire Hazard Severity Zone (Fire Zone 4)?**
- ii.   **within a high fire hazard area with inadequate access?**
- iii.   **within an area with inadequate water and pressure to meet fire flow standards?**
- iv.   **within proximity to land uses that have the potential for dangerous fire hazard?**

**Threshold 3-9**      **Does the proposed use constitute a potentially dangerous fire hazard?**

### *On-Site Impacts*

The Project would introduce urban development in an undeveloped area subject to wildfire hazards. The Project area is within a VHFHSZ and an HFHSV, which are subject to high fire hazards due to the presence of high brush, woodlands, and steep slopes.

### Fire Hazard Assessment

Project implementation would result in the construction of residential areas, commercial and office uses, mixed-uses, business parks, institutional uses, and utilities in areas that have been designated as VHFHSZ or HFHSV. Current characteristics of the Project site that contribute to this designation include (1) limited access, (2) lack of existing adequate fire flows, (3) topography, and (4) types of vegetative cover. These characteristics would be addressed as the Project site is developed. An analysis of the Project site's fire hazard potential relative to these four factors is presented below.

1. **Access.** The Project includes an extensive backbone vehicular circulation system that would provide five points of access to the site via SR-138. The design of the Project's internal circulation system would implement the County standards, as applicable, regarding access (i.e., roadway widths, length of single access streets, cul-de-sac dimensions, street parking restrictions) (see Section 5.10, Traffic, Access and Circulation, for additional discussion of roadway design). Additionally, the Project will incorporate up to four new fire stations within the Project site. Consequently, access would be improved from the existing condition and impacts associated with emergency fire response would be less than significant with incorporation of emergency response requirements (MM 3-7).
2. **Fire Flows.** Exhibit 4-13, Centennial Project – Conceptual Domestic Water System, shows the Project's water system that would provide water supplies to support proposed land uses and provide adequate fire flows and pressure to support any fire-suppression activity in the event of wildland or structural fires (refer to Section 5.18, Water Resources, for further discussion of the water system). The proposed

water system includes water mains, water tanks, pump stations (where necessary), and fire hydrants to ensure sufficient fire flows and water pressure to meet County of Los Angeles Department of Public Works' and LACFD's fire-suppression standards for improved property and development. These standard requirements must be met prior to the approval of building permits; therefore, the Project would implement a water system that would meet all County requirements in support of fire-suppression activities so that less than significant water-related fire hazards would occur.

- 3. Topography.** Topography is connected to wildland fire hazards because steep slopes are not only inaccessible to fire fighting vehicles, but steep canyons can create updraft conditions (much like a chimney) and a fire in a steep canyon can spread rapidly into adjacent areas. Steep canyons that are densely covered with combustible vegetation are especially hazardous. The Project's land uses would be developed in accordance with fuel modification requirements to ensure appropriate buffer zones for protection from wildfire events (MM 3-9). Areas of the Project site that are undeveloped and contain steep slopes would restrict human access to the use of trails. Despite limited access to the general population, and the portions of the site with the greatest topographic relief would be accessible to fire-fighting equipment via helicopter, other air transport access, and existing unpaved fire roads. As required by the LACFD, upon their Project-level review (e.g., tract map review), clearance for fire access roads and gates would be incorporated into developed areas. Implementation of the Fuel Modification Plan (MM 3-9) for the Project would ensure that potential impacts would be less than significant.
- 4. Vegetative Cover.** The majority of residential development is proposed for the flatter portions of the Project site. Some residential development, however, is proposed in areas that would be adjacent to large open space areas with moderate vegetative cover. The plant communities that make up this cover are highly combustible and would therefore present a high fire hazard and pose a potentially significant impact to development in these areas. With MM 3-9 for fuel modification requirements, impacts related to fire hazards would be less than significant.

As development of the Project site proceeds, fire hazards associated with the natural vegetative cover would be eliminated through its replacement with urban landscape vegetation, which is irrigated and less combustible than the existing vegetation. However, the potential for wildland fire hazards would still exist at the wildland/urban interface due to (a) the presence of brush; (b) increased human activity; and (c) the increased potential for fires due to accidental and arson-related causes. The boundaries of this interface would change over time as the Project reaches buildout. With the implementation of the Fuel Modification Plan as mandated by the LACFD's requirements for fuel modification and construction in Fire Hazard Severity Zones, ensured with implementation of MM 3-9, the fire hazard potential in this interface zone would be less than significant.

#### Fuel Modification and Fire Codes

The Project would comply with State law and with all County requirements related to development in a designated VHFHSZ or HFHSV. Specifically, as required by Section 4908.1 of the County of Los Angeles Code (Title 32, Fire Code), a Fuel Modification Plan would be

submitted with any subdivision of land located in an area designated as a Fire Hazard Severity Zone in a State Responsibility Area, which includes the entirety of Project site. Under current LACFD regulations, the Fuel Modification Zone for the Project should extend 200 feet from structures; the three fuel modification zones (A, B, and C) are detailed above.

Preliminary discussions with the LACFD indicate that, due to a variety of variables such as topography and nearby vegetation, it may be appropriate to utilize a fuel-modification buffer that is less than 200 feet (Condon and Pontes 2007). The extent and location of the fuel zone clearance area, along with conditions under which the setback may be reduced would be finalized with LACFD review and approval of the Fuel Modification Plan. Based on conversations between the Applicant and the LACFD, the buffer from structures for the majority of the Project site would be 100 feet because the Project site is predominantly characterized by annual grassland. Because this is low combustible vegetation, an alternative compliance of a 100-foot setback from structures is likely more appropriate for the majority of the property. However, in some instances, an alternative compliance of a 150-foot setback from the structure may be appropriate, especially in cases where a number of trees are in the immediate vicinity of lots but are at a grade uphill from the lots.

In order to reduce potential impacts associated with wildfire hazards, MM 3-9 requires that new property owners are informed of their individual responsibilities for maintaining fuel modification zones on their property, either via the Covenants, Conditions, and Restrictions (CC&Rs) or disclosure statements. In accordance with the Landscape Plan for the Project (see MM 7-13 in Section 5.7, Biological Resources), the Fuel Modification Plan (see MM 3-9) will utilize a plant palette that is tailored to the unique environmental conditions of the Project site and that borrows extensively from the existing landscape, allowing for both native and adopted species of oaks, willows, cottonwoods, and grasses. The design of this plan would take the Project site's topographical features into consideration. Transitional slopes and some greenways would be enhanced with regionally appropriate species that relate to the historic background of this region such as stone fruits (i.e., peaches, plums, avocados) and orchards (i.e., citrus and nuts). Furthermore, species selected for modification would be adapted to the conditions found on the Project site by surviving hot, dry summers without high irrigation demands. A partial species list includes evergreens and deciduous trees that may be modified by the Community Forester in consultation with County Biologists.

As indicated previously, all projects must adhere to State and County Fire Codes, standards, and guidelines, including the CAL FIRE's Fire Plan. While the Fire Plan does not include requirements for individual projects, it does describe collaborative wildfire-related planning efforts with local agencies (such as the LACFD) and establishes the levels of statewide fire protection services for State Responsibility Area lands. These service levels recognize other fire protection resources at the federal and local level that collectively provide a regional and statewide emergency response capability. In addition, California's integrated mutual aid fire protection system provides fire protection services through automatic and mutual aid agreements for fire incidents across all ownerships (CAL FIRE 2016). It is the expectation that, as the Project is built out over 20 years, the Fire Codes, standards, and guidelines would be continually updated by the State and County agencies as the knowledge gained from past fires is increased; these updated code requirements, as finalized through discussions with the LACFD, would be applied to subsequent development phases of the Project.

As discussed above under Relevant Plans, Policies, and Regulations, the AVAP includes a goal and several related policies related to fire hazard planning. The Project is consistent with the AVAP land use designations, and therefore is consistent with Policy PS 1.1. As discussed in detail above, the Project would provide appropriate emergency access and evacuation routes; would implement all appropriate wildland fire-prevention measures; and would implement all Fire Code requirements and other regulations. The Project, therefore, is consistent with Policies PS 1.2 through 1.4. With adherence to the required and best-accepted practices for fuel-modification zone management, emergency access, building materials and methods, as well as the changes in land use, the potential impact of the Project related to wildfires is considered to be less than significant.

#### Proximity to Potentially Dangerous Fire Hazard Land Uses

As described above under Section 5.3.2, Hazards and Hazardous Materials, Phase I ESAs were prepared to address potentially hazardous current and historic land uses that could adversely affect Project site development. Based on these reports, there are no adjacent land uses that represent fire hazards. The National Cement Company is an industrial land use, but it does not utilize flammable materials or otherwise have a risk of explosion. The sole risk of reasonably foreseeable explosion on or near the Project is related to flammable materials transport on SR-138.

The increased potential for an accident involving a hazardous material transporter on SR-138 and Interstate (I) 5 due to increased traffic from the Project would also be less than significant. Such materials are transported daily on arterial roadways and railways that traverse through populated areas throughout Southern California. Additionally, the traffic analysis prepared for the Project determines that, with implementation of mitigation, all mainline freeways in the Project area, including SR-138 and I-5, would continue to flow in an acceptable manner with the Project. Therefore, the traffic analysis quantitatively determines that increased traffic would not create a greater hazard. There would be no impact related to proximity to a dangerous fire hazard condition and no mitigation is required.

#### ***Off-Site Impacts***

The off-site Project features (intersections with SR-138, utility connections, water wells, and California Aqueduct crossings) would not include land uses that would, by themselves, increase the risk of fire hazards. With Project implementation, adequate access, adequate water pressures and flows, and fuel modification would be provided on the site and would either include the locations of off-site features or support the adequate water pressures and flows (i.e., water wells and infrastructure in 300<sup>th</sup> Street West). These features do not represent dangerous fire hazards, nor would they be located proximate to a fire hazard. There would be no impact and no mitigation is required.

***Impact Summary:*** With adherence to State and County requirements for fuel modification zone management, emergency access, building materials and methods, as well as change in land use, to be ensured with implementation of MM 3-9, the impact of the Project related to wildfires is considered to be less than significant.

The Project would not result in significant impacts related to proximity of a land use representing a potential fire hazard, and no mitigation would be required.

## Mitigation Measures

**MM 3-9** The Project Applicant/Developer shall prepare a Fuel Modification Plan demonstrating compliance with the County Fire Code Title 32 and shall provide all new residents and business owners with recorded Covenants, Conditions, and Restrictions (CC&Rs) or disclosure statements that identify the responsibilities for maintaining the fuel modification zone(s) on their property, as defined in the approved Fuel Modification Plan. The CC&Rs or disclosure statements prepared by the Project Applicant/Developer shall be submitted to the County of Los Angeles to confirm that new property owners will be informed of their responsibilities for maintaining the fuel modification zone(s) on their property.

## Level of Significance after Mitigation

Impacts related to fire hazards would be less than significant with implementation of MM 3-9.

## 5.4 WATER QUALITY

### 5.4.1 INTRODUCTION

#### Purpose

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that water quality issues be evaluated as part of the environmental documentation process. The effects of the Project on the quality of both surface waters and groundwater are addressed. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts related to water quality are described in Sections 6.0 and 7.0, respectively. Drainage and flood-control issues are analyzed in Section 5.2, Hydrology and Flood; water supply is analyzed in Section 5.18, Water Resources (Supply and Services); and recycled water use is analyzed in Section 5.19, Wastewater.

#### Summary

In 2014, the County of Los Angeles (County) prepared its *Low Impact Development Standards Manual* (LID Standards Manual) to implement the National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit for storm water and non-storm water discharges issued to the County by the California Regional Water Quality Control Board, Los Angeles Region (CAS004001, Order No. R4- 2012-0175) (MS4 Permit). The LID Standards Manual also implements the County's Low Impact Development (LID) Ordinance (County Code Section 12.84). The objectives and goals of the LID Standards Manual, the County MS4 permit and the County LID Ordinance are to (1) lessen the adverse impacts of storm water runoff from development and urban runoff on natural drainage systems, receiving waters, and other water bodies; (2) minimize pollutant loadings from impervious surfaces by requiring development projects to incorporate properly designed, technically appropriate Best Management Practices (BMPs) and other LID strategies; and (3) minimize erosion and other hydrologic impacts on natural drainage systems by requiring development projects to incorporate properly designed, technically appropriate hydromodification control development principles and technologies (LACDPW 2014).

The proposed Project has been designed to meet or exceed County MS4 Permit, LID Standards Manual, and LID Ordinance water quality requirements for new development and to avoid impacts to applicable surface and groundwater beneficial uses designated in the basin plans adopted by the Lahontan and Los Angeles Regional Water Quality Control Boards (RWQCBs). The Project will include site-design, source-control, LID, and hydromodification-control BMP requirements. Most Project runoff will be subject to control and treatment in a regional system that consists of 28 detention and retention basins located throughout the Project site (see Exhibit 5.2-4, Proposed Infiltration Basin Locations, in Section 5.2, Hydrology and Flood). Other developed areas will treat and control runoff by utilizing distributed, smaller, or parcel-specific LID measures (see Exhibit 5.4-2, Low Impact

Development [LID] Drainage Areas with Project). These regional and distributed measures will also meet County LID standards for new development and will provide sufficient treatment capacity to reduce potential surface and groundwater quality impacts to less than significant levels.

The Project's water quality performance standard is consistent with County requirements for new development and is incorporated in Mitigation Measure (MM) 4-1. The Project will also implement integrated pest management (IPM) and landscaping BMPs consistent with IPM and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. The IPM and landscaping BMPs are incorporated in MM 4-2 and will be further confirmed prior to the issuance of building permits and during the County tract map review process. These measures will control potential pesticide, nitrogen, and other pest and landscaping-related water quality impacts to less than significant levels.

During construction, the Project will comply with and implement the requirements of the General Construction Permit issued by the State Water Resources Control Board (CAR000002, Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-0006-DWQ)(Construction General Permit). The Construction General Permit requires that potential risks to water quality be evaluated for construction activity and that a Stormwater Pollution Prevention Plan (SWPPP), including specific BMPs that will avoid potentially significant construction period storm water impacts based on the Project risk assessment, be implemented.

With mitigation, the Project would not have a significant impact on surface water or groundwater quality. Developed area runoff constituent concentrations would be below all water quality objectives and criteria. Qualitatively assessed constituents in post-development runoff would not occur at levels that would exceed water quality standards or adversely affect beneficial uses of receiving surface or ground waters. Implementation of the planned BMPs in compliance with the Los Angeles County MS4 Permit, LID Ordinance, and LID Standards Manual would meet or exceed the requirements of the federal, State, and County standards for water quality. As discussed in Section 5.19, Wastewater, the two proposed Wastewater Reclamation Facilities (WRFs) will produce recycled water treated to unrestricted reuse standards under Title 22 of the *California Code of Regulations*. The WRFs will be issued Waste Discharge Requirements (WDRs) by the Lahontan RWQCB and will be operated in accordance with the WDRs to protect surface and groundwater quality and designated beneficial uses. MM 19-5 in Section 5.19, Wastewater, requires that WRF compliance with Title 22 and WDR requirements be confirmed in documentation submitted to the County prior to the issuance of building permits for Project development.

## **Section Format**

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to

reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0 for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Water Quality Assessment Methodology
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

### 5.2.1 RELEVANT PLANS, POLICIES, AND REGULATIONS

#### Federal

##### *Federal Clean Water Act*

The federal Clean Water Act (CWA, *United States Code*, Title 33, Sections 1251 et seq.) requires National Pollutant Discharge Elimination System (NPDES) permits for the discharge of pollutants into “waters of the U.S.” from any point source. Point sources are discrete conveyances such as pipes or man-made ditches. Examples of pollutants include, but are not limited to, rock, sand, dirt, and agricultural, industrial, and municipal waste discharged into “waters of the U.S.”. Point sources that discharge into municipal sewer systems (e.g., such as

residential wastewater conveyance pipes) do not require individual permits, but the sewer systems do require an NPDES permit.

In California, responsibility for implementing the NPDES program has been delegated to the State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCBs) acting under the auspices of the state board. The SWRCB and the RWQCBs typically issue NPDES permits that also include waste discharge requirements (WDRs) under State law. The Los Angeles County MS4 permit and the state General Construction Permit have been issued as NPDES permits and as WDRs and are discussed in more detail below.

The CWA requires that States adopt water quality standards for receiving water bodies, including designated beneficial uses (e.g., wildlife habitat, agricultural supply, fishing) and the water quality criteria necessary to support those uses. Water quality criteria are prescribed concentrations or levels of constituents—such as lead, suspended sediment, or fecal coliform bacteria—or narrative statements that represent the quality of water that support a particular use. Water quality standards applicable to the Project site are established in the Basin Plans adopted by the Lahontan and Los Angeles Regional Water Quality Control Boards and also in the California Toxics Rule (CTR) (40 *Code of Federal Regulations* [CFR] 131.38) adopted by the U.S. Environmental Protection Agency (see the discussion of state regulations below) under the CWA.

#### Section 303(d) of the Clean Water Act

Section 303(d) of the CWA requires that water bodies for which beneficial uses are not being achieved be listed as “impaired” and that Total Maximum Daily Loads (TMDLs) must be developed for each impairing constituent to reduce discharge levels and meet applicable water quality standards. The list of impaired water bodies is commonly referred to as the “303d list”. A TMDL is an estimate of the total load of a constituent, including a margin of safety, from point, non-point, and natural sources that a water body may receive without exceeding applicable water quality standards. Once established, a TMDL allocates the total constituent load to current and future sources that discharge to the affected water body.

Approximately 96 percent of the Project site, including locations that will be preserved in open space and remain undeveloped, are located within the Antelope Valley Watershed (93 percent of the site) and the much smaller Quail Lake Watershed to the south (3 percent of the site), both of which are within the jurisdiction of the Lahontan RWQCB. Exhibit 5.2-1, Regional Water Quality Control Board Boundaries, in Section 5.2, Hydrology and Flood, shows the jurisdictional boundaries of the Lahontan RWQCB relative to the Project site. Water bodies in the Antelope Valley Watershed that could receive flows from the Project site are not listed as impaired on the currently applicable 2010 303(d) list or the proposed 2012 303(d) list (SWRCB 2015a, 2015b).

Approximately 4 percent of the site drains to Gorman Creek, which is located about 4.5 miles downstream from the southwestern edge of the Project site. Gorman Creek is within the Santa Clara River Watershed and the Santa Clara-Calleguas Hydrologic Unit, Piru Hydrologic Area as defined in the *Water Quality Control Plan for the Los Angeles Region* (Los Angeles Basin Plan). The Santa Clara River Watershed is under the jurisdiction of the Los Angeles

RWQCB. Exhibit 5.2-1, in Section 5.2, Hydrology and Flood, shows the jurisdictional boundaries of the Los Angeles RWQCB relative to the Project site.

Gorman Creek flows to Cañada de los Alamos in the Lower Hungry Valley before discharging to Pyramid Lake about six miles downstream from the Project boundary. Downstream of Pyramid Lake, Piru Creek flows south approximately 19 miles to Piru Lake, which is formed by the Santa Felicia Dam and then for approximately 6 miles south from Piru Lake to Reach 4 of the Santa Clara River. The point of confluence with the Santa Clara River is located approximately 40 miles south of the Project site.

Stream segments listed as impaired in the approved 2010 303(d) list for the Los Angeles RWQCB within Piru Creek and Santa Clara River downstream of the Project include Reach 3 and Reach 1 (downstream of Reach 4) of the Santa Clara River; the Santa Clara River Estuary; and Piru Creek (from the confluence with the Santa Clara River to the headwaters). Reach 3 of the Santa Clara River is listed for ammonia, chloride, total dissolved solids (TDS), and toxicity. Reach 1 of the Santa Clara River, located approximately 68 miles downstream of the Project site, is listed for toxicity. The Santa Clara River Estuary (located approximately 72 miles downstream of the Project site) is listed for coliform, historical pesticides, Toxaphene, nitrate-nitrogen, and toxicity. Piru Creek is listed for boron, specific conductance, sulfates, and total dissolved solids in Santa Clara River Reach 11 (included on the list as Piru Creek from the confluence with Santa Clara River Reach 4 to the gauging station below the Santa Felicia Dam), and for chloride and hydrogen ion activity (pH) from the gauging station below the Santa Felicia Dam upstream to the creek headwaters (Los Angeles RWQCB 2006).

#### Section 401 and 404 of the Clean Water Act

Section 401 of the CWA (33 USC 1251 et seq.) requires that any person applying for a federal permit or license that may result in a discharge of pollutants into “waters of the U.S.” must obtain a State water quality certification that concludes that the activity complies with all applicable water quality standards, limitations, and restrictions. Subject to certain limitations, no license or permit may be issued by a federal agency until a Section 401-required certification has been granted. Further, no license or permit may be issued if certification has been denied. The CWA Section 404 permits and authorizations (described in the next paragraph) are subject to Section 401 certification by the local RWQCB.

Section 404 of the Clean Water Act (CWA) is a program that regulates the discharge of dredged and fill material into “waters of the U.S.”, including wetlands. Activities in “waters of the U.S.” that are regulated under this program include fills for development (including physical alterations to drainages to accommodate storm drainage, stabilization, and flood-control improvements); water resource projects (such as dams and levees); infrastructure development (such as highways and airports); and conversion of wetlands to uplands for farming and forestry. The U.S. Environmental Protection Agency (USEPA) and the U.S. Army Corps of Engineers (USACE) have issued Section 404(b)(1) Guidelines (40 CFR 230) that regulate dredge and fill activities, including water quality aspects of such activities. Subpart C of Sections 230.20–230.25 contains water quality regulations applicable to dredge and fill activities. Among other topics, these guidelines address discharges that alter substrate elevation or contours; suspended particulates and water clarity; nutrients and chemical

content; current patterns and water circulation; water fluctuations (including those that alter erosion or sediment rates); and salinity gradients. As discussed in Section 5.7, Biological Resources, approximately 1 percent of all on-site and immediately adjacent water features (1.8 acres of a total of 165.5 acres) have been delineated as federally jurisdictional waters by the USACE (see Table 5.7-9, Jurisdictional Wetlands and Waters Summary, from Section 5.7, Biological Resources).

### ***Federal Antidegradation Policy***

The Federal Antidegradation Policy (40 CFR 131.12) requires that, subject to specific exceptions, existing beneficial uses and water quality levels in unimpaired waters must be maintained and that new discharges may not degrade these uses and levels. The policy implements three tiers of antidegradation requirements. Tier 1 is the most broadly applicable and requires that existing uses and the water quality levels that support existing uses must be maintained. Tier 2 applies to high quality water bodies in which existing water quality exceeds levels necessary to support propagation of fish, shellfish, and wildlife and recreational uses. Tier 3 provides special protection for “Outstanding National Resources Waters” that have been designated as unique or ecologically sensitive. Activities that would degrade existing beneficial uses and water quality can be permitted by a State under the Federal Antidegradation Policy only after completion of applicable intergovernmental coordination and public participation requirements and findings that (a) allow that lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located; (b) the State assures that, although degradation or lower water quality will occur, water quality adequate to protect existing uses will be maintained; and (c) all new and existing point sources and all cost-effective and reasonable best management practices for nonpoint source control achieve the highest statutory and regulatory requirements.

## **State**

### ***California Porter-Cologne Act***

The Porter-Cologne Water Quality Control Act of 1970 (Porter-Cologne Act)(*California Water Code*, Sections 13000 et seq.) is California’s primary statute governing water quality and water pollution issues, including sediment transport and protection of surface waters and groundwater. The Porter-Cologne Act provides the SWRCB and nine RWQCBs with the authority to protect water quality and is the primary vehicle for implementing California’s responsibilities under the federal CWA. Each RWQCB must formulate and adopt a water quality control plan (commonly referred to as a “basin plan”) for the region within its jurisdiction. The basin plan must conform to the policies set forth in the Porter-Cologne Act and the state water policy established by the SWRCB. The basin plan establishes beneficial uses for surface and groundwaters in the region, and includes narrative and numeric water quality standards to protect those beneficial uses. Each RWQCB is also authorized to include water discharge prohibitions applicable to particular conditions, areas, or types of waste within its jurisdiction. The Act requires that, unless otherwise authorized by a general or other permit, Reports of Waste Discharge to regulated “waters of the State” must be provided to each RWQCB. The RWQCB may issue discharge permits under State law in response to a Report of Waste Discharge. These permits are commonly referred to as “waste discharge

requirements” (WDRs) and are issued by the RWQCBs for activities within each regional board’s jurisdiction.

### ***State Antidegradation Policy***

The State Antidegradation Policy (SWRCB Resolution No. 68-16), was adopted to prevent degradation of surface water and groundwater in California. The Antidegradation Policy requires that, whenever the existing quality of water is higher than the quality established in policies as of the date on which such policies become effective, the existing higher quality will be maintained until it has been demonstrated that any change (a) will be consistent with maximum benefit to the people of the state; (b) will not unreasonably affect present and anticipated beneficial use of the affected water; and (c) will not result in water quality that is lower than prescribed in the policies. The policy also provides that any activity that produces or may produce a waste or increased volume or concentration of waste and would discharge to existing high quality waters must meet waste discharge requirements that achieve the best practicable discharge treatment or control to ensure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the state will be maintained.

### ***Construction General Permit***

The NPDES program allows for the issuance of general permits that cover specific actions by multiple parties, such as construction activities. Dischargers covered under a general permit must comply with the permit terms and conditions. In 2009, the SWRCB issued the statewide Construction General Permit to regulate discharges or pollutants in storm water associated with construction activities (NPDES No. CAR000002, Water Quality Order 2009-0009-DWQ as amended by 2010-0014-DWQ and 2012-006-DWQ). Dischargers are required to obtain coverage under the Construction General Permit if a project disturbs one or more acres of soil or disturbs less than one acre, but is part of a larger common plan of development that, in total, disturbs one or more acres.

The Construction General Permit requires that projects implement an SWPPP that includes specific BMPs and establishes numeric effluent limitations to meet water quality and technology-based standards. Major components of the adopted Construction General Permit include the following:

**Risk-Based Permitting Approach.** The Construction General Permit includes a three-tiered system for discharges (identified as Risk Levels 1, 2, and 3) that is based on the relative risk a project poses to causing water quality impacts. Risk levels are established by calculating two factors: (1) the project’s sediment risk and (2) receiving water risk during periods of soil exposure (i.e., grading and site stabilization) (SWRCB 2015b). Sediment risk is determined by the relative amount of sediment that can be discharged from the construction site given the duration of construction, project location, and other project site details. Receiving water risk is based on whether a project drains to a sediment-sensitive waterbody. A high-risk waterbody has one of the following conditions:

- It is listed as impaired for sediment on the most recent List of Impaired Water bodies maintained in compliance with CWA Section 303(d).

- It has a USEPA-approved Total Maximum Daily Load implementation plan for sediment.
- Has been designated in an applicable basin plan for COLD (cold freshwater habitat), SPWN (spawning, reproducing and/or early development), and MIGR (migration of aquatic organisms) beneficial uses.

Depending on the level of risk identified for a project, the Construction General Permit requirements progressively increase. Certain short-duration projects of less than five acres and constructed during one dry season may qualify for a rainfall erosivity waiver under the permit.

**Numeric Action Levels and Numeric Effluent Limitations.** To be covered by the Construction General Permit, dischargers must meet specific Numeric Action Levels (NALs) for pH and turbidity. Exceedance of an NAL does not constitute a permit violation, but does trigger mandatory implementation of additional BMPs and/or corrective actions. In addition, the Construction General Permit requires that Risk Level 3 dischargers with direct discharges to surface waters monitor the receiving water body if an effluent sampling result exceeds receiving water monitoring triggers (effluent pH outside the range of 6.0 and 9.0 pH units or turbidity exceeding 500 Nephelometric Turbidity Units [NTU]). Where active treatment systems are used, dischargers must meet Numeric Effluent Levels (NELs) for turbidity. Exceedances of the Active Treatment System turbidity NEL are considered to be violations of the Construction General Permit.

**Post-Construction Standards.** The Construction General Permit requires that the pre-project water balance (i.e., the volume of rainfall that ends up as runoff) be replicated under post-construction conditions for the smallest storms up to the 85<sup>th</sup> percentile storm event (or the smallest storm event that generates runoff, whichever is larger). In addition, for projects that disturb more than two acres, the post-project time of runoff concentration must be equal to or greater than pre-project time of concentration. Finally, BMPs to reduce pollutants in storm water discharges that are reasonably foreseeable after all construction phases have been completed must be implemented under the permit.

**Best Management Practices.** The Construction General Permit specifies mandatory, minimum BMPs to prevent storm water pollution and post-construction impacts. The required level of BMPs increases with a project's risk level. The minimum BMPs for all projects include site run-on control, perimeter controls, and good housekeeping practices, among numerous other requirements. BMPs must be implemented to meet the Best Available Technology Economically Achievable (BAT)/Best Conventional Pollutant Control Technology (BCT) standard.

**Rain Event Action Plan.** During the rainy season, the permit requires that adequate sediment-control materials be available to control sediment discharges in the event of a predicted storm. Risk Level 2 and 3 sites must also develop and implement a Rain Event Action Plan (REAP) designed to protect all exposed portions of the site within 48 hours prior to any likely precipitation event. A written REAP specific for each rain event is required whenever there is a 50 percent or greater chance of receiving precipitation in the project area.

---

**Monitoring and Reporting Requirements.** In addition to visual monitoring at all sites, the Construction General Permit requires the following:

- Sampling, analysis, and monitoring requirements for non-visible pollutants at all sites;
- Effluent and receiving water monitoring for pH and turbidity for all Risk Level 3 sites;
- Receiving water bioassessment sampling before and after project completion for larger Risk Level 3 sites; and
- Submission of an Annual Report no later than September 1 of each year must be electronically submitted via the SMARTS website. Each Annual Report must include sampling data, a summary of all exceedances and violations, corrective actions, names of all responsible parties, and training documentation.

### ***Title 22 (California Water Code)***

The requirements of Title 22—as revised in 1978, 1990, 2001, and 2014—establish the quality and/or treatment processes required for recycled water to be used for a non-potable application. In addition to recycled water uses and treatment requirements, Title 22 addresses (1) sampling and analysis requirements at a treatment plant; (2) preparing an engineering report prior to production or use of recycled water; and (3) ensuring there are general treatment design requirements, reliability requirements, and alternative methods of treatment. Permits are issued to each water recycling project by one of the nine RWQCBs. These permits include water quality and public health protections, as detailed in Title 22.

### ***California Green Building Standards (CALGreen) Code***

In January 2013, the State of California enacted the third revision of the California Green Building Standards (CALGreen Code) Code as part 11 of the California Building Standards Code (Title 24). CALGreen measures are designed to improve public health, safety, and general welfare by utilizing design and construction methods that reduce the negative environmental impact of development and encourage sustainable construction practices.

CALGreen provides mandatory direction to developers of all new construction and renovations of residential and non-residential structures with regard to all aspects of design and construction, including but not limited to site drainage design, storm water management, and water use efficiency. Required measures are accompanied by a set of voluntary standards that are designed to encourage developers and cities to aim for a higher standard of development.

Under CALGreen, all residential and non-residential sites are required to be planned and developed to keep surface water from entering buildings and to incorporate efficient outdoor water use measures. Construction plans are required to show appropriate grading and surface water management methods such as swales, water collection and disposal systems, French drains, water retention gardens, and other water measures that keep surface water away from buildings and aid in groundwater recharge. Plans should also include outdoor water use plans that utilize weather- or soil-moisture-controlled irrigation systems. Non-residential structures are also required to develop an irrigation water budget

for landscapes greater than 2,500 square feet that conforms to a local water efficient landscape ordinance or to the State's Model Water Efficient Landscape Ordinance (MWELo) where no local ordinance is applicable. The MWELo was recently updated by the California Governor's Drought Executive Order (B-19-25) on July 15, 2015. The MWELo requirements for the project are discussed in Section 5.18, Water Resources.

### ***California Toxics Rule (CTR)***

The California Toxics Rule (CTR, 40 CFR 131.38) is a federal regulation issued by the USEPA that provides water quality criteria for potentially toxic constituents in California surface waters with human-health or aquatic-life designated uses. The USEPA adopted the CTR in 2000 to create legally applicable water quality criteria for priority toxic pollutants for inland surface waters, enclosed bays, and estuaries to protect human health and the environment for all purposes and programs under the CWA. The CTR aquatic life criterion was derived using a CWA Section 304(a) method that produces an estimate of the highest concentration of a substance in water which does not present a significant risk to the aquatic organisms in the water and their uses. The CTR water quality criteria provide a reasonable and adequate amount of protection with only a small possibility of substantial overprotection or under protection.

The CTR's numerical aquatic life criteria are expressed as short-term (acute) and long-term (chronic) averages, rather than one number, in order that the criterion more accurately reflect toxicological and practical realities. Acute criteria represent the highest concentration of a pollutant to which aquatic life can be exposed for a short period of time (one hour) without deleterious effects. Chronic criteria represent the highest concentration to which aquatic life can be exposed for an extended period of time (four days) without deleterious effects. Due to the intermittent nature of storm water runoff in Southern California, the acute criteria are considered to be more applicable to storm water conditions than chronic criteria and therefore are used in assessing Project impacts.

CTR criteria are applicable to the receiving water body. The metals criteria, which are expressed as a function of receiving water hardness, must be calculated based on the probable hardness values of the Project's receiving waters for evaluation of acute and chronic toxicity criteria. At higher hardness values, copper, lead, and zinc are more likely to be complexed or bound with other components in the water column, which reduces the bioavailability and resulting potential toxicity of the affected metals. Available hardness data for runoff in the Project vicinity (i.e., data from Piru Creek, see Table 5.4-1 in Section 5.4.3 below) averages approximately 589 milligrams per liter (mg/L) as calcium carbonate (CaCO<sub>3</sub>) and the maximum hardness value used to calculate metals criteria in the CTR (CFR 131.38[c][4][b][2]) is 400 mg/L. As a result, a hardness value of 400 mg/L as CaCO<sub>3</sub> was used to approximate CTR criteria for metals in the project's water quality analysis.

### ***Title 3 (California Code of Regulations)***

To address concerns that pyrethroid (i.e. chemicals contained in some pesticides) concentrations found in California surface waters are negatively affecting water quality, the California Department of Pesticide Regulation (CDPR) adopted Section 6970 in Title 3 of the *California Code of Regulations* (CCR), titled "Surface Water Protection in Outdoor

Nonagricultural Settings”. The aim of these regulations is to reduce the amount of runoff from 17 pyrethroids commonly applied outdoors by any person performing pest control for hire (i.e., pest control businesses). Primarily, the regulations restrict applications made to and around impervious horizontal surfaces (e.g., building exteriors, foundations, walkways, and driveways), which are believed to be the primary transport conduit of pesticides from urban landscapes. The statewide regulations became effective on July 19, 2012.

## **Regional**

### ***Basin Plans***

Portions of the Project site are subject to basin plans adopted by the Lahontan RWQCB and the Los Angeles RWQCB (Lahontan RWQCB 1994; Los Angeles RWQCB 2006, both as amended). The basin plans provide quantitative and narrative criteria for water quality constituents applicable to receiving surface and ground water within the Lahontan and Los Angeles RWQCB jurisdictions. Specific criteria are provided for larger water bodies within the two regions, and general criteria or guidelines are established for ocean waters, bays and estuaries, inland surface waters, and groundwater. In general, the narrative criteria preclude water quality degradation that would adversely impact a water body’s designated beneficial uses. For example, the Lahontan Basin Plan states that surface waters shall not contain suspended or settleable solids in amounts which “cause nuisance or adversely affect the water for beneficial uses” (Lahontan RWQCB 1994). Water quality criteria apply to receiving waters and do not apply directly to runoff prior to contact with applicable receiving waters.

The Basin Plans contain narrative and numerical water quality criteria for groundwater. For example, the Lahontan Basin Plan requires that “Ground waters shall not contain taste or odor producing substances in concentrations that cause nuisance or adversely affect beneficial uses” (Lahontan RWQCB 1994). For groundwaters designated for municipal beneficial uses, the Basin Plan requires that constituent concentrations not exceed maximum contaminant levels (MCLs) or adopted Secondary Maximum Contaminant Levels (SMCLs) specified in Title 22 of the *California Code of Regulations* (CCR). Maximum contaminant levels are the primary drinking water standards established for public water systems to prevent adverse health effects. Secondary maximum contaminant levels apply to contaminants that will not cause adverse health effects such as water color, taste, and odor.

### ***Regional Water Quality Control Board Construction General Waste Discharge Requirements***

#### Lahontan Regional Water Quality Control Board

The Lahontan RWQCB has issued General WDRs and NPDES Permit requirements (under Order No. R6T-2014-0049, NPDES No. CAG996001) for limited threat discharges to surface waters (Limited Threat Discharge Permit). The permit covers construction dewatering in addition to the following discharge categories:

- Diverted stream flows
- Dredge spoils dewatering

- Subterranean seepage dewatering
- Well construction and pump testing of aquifer supplies
- Geothermal well testing
- Hydrostatic testing, maintenance, repair, and disinfection of potable water supply pipelines, tanks, reservoirs, and other similar facilities
- Water treatment plant backflushing, residuals, and wasting
- Fire hydrant testing or flushing
- Hydrostatic testing of newly constructed pipelines, tanks, reservoirs, and other facilities used for purposes other than potable water supply (e.g., gas, oil, reclaimed water)

The Limited Threat Discharge Permit contains discharge prohibitions, receiving water limitations, and monitoring and reporting requirements.

#### Los Angeles Regional Water Quality Control Board

The Los Angeles RWQCB has issued a General NPDES Permit and General WDRs (Los Angeles RWQCB Order No. R4-2013-0095; NPDES No. CAG994004 [RWQCB 2013]) governing construction-related dewatering discharges. This permit, known as the General Dewatering Permit, addresses discharges from temporary dewatering operations associated with construction and permanent dewatering operations associated with development. The discharge requirements include provisions mandating notification, sampling and analysis, and reporting of dewatering and testing-related discharges. The General Dewatering Permit authorizes applicable construction-related dewatering activities so long as all conditions of the permit are fulfilled.

### **County of Los Angeles**

#### ***Storm Water Permitting (Municipal Separate Storm Sewer System Permit)***

In 2012, the Los Angeles RWQCB issued an MS4 permit covering Los Angeles County and several municipalities within the County in accordance with the federal NPDES permit program and WDRs under State law (CAS004001, Order No. R4-2012-0175) (MS4 Permit). In 2013, the County amended Chapter 12.84 of the Los Angeles County Code to require that new development utilize LID BMPs in conformance with the MS4 Permit. In 2014, the County prepared the LID Standards Manual to provide guidance for new development in meeting the storm water runoff standards in Chapter 12.84 of the County Code and in the MS4 Permit.

#### County Low Impact Development Ordinance

As amended in 2013, Chapter 12.84 requires that new development do the following:

- Mimic undeveloped storm water runoff rates and volumes in any storm event up to and including the “Capital Flood” event (a 50-year storm).

- Prevent pollutants of concern from leaving the development site in storm water as the result of storms, up to and including a water quality design storm event.
- Minimize hydromodification impacts to natural drainage systems.

To achieve these objectives, Chapter 12.84 requires compliance with one or more of the following standards:

- 1) The project shall retain 100 percent of the Storm Water Quality Design Volume (SWQDv) on site, through infiltration, evapotranspiration, rainfall harvest and use, or a combination thereof, unless the Director of Public Works determines that it would be technically infeasible to do so;
- 2) If the Director determines that it would be technically infeasible to retain 100 percent of the SWQDv on site, the project shall comply with one of the following alternative compliance measures:
  - a. The project shall provide for on-site biofiltration of 1.5 times the portion of the SWQDv that is not retained on-site;
  - b. The project shall include infiltration or bioretention BMPs to intercept the portion of the SWQDv that is not retained on site at an off-site location, as approved by the Director of Public Works. The project shall also provide for treatment of the portion of the SWQDv discharged from the project site, as approved by the Director of Public Works;
  - c. The project shall provide for the replenishment of groundwater supplies that have a designated beneficial use in the Basin Plan.
    - i. Groundwater replenishment projects shall include infiltration or bioretention BMPs to intercept the portion of the SWQDv that is not retained on site at an off-site location, as approved by the Director of Public Works.
    - ii. Groundwater replenishment projects shall also provide for treatment of the portion of the SWQDv discharged from the project site, as approved by the Director of Public Works.
  - d. The project shall include infiltration, bioretention, or rainfall harvest and use BMPs to retrofit an existing development with similar land uses as the project to intercept the portion of the SWQDv that is not retained on-site
  - e. The County, independently or in conjunction with one or more cities, may apply to the RWQCB for approval of a regional or subregional storm water mitigation program to substitute in part or wholly for the provisions of Chapter 12.84 for the area covered by the regional or sub-regional storm water mitigation program. If the RWQCB approves the program, provisions of the program shall apply in lieu of any conflicting provisions of Chapter 12.84.

Development projects that consist of five or more residential units, or nonresidential development projects, must further comply with the following standards:

The excess storm water runoff volume ( $\Delta V$ , defined by the LACDPW as the post-developed runoff volume minus the pre-developed runoff volume for the 85<sup>th</sup> percentile storm event) from each lot upon which such development is occurring shall be infiltrated at the lot level or in the alternative, the excess storm water runoff volume from the entire development site (including streets and public rights-of-way) shall be infiltrated in sub-regional infiltration facilities built for this specific purpose. The tributary area of a sub-regional infiltration facility shall be limited to five acres, but may be exceeded with approval of the Director of the LACDPW. When infiltration of all excess storm water runoff volume is not technically feasible, on-site storage, reuse, or other water conservation uses of the excess runoff volume is required and shall be implemented as authorized by the Director of the LACDPW in accordance with the requirements and provisions of the LID Standards Manual.

#### County Low Impact Development Standards Manual

The 2014 LID Standards Manual was prepared by the LACDPW and updates and provides a compilation of the following documents:

- Development Planning for Storm Water Management: A Manual for the Standard Urban Storm Water Mitigation Plan (SUSMP Manual, September 2002).
- Technical Manual for Stormwater Best Management Practices in the County of Los Angeles (2004 Design Manual, February 2004).
- Stormwater Best Management Practice Design and Maintenance Manual (2010 Design Manual, August 2010).
- Low Impact Development Standards Manual (2009 LID Manual, January 2009).

The LID Standards Manual also supersedes the water quality portions of the following ordinances and policies:

- Water Quality section of the Los Angeles County Hydrology Manual;
- Interim Drainage Policy for Quartz Hill;
- Acton Interim Drainage Policy and Guidelines;
- Antelope Valley Interim Drainage Policy;
- Financing the Cost to Maintain Standard Urban Stormwater Mitigation Plan Devices/Systems;
- Permanent Standard Urban Storm Mitigation Plan Devices for No Fee Miscellaneous Transfer Drains, Small Drainage Systems, and Storm Drain Connection Permits;
- Interim Peak Flow Runoff Criteria for New Development;
- Policy for New Percolation Basin Testing, Design, and Maintenance; and

- Clarification on the Policy for Financing the Cost to Maintain Standard Urban Stormwater Mitigation Plan (SUSMP) Devices/Systems Constructed by New Development or Other Agencies (LACDPW 2014).

The LID Standards Manual requires that “Designated Projects”, which include large scale residential and nonresidential development projects, prioritize the selection of BMPs to retain 100 percent of the SWQDv on site through infiltration, evapotranspiration, storm water runoff harvest and use, or a combination thereof, unless it is demonstrated that it is technically infeasible to do so. BMPs should be implemented in the following order of preference: (1) infiltration and/or bioretention and (2) storm water runoff harvest and use.

Designated Projects that are unable to fully retain the SWQDv on site through retention-based storm water quality control measures must implement alternative compliance measures (e.g., on-site biofiltration, off-site groundwater replenishment, off-site infiltration and/or bioretention, and off-site retrofit). Prior to off-site mitigation, the portion of the SWQDv that cannot be reliably retained on site must be treated to meet effluent quality standards.

The LID Standards Manual indicates site conditions where infiltration may not be possible, including the following:

- Locations where the corrected in-situ infiltration rate is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of retention-based storm water quality control measures for the SWQDv on site;
- Locations where seasonal high groundwater is within 10 feet of the surface;
- Locations within 100 feet of a groundwater well used for drinking water;
- Brownfield development sites or other locations where pollutant mobilization is a documented concern;
- Locations with potential geotechnical hazards;
- Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with the on-site retention requirement;
- Locations where infiltration could cause adverse impacts to biological resources; and
- Locations where infiltration would cause health and safety concerns.

The LID Standards Manual also states where runoff harvest and use may not be possible:

- Projects that would not provide sufficient irrigation or (where permitted) domestic greywater demand for use of stored runoff due to limited landscaping or extensive use of low-water-use plant palettes in landscaped areas.
- Projects that are required to use recycled water for irrigation of landscaping.

- Development projects in which the storage and reuse of storm water runoff would conflict with local, State, or federal ordinances or building codes.
- Locations where storage facilities would cause potential geotechnical hazards, as outlined in a report prepared by a licensed geotechnical engineer.
- Locations where storage facilities would cause health and safety concerns.

Chapter 12.84 and the LID Standards Manual establish requirements for hydromodification, hydrology (flood) and water quality control and require projects to fully mitigate for off-site drainage impacts caused by hydromodification and changes in water quality, flow velocity, flow volume, and the depth/width of flow, as determined by the Director of Public Works, in accordance with the requirements and provisions specified in the LID Standards Manual. If the Director of Public Works determines that it is infeasible for a project to comply with applicable mitigation standards, then the project must obtain written consent to the unmitigated impacts from the owner of every impacted downstream property. In addition, the project must comply with one of the following alternative requirements:

1. The project shall infiltrate on site at least the runoff from a 2-year, 24-hour rainfall event;
2. The runoff flow rate, volume, velocity, and duration for the project's post-development condition shall not exceed the pre-development condition for the 2-year, 24-hour rainfall events; or
3. The erosion potential (Ep) as defined in the LID Standards Manual in the receiving water channel shall approximate 1, as demonstrated by a hydromodification analysis study approved by the Director of Public Works.

### ***Los Angeles County Green Building Standards Code***

In 2008, the County adopted the Green Building Program, which included the Drought-Tolerant Landscaping, Green Building, and Low Impact Development Ordinances (the Ordinances), and created an Implementation Task Force and Technical Manual. In November 2013, in response to the mandates set forth in the 2010 CALGreen Code, the Board of Supervisors adopted the Los Angeles County Green Building Standards Code (Title 31). The CALGreen Code and the Ordinances adopted in 2008 comprise the County's primary green building and low impact development standards. The County Green Building Standards Code requires that post-construction landscape designs comply with all of the following:

1. Turf areas shall not exceed 25 percent of the total landscaped area.
2. Non-invasive, drought-tolerant plant and tree species appropriate for the climate zone region shall be utilized in at least 75 percent of the total landscaped area.
3. Hydrozoning irrigation techniques shall be incorporated into the landscape design.

In addition, a water budget must be developed for landscape irrigation use that conforms to the state MWELo, which was recently updated by the California Governor's Drought Executive Order (B-19-25) on July 15, 2015. The MWELo requirements for the project are discussed in Section 5.18, Water Resources.

---

***Los Angeles County General Plan and Antelope Valley Area Plan***

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, part of the County General Plan, were updated in 2015 and include goals and policies that address water quality issues in the unincorporated County. The AVAP goals and policies applicable to the analysis of water quality with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal LU 2:** A land use pattern that protects environmental resources.

**Policy LU 2.5:** Except within economic opportunity areas, limit the amount of potential development in riparian areas and groundwater recharge basins, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Goal COS 1:** Growth and development are guided by water supply constraints.

**Policy COS 1.3:** Limit the amount of potential development in groundwater recharge areas through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Goal COS 2:** Effective conservation measures provide an adequate supply of clean water to meet the present and future needs of humans and natural ecosystems.

**Policy COS 2.3:** Require onsite stormwater infiltration in all new developments through the use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.

**Goal COS 3:** A clean water supply untainted by natural and man-made pollutants and contaminants.

**Policy COS 3.1:** Discourage the use of chemical fertilizers, herbicides and pesticides in landscaping to reduce water pollution.

**Policy COS 3.4:** Support preservation, restoration and strategic acquisition of open space to preserve natural streams, drainage channels, wetlands, and rivers, which are necessary for the healthy functioning of ecosystems.

**Policy COS 3.5:** Protect underground water supplies by enforcing controls on sources of pollutants.

**Policy COS 3.6:** Support and encourage water banking facilities throughout the Antelope Valley, including within Significant Ecological Areas.

**Goal COS 17:** Buildings are sustainable, conserving energy, water, and other resources, and limiting greenhouse gas emissions.

**Policy COS 17.8:** Require onsite stormwater infiltration in all new developments through use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.

**Goal PS 3:** Protection of the public through flood hazard planning and mitigation.

**Policy PS 3.2:** Require onsite stormwater filtration in all new developments through use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.

**Policy PS 3.3:** Review the potential local and regional drainage impacts of all development proposals to minimize the need for new drainage structures.

## 5.2.2 ENVIRONMENTAL SETTING

### Regional Watershed

Approximately 96 percent of the Project site, including locations that will be preserved in open space and remain undeveloped, is located within the Antelope Valley Watershed (93 percent of the site) and the much smaller Quail Lake Watershed to the south (3 percent of the site), both of which are within the jurisdiction of the Lahontan RWQCB. Approximately 4 percent of the site drains to Gorman Creek, which is located about 1.5 miles downstream from the southwestern edge of the Project site. Gorman Creek is within the Santa Clara River Watershed and the Santa Clara-Calleguas Hydrologic Unit, Piru Hydrologic Area as defined in the *Water Quality Control Plan for the Los Angeles Region* (Los Angeles Basin Plan). The Santa Clara River Watershed is under the jurisdiction of the Los Angeles RWQCB. Exhibit 5.2-1, Regional Water Quality Control Board Boundaries, in Section 5.2, Hydrology and Flood, shows the jurisdictional boundaries of the Los Angeles and Lahontan RWQCBs relative to the Project site.

As shown on Exhibit 5.2-2, Drainage Areas on the Project Site, in Section 5.2, four drainage systems extend into portions of the Project site. The two largest systems are the East Drainage Area and the Oso Creek Drainage Area. Portions of the Gorman Creek Drainage Area and the Quail Lake Drainage Area also extend into the west and southwest portions of the site. Larger canyons that convey channel flows in the Project area include Oso Canyon and Tentrock Canyon. Little Sycamore Creek and Los Alamos Creek are tributary to Oso Creek and traverse through a small portion of the site from the north.

As discussed in Section 5.2, Hydrology and Flood, and in Section 5.7, Biological Resources , the Project will avoid most of the watercourses and watershed area in the Gorman Creek, Quail Lake, and Oso Creek Drainage Areas (see Exhibit 5.2-2, Drainage Areas on the Project Site, in Section 5.2). Approximately 10 percent of the proposed development would occur

west of the West Branch of the Aqueduct, and drainage impacts in this area would primarily affect Oso Creek tributaries flowing north from the southern side (i.e., the northerly face) of Oso Canyon. Drainage impacts in the Gorman Creek Drainage Area would largely be avoided. No watercourse impacts would occur in the Quail Lake Drainage Area.

Approximately 90 percent of the proposed development would occur east of the West Branch of the Aqueduct. As discussed in Section 5.2, Hydrology and Flood, and in Section 5.7 Biological Resources, most of the Project impacts to existing watercourses would occur in the East Drainage Area (see Exhibit 5.2-2 in Section 5.2). Smaller drainages in this location would generally be integrated with the Project's storm drain system. Flow patterns associated with several existing larger tributary systems, including East Tributary systems and the Cow Spring Canyon, Horse Camp Canyon, the 300<sup>th</sup> Street Tributary systems, will largely be maintained by avoiding or constructing flow controls within existing channels or by recreating existing channels after site grading. Flow, LID, and hydromodification management facilities (e.g., detention and retention basins) will be constructed adjacent to channels, primarily in downstream reach locations. Approximately 17 basins would be at the elevation of the development pads, 3 would be adjacent to a channel, and 8 would be within a channel.

The following sections provide additional information about existing conditions in the four drainage areas that extend into the Project site, as shown on Exhibit 5.2-2.

### ***East Drainage Area***

The East Drainage Area includes approximately 18,910 acres, of which 41 percent is within the Project site. Flows in the drainage that are conveyed through the East Tributary systems originate just west of the West Branch of the Aqueduct where flows are conveyed under the Aqueduct via existing culverts. All watersheds contributing runoff to the East Tributaries are located within the Project site and within areas of proposed development. Flows from the north-facing slopes of La Liebre Mountain are conveyed to the north and east under State Route (SR) 138 through Cow Spring Canyon, Horse Camp Canyon, the 300<sup>th</sup> Street Tributary, Tentrock Canyon, and lower-lying tributaries. Ground elevations within the East Drainage Area range from 2,960 feet above mean sea level (msl) to 5,800 feet above msl. Flows from the East Drainage Area reach the East Branch of the Aqueduct to the east of the Project boundary and are conveyed by crossings at 292<sup>nd</sup> Street and 286<sup>th</sup> Street. In low-flow conditions, East Drainage Area flows are infiltrated in the valley floor prior to reaching the Aqueduct crossings.

### ***Oso Canyon Drainage Area***

The Oso Canyon Drainage Area drains a total of approximately 20,040 acres, of which approximately 18 percent is located within the Project site. Ground elevations within the drainage range from 3,000 feet above msl to 4,500 feet above msl. The primary watercourse in the Oso Canyon Drainage Area is Oso Canyon Creek (Oso Creek), which originates in the Tehachapi Mountains to the northwest of the site. Oso Creek drains northwest to east through the northern part of the site and merges with Los Alamos Creek at the eastern site boundary. The flows are conveyed across the West Branch of the California Aqueduct; reenter the extreme eastern portion of the site; and then merge with flows from Little

Sycamore Canyon off site after crossing the East Branch of the Aqueduct. Flows in the main stem of Oso Creek are typically ephemeral in the Project area and generally infiltrate when they reach the valley floor under low-flow conditions.

### ***Quail Lake Drainage Area***

The Quail Lake Drainage Area encompasses approximately 2,030 acres, of which approximately 17 percent is within the Project site. Ground elevations in the drainage range from 3,320 feet above msl at Quail Lake to approximately 3,600 feet above msl. Quail Lake is one of 29 storage facilities used to convey water in the State Water Project (SWP) and is managed by the California Department of Water Resources (DWR). The SWP conveyance system, including Quail Lake, is used to provide imported water for urban and agricultural uses throughout California, including Southern California. The lake was historically a sag pond along the San Andreas Fault and was expanded to store approximately 7,500 acre-feet of imported water from the West Branch of the Aqueduct. The SWP system conveys water from Quail Lake south to Pyramid Lake and further downstream to Castaic Lake, which is the southern terminus of the West Branch of the California Aqueduct. Pyramid Lake stores SWP water for delivery to Southern California, provides regulated storage for the Castaic power plant, and provides flood protection along Piru Creek. Downstream of Pyramid Lake, Piru Creek flows south approximately 20 miles to Piru Lake, which is formed by the Santa Felicia Dam and then for approximately 6 miles south to Reach 4 of the Santa Clara River. The point of confluence with the Santa Clara River is located approximately 35 miles south of the Project site.

### ***Gorman Drainage Area***

The Gorman Drainage Area encompasses approximately 960 acres, of which approximately 52 percent is within the Project site boundaries. The primary direction of surface water flow is westerly along SR-138. Ground elevations range from 3,100 feet above msl at the outlet to Gorman Creek to 3,600 feet above msl in the drainage. As shown in Exhibit 5.2-2, the Gorman Tributary flows into Gorman Creek about 1.5 miles downstream from the Project boundary. Gorman Creek flows to Cañada de los Alamos in the Lower Hungry Valley before discharging to Pyramid Lake about six miles downstream from the Project boundary.

### ***Existing On-Site Channels***

The Project site is predominately undeveloped with localized changes related to ongoing livestock grazing and agriculture. Most of the Project site is currently used for cattle grazing, which has occurred for over 150 years. Portions of the eastern site are used for agriculture. A few residential dwellings are located near the center of the northern property line, including single-family units and several trailers used in support of grazing and property caretaking activities. An inactive hunters' camp, located in the western portion of the site, consists of six trailers, a shooting range, and two outhouses. The site contains two aboveground water storage tanks and a water well (Geosyntec 2016a).

Several unpaved roads exist on the Project site. Paved roadways also traverse portions of the site that provide access to the National Cement Plant located to the north, facilities associated with the Aqueduct, and agricultural operations. SR-138 traverses through the southern

portion of the Project site, and 300<sup>th</sup> Street West runs north from SR- 138. Several siphons and culverts have been installed in conjunction with the Aqueduct to convey flows from existing drainages over or under the Aqueduct. Minor agricultural drainage ditches have also been constructed in certain locations (Geosyntec 2016a).

The existing site channel network is generally a dynamic (i.e., changing) system originating locally in the foothills of the Tehachapi Mountains to the west and north of the site and the La Liebre Mountains to the south. Uplift along the San Andreas Fault has tipped the valley floor down toward the north causing drainage channels to trend along south facing hill slopes. In the downstream and eastern portions of the Oso Canyon and East Drainage Areas, the alluvial valley floor is broader, the longitudinal slope is flatter, and the bed and banks consist of unconsolidated sands and fine gravel that promotes infiltration. East of the Aqueduct, and outside the Project's northeastern boundary, the channels become less defined and Oso Creek and the Eastern Drainage Area channels disappear into flat agricultural areas associated with the western portion of Antelope Valley (Geosyntec 2016a).

### Surface Water Designated Beneficial Uses

Receiving waters for the Project site include drainages within the Antelope Valley Watershed, which is regulated by the Lahontan RWQCB, and within the Gorman Drainage Area, which is regulated by the Los Angeles RWQCB (see Exhibit 5.2-1, Regional Water Quality Control Board Boundaries, in Section 5.2, Hydrology and Flood).

The Lahontan Basin Plan lists existing or potential beneficial uses of major water bodies in the Antelope Valley. Waters that could receive flows from the Project site in the Antelope Valley Watershed are subject to the beneficial uses designated in the Basin Plan for "Minor Surface Waters", which include the following (Lahontan RWQCB 1994):

- **MUN:** Community, military, or individual water supply systems including, but not limited to, drinking water supply (existing or potential).
- **AGR:** Agricultural supply waters used for farming, horticulture, or ranching (existing or potential).
- **GWR:** Natural or artificial groundwater recharge (existing or potential).
- **FRSH:** Natural or artificial maintenance of surface water quantity or quality (e.g., salinity) (existing or potential).
- **REC-1:** Recreational bodily contact with water, where ingestion is reasonably possible (existing or potential).
- **REC-2:** Recreational activities involving contact in proximity to water, but not involving body contact (existing or potential).
- **COMM:** Commercial or recreational collection of fish or other organisms (existing or potential).
- **COLD:** Cold freshwater habitat to support cold water ecosystems (existing or potential).
- **WILD:** Waters that support wildlife habitats (existing or potential).

- **RARE:** Waters that support rare, threatened, or endangered species and their associated habitats (existing or potential).
- **SPWN:** High quality aquatic habitats suitable for reproduction and early development of fish (existing or potential).

The Los Angeles Basin Plan designates beneficial uses for water bodies in the Los Angeles RWQCB region. Beneficial uses for the Gorman Creek Tributary that could receive flows from the Project site are not specifically identified. The following beneficial uses are designated in the Los Angeles Basin Plan for Gorman Creek, which located downstream from the tributary (Los Angeles RWQCB 2006):

- **MUN:** Community, military, or individual water supply systems including, but not limited to, drinking water supply (intermittent and conditional [i.e., may be considered for exemptions at a later date]).
- **AGR:** Agricultural supply waters used for farming, horticulture, or ranching (intermittent).
- **GWR:** Natural and artificial groundwater recharge (intermittent).
- **REC-1:** Recreational bodily contact with water where ingestion is reasonably possible (intermittent).
- **REC-2:** Recreational activities involving contact in proximity to water (intermittent).
- **WARM:** Warm freshwater habitat to support warm water ecosystems (intermittent).
- **COLD:** Cold freshwater habitat to support cold water ecosystems (intermittent).
- **WILD:** Wildlife habitat waters that support wildlife habitats (existing).
- **RARE:** Waters that support rare, threatened, or endangered species and their associated habitats (potential).

## Groundwater Designated Beneficial Uses

Approximately 96 percent of the Project site, including locations that will be preserved in open space and remain undeveloped, is located within the Antelope Valley and Quail Lake Watersheds and is subject to the jurisdiction of the Lahontan RWQCB. As discussed in Section 5.18, Water Resources, in December 2015 the Superior Court of California entered an adjudication Judgment and Physical Solution in the consolidated Antelope Valley Groundwater Cases litigation. A copy of the Judgment and Physical Solution is attached as Appendix 5.18-E of this Draft EIR. The adjudication regulates groundwater use in the Antelope Valley Basin and its surrounding watershed to avoid overdraft conditions and to ensure that future groundwater production is consistent with a total sustainable yield of approximately 110,000 acre-feet per year. As shown on Exhibit 5.4-1, Groundwater Basins in the Project Area, most of the Project site is located within the adjudication area boundary, including the Antelope Valley Groundwater Basin and its contributing watershed (also see Exhibit 5.18-3 in Section 5.18, Water Resources, for a map of the Antelope Valley Adjudication Area, as defined in the litigation).

The groundwater basin and watershed includes low lying alluvial portions of the Antelope Valley in Los Angeles County and Kern County, which receive flows from drainages that originate in the surrounding mountains and foothills. Most of the surrounding drainages flow only during storm events and are dry during other periods. In general, the valley floor lacks defined natural channels outside the foothills and is subject to unpredictable sheet-flow patterns. For more information concerning the Antelope Valley Watershed, please see Section 5.18.3, Environmental Setting, Antelope Valley Groundwater Basin. For more information regarding site geology, topography and drainage characteristics, please see Section 5.7.3, Biological Resources, Environmental Setting, Characteristics of the Site.

The Lahontan Basin Plan designates the following beneficial uses for the Antelope Valley Groundwater Basin (Lahontan RWQCB 1994):

- **MUN:** Community, military, or individual water supply systems including, but not limited to, drinking water supply (existing or potential).
- **AGR:** Agricultural supply waters used for farming, horticulture, or ranching (existing or potential).
- **IND:** Industrial activities that do not depend primarily on water quality (existing or potential).
- **FRSH:** Natural or artificial maintenance of surface water quantity or quality (e.g., salinity) (existing or potential).

A small portion (approximately four percent) of the southwestern corner of the Project site is connected to the Hungry Valley and Peace Valley Groundwater Basins included in the Los Angeles Basin Plan. The Basin Plan designates the following beneficial uses for these basins (Los Angeles RWQCB 2006):

- **MUN:** Community, military, or individual water supply systems including, but not limited to, drinking water supply (existing).
- **IND:** Industrial activities that do not depend primarily on water quality (potential).
- **PROC:** Industrial activities that depend primarily on water quality (existing).
- **AGR:** Agricultural supply waters used for farming, horticulture, or ranching (existing).

### **Existing Receiving Water Quality (Surface and Groundwater)**

Water quality data for the Project site's receiving waters are limited. The USGS and the DWR regularly monitor water quality in the California Aqueduct, but existing water quality data for Oso Creek, the East Drainage Area drainages, Gorman Creek, and Quail Lake are not available. Groundwater monitoring has been conducted in the Project vicinity (Geosyntec 2016b). The following sections qualitatively discuss the existing water quality of the Project site's receiving surface waters with quantitative data provided where available.

***Oso Creek and the East Drainage Area***

As described above, Oso Creek is an ephemeral drainage that terminates in the Antelope Valley floor to the northeast of the Project boundary. Similarly, the East Drainage Area consists of several drainages originating in the mountains and foothills that flow across the valley floor and eventually pond in the dry lakes adjacent to the Kern County line. During large rainfall events, these drainages are likely to carry a high sediment load, indicated by elevated total suspended solids (TSS) and turbidity, due to the dirt roads, steep slopes, gullied land, and exposed silty and sandy soils in the watershed.

***Cañada de los Alamos (downstream of Gorman Creek)***

A small portion of the Project site drains through an unnamed tributary to Gorman Creek about 4.5 miles downstream from the site boundary. Gorman Creek flows through Cañada de los Alamos in the Lower Hungry Valley to the Warne Power Plant at Pyramid Lake, about six miles downstream from the site boundary. Hungry Valley is one of the largest Off-Highway Motor Vehicle (OHV) recreational areas in California with over 130 miles of trails across 19,000 acres. The impact of off-road vehicles on soil compaction and erosion rates has been documented by a number of researchers. Therefore, it is likely that, during storm events large enough to produce runoff, TSS and turbidity are high in Cañada de los Alamos.

***Piru Creek (Downstream of Quail Lake)***

The closest surface water sampling data available near the Project site is for Piru Creek and one of its tributaries, Lockwood Creek, which are located about ten miles to the southwest of the Project area and drain to Pyramid Lake. The drainage area is undeveloped. Data were available on the California Environmental Data Exchange Network (CEDEN) for 17 locations on Piru Creek and Lockwood Creek, with most locations only having one sample event. Data are summarized in Table 5.4-1 below as well as associated water quality standards from the Los Angeles Basin Plan for Piru Creek from the gauging station below the Santa Felicia Dam upstream to the headwaters. The only constituent with results greater than applicable water quality objectives is total dissolved solids (TDS), which had an average value of over 1,000 mg/L from 14 sampling events. As discussed above, this reach of Piru Creek is listed as impaired for chloride and pH on the 2010 CWA 303(d) List. The sources for the TDS concentrations are unknown.

**TABLE 5.4-1  
SUMMARY OF MONITORING DATA IN PIRU CREEK**

Constituent	Water Quality Standard	Number of Samples	Number of Detections	Average <sup>a</sup>
pH	b	22	22	7.97
TSS (mg/L)	c	10	10	4.44
TDS (mg/L)	500 <sup>d</sup>	14	14	1,023
Hardness (mg/L as CaCO <sub>3</sub> )	N/A	7	7	589
Chloride (mg/L)	500 <sup>d</sup>	20	20	10.3
Total Phosphorus (mg/L)	e	11	11	0.012
Ammonia-N (mg/L)	1.24 <sup>f</sup>	9	5	0.034
Nitrate-N (mg/L)	10 <sup>g</sup>	18	12	0.295
Nitrite-N (mg/L)	1 <sup>g</sup>	14	1	0.003
Total Nitrogen (mg/L)	10 <sup>g</sup>	10	10	0.785
Dissolved Aluminum (µg/L)	N/A	4	4	5.53
Total Aluminum (µg/L)	1000 <sup>h</sup>	4	4	37.7
Dissolved Copper (µg/L)	50 <sup>i</sup>	4	4	0.61
Total Copper (µg/L)	52 <sup>i</sup>	4	4	0.60
Dissolved Lead (µg/L)	281 <sup>i</sup>	4	1	0.011
Total Lead (µg/L)	477 <sup>i</sup>	4	2	0.013
Dissolved Zinc (µg/L)	379 <sup>i</sup>	8	3	8.32 <sup>j</sup>
Total Zinc (µg/L)	388 <sup>i</sup>	4	3	1.73
Dissolved Iron (µg/L)	N/A	3	3	24.3
Total Iron (µg/L)	N/A	3	3	93
Dissolved Arsenic (µg/L)	N/A	4	4	3.84
Total Arsenic (µg/L)	10 <sup>h</sup>	4	4	3.8
Dissolved Chromium (µg/L)	N/A	4	4	0.453
Total Chromium (µg/L)	50 <sup>h</sup>	4	3	0.445

pH: hydrogen potential; TSS: total suspended solids; mg/L = milligrams per liter; TDS: total dissolved solids; nitrate-N, nitrite-N and ammonia-N are inorganic forms of nitrogen; CaCO<sub>3</sub>: calcium carbonate; N/A: not applicable; µg/L = micrograms per liter; CEDEN: California Environmental Data Exchange Network; USEPA: U.S. Environmental Protection Agency; MCL: maximum contaminant level; ELS: early life stage; °C: degrees Celsius; CTR: California Toxics rule

<sup>a</sup> Data averaged from 17 locations on Piru Creek and Lockwood Creek (small tributary to Piru Creek), upstream of Pyramid Lake. Data accessed October 12, 2015, on CEDEN. Sample dates from 6/21/00–5/30/13. Averages were calculated assuming non-detects were equivalent to half of the associated sample detection limit.

**TABLE 5.4-1  
SUMMARY OF MONITORING DATA IN PIRU CREEK**

Constituent	Water Quality Standard	Number of Samples	Number of Detections	Average <sup>a</sup>
b	The pH of inland surface waters shall not be depressed below 6.5 or raised above 8.5 as a result of waste discharges. Ambient pH levels shall not be changed more than 0.5 unit from natural conditions as a result of waste discharge.			
c	Water shall not contain suspended or settleable material in concentrations that cause nuisance or adversely affect beneficial uses.			
d	USEPA secondary Maximum Contaminant Level (MCL) for MUN beneficial use.			
e	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses			
f	30-day average, ELS present, based on average pH (7.97) and average temperature of 25°C.			
g	Waters shall not exceed 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen (NO <sub>3</sub> -N + NO <sub>2</sub> -N), 45 mg/L as nitrate (NO <sub>3</sub> ), 10 mg/L as nitrate-nitrogen (NO <sub>3</sub> -N), or 1 mg/L as nitrite-nitrogen (NO <sub>2</sub> -N).			
h	California primary MCL for MUN beneficial use.			
i	Water quality standards for metals are acute (maximum one hour average concentration) CTR criteria for the maximum hardness value (400 mg/L) for waters with hardness of over 400 mg/L.			
j	High detection limits for some samples resulted in a high dissolved concentration when calculating the average using half of the detection limit.

### ***Antelope Valley Groundwater Basin***

Groundwater in closed basins, such as the Antelope Valley, is generally high in dissolved salts because evapotranspiration concentrates minerals in the water. Consequently, drinking water standards are often exceeded in local wells for TDS and fluoride. TDS concentrations remained relatively constant in the Antelope Valley between 1908 and 1955. The groundwater chemistry in the Antelope Valley is typically characterized as calcium bicarbonate near the surrounding mountains and as sodium bicarbonate or sodium sulfate in the central part of the basin.

Groundwater monitoring near the Project site was conducted in 2007 by Geosyntec Consultants (see Appendix 5.4-A) for two Tejon Ranch Company (TRC) wells and one DWR well in the Project area. The sampled wells are located in the Antelope Valley Groundwater Basin. The area is underlain by the three separate aquifers (i.e., western, southern, and deep), and one sample was collected from each separate aquifer. The monitoring results are summarized in Table 5.4-2, 2007 Groundwater Monitoring Data for the Project Area, below. The Maximum Contaminant Level (MCL) is provided in the table for each sampled water quality parameter. Additional water quality tests were conducted in 2010 by GEI, Inc. at well TRC-98 (located at the existing TRC water bank in the Project vicinity) and at well TRC-106 (located within the Project site at the approximate location of the proposed on-site water bank) were consistent with the 2007 sampling results (for a discussion of the existing TRC water bank and the proposed on-site water bank, please see Section 5.18, Water Resources). The results of the 2010 GEI groundwater testing are presented in Table 5.4-3, 2010 Groundwater Monitoring Data for the Project Area, below.

With the exception of arsenic, none of the groundwater samples analyzed in 2007 contained concentrations that exceeded the listed MCLs. As shown in Table 5.4-3, the arsenic concentrations in the TRC-98 and TRC-106 wells were 8.9 micrograms per liter ( $\mu\text{g/L}$ ) and 13  $\mu\text{g/L}$ , respectively. The sample from the TRC-106 well is slightly above the MCL of 10  $\mu\text{g/L}$ , as set by the USEPA. The arsenic levels appear to be from natural conditions in the geologic structure of the aquifer; MCL standards can be met for this small exceedance through blending with higher quality water or through other methods discussed in Section 5.18, Water Resources. Therefore, arsenic is not considered a pollutant of concern for analysis. No other metals were detected above their respective MCL.

### ***Hungry Valley Groundwater Basin***

According to California's Groundwater Bulletin 118, bicarbonate is the major anion (i.e., negatively charged ion) in the Hungry Valley Groundwater Basin, and calcium, sodium, and potassium occur in almost equal amounts. The average TDS concentration is less than 350 mg/L. The groundwater has an average pH of 8.1, which is slightly alkaline (Geosyntec Consultants 2016b). There are no data in the vicinity of the Project site for this groundwater basin.

## **5.2.3 PROJECT DESIGN FEATURES**

### **Project Design Features**

**PDF 4-1** The Project will implement a comprehensive system of site design, source control, low impact development, and hydromodification Best Management Practices (BMPs) that meet or exceed the water quality and hydrology (stormwater runoff) and hydromodification standards for new development in the County Low Impact Development (LID) Ordinance (Los Angeles County Code Section 12.84) and the County LID Standards Manual. Both these documents were adopted and prepared by the County of Los Angeles Department of Public Works to comply with the revised Los Angeles County

Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175). All controls are designed to meet or exceed the following LID performance standards, which are consistent with the requirements of the MS4 Permit, the LID Ordinance, and the LID Standards Manual:

LID BMPs shall be selected and sized to retain the volume of stormwater runoff produced from the 85<sup>th</sup> percentile, 24-hour storm depth as determined from the Los Angeles County 85<sup>th</sup> Percentile 24-hr Rainfall Isohyetal Map (February 2004) (LID design volume). When it has been demonstrated that 100 percent of the LID design volume cannot be feasibly infiltrated within the Project, then biofiltration shall be provided for 1.5 times the portion of the LID design volume that is not retained. Runoff from roadways shall be retained or biofiltered in retention or biofiltration BMPs sized to capture the design storm volume or flow, per the guidance in USEPA's *Managing Wet Weather with Green Infrastructure: Green Streets*. LID BMPs may be parcel-based or regional facilities.

During construction, the Project will comply with the State Construction General Permit, the Lahontan Regional Water Quality Control Board (RWQCB) Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit.

**PDF 4-2** The Project will implement integrated pest management (IPM) and landscaping BMPs consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. The IPM and landscaping BMPs will be confirmed in a landscaping plan submitted to the County during the review and approval process for each tract map application. The BMPs will include a planting plan that is consistent with the plant water use requirements of Section 3.3 of the *Centennial Specific Plan*, with procedures for removing non-native vegetation and planting native vegetation, fertilizer guidelines, and the IPM approach for preventing or suppressing pest problems (i.e., insects and diseases) through a combination of techniques including using pest-resistant plants; biological controls; cultural practices; habitat modification; and the judicious use of pesticides. The IPM and landscaping BMPs will address:

- Pest identification.
- Practices to prevent pest incidence and reduce pest buildup.
- Monitoring requirements to examine vegetation and surrounding areas for pests; to evaluate trends; and to identify when controls are needed.
- Establishment of action thresholds that trigger control actions.
- Pest-control methods (cultural, mechanical, environmental, biological) and appropriate pesticides.

- Pesticide management controls including those that comply with safety requirements (e.g., Material Safety Data Sheets, precautionary statements, protective equipment); regulatory requirements; spill mitigation measures; groundwater and surface water protection measures associated with pesticide use; and pesticide applicator certifications, licenses, and training (i.e., all pesticide applicators must be certified by the California Department of Pesticide Regulation).
- Fertilizer management tasks including those for soil assessment, fertilizer types, application methods, and storage and handling.

## 5.2.4 WATER QUALITY ASSESSMENT METHODOLOGY

### Surface Water Pollutants of Concern

Pollutants of concern exhibit one or more of the following deleterious characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water; elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein; or the detectable inputs of the pollutant are at concentrations or loads considered potentially toxic to humans and/or flora and fauna.

The pollutants of concern for the water quality analysis are those that are anticipated to be or could potentially be generated by the Project at concentrations, that exhibit these characteristics (i.e., based on water quality data collected in Los Angeles County from land uses that are the same as those proposed by the Project). Consideration of each Basin Plan's beneficial uses and water quality objectives, CTR criteria, and current 303(d) listings are also factored into the identification of the pollutants of concern for the Project. The Water Quality Technical Report (see Section 4 of Appendix 5.4-A) lists the pollutants of concern for both surface water and groundwater (discussed further below); the basis for their selection; and the significance criteria that will be applied for each (Geosyntec Consultants 2016b). The report also explains why other Basin Plan constituents are not considered to be pollutants of concern for the Project.

Based upon the above considerations, the following pollutants were chosen as pollutants of concern for purposes of evaluating water quality:

- Sediments (Total Suspended Solids [TSS] and turbidity)
- Nutrients (phosphorus and nitrogen [Nitrate-N, Nitrite-N, Ammonia-N, and Total Nitrogen])
- Trace metals (copper, lead, and zinc)
- Chloride
- Pesticides (including herbicides, insecticides, and fungicides)
- Pathogens (bacteria, viruses, and protozoa)

- Petroleum hydrocarbons (oil and grease and polynuclear aromatic hydrocarbons [PAHs])
- Trash and debris
- Methylene blue activated substances (MBAS)

Brief descriptions of the characteristics of each of the above pollutants of concern are provided below.

***Sediments (Total Suspended Solids [TSS] and Turbidity)***

Excessive erosion, transport, and deposition of sediment in surface waters comprise a significant form of pollution that can result in major water quality problems. Sediment imbalances can impair the beneficial uses of receiving waters. Excessive sediment can impair aquatic life by filling interstitial spaces of spawning gravel; by impairing fish food sources; by filling rearing pools; and by reducing beneficial habitat structure in stream channels. In addition, excessive sediment can create taste and odor problems in drinking water supplies and block water intake structures.

***Nutrients (Phosphorous and Nitrogen [Nitrate-N, Nitrite-N, Ammonia-N, and Total Nitrogen])***

Nutrients are inorganic forms of phosphorous and nitrogen (nitrate, nitrite, and ammonia). Phosphorous can be measured as total phosphorous (TP) or as dissolved phosphorous. Dissolved phosphorous is the more bioavailable form of phosphorous. TP is often composed mostly of soil-related particulate phosphorous. Organic forms of nitrogen are associated with vegetative matter such as particulates from sticks and leaves. Inorganic forms of nitrogen include nitrate, nitrite, and ammonia. Total Nitrogen (TN) is a measure of all nitrogen present, including inorganic and particulate forms. There are several sources of nutrients in urban areas, mainly fertilizers in runoff from lawns; pet wastes; failing septic systems; atmospheric deposition from industry and automobile emissions; and soil erosion. Nutrient over-enrichment is especially prevalent in agricultural areas where manure and fertilizer inputs to crops significantly contribute to nitrogen and phosphorous levels in streams and other receiving waters. Eutrophication in surface water from excessive nutrient input can lead to changes in algae, benthic, and fish communities; extreme eutrophication can cause hypoxia or anoxia (too much or too little oxygen, respectively), resulting in fish kills. Eutrophication is characterized by an abundant accumulation of nutrients that support a dense growth of algae and other organisms, the decay of which depletes the shallow waters of oxygen in summer. Surface algal scum, water discoloration, and the release of potentially toxic metals from sediment can also occur.

---

***Trace Metals (Copper, Lead, and Zinc)***

The primary sources of trace metals in storm water are typically commercially available metals used in vehicles (e.g., automobiles), buildings, and infrastructure. Metals are also found in fuels, adhesives, paints, and other coatings. Copper, lead, and zinc are the most prevalent metals typically found in urban runoff. Other trace metals (such as cadmium, chromium, and mercury) are typically not detected in urban runoff or are detected at very low levels. Metals are of concern because of the potential for toxic effects on aquatic life and the potential for ground water contamination. High metal concentrations can lead to bioaccumulation in fish and shellfish and can affect beneficial uses of receiving waters. Bioaccumulation takes place within an organism when the rate of intake of a substance is greater than the rate of excretion or metabolic transformation of that substance.

***Chloride***

Irrigation of salt-sensitive crops (e.g., avocados and strawberries with water-containing elevated levels of chloride) can potentially result in reduced crop yields. Chloride levels in some areas exceed water quality standards. Chloride TMDLs have been developed and adopted into the Los Angeles Basin Plan for the Santa Clara River Reaches 3, 5 and 6. The major source of elevated chloride levels in the Santa Clara River are discharges from a wastewater treatment plant. Minor point sources are dewatering operations and uncontrolled swimming pool and water ride discharges. High levels of chloride in Piru Creek above the Santa Felicia Dam have caused listings for impairment, although these chloride sources are unknown.

***Pesticides***

Pesticides (including herbicides, insecticides, and fungicides) are chemical compounds commonly used to control insects, rodents, plant diseases, and weeds. Excessive application of a pesticide in connection with landscaping or cultivating agriculture may result in runoff that contains toxic levels of the pesticide's active ingredient. Pesticides may be classified as organochlorine pesticides or organophosphorous pesticides, the former being associated with persistent bioaccumulative pesticides (e.g., dichlorodiphenyltrichloroethane [DDT] and other legacy pesticides) which have been banned. The Santa Clara River estuary is listed as impaired for legacy pesticides, including chlorinated pesticides. Santa Clara River Reaches 6, 3, and 1 and the estuary are also included on the state CWA Section 303(d) list for toxicity, which can be a byproduct of pesticides. As discussed above, Reaches 3 and 1 and the estuary are located 48, 68, and 72 miles south and southwest of the Project site, respectively (Reach 6 is upgradient of where Piru Creek flows into the Santa Clara River). Toxic organophosphorous pesticides include diazinon and chlorpyrifos whose uses also are being banned or restricted by the USEPA. The current pesticides of concern for water quality are pyrethrums; parathyroids (bifenthrin, cyfluthrin, cypermethrin, deltamethrin, esfenvalerate, and permethrin); carbaryl; Malathion; and imidacloprid.

***Pathogens (Bacteria, Viruses, and Protozoa)***

Elevated pathogens are typically caused by the transport of domestic animal, wildlife, or human fecal wastes from a watershed. Even runoff from natural areas can contain pathogens (e.g., from wildlife). Other sources of pathogens in urban areas include pets, septic systems, and leaky sanitary sewer pipes. The presence of pathogens in runoff can impair receiving waters and contaminate drinking water sources. Historically, fecal indicator bacteria (FIB) such as fecal coliform have been used to indicate the presence of pathogens due to the difficulty of monitoring for pathogens directly. More recently, the scientific community has questioned the use of certain indicator organisms, as there are various confounding factors that affect the reliability of some FIB as pathogen indicators in storm water runoff. The Basin Plan objective is now based on the use of *E. Coli* as a pathogen indicator in fresh waters designated for water contract recreation (REC-1) beneficial use, including the Santa Clara River. Santa Clara River Reaches 5, 6, and 7 and the estuary are identified on the state CWA Section 303(d) list as impaired by high fecal coliform counts from point and non-point sources. An Indicator Bacteria TMDL was approved by the Regional Water Board for the estuary and Reaches 3, 5, 6, and 7 on July 8, 2010. As discussed above, Reach 3 and the estuary are, respectively, 48 to 72 miles south and southwest of the Project site. Santa Clara River Reaches 5, 6, and 7 are upgradient of where Piru Creek flows into the Santa Clara River.

***Petroleum Hydrocarbons (Oil, Grease, and polynuclear aromatic hydrocarbons [PAHs])***

The sources of oil, grease, and other petroleum hydrocarbons in urban areas include spills of fuels and lubricants, discharge of domestic and industrial wastes, atmospheric deposition, and runoff. Runoff can be contaminated by leachate from asphalt roads, wearing of tires, and deposition from automobile exhaust. A leachate is a product or solution formed by the removal of soluble material from a substance, such as soil or rock, through the percolation of water, especially a solution containing contaminants picked up through the leaching of soil. Deliberate dumping of used oil and other automobile-related fluids directly into storm drains can also contribute to pollution. Petroleum hydrocarbons, such as polycyclic aromatic hydrocarbons (PAHs), can bioaccumulate in aquatic organisms from contaminated water, sediments, and food and are toxic to aquatic life at low concentrations. Hydrocarbons can persist in sediments for long periods of time, resulting in adverse impacts on the diversity and abundance of benthic communities. Hydrocarbons can be measured as total petroleum hydrocarbons (TPH), oil and grease, or as individual groups of hydrocarbons, such as PAHs.

***Trash and Debris***

Trash (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic debris (such as leaves, grass cuttings, and food waste) are general waste products on the landscape that can be entrained in urban runoff. The presence of trash and debris may have a significant impact on the recreational value of a water body and aquatic habitat. Excess organic matter can create a high biochemical oxygen demand in a water body and thereby lower its water quality. Also, in areas where stagnant water exists, the presence of excess organic matter can promote low-oxygen (anoxic) conditions resulting in the growth of undesirable organisms and the release of odorous and hazardous compounds such as hydrogen sulfide.

### ***Methylene Blue Activated Substances (MBAS)***

MBAS are related to the presence of detergents in water. Positive results may indicate the presence of wastewater or be associated with urban runoff due to commercial and/or residential vehicle washing or other outdoor washing activities. These substances disturb the surface tension affecting insects and gill function in aquatic life.

### **Groundwater Pollutants of Concern**

Groundwater will be a source of drinking water for the Project, and recycled water treated to unrestricted reuse standards under Title 22 of the *California Code of Regulations* will be used for outdoor irrigation and for cooling and wastewater in the commercial portions of the proposed business park as permitted by applicable laws and regulations (see Section 5.18, Water Resources). As discussed in Section 5.2, Hydrology and Flood, and in more detail below, 28 on-site retention and detention basins will provide regional hydrology, hydromodification, and water quality controls for the Project (see Exhibit 5.2-4, Proposed Infiltration Basin Locations). LID measures serving two or more parcels (e.g., facilities that could require maintenance through a “Project Water Purveyor”) or parcel-specific LID measures (e.g., facilities maintained by property owner) will also be used to meet hydrology, hydromodification, and water quality control requirements (see Exhibit 5.4-2, Low Impact Development [LID] Drainage Area with Projects). These storm water management BMPs would infiltrate a portion of the Project’s urban runoff to groundwater after receiving treatment (see PDFs 4-1 and 4-2 and MMs 4-1 and 4-2). Infiltration of recycled water could also occur. Research conducted on the effects on groundwater from storm water infiltration indicates that the potential for contamination is dependent upon a number of factors, including the local hydrogeology and the chemical characteristics of the pollutants of concern. The Water Augmentation Study conducted by the Los Angeles and San Gabriel Rivers Watershed Council, in partnership with several agencies including water districts, municipalities, and the U.S. Bureau of Reclamation, indicates that the infiltration of storm water, with appropriate pretreatment, does not adversely impact groundwater quality (Geosyntec 2016b).

Chemical characteristics that influence the potential for groundwater impacts include high mobility (low adsorption potential), high solubility fractions, and concentrations in runoff, including dry weather flows. As a class of constituents, trace metals tend to adsorb onto soil particles or be taken up by plants and are thereby effectively filtered out by the soils. This has been confirmed by extensive data collected beneath storm water infiltration/detention ponds in Fresno (conducted as part of the Nationwide Urban Runoff Program) that showed that trace metals tended to be adsorbed in the upper few feet in the bottom sediments (Geosyntec 2016b). Bacteria are also filtered out by soils. More mobile constituents such as chloride and nitrate would have a greater potential for infiltration.

Based on water quality data collected in Los Angeles County from land uses that are the same as those included in the Project, the pollutants of concern for the groundwater quality analysis are those that are anticipated or that could potentially be generated by the Project. Identification of the pollutants of concern for the Project considered the land uses and the

pollutants that have the potential to impair beneficial uses of the groundwater beneath the Project site.

The Los Angeles and Lahontan Basin Plans contain groundwater numerical objectives for bacteria, mineral quality (Los Angeles Basin only), nitrogen (Los Angeles Basin Plan only), and various toxic chemical compounds; they also contain qualitative objectives for taste and odor. Water quality objectives from the Basin Plans for pollutants of concern are included in Section 4.2 of EIR.

### ***Nitrate and Chloride***

Nitrate-N and chloride were identified as pollutants of concern for purposes of evaluating groundwater quality impacts because their chemical characteristics make them potentially mobile. High nitrate levels in drinking water can cause health problems in humans. Infants can develop methemoglobinemia (blue-baby syndrome) caused by the decreased oxygen carrying capacity in hemoglobin from consumption of water with high nitrate levels. High chloride concentrations in groundwater can impact its use for drinking water or agricultural irrigation uses. Human activities and land use practices can influence nitrogen (of which nitrate is a component) and chloride concentrations in groundwater. For example, irrigation water containing fertilizers or high chloride can increase levels of nitrogen and chloride in groundwater.

## **Construction-Related Pollutants of Concern**

The potential impact of construction activities, construction materials, and non-storm water runoff on surface water and groundwater quality during the construction phase focuses primarily on sediment (TSS and turbidity) and on certain non-sediment-related pollutants. Construction-related activities that are primarily responsible for sediment releases are related to exposing soils to erosion by rainfall or runoff, truck traffic, and/or wind (i.e., fugitive dust). Such activities include removing vegetation, grading, and trenching for infrastructure improvements. Environmental factors that affect erosion include topography, soil, and rainfall characteristics.

Non-sediment-related pollutants that are also of concern during construction include construction materials (e.g., paint, stucco); chemicals, liquid products, and petroleum products used in building construction or the maintenance of heavy equipment; and concrete-related pollutants.

## **Water Quality Model Description**

A water quality model was used to estimate pollutant loads and concentrations in storm water runoff from the Project for certain pollutants of concern; estimations were made for pre-development conditions and post-development conditions. Modeling runs were conducted to represent the entire Project site plus 15 acres of associated off-site roadway improvements. The water quality model used was selected because it is one of the few models that accounts for the observed variability in storm water hydrology and water quality. This is accomplished by characterizing the probability distribution of observed rainfall storm event depths, the probability distribution of event mean storm water runoff

concentrations, and the probability distribution of the number of storm events per year. These distributions are then sampled randomly using a Monte Carlo approach to develop estimates of mean annual loads and concentrations.

A detailed description of the water quality model and model assumptions is presented in Appendix B of the Water Quality Technical Report (Appendix 5.4-A to this EIR). The major features of the water quality model are listed below:

- **Rainfall Data.** The water quality model estimates the volume of runoff from storm events. The storm events were determined from 30 years (1949–1979) of hourly rainfall data measured at the nearest gage to the Project site (the National Climatic Data Center [NCDC] Sandberg rain gage). Also, this rain gage was selected because the rainfall measurements are at one-hour intervals and has been in operation for many years. Such data is essential in applying the water quality model. Although global climate change is expected to affect rainfall patterns in the future, this 40-year period of record has been used in the Water Quality Technical Report to represent the distribution of rainfall expected for the Project because the current suite of climate models is not designed to accurately predict the quantitative effects of global climate change on rainfall patterns at the local scale. Analysis of precipitation records throughout California show large year-to-year variability in the amount of annual precipitation with periods of consecutive dry or wet years and no apparent trend over the past century. Current climate projections imply an increase in the uncertainty of future precipitation conditions and that extreme events are expected to become more frequent. While precipitation projections do not show a clear trend in the future, an ensemble of 12 climate models shows a trend of decreasing runoff for Southern California between the end of the 20<sup>th</sup> and 21<sup>st</sup> centuries.
- **Land Use Runoff Water Quality.** The water quality model estimates the concentration of pollutants in runoff from storm events based on existing and all land uses on the Project site. The pollutant concentrations for various land uses, in the form of Event Mean Concentrations (EMCs), were estimated from data collected in Los Angeles County. The Los Angeles County database was chosen for use in the model because (1) it is an extensive, comprehensive database; (2) it contains monitoring data from land-use-specific drainage areas; and (3) the data is representative of the semi-arid conditions in Southern California.
- **Pollutant Load.** The pollutant load associated with each storm is estimated as the product of the storm event runoff times the EMC. For each year in the simulation, the individual storm event loads are added to estimate the annual load. The mean annual load is then the average of all the annual loads.
- **BMPs Modeled.** The modeling considers the LID, hydrology, and hydromodification BMPs planned for the Project, including 28 retention and detention basins (see Exhibit 5.2-4, Proposed Infiltration Basin Locations) and distributed or parcel-specific LID measures (see Exhibit 5.4-2, Low Impact Development [LID] Drainage Areas with Project). The modeling does not take into account source-control BMPs (e.g., street sweeping) that would also improve water quality. As a result, the modeling results are conservative and tend to overestimate pollutant loads and concentrations.

- **Treatment Effectiveness.** The water quality model estimates mean pollutant concentrations and loads in storm water following treatment. The amount of storm water runoff that is captured by the LID, hydrology, and hydromodification BMPs was calculated for each storm event, taking into consideration the intensity of rainfall, duration of the storm, and duration between storm events. The mean effluent water quality for the LID BMPs was based on the International Storm Water BMP Database. The International Storm Water BMP Database was used because it is a peer-reviewed database that contains a wide range of BMP-effectiveness studies that reflect diverse land uses.
- **Accounting for Bypass Flows.** The water quality model takes into account both the conditions when a treatment facility is full and when flows bypass the facility.
- **Volume Reduction.** The water quality model accounts for volume reductions from the BMPs due to infiltration and evaporation.
- **Use of Representative Data for Local Conditions.** The model utilizes runoff water quality data obtained from tributary areas that have a predominant land use and are measured prior to discharge into a receiving water body. Currently, such data are available from storm water programs in Los Angeles County, San Diego County, and Ventura County. Such data is often referred to as “end-of-pipe” data to distinguish it from data obtained in urban streams.
- **Infiltration.** Existing conditions infiltration parameters were based on soil hydrologic group, soil texture class, and the federal Natural Resource Conservation Service (NRCS) Soil Survey of the Project area (see Section 5.2, Hydrology and Flood, for a discussion of on-site channels and soils). As discussed in Section 5.2, and shown on Exhibit 5.2-2, Drainage Areas on the Project Site, about 90 percent of the proposed Project development will occur to the east of the West Branch of the California Aqueduct, and 10 percent of the development will occur west of the Aqueduct. These development areas will be subject to grading, including cut and fill operations, to construct infrastructure and the proposed Project’s residential, commercial, institutional and other structures. To conservatively reflect post-development conditions, soil compaction impacts were modeled for post-development open and landscaped areas assuming a 25 percent reduction in saturated hydraulic conductivity, or infiltration rate, from the pre-developed to post-developed condition. Impervious surfaces were modeled assuming no infiltration.

### ***Modeled Pollutants***

The appropriate form of data used to address water quality are flow composite storm event samples, which measure the average water quality during the event. Obtaining such data usually requires automatic samplers that collect data at a frequency that is proportionate to flow rate. The pollutants of concern for which there are sufficient flow composite sampling data in the Los Angeles County database are the following:

- TSS (sediment)
- Total Phosphorus
- Nitrate + Nitrite-Nitrogen, Ammonia, and Total Nitrogen

- Total and Dissolved Copper
- Total Lead
- Total and Dissolved Zinc
- Chloride

### ***Qualitatively Evaluated Pollutants***

Post-development storm water runoff water quality impacts associated with the following pollutants of concern were qualitatively addressed due to the unavailability of flow composite sampling data based on literature information and professional judgment:

- Turbidity
- Pesticides
- Pathogens (bacteria, viruses, and protozoa)
- Petroleum hydrocarbons (oil and grease, PAHs)
- Trash and debris
- MBAS
- Toxicity
- Emerging Contaminants

Human pathogens are usually not directly measured in storm water monitoring programs due to technical difficulty and expense and, in most cases, indicator bacteria such as fecal coliform or certain strains of *E. Coli* are measured. Because maximum allowable holding times for bacterial samples are necessarily short, most storm water programs do not collect flow-weighted composite samples that could potentially produce more reliable statistical estimates of concentrations. Fecal coliform and *E. Coli* are typically measured with grab samples, making it difficult to develop reliable event mean concentrations (EMCs). Total coliform and fecal bacteria (fecal coliform, fecal streptococcus, and fecal enterococci) were detected in storm water samples tested in Los Angeles County at highly variable densities (measured by “most probable number” of colony forming units, or MPN) ranging between several hundred to several million colony forming units per 100 milliliters (mL).

Petroleum hydrocarbons are difficult to measure because of laboratory interference effects and sample collection issues (hydrocarbons tend to coat sample bottles). Hydrocarbons are typically measured with single grab samples, making it difficult to develop reliable EMCs for the reasons explained above for pathogens.

Pesticides in urban runoff are often present at concentrations that are below detection limits for most commercial laboratories, thereby limiting the availability of statistically reliable data on pesticides in urban runoff. Pesticides were not detected in Los Angeles County monitoring data for land-use-based samples, except for diazinon and glyphosate, which were detected in less than 15 percent and 7 percent of samples, respectively.

Trash and debris, MBAS, toxicity, and emerging contaminants are not typically included in routine urban storm water monitoring programs. Several studies conducted in the Los Angeles River Basin have attempted to quantify trash generated from discrete areas, but the data represent relatively small areas, relatively short time periods, or both. MBAS was included in the land-use-based monitoring data, but not enough data is available for modeling purposes. Toxicity and emerging contaminants were not included in the Los Angeles County land use-based monitoring program.

Potential construction-phase water quality impacts caused by runoff and dewatering discharges are also qualitatively analyzed because the highly variable nature of construction conditions do not lend themselves to water quality modeling.

### **Best Management Practice Implementation for the Project**

Effective management of wet and dry weather runoff water quality begins with limiting increases in runoff pollutants and flows at the source. Site-design and source-control BMPs minimize runoff and the introduction of pollutants into runoff. LID, hydrology, and hydromodification control BMPs are designed to control increases in post-development runoff flows, volumes, and/or durations as well as pollutant loads. PDF 4-1 and MM 4-1 incorporate LID performance standards that meet the County MS4 Permit, LID Ordinance, and LID Standards Manual requirements. The following discussion provides a description of the planned BMPs that will be implemented to meet the LID performance standards. As discussed in Section 5.2, Hydrology and Flood, these measures will also provide hydrology (flood) and hydromodification controls that meet or exceed County requirements in MM 2-1 (hydromodification) and MM 2-2 (peak and volume flows from a 50-year storm). Exhibit 5.4-2, Low Impact Development (LID) Drainage Areas with Project, shows the portions of the Project site that require treatment with regional or distributed and parcel-specific LID BMPs, and those areas that do not require treatment.

#### ***Source Control Best Management Practices***

Table 5.4-4 summarizes the source-control requirements of the Los Angeles County LID Standards Manual and the corresponding BMPs that would be incorporated into the Project.

**TABLE 5.4-4  
LOW IMPACT DEVELOPMENT STANDARDS MANUAL  
SOURCE CONTROL REQUIREMENTS AND PROJECT  
BEST MANAGEMENT PRACTICES**

Source-Control Requirement	Criteria/Description	Corresponding Centennial Project Source-Control BMPs
S-1: Storm Drain Message and Signage	<ul style="list-style-type: none"> <li>• All storm drain inlets and catch basins in the Project area must be marked with prohibitive language and/or graphical icons to discourage illegal dumping.</li> <li>• Signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, must be posted at public access points along channels and creeks in the Project area.</li> <li>• Legibility of stencils and signs must be maintained.</li> </ul>	<ul style="list-style-type: none"> <li>• All storm drain inlets and water quality inlets will be stenciled or labeled.</li> <li>• Signs will be posted in areas where dumping could occur.</li> <li>• The Maintenance Entity will maintain stencils and signs.</li> </ul>
S-2: Outdoor Material Storage Areas	<ul style="list-style-type: none"> <li>• Where Project plans include outdoor materials storage areas that may contribute pollutants to the storm water conveyance system, measures to mitigate impacts must be included.</li> </ul>	<ul style="list-style-type: none"> <li>• Pesticides, fertilizers, paints, and other high-risk materials used for maintenance of common areas, parks, commercial areas, and multi-family residential common areas will be kept in enclosed storage areas.</li> </ul>

BMPs: Best Management Practices. Source: LACDPW 2014		

The Project would include additional source-control BMPs to minimize pollutants in storm water runoff. These BMPs will include provision of animal waste bag stations and a carwash pad for multi-family residential areas. An education program would be implemented that includes both the education of residents and commercial businesses regarding water quality issues. Topics would include services that could affect water quality, such as carpet cleaners and others that may not properly dispose of cleaning wastes; community car washes; and residential car washing. The education program would emphasize animal waste management, such as the importance of cleaning up after pets. As described in PDF 4-2, the Project would develop and implement Integrated Pest Management measures in accordance with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. The IPM measures will control nutrients and reduce pesticide use.

### ***Site-Design Best Management Practices***

Site-design principles reduce storm water runoff flows and impacts associated with land development to sensitive environmental features such as riparian areas, wetlands, and steep slopes. The benefits derived from site-design BMPs include the following:

- Reduction in the size of storm water quality control measures and conveyance systems.

- Reduction in pollutant loading to storm water quality control measures and receiving waters.
- Reduction in hydraulic impact on receiving waters.

The site-design principles in the Los Angeles County LID Standards Manual include site planning; protection and restoration of natural areas; minimization of land disturbance; and minimization of impervious cover. The following site designs have been incorporated into the Project to implement with the LID Standards Manual principles:

- Impervious areas would be minimized by incorporating parks and open space areas into the Project. Approximately 6,116 acres (approximately 50 percent) of the 12,323-acre Project site are parks and open space.
- Project BMPs, including parcel-based and regional LID BMPs, would disconnect impervious areas and reduce flows to natural channels through infiltration and evapotranspiration.
- In areas not subject to mass grading, the smallest site disturbance area possible would be delineated and flagged and temporary storage of construction equipment would be restricted in these areas to minimize soil compaction on site. Site clearing and grading would be limited as necessary to allow development, to allow access, and to provide fire protection.
- Streets, sidewalks, and parking lot aisles would be designed to the minimum widths required by the Americans with Disabilities Act and safety regulations for fire and emergency vehicle access.
- Native and/or non-native/non-invasive vegetation that requires less watering and chemical application will be utilized in compliance with the County Code and Section 3.3 of the Specific Plan.
- Impervious surfaces will be minimized in common area landscape design.

### ***Low Impact Development and Hydromodification Best Management Practices***

The LID performance standards will be achieved with regional BMPs, including 28 on-site detention and retention basins, and distributed or parcel-specific BMPs. As required by MM 4-1, compliance with the LID performance standards will be further confirmed in a drainage system engineering and planning report submitted to the County in conjunction with the review and approval process for each tract map application. The following sections describe the principles used to design LID BMPs for the Project; the regional LID BMP system; and the Project's distributed and parcel-specific BMPs.

The principles used to design LID BMPs are consistent with the MS4 Permit, the LID Ordinance, and the LID Standards Manual, and include the following:

- Institutional, commercial, multi-family residential, recreation, and parkland use parcels will implement retention or biofiltration BMPs within the parcel footprint. Runoff from the remaining developed area and that is not retained within the parcel

footprints would flow through the storm drain system to regional infiltration/biofiltration facilities.

- Based on feasibility, the LID performance standards will be achieved in specific locations as follows:
  - a. If it is feasible to infiltrate all of the runoff produced from the LID design storm from the developed area (i.e., soil infiltration rates are at least 0.3 inch per hour, and no other technical infeasibility concerns exist), infiltration BMPs (Category 1) would be used. Category 1 infiltration BMPs include bioretention (without an underdrain), permeable pavement, infiltration galleries, infiltration basins or trenches, drywells, or an equivalent infiltration BMP.
  - b. If Category 1 infiltration BMPs are infeasible due solely to low soil infiltration rates (i.e., the soil infiltration rate is less than 0.3 inch per hour), bioinfiltration BMPs (Category 2) would be used. Bioinfiltration facilities are similar to bioretention facilities with an underdrain and include storage below the underdrain to maximize the volume infiltrated. Category 2 facilities would retain a portion of the runoff from the LID design storm, then biofilter 1.5 times the remaining runoff from the LID design storm included in the LID performance standards (see PDF 4-1 and MM 4-1).
  - c. If Category 1 or Category 2 BMPs are infeasible, biofiltration BMPs (Category 3) will be used. Category 3 BMPs biofilter runoff produced from the 1.5 times the LID design storm (see PDF 4-1 and MM 4-1) and include bioretention with an underdrain, flow-based biofiltration BMPs, or an equivalent biofiltration BMP.
- Runoff from roadways will be retained or biofiltered in retention or biofiltration BMPs within the right-of-way sized to capture the LID design storm volume or flow (see PDF 4-1 and MM 4-1), per the guidance in USEPA's *Managing Wet Weather with Green Infrastructure Municipal Handbook: Green Streets*, or roadways may drain to regional facilities.
- Regional facilities would be implemented to infiltrate the LID design storm volume or biofilter 1.5 times the LID design storm volume (see PDF 4-1 and MM 4-1) that has not been retained or biofiltered within parcels or road rights-of-way. These regional facilities will be designed to meet the County requirements for hydromodification-impacts in combination with the LID performance standards.

Descriptions of the LID, hydrology, and hydromodification control BMPs that would be implemented within the Project are provided below. Exhibits 4-20a through 4-20f provide representative designs of the proposed Project BMPs.

### Storm Water Management Facilities

The proposed Project has been designed to meet or exceed County MS4 Permit, LID Standards Manual, and LID Ordinance hydromodification and hydrology (flood-control) requirements for new development. The Project will implement site-design, source-control, LID, and hydromodification BMP features. Most Project runoff will be subject to control and treatment in a regional system that consists of 28 detention and retention basins located throughout the Project site (see Exhibit 5.2-4, Proposed Infiltration Basin Locations). Other

developed areas will control and treat runoff by utilizing distributed, smaller, or parcel-specific LID measures (see Exhibit 5.4-2, Low Impact Development [LID] Drainage Areas with Project). LID measures that will be implemented for the Project are discussed in more detail below.

#### *Regional Infiltration/Retention Basins*

Regional detention and retention basins are storm water management facilities designed to detain or infiltrate runoff from multiple parcels or project areas. The basins are typically shallow with flat, vegetated bottoms. Regional basins are constructed by either excavating a depression or building a berm to create aboveground storage. Runoff is stored in the basin and in the pore spaces of the underlying surface soils. Storm water treatment measures (e.g., swales, filter strips, and sedimentation forebays) that intercept runoff prior to reaching the basins reduce pollutant loads and provide water quality controls. Basin outlet structures are designed to mimic pre-development discharge rates. The basins allow for infiltration below the lowest surface discharge of the facility; remove sediment and sediment-bound pollutants by filtration in the underlying soils; and retain water in the form of soil moisture to promote the adsorption of pollutants (e.g., dissolved metals and petroleum hydrocarbons) into the surface of soil matrix. Plants utilize soil moisture and promote the drying of the soil. Extended detention for flood or hydromodification control would also provide additional pollutant removal through settling. As discussed in Section 5.2, Hydrology and Flood, the regional detention and retention basin system has been sized and designed to also meet applicable flood-control and hydromodification requirements.

The regional infiltration detention system for the Project includes 28 basins that will provide both hydromodification and flow control and water quality treatment for the majority of the proposed development area. The locations of the basins are shown on Exhibit 5.2-4. Normalized sizing charts were applied to the proposed development area's tributary to each basin to identify flow retention and duration volumes required to match the pre-development flow conditions and to achieve the LID and water quality performance standards. The water quality control volumes required to meet the LID performance standards and the total volume provided for hydromodification as well as flood and hydromodification control at each basin location are listed in Table 5.4-5.

**TABLE 5.4-5  
SUMMARY OF REGIONAL RETENTION AND DETENTION  
FOR WATER QUALITY CONTROL**

<b>Regional Basin Number</b>	<b>Receiving Channel</b>	<b>Tributary Area (acres)</b>	<b>Tributary Area Imperviousness (%)</b>	<b>LID Total Volume Required (acre-feet)</b>	<b>Total Volume Provided (acre-feet)</b>

LID: Low Impact Development Source: Geosyntec 2016a					

### ***Parcel-Based Best Management Practices***

Distributed and parcel-based BMPs are smaller-scale facilities typically treating runoff from one or a few parcels, including underground vaults and pipes. Exhibit 5.4-2, Low Impact Development (LID) Drainage Areas with Project, shows the locations of the primary distributed LID management measures that will be implemented for portions of the Project site. As discussed in Section 5.2, Hydrology and Flood, these measures also provide flood and hydromodification controls. Distributed and parcel-based measures will meet the LID performance standards incorporated into MM 4-1 and include infiltration, bioinfiltration, and biofiltration BMPs.

Distributed and parcel-based infiltration, bioinfiltration, and biofiltration BMPs provide for pollutant removal (e.g., filtration, adsorption, nutrient uptake) by filtering storm water through vegetation and soils and by reducing runoff volumes by infiltration. To achieve the LID performance standards, distributed and parcel-based LID BMPs are designed to (1) have a minimum storage volume equivalent to the storm water quality design volume (SWQDv), as calculated in accordance with the Los Angeles County LID Calculator (LACDPW 2014); (2) infiltrate to the extent feasible based on parcel-specific infiltration feasibility; and (3) biofilter 1.5 times the runoff that cannot be feasibly infiltrated from the 1.1-inch design storm.

### ***Green Streets***

The Project will utilize “green street” techniques consistent with the USEPA’s *Managing Wet Weather with Green Infrastructure Municipal Handbook: Green Streets* to meet the requirements of the LID performance standards for runoff from public rights-of-way. Two forms of green street implementation would be incorporated into the Project:

1. Where streets are tributary to regional facilities, the full requirements of the LID performance standards would be met by managing runoff in the regional LID facilities.
2. For streets that are not tributary to regional LID facilities, stand-alone green street BMPs within the street right-of-way would be used to meet the requirements of the LID performance standards, and distributed hydromodification-control BMPs would be used to meet the County LID Standards Manual Green street LID BMPs include infiltration or biofiltration BMPs, such as bioretention systems with an underdrain, vegetated swales, and filter strips. Proprietary flow-based biofiltration BMPs (e.g., Filterra® or equivalent) would also be used where appropriate and feasible.

### ***Operation and Maintenance of Best Management Practices***

As discussed in Section 5.18, Water Resources, the Project’s potable and recycled water infrastructure—including potable and recycled water treatment, delivery, metering and monitoring—will be managed by a water district or public utility district (PUD) that will serve the Project (the “Project Water Purveyor”). The Project Water Purveyor could also operate and maintain non-construction water-control BMPs within the site, and would be responsible for BMP inspections, monitoring, maintenance, and enforcement. Until the Project Water Purveyor or a similar BMP management agency is established, the Project

Applicant/Developer will be responsible for all water quality BMPs, including design, permitting, construction, operations, and maintenance.

### 5.2.5 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

- Threshold 4-1** Violate any (surface water) water quality standards or waste discharge requirements.
- Threshold 4-2** Generate construction or post-construction runoff that would violate applicable stormwater NPDES permits or otherwise significantly affect surface water or groundwater quality.
- Threshold 4-3** Result in point or nonpoint source pollutant discharges into State Water Resources Control Board-designated Areas of Special Biological Significance.
- Threshold 4-4** Use onsite wastewater treatment systems in areas with known geological limitations (e.g. high groundwater) or in close proximity to surface water (including, but not limited to, streams, lakes, and drainage course).
- Threshold 4-5** Otherwise substantially degrade water quality.

To evaluate whether the Project would cause a significant impact under any of the following thresholds, an integrated or “weight of evidence” approach was employed (rather than a decision based on any one criterion). The application of this approach is described in more detail below as it applies to evaluation of surface and groundwater quality.

The Water Quality Technical Report (see Appendix 5.4-A) analyzes whether polluted runoff may result from the Project based on the results of quantitative water quality modeling and qualitative assessments that account for the water quality controls and BMPs that will be implemented in accordance with PDF 4-1 and PDF 4-2 and required by MM 4-1 and MM 4-2. Any increases in pollutant concentrations or loads in runoff resulting from the development of the Project site are considered an indication of a potentially significant adverse water quality impact. If loads and concentrations resulting from development are predicted to stay the same or to be reduced when compared with existing conditions, it is concluded that the Project will not cause a significant adverse impact to the ambient water quality of the receiving waters for that pollutant.

If pollutant loads or concentrations are expected to increase, then for both the construction and post-development phases, potential impacts are assessed by evaluating the Project’s compliance with the applicable regulatory requirements of the Construction General Permit and the General Dewatering Permit during construction, and County MS4 Permit, LID Ordinance and LID Standard Manual requirements under post-construction conditions. Post-development increases in pollutant loads and concentrations are evaluated by comparing

the magnitude of the increase to relevant water quality criteria, including receiving water quality objectives and criteria from the Los Angeles or Lahontan Basin Plans and the CTR, as described below.

Groundwater quality standards are compared with post-development runoff water quality to assess potential Project impacts to groundwater quality.

### **Surface Water Quality Analysis Criteria**

Potential Project impacts to surface receiving waters subject to a TMDL are analyzed by comparing construction and post-development water quality runoff constituent concentrations with applicable TMDL waste load or load allocations. Potential Project impacts to all surface receiving waters are analyzed by comparing post-development water quality runoff constituent concentrations with applicable numeric and narrative receiving water quality criteria in the Los Angeles and Lahontan Basin Plans and the CTR.

The narrative and numeric water quality objectives contained in the Los Angeles and Lahontan Basin Plans and the CTR apply to the Project's receiving waters. Pollutant levels in Project runoff that do not exceed receiving water quality objectives are considered to have no significant impacts to water quality.

### **Municipal Separate Storm Sewer System Permit, Low Impact Development Ordinance, and Low Impact Development Standards Manual Analysis Criteria**

As described in PDF 4-1 and required by MM 4-1, the Project will implement the hydrology (storm water runoff), and LID standards for new development in the County MS4 Permit, the County LID Ordinance, and the County LID Standards Manual. The MS4 Permit requires that BMPs be implemented to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP). The effectiveness of storm water LID controls are primarily based on two factors: (1) the amount of runoff that is captured by the controls and (2) the selection of BMPs to address identified pollutants of concern. The MS4 Permit, LID Ordinance, and LID Standards Manual include selection and numerical sizing criteria for new development water quality controls. Project runoff subject to treatment in LID BMPs that comply with County selection and numerical sizing criteria for new development are considered to have no significant impacts to water quality related to MS4 Permit requirements.

### **Construction General Permit and General Dewatering Permit Analysis Criteria**

As discussed in Section 5.4.2, the Project will comply with the state's Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit during construction. The Construction General Permit requires that construction period BMPs be implemented in accordance with an impact risk assessment. A Storm Water Pollution Prevention Plan (SWPPP) must be prepared and implemented that includes BMPs that meet or exceed the permit requirements applicable to the level of construction risk. The Lahontan RWQCB Limited Threat Discharge Permit covers

construction dewatering and other construction-related discharges associated with low or limited water quality risks. The limited threat discharge permit contains discharge prohibitions, receiving water limitations, and monitoring and reporting requirements. The Los Angeles RWQCB General Dewatering Permit addresses discharges from temporary dewatering operations associated with construction and permanent dewatering operations associated with development. Project construction period runoff that is subject to treatment BMPs that comply with the state's Construction General Permit and with the limited threat discharge and dewatering permits adopted by the Lahontan and Los Angeles RWQCBs during construction are considered to have no significant impacts to water quality.

Potential water quality impacts to surface water from quantitatively analyzed constituents of concern are discussed under Threshold 4-1. Potential water quality impacts to surface water from qualitatively-analyzed constituents of concern are discussed under Threshold 4-5. Potential water quality impacts to groundwater are discussed in Threshold 4-2. Thresholds 4-3 and 4-4 discuss potential impacts to Areas of Special Biological Significance and from the location of wastewater reclamation facilities near ephemeral and intermittent drainage courses.

## 5.2.6 ENVIRONMENTAL IMPACTS

**Threshold 4-1      Would the project violate any (surface water) water quality standards or waste discharge requirements?**

### **On-Site Impacts**

Potential surface water quality impacts during construction and operation (i.e., post-construction) of the Project for qualitatively analyzed constituents are discussed under Threshold 4-1 and would be less than significant with mitigation. Potential groundwater quality impacts during construction and operation (i.e., post-construction) of the Project are discussed under Threshold 4-2 and would be less than significant with mitigation.

Potential surface water quality impacts during construction and operation (i.e., post-construction) for quantitatively analyzed constituents are discussed below. As discussed in Section 5.4.5, the pollutants of concern for which there are sufficient flow composite sampling data in the Los Angeles County database to conduct a quantitative analysis are the following:

- TSS (sediment)
- Total Phosphorus
- Nitrate + Nitrite-Nitrogen, Ammonia, and Total Nitrogen
- Total and Dissolved Copper
- Total Lead
- Total and Dissolved Zinc
- Chloride

### **Construction Impacts**

Construction impacts from Project development would be minimized through compliance with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit. The state Construction General Permit requires that construction period BMPs be implemented in accordance with an impact risk assessment. An SWPPP must be prepared and implemented that includes BMPs that meet or exceed the permit requirements applicable to the level of construction risk. Construction period BMPs may include erosion controls that prevent erosion; sediment controls that trap sediment carried in runoff in basins or other facilities; or BMPs that control other potential construction-related pollutants. The permit requires that BMPs incorporate the best available technology economically achievable and best conventional pollutant control technology (the “BAT/BCT standard”). BMP implementation must be based on the phase of construction and current weather conditions to control erosion and sediment. A Construction Site Monitoring Program that identifies monitoring and sampling requirements during construction is a required component of the SWPPP.

Project construction is anticipated to be classified as Risk Level 2 as defined in the Construction General Permit. Water Quality BMPs will be implemented in response to the risk assessment (Geosyntec 2016b). The following types of BMPs would be implemented during construction of the Project and would meet the BAT/BCT standard to comply with the Construction General Permit:

- **Erosion Control**

- Physically stabilizing the area through hydraulic mulch, soil binders, straw mulch, bonded fiber matrices, and erosion-control blankets (i.e., rolled erosion-control products).
- Containing and securely protecting stockpiled materials from wind and rain at all times, unless actively being used.
- Roughening soil in graded areas (through track walking, scarifying, sheepsfoot rolling, or imprinting) to slow runoff, to enhance infiltration, and to reduce erosion.
- Stabilizing vegetation through temporary seeding and mulching to establish interim vegetation.
- Controlling wind-erosion (dust) through the application of water or other dust palliatives (serving to lessen), as necessary, to prevent and alleviate dust nuisance.

- **Sediment Control**

- Protecting perimeters through silt fences, fiber rolls, gravel bag berms, gravel bag barriers, sand bag barriers, and compost socks to prevent discharges.
- Protecting storm drain inlets.
- Capturing sediment with sediment traps and basins.

- Reducing velocity through check dams, sediment basins, and outlet protection/velocity dissipation devices.
- Reducing off-site sediment tracking through stabilized construction entrance/exit, construction road stabilization, and entrance/exit tire wash.
- Slope interruption at permit-prescribed intervals (fiber rolls, gravel bag berms, sand bag berms, compost socks, biofilter bags).
- **Waste and Materials Management**
  - Managing the following types of materials, products, and wastes (i.e., solid, sanitary, concrete, hazardous, and equipment-related). Management measures include covered storage and secondary containment for material storage areas, secondary containment for portable toilets, covered dumpsters, dedicated and lined concrete washout/waste areas, proper application of chemicals, and proper disposal of all manner of wastes.
  - Protecting soil, landscaping, and construction material stockpiles by covering them, applying water or soil binders, and using perimeter-control measures.
  - Incorporating a spill response and prevention program as part of the SWPPP and on-site availability of spill response materials to be conspicuously located at all times.
- **Non-Storm Water Management**
  - Incorporating BMPs or good housekeeping practices to reduce or limit pollutants at their source before they are exposed to storm water, including such measures as water conservation practices, vehicle and equipment cleaning, fueling practices, and street sweeping. All such measures will be recorded and maintained as part of the Project's SWPPP.
  - Protecting receiving waters through compliance with the Los Angeles and the Lahontan RWQCB's General WDRs, which govern construction-related dewatering discharges. Typical BMPs for construction dewatering are listed below.
    - i. Infiltration of clean groundwater.
    - ii. On-site treatment using suitable treatment technologies.
    - iii. On-site or transport off site of sanitary sewer discharge with local sewer district approval.
    - iv. Use of sedimentation bags for small volumes of localized dewatering.
- **Training and Education**
  - Including Construction General Permit-defined "Qualified SWPPP Developers" (QSD) and "Qualified SWPPP Practitioners" (QSP). QSDs and QSPs shall have required certifications and shall attend State Board sponsored training.
  - Training individuals responsible for SWPPP preparation, implementation, and permit compliance, including contractors and subcontractors.

- Including signage (bilingual, if appropriate) to address SWPPP-related issues (such as site cleanup policies, BMP protection, washout locations).
- **Inspections, Maintenance, Monitoring, and Sampling:**
  - Performing routine site inspections and inspections before, during (for storm events lasting more than 24 hours), and after storm events.
  - Preparing and implementing Rain Event Action Plans (REAPs) prior to any storm event with 50 percent probability of producing 0.5 inch of rainfall, including performing required preparatory procedures and site inspections.
  - Implementing BMP maintenance and repairs, as indicated by routine, storm-event, and REAP inspections.
  - Implementing a Construction Site Monitoring Plan for non-visible pollutants, if a leak or spill is detected.
  - Sampling discharge points for turbidity and pH, at minimum, three times per qualifying storm event and recording and retention of results.

Additional information concerning the implementation of the Construction General Permit during Project construction is provided in Section 5.2, Hydrology and Flood, and in the Water Quality Technical Report, which is Appendix 5.4-A of this EIR.

Construction on the Project site may require dewatering. For example, dewatering may be needed if water has been standing on site and needs to be removed for construction, vector control, or other reasons. Further, dewatering may be necessary if groundwater is encountered during grading or to allow discharges associated with testing of water lines, sprinkler systems, and other facilities. In general, the Construction General Permit authorizes construction dewatering activities and other construction-related non-storm water discharges that (1) comply with Section III.C of the General Permit; (2) do not cause or contribute to a violation of any water quality standards; (3) do not violate any other provisions of the General Permit; (4) do not require a non-storm water permit as may be issued by certain RWQCBs in the state; and (5) are not prohibited by the applicable basin Plan provision.

The Lahontan RWQCB's Limited Threat Discharge Limited Permit authorizes construction dewatering activities in the Lahontan RWQCB region provided the following occur:

1. pollutant concentrations in the discharge do not cause, have a reasonable potential to cause, or contribute to an excursion above any applicable federal water quality criterion promulgated by USEPA pursuant to the CWA Section 303, or water quality objective adopted by the Regional Water Quality Control Board or the SWRCB, including discharge prohibitions for the receiving waters in the Lahontan Region;
2. pollutant concentrations in the discharge will not cause or contribute to degradation of water quality or impair beneficial uses of receiving waters;
3. the discharge does not cause acute or chronic toxicity in the receiving waters; and

4. discharge to land is not a practical alternative based on information provided by the discharger.

The discharger must also comply with a monitoring and reporting program that includes monitoring of the discharge and receiving waters for a mandatory suite of constituents and submit quarterly reports to the Lahontan RWQCB.

The Los Angeles RWQCB General Dewatering Permit authorizes discharges within the Los Angeles RWQCB region subject to BMPs that control potential water quality and other hydrological impacts. The Lahontan RWQCB Limited Threat Discharge Permit WDRs authorize discharges within the Lahontan RWQCB region subject to BMPs that control their potential water quality impacts. BMPs that would be implemented under the General Dewatering Permit for construction dewatering include infiltration of clean groundwater; on-site treatment using suitable treatment technologies; on-site or transport off site for sanitary sewer discharge with local sewer district approval; or use of a sedimentation bag for small volumes of localized dewatering.

The Project would reduce or prevent erosion and sediment transport and transport of other potential pollutants from the Project site during construction through implementation of BMPs meeting the BAT/BCT standard in accordance with the state Construction General Permit. These measures will ensure that discharges during Project construction do not cause or contribute to any exceedance of water quality standards in any receiving waters. All discharges from qualifying storm events must be sampled for turbidity and pH, and results will be compared to Numeric Action Levels (250 NTU and 6.5–8.5, respectively) to ensure that BMPs are functioning as intended. If discharge sample results exceed applicable action levels, a review of causative agents and the existing site BMPs must be undertaken, and maintenance and repair on existing BMPs be performed and/or additional BMPs be provided to ensure that future discharges meet the criteria. Construction BMPs would ensure effective control of sediment discharges and pollutants associated with sediments, such as nutrients, heavy metals, and certain pesticides, including legacy pesticides. Compliance with the BAT/BCT standards requires that BMPs used to control construction water quality are updated over time as new water quality control technologies are developed and become available for use. Compliance with the Construction General Permit will reduce construction period water quality impacts to less than significant levels.

The Project will also comply with the Lahontan RWQCB Limited Threat Discharge Permit and the Los Angeles RWQCB General Dewatering Permit during covered construction activities. These permits require BMPs that reduce potential construction impacts from dewatering and other low-threat construction discharges to less than significant levels.

The Project will comply with the waste discharge requirements in the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit during construction. The risk-based water quality and other BMPs implemented to the BAT/BCT standard (as required by the Construction General Permit) as well as additional measures required by the Lahontan RWQCB Limited Threat Discharge Permit and the Los Angeles RWQCB General Dewatering Permit will also avoid violation of any surface water quality standard during construction. Potential construction

period Project impacts from the violation of any surface water quality standards or waste discharge requirements would be less than significant and no mitigation is required.

### ***Operational Impacts***

As discussed above, the Project will construct and maintain distributed and parcel-specific LID and regional flood, hydromodification, and LID-control facilities that will meet or exceed applicable federal, State, and County hydrology and water quality control requirements. The locations of the primary distributed and parcel-specific LID facilities are shown in Exhibit 5.4-2, Low Impact Development (LID) Drainage Areas with Project. The locations of the 28 runoff detention and retention basins that comprise the regional control system are shown in Exhibit 5.2-4. Each basin has been sized to provide sufficient capacity to meet hydrology and flood, hydromodification, and water quality protection requirements. The following discussion summarizes the quantitative analysis of Project runoff water quality under post-development conditions, including regional, distributed and parcel-specific BMPs, relative to applicable receiving water quality standards. Potential water quality impacts for constituents subject to a qualitative analysis are discussed in Threshold 4-5.

### **Quantitative Analysis Results**

Computer modeling was completed to forecast potential pollutant loadings that could be generated on the Project site under post-development conditions with applicable BMPs. Quantitatively analyzed constituents were evaluated with respect to the following three criteria:

1. Comparison of post-development versus pre-development (i.e., existing condition, which is primarily open space with livestock grazing and agriculture) storm water quality concentrations and loads;
2. Comparison with Los Angeles County MS4 Permit requirements; and
3. Evaluation relative to receiving water quality criteria. (The water quality criteria do not apply directly to runoff from the Project site and are used as conservative measures of potential water quality impacts.)

The comparison of post-development versus pre-development storm water quality concentrations and loads (criterion 1) are summarized in Table 5.4-6, Average Annual Runoff Volume and Pollutant Loads, and Table 5.4-7, Predicted Average Annual Pollutant Concentrations. Table 5.4-6 summarizes the predicted changes in the post-development mean annual volume of storm water runoff from existing conditions and mean annual loads for the pollutants of concern subject to a quantitative analysis. Table 5.4-7 summarizes the predicted changes in the average annual pollutant concentrations for these pollutants of concern. Pollutant loads refer to the total amount of each pollutant that would be produced on the site as an absolute volume. The pollutant concentration is a function of the measurement of the pollutant within a given amount of water. Therefore, the units for pollutant concentrations reflect the amount of the pollutant in one liter (L) of water.

The results include the Project site and approximately 15 acres located off site that would be subject to Project-related construction, including intersections with SR-138, utility connections, water wells, and Aqueduct crossings (see Section 4.0, Project Description). The modeling results are conservative because they only consider pollutant reductions attributable to the implementation of the proposed LID BMPs. Additional pollution reductions would occur due to site design and source-control, hydrology or hydromodification BMPs, and the post-development constituent loads and concentrations are likely to be lower than projected in the analysis.

**TABLE 5.4-6  
PREDICTED AVERAGE ANNUAL POLLUTANT LOADS**

<b>Parameter</b>	<b>Units</b>	<b>Existing</b>	<b>Developed</b>	<b>Change</b>
Volume	af	240	1,014	774
TSS	tons/yr	84	131	47
Total Phosphorous	lbs/yr	355	807	452
Nitrate-N + Nitrite-N	lbs/yr	1,448	1,981	533
Ammonia-N	lbs/yr	129	1,216	1,087
Total Nitrogen	lbs/yr	2,287	8,908	6,621
Total Copper	lbs/yr	11	42	31
Dissolved Copper	lbs/yr	1.2	19.8	18.6
Total Lead	lbs/yr	3.3	18.7	15.4
Total Zinc	lbs/yr	18	236	218
Dissolved Zinc	lbs/yr	19	141	122
Chloride	tons/yr	3.7	23.9	20.2

af: acre-feet; TSS: total suspended solids (a measure of sediment); tons/yr: tons per year; nitrate-N, nitrite-N and ammonia-N are inorganic forms of nitrogen; lbs/yr: pounds per year.

Note: Modeled off-site improvements include 15 acres of roadway improvements.

**TABLE 5.4-7  
PREDICTED AVERAGE ANNUAL POLLUTANT CONCENTRATIONS**

Parameter	Units	Existing	Developed	Change
TSS	mg/L	256	95	-161
Total Phosphorous	mg/L	0.5	0.3	-0.2
Nitrate-N + Nitrite-N	mg/L	2.2	0.7	-1.5
Ammonia-N	mg/L	0.2	0.4	0.2
Total Nitrogen	mg/L	3.5	3.2	-0.3
Total Copper	µg/L	16.3	15.2	-1.1
Dissolved Copper	µg/L	1.9	7.2	5.3
Total Lead	µg/L	5.0	6.8	1.8
Total Zinc	µg/L	27.0	85.6	58.6
Dissolved Zinc	µg/L	28.6	51.1	22.5
Chloride	mg/L	11.4	17.3	5.9

TSS: total suspended solids (a measure of sediment); mg/L: milligrams per liter; nitrate-N, nitrite-N and ammonia-N are inorganic forms of nitrogen; µg/L: micrograms per liter.

Note: Modeled off-site improvements include 15 acres of roadway improvements.

Source: Geosyntec Consultants 2016b

A discussion of the results shown in Tables 5.4-6 and 5.4-7 above, including a comparison of pre- and post-Project development conditions as well as comparison with water quality criteria for each pollutant modeled, is provided below.

### Runoff Volume

Mean annual runoff volumes with are projected to increase from approximately 224 acre-feet per year (afy) under existing conditions to 774 afy under post-development conditions due to the increase in impervious surfaces on the site. For modeling purposes, the existing site was assumed to have an imperviousness of one percent in accordance with the Los Angeles County Hydrology Manual (Hydrology Manual) (LACDPW 2006). As discussed below, the increase in mean annual runoff volumes is projected to increase the annual load (in tons or pounds per year; see Table 5.4-6) of most constituents of concern.

Post-development impervious surfaces were estimated based on the proposed land uses and on the associated level of imperviousness indicated in the Hydrology Manual; these surfaces would have a composite imperviousness of approximately 54 percent. The entire Project site was estimated to have a composite imperviousness at buildout of approximately 30 percent when open space is included. Generally, runoff volume is directly proportional to percent imperviousness. As discussed above and in Section 5.2, Hydrology and Flood, the Project includes site-design, source-control, LID, water quality, and hydromodification-control BMPs that will meet or exceed County MS4 Permit, LID Ordinance, and LID Standards Manual standards for new development. Site-design BMPs, including the minimization of impervious area and the conservation of approximately 47 percent of the site (or 5,807 acres) in park and open space land uses, would reduce the post-development storm water runoff volumes. LID BMPs also reduce mean annual runoff volumes by infiltrating approximately 121 acre-

feet of storm water runoff per year on average. Potential Project impacts related to runoff volume are discussed in Section 5.2, Hydrology and Flood, and will be less than significant with mitigation.

#### Total Suspended Solids (TSS)

**Comparison of Pre- and Post-Development Conditions:** Post-development TSS loads are predicted to increase due to the increase in mean annual runoff volume discussed above. Under post-development conditions, the average TSS concentration in storm water runoff from the Project site would be reduced from 256 mg/l to 95 mg/l (see Table 5.4-7). This reduction is due to several factors, including increased hardscape and decreased grazing on the Project site, which tends to reduce the amount of suspended solids that would be carried in runoff.

**Comparison with Water Quality Criteria:** Table 5.4-8, Comparison of Predicted Total Suspended Solids Concentrations with Water Quality Criteria for the Project, compares the predicted average annual TSS concentration in post-development storm water runoff from the total modeled area to the narrative TSS water quality criteria in the Lahontan and Los Angeles Basin Plans.

**TABLE 5.4-8  
COMPARISON OF PREDICTED TOTAL SUSPENDED SOLIDS CONCENTRATIONS WITH  
WATER QUALITY CRITERIA FOR THE PROJECT**

Parameter	Predicted Average Annual Total Project Concentration (mg/L)	Los Angeles Basin Plan Surface Water Quality Objectives	Lahontan Basin Plan Surface Water Quality Objectives
TSS	95	Water shall not contain suspended or settleable material in concentrations that cause nuisance or adversely affect beneficial uses.	<p>The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect the water for beneficial uses.</p> <p>Waters shall not contain suspended materials in concentrations that cause nuisance or that adversely affect the water for beneficial uses.</p> <p>For natural high quality waters, the concentration of total suspended materials shall not be altered to the extent that such alterations are discernible at the 10% significance level.</p>
mg/L: milligrams per liter			
Source: Geosyntec Consultants 2016b			

As shown in Table 5.4-7, post-development average annual TSS concentrations would be significantly lower than under current conditions. This reduction would avoid the creation of nuisance or adversely affect beneficial uses in applicable receiving waters. There are no natural high quality waters as defined in the Lahontan Basin Plan that could be affected by

Project runoff. Potential Project impacts related to TSS concentrations would be less than significant.

### Nutrients

**Comparison of Pre- and Post-Development Conditions:** Total phosphorous loads are predicted to increase with development. Post-development phosphorus concentrations are predicted to decrease from 0.5 mg/L to 0.3 mg/L due to the reduction in agricultural and related land uses that are known to generate nutrient loads in runoff (see Table 5.4-7).

Nitrate + nitrite-nitrogen and total nitrogen average annual concentrations are also predicted to decrease while the average annual concentration of ammonia is predicted to increase in storm water runoff as a result of the Project (see Table 5.4-7). The nitrate + nitrite-nitrogen and total nitrogen decreases can be attributed to the reduction in agricultural and related land uses that are known to generate nutrient loads in discharges from LID BMPs. Ammonia concentrations will increase slightly due to greater concentrations of ammonia measured in developed area runoff in comparison to open space runoff.

As discussed above, the nutrient analysis is conservative because it only considers LID and hydromodification-control BMP constituent reductions. Other BMPs—including site-design BMPs that minimize nutrients in runoff through the preservation of natural areas, the use of native or drought tolerant plants in development area plant palettes, educational materials regarding the proper handling of fertilizers and pet waste, and the implementation of an IPM program—would further reduce nutrient loads and concentrations below the levels projected in Tables 5.4-6 and 5.4-7.

**Comparison with Water Quality Criteria:** The Lahontan and Los Angeles Basin Plans contain both narrative and numerical objectives for nutrients, including total phosphorus, total nitrogen, nitrate-N plus nitrite-N, and total ammonia (Table 5.4-9, Comparison of Nutrient Concentrations with Water Quality Criteria for the Project).

**TABLE 5.4-9  
COMPARISON OF NUTRIENT CONCENTRATIONS WITH WATER QUALITY CRITERIA  
FOR THE PROJECT**

Parameter	Predicted Average Annual Concentration (mg/L)	Los Angeles Basin Plan Surface Water Quality Objectives (mg/L)	Lahontan Basin Plan Surface Water Quality Objectives (mg/L)
Total Phosphorus	0.3	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses.	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growths cause nuisance or adversely affect the water for beneficial uses whereby discharges are not to cause excessive algae growth in receiving waters.
Total Nitrogen	3.2		
Nitrate-N + Nitrite-N	0.7		
Total Ammonia	0.4	1.24 <sup>b</sup>	8.5 <sup>c</sup>
mg/L: milligrams per liter; ELS: early life stage ; pH: hydrogen potential; °C: degrees Celsius; °F: degrees Fahrenheit			
<sup>a</sup> Waters shall not exceed 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen (NO <sub>3</sub> -N + NO <sub>2</sub> -N), 45 mg/L as nitrate (NO <sub>3</sub> ), 10 mg/L as nitrate-nitrogen (NO <sub>3</sub> -N), or 1 mg/L as nitrite-nitrogen (NO <sub>2</sub> -N).			
<sup>b</sup> 30-day average, ELS present, based on average pH (7.97) and average temperature of 25°C.			
<sup>c</sup> Total ammonia Water Quality Objective calculated using pH = 7.5 (log mean pH) and Temperature = 30°C (86°F), which is very conservative.			
Source: Geosyntec Consultants 2016b			

The post-development total phosphorous concentration in Project storm water discharges to ephemeral receiving water drainages is lower than under existing conditions and is not likely to promote (i.e., increase) algae growth and therefore would comply with the narrative objective for biostimulatory substances in the Basin Plans. Ephemeral drainages dry out between storm events and do not support algal growth. As shown in Table 5.4-9, the average annual storm water concentration of ammonia, nitrate-N, and nitrite-N are predicted to be considerably lower than the numerical objectives in both basin plans and would also comply with applicable narrative water quality objectives. Potential Project impacts related to nutrients would be less than significant.

### Metals

**Comparison of Pre- and Post-Development Conditions:** Projected loads and concentrations for the trace metals, copper, lead, and zinc are presented in Tables 5.4-6 and 5.4-7 above. Except for lead, CTR criteria apply to the dissolved forms of each metal. Los Angeles County land use-based monitoring data for dissolved lead is insufficient to facilitate modeling for this constituent. Copper, lead, and zinc are the most prevalent metals typically found in urban runoff. Other trace metals, such as cadmium, chromium, and mercury, are typically not detected in urban runoff or are detected at very low levels.

As shown in Tables 5.4-6 and 5.4-7, post-development dissolved copper, total lead, and total and dissolved zinc loads and concentrations are projected to increase compared with

pre-development conditions. The average annual concentration of total copper is predicted to decrease. These results are consistent with data indicating that metal loads and concentrations generally increase when a largely undeveloped site is subject to development from the introduction of automobile components, infrastructure materials, and atmospheric deposition.

As discussed above, the metals analysis is conservative because it only considers LID and hydromodification-control BMP constituent reductions. Other BMPs, such as site-design measures that direct drainage from impervious areas to vegetated infiltration areas, the selection of building materials that do not include copper or zinc, or source controls (e.g., education for property owners, street sweeping private streets, and parking lots) would further reduce metal loads and concentrations below the levels projected in Tables 5.4-6 and 5.4-7.

**Comparison with Water Quality Criteria:** Table 5.4-10, Comparison of Predicted Metals Concentrations with Water Quality Criteria for the Project, compares the projected post-development metal concentrations with narrative metals water quality objectives in the Lahontan and Los Angeles Basin Plans and numerical criteria in the CTR.

**TABLE 5.4-10  
COMPARISON OF PREDICTED METALS CONCENTRATIONS WITH WATER QUALITY  
CRITERIA FOR THE PROJECT**

<b>Parameter</b>	<b>Predicted Average Annual Total Concentration (µg/L)</b>	<b>Los Angeles Basin Plan Surface Water Quality Objectives</b>	<b>Lahontan Basin Plan Surface Water Quality Objectives</b>	<b>CTR Criteria*</b>
Total Copper	15.2	All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life.	All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life. Compliance with this objective would be determined by use of indicator organisms, analyses of species diversity, population density, growth anomalies, bioassays of appropriate duration and/or other appropriate methods as specified by the Regional Board. The survival of aquatic life in surface waters subjected to a waste discharge or other controllable water quality factors shall not be less than that for the same water body in areas unaffected by the waste discharge or, when necessary, for other control water that is consistent with the requirements for "experimental water" as defined in Standard Methods for the Examination of Water and Wastewater.	52
Dissolved Copper	7.2			50
Total Lead	6.8			480
Total Zinc	85.6			390
Dissolved Zinc	110	All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life.		120

µg/L: micrograms per liter; CTR: California Toxics Rule; mg/L: milligrams per liter

\* CTR acute aquatic life criteria are calculated for the maximum allowable hardness of 400 mg/L; an average hardness of 589 mg/L was observed in Piru Creek, which is representative of the Project's receiving waters.

Source: Geosyntec Consultants 2016b.

The narrative objectives in each Basin Plan focus on avoiding metals (i.e., “toxic substances”) in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life. The CTR numerical criteria are based on similar water quality objectives required to protect aquatic life and provide a quantitative basis for evaluating Project compliance with the Basin Plan narrative objectives. CTR criteria are expressed for acute (one hour) and chronic (four-day average) conditions. For the Project site, only acute conditions are applicable because the duration of storm water discharges in the Antelope Valley region is consistently less than four days. The CTR criteria are calculated on the basis of the hardness of the receiving waters. Lower hardness concentrations result in lower, more stringent CTR criteria. The maximum allowable hardness of 400 mg/L was used as an estimate of the hardness in the Project’s receiving waters based on an average hardness of 589 mg/L observed in Piru Creek, the most proximate receiving water to the site for which hardness data was available.

As shown on Table 5.4-10, each of the projected post-development metal concentrations are below the CTR numerical criteria. As a result, the projected post-development metals concentrations would also comply with the toxicity avoidance narrative criteria in the Lahontan and Los Angeles Basin Plans. Potential Project impacts related to metals would be less than significant.

### Chloride

**Comparison of Pre- and Post-Development Conditions:** As shown in Tables 5.4-6 and 5.4-7, average annual chloride concentrations and loads are predicted to increase compared with existing conditions. This result is due to the fact that chloride sources in urban areas (e.g., bulk precipitation deposition, leaching from materials such as plywood and plastics, fumigants, and paint removers) are typically more prevalent in developed areas than in undeveloped locations in Los Angeles County.

**Comparison with Water Quality Criteria:** Table 5.4-11, Comparison of Predicted Chloride Concentrations with Water Quality Criteria for the Project, compares the predicted chloride concentration in post-development Project runoff with the Los Angeles Basin Plan water quality objective. The Lahontan Basin Plan does not contain water quality objectives for chloride.

**TABLE 5.4-11  
COMPARISON OF PREDICTED CHLORIDE CONCENTRATIONS WITH WATER QUALITY  
CRITERIA FOR THE PROJECT**

Parameter	Predicted Average Annual Total Concentration (mg/L)	Los Angeles Basin Plan Surface Water Quality Objectives (mg/L)	Lahontan Basin Plan Surface Water Quality Objectives*
Chloride	17.3	100	N/A
mg/L: milligrams per liter; N/A: not applicable			
* There is no Lahontan Basin Plan surface water quality objective for chloride in the Project site’s receiving waters.			
Source: Geosyntec Consultants 2016b.			

As shown in Table 5.4-11, the post-development conditions for chloride concentrations would be less than significant.

In summary, the development average annual chloride concentration in storm water runoff from the Project site is significantly below the Los Angeles Basin Plan water quality objective for chloride. Potential Project impacts related to chloride concentrations would potential Project impacts for all quantitatively analyzed constituents of concern, including TSS, nutrients, trace metals, and chloride, would be consistent with or significantly below applicable narrative and numerical water quality objectives in the Lahontan and Los Angeles Basin Plans and in the CTR. As discussed in Threshold 4-5, potential Project impacts related to constituents of concern that are qualitatively analyzed, including turbidity, pesticides, pathogens (bacteria, viruses, and protozoa), petroleum hydrocarbons (oil and grease, PAHs), trash and debris, MBAS, toxicity, and emerging contaminants, would be less than significant. As a result, with the implementation of MM 4-1 and MM 4-2, the Project would not result in a violation any surface water quality standards or waste discharge requirements and impacts would be less than significant.

## **Off-Site Impacts**

### ***Construction and Operational Impacts***

Approximately 15 acres located off site would be subject to Project-related construction, including intersections with SR-138, utility connections, water wells, and Aqueduct crossings (see Section 4.0, Project Description). The construction period and operational quantitative and qualitative water quality analysis includes these off-site locations. Consistent with the on-site analysis, with the implementation of MM 4-1 and MM 4-2 the Project would not result in a violation any off-site (surface water) water quality standards or waste discharge requirements and impacts would be less than significant.

***Impact Summary:*** The Project will implement a comprehensive system of site design, source control, low impact development, and hydromodification Best Management Practices that meets or exceeds the water quality and hydrology (storm water runoff) standards for new development in the County LID Ordinance, LID Standards Manual, and MS4 Permit. All water quality controls, including regional, distributed and parcel-specific measures, are designed to meet or exceed the LID performance standards consistent with the requirements of the MS4 Permit, the LID Ordinance, and the LID Standards Manual. The project will also implement integrated pest management and landscaping BMPs consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. Compliance with the LID performance standards and integrated pest management and landscaping BMP requirements will be reconfirmed in drainage and landscape plans to be submitted to the County in conjunction with each Project tract map review and approval process. These requirements

are incorporated in MM 4-1 and MM 4-2. During construction, the Project will comply with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit and implement BMPs that will comply with all applicable waste discharge requirements and applicable water quality standards. The quantitative analysis results show that post-development concentrations of TSS, nutrients, trace metals, and chloride would be consistent with or significantly below applicable narrative and numerical water quality objectives in the Lahontan and Los Angeles Basin Plans and in the CTR. The qualitative analysis in Threshold 4-5 shows potential Project impacts related to turbidity, pesticides, pathogens (bacteria, viruses, and protozoa), petroleum hydrocarbons (oil and grease, PAHs), trash and debris, MBAS, toxicity, and emerging contaminants would be less than significant. With the implementation of MM 4-1 and MM 4-2, and compliance with applicable laws and regulations, including the state Construction General Permit and the Lahontan RWQCB Limited Threat Discharge Permit, potential Project impacts related to a violation of any surface water quality standards or waste discharge requirements would be less than significant.

**Threshold 4-2**      **Would the project generate construction or post-construction runoff that would violate applicable stormwater NPDES permits or otherwise significantly affect surface water or groundwater quality?**

### **On-Site Impacts**

Surface water quality impacts during construction and operation (i.e., post-construction) of the Project are discussed under Threshold 4-1 above for qualitatively analyzed constituents and under Threshold 4-5 for qualitatively analyzed constituents. With mitigation, and compliance with applicable laws and regulations, the Project would not result in a violation of any surface water quality standards, waste discharge requirements, or applicable stormwater National Pollutant Discharge Elimination System (NPDES) permits, nor would it otherwise significantly affect or degrade surface water quality.

Potential groundwater quality impacts are addressed below.

### **Construction Impacts**

The primary groundwater quality concern during Project construction is that construction activities could substantially increase the rate or amount of surface runoff in a manner that would result in the infiltration of pollutants into the Antelope Valley Groundwater Basin. As discussed above, approximately 96 percent of the Project site is located within the Antelope Valley Groundwater Basin Watershed. No runoff from developed areas on the Project site will occur in the Quail Lake Watershed. Approximately 4 percent of the site is in the Gorman Creek Watershed, which drains to the Hungry Valley and Peace Valley Groundwater Basins.

Potential construction impacts to groundwater from Project development would be minimized through compliance with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit, all of which have been issued as NPDES and state permits. The state Construction General Permit requires that construction period BMPs be implemented in accordance with an impact risk assessment. An SWPPP must be prepared and implemented that includes BMPs that meet or exceed the permit requirements applicable to the level of construction risk. Construction period BMPs may include erosion controls that prevent erosion; sediment controls that trap sediment carried in runoff in basins or other facilities; or BMPs that control other potential construction-related pollutants. The permit requires that BMPs incorporate the best available technology economically achievable and best conventional pollutant control technology. BMP implementation must be based on the phase of construction and current weather conditions to control erosion and sediment. A Construction Site Monitoring Program that identifies monitoring and sampling requirements during construction is a required component of the SWPPP.

Project construction is anticipated to be classified as Risk Level 2, as defined in the Construction General Permit. Water quality BMPs will be implemented in response to the risk assessment (Geosyntec 2016b). Additional information concerning the implementation of the Construction General Permit during Project construction is provided in Threshold 4-1 and Section 5.2, Hydrology and Flood, of this EIR. As discussed in Threshold 4-1, the Project will also comply with the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit during covered construction activities.

Compliance with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit during construction will not result in violation of applicable storm water NPDES permits or otherwise significantly affect surface water or groundwater quality. Potential impacts would be less than significant and no mitigation is required.

### ***Operational Impacts***

Groundwater quality impacts could result from the infiltration of developed area runoff into the Antelope Valley Groundwater Basin. As discussed above, approximately 93 percent of the Project site is located within the Antelope Valley Groundwater Basin Watershed. No runoff from Project developed areas will occur in the Quail Lake Watershed. Approximately four percent of the site is in the Gorman Creek Watershed, which drains to the Hungry Valley and Peace Valley Groundwater Basins. Developed area runoff could infiltrate into groundwater by (1) the infiltration of water applied to outdoor areas for landscaping, slopes, parks, schools, and common area irrigation; (2) infiltration in regional detention and retention basins and in distributed or parcel-specific LID BMPs; and (3) infiltration of post-treatment runoff that flows from regional detention and retention basins and distributed or from parcel-specific LID BMPs that eventually flows to Antelope Valley Groundwater Basin recharge locations.

As discussed in Section 5.4.5, Groundwater Pollutants of Concern, research conducted on the effects on groundwater from storm water infiltration indicates that, with appropriate pretreatment, storm water infiltration does not adversely impact groundwater quality

(Geosyntec 2016b). Exhibit 5.4-2, Low Impact Development (LID) Drainage Areas with Project, shows the portions of the site that are subject to regional water quality treatment in 28 retention and detention basins and the locations that are subject to water quality treatment in distributed or parcel-specific LID BMPs; as shown, all on-site runoff will be subject to appropriate pretreatment prior to infiltration in regional and distributed or parcel-specific LID BMPs.

Groundwater constituents of concern are characterized by high mobility, low adsorption potential, high solubility fractions, and high concentrations in runoff. Most of the constituents of concern, including metals and bacteria, lack these characteristics and are filtered from runoff by soils. As discussed in Threshold 4-1 for qualitatively analyzed constituents, and in Threshold 4-5 for quantitatively analyzed constituents, most constituents of concern would also not occur in high concentrations or in concentration levels that exceed applicable water quality objections. With the implementation of MM 4-1 and MM 4-2, potential groundwater impacts from these constituents would be less than significant.

As discussed in Section 5.4.5, chloride and nitrate have a greater potential for infiltration because these constituents are more mobile and could reach groundwater by infiltration. Table 5.4-12 compares the predicted average annual nitrate-N and chloride concentrations in Project post-development runoff with applicable groundwater quality objectives from the Los Angeles and Lahontan Basin Plans. As shown in Table 5.4-12, under developed conditions and including the proposed regional and distributed or parcel-specific LID BMPs, predicted average annual nitrate-N and chloride concentrations in Project runoff would be significantly below the nitrate-N groundwater quality objective in the Los Angeles Basin Plan (no nitrate-N groundwater objective is included in the Lahontan Basin Plan) and the chloride groundwater objectives in both Basin Plans.

**TABLE 5.4-12  
COMPARISON OF NITRATE-N AND CHLORIDE CONCENTRATIONS  
WITH GROUNDWATER QUALITY OBJECTIVES FOR THE PROJECT SITE**

Predicted Average Annual Concentration in Storm Water (mg/L)		Los Angeles Basin Plan Water Groundwater Quality Objectives (mg/L)		Lahontan Basin Plan Groundwater Quality Objectives (mg/L)	
Nitrate-N	Chloride	Nitrate-N	Chloride	Nitrate-N*	Chloride
0.7	17.3	10	50	N/A	250
mg/L: milligrams per liter; N/A: not applicable					
* There is no Lahontan Basin Plan groundwater quality objective for nitrate-N in the Project area groundwater basin.					
Source: Geosyntec Consultants 2016b.					

The Los Angeles Basin Plan groundwater quality objective for nitrate-nitrogen is 10 mg/L. The predicted nitrate-nitrogen concentration in runoff after treatment with LID BMPs is 0.7 mg/L, significantly below the Los Angeles Basin Plan groundwater quality objective.

The Lahontan Basin Plan groundwater quality objective for chloride is 250 mg/L and the Los Angeles Basin Plan's groundwater quality objective for the Hungry Valley and Peace Valley Groundwater Basins is 50 mg/L. The average annual chloride concentration in Project site runoff is predicted to be 17.3 mg/L, which is significantly lower than the groundwater objectives. Therefore, the potential for adversely affecting groundwater quality for chloride due to infiltration of Project site runoff would be less than significant.

As discussed in Section 5.18, Water Resources, at buildout, the Project will use approximately 4,659 afy of recycled water treated to unrestricted reuse standards in accordance with Title 22 of the of the *California Code of Regulations*, primarily for outdoor irrigation. Recycled water can be a contributing source of nitrate-N and chloride in runoff.

As discussed in Section 5.19, Wastewater, the Project will include two wastewater reclamation facilities (WRFs), including one to the west of and a larger facility to the east of the West Branch of the California Aqueduct. Title 22 of the *California Code of Regulations* establishes criteria for recycled water, treatment, conveyance, and water quality testing; these criteria are administered by the SWRCB Division of Drinking Water. State surface and ground water quality, including discharge from the WRFs, is further regulated by the Lahontan RWQCB under the Porter Cologne Act. Each of the proposed WRFs will be required to obtain WDRs from the Lahontan RWQCB that include enforceable operational, treatment, conveyance, discharge, water quality, and monitoring requirements before wastewater treatment and recycled water operations may commence. The WDRs issued by the board will be consistent with the RWQCB's wastewater treatment requirements. The proposed WRFs will not be located in or discharge to portions of the site within the boundaries of the Los Angeles RWQCB.

On February 3, 2009, in Resolution No. 2009-0011, the SWRCB adopted a Recycled Water Policy (SWRCB 2009b)(Policy) that provides direction to each RWQCB regarding appropriate criteria to be used in issuing permits for recycled water projects and is intended to streamline recycled water project permitting. The Policy notes that (1) some groundwater basins contain salts and nutrients that exceed or threaten to exceed water quality objectives established in Basin Plans; (2) all salts and nutrients should be managed on a basin-wide or watershed-wide basis through development of regional or sub-regional management plans; and (3) every groundwater basin/sub-basin in California is to have a consistent, locally driven salt/nutrient management plan developed by water and wastewater entities, together with contributing stakeholders in collaborative processes, including compliance with CEQA and participation by RWQCB staff. The Policy describes the components of these salt and nutrient management plans. Finally, the Policy addresses the control of incidental runoff from landscape irrigation projects, recycled water, groundwater recharge projects, anti-degradation factors, control of emerging constituents, and chemicals of emerging concern.

The WRF permits issued by the Lahontan RWQCB will contain waste discharge requirements that ensure compliance with the Lahontan Basin Plan surface water quality objectives for nitrate-N (10 mg/L) and chloride (100 mg/L) as well as the Basin Plan groundwater chloride objective of 250 mg/L. The permits will also be consistent with the SWRCB Recycled Water Policy, including salt and nutrient policy provisions. MM 19-5 in Section 5.19, Wastewater,

requires that, prior to the issuance of grading permits for areas served by each WRF, the County must be provided with documentation demonstrating that the applicable WRF is in conformance with all Lahontan RWQCB and Title 22 requirements.

With the implementation of MM 4-1, MM 4-2 and MM 19-5, and compliance with all WRF permit terms and conditions, the Project would not significantly affect groundwater quality and potential impacts will be less than significant.

## **Off-Site Impacts**

Approximately 15 acres located off site would be subject to Project-related construction, including intersections with SR-138, utility connections, water wells, and Aqueduct crossings (see Section 4.0, Project Description). The construction period and operational quantitative and qualitative water quality analysis includes these off-site locations. Consistent with the on-site analysis, with the implementation of MM 4-1, MM 4-2, and MM 19-5 and with compliance with all WRF permit terms and conditions, the Project would not significantly affect off-site groundwater quality, and potential impacts will be less than significant.

**Impact Summary:** The Project will implement a comprehensive system of site design, source control, low impact development, and hydromodification Best Management Practices that meet or exceed the water quality and hydrology (storm water runoff standards for new development in the County LID Ordinance, the LID Standards Manual, and the MS4 Permit. All water quality controls, including regional, distributed and parcel-specific measures, are designed to meet or exceed the LID performance standards consistent with the requirements of the MS4 Permit, the LID Ordinance and the LID Standards Manual. The project will also implement integrated pest management and landscaping BMPs consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. Compliance with the LID performance standards and integrated pest management and landscaping BMP requirements will be reconfirmed in drainage and landscape plans to be submitted to the County in conjunction with each Project tract map review and approval process. These requirements are incorporated in MM 4-1 and MM 4-2. Two WRFs will be operated in conformance with all Lahontan RWQCB and Title 22 requirements, which will be reconfirmed in documentation and to be submitted to the County prior to the issue of building permits. These requirements are incorporated into MM 19-5. During construction, the Project will comply with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit. Potential surface water quality impacts are discussed in Threshold 4-1 and 4-5 and will be less than significant after mitigation. With implementation of MM 4-1, MM 4-2, and MM 19-5

as well as compliance with applicable laws, regulations, and WRF permits, potential Project impacts from construction or post-construction runoff that would violate applicable storm water NPDES permits or that would otherwise significantly affect groundwater quality would be less than significant.

**Threshold 4-3      Would the project result in point or nonpoint source pollutant discharges into State Water Resources Control Board-designated Areas of Special Biological Significance?**

### **On-Site and Off-Site Impacts**

SWRCB-designated Areas of Special Biological Significance (ASBS) are 34 ocean areas, covering much of the length of California's coastal waters, that are monitored and maintained for water quality by the SWRCB. The only coastal ASBS in Los Angeles County is the Laguna Point to Latigo Point ASBS, which encompasses 11,842 acres of marine habitat and approximately 24 miles of coastline roughly between Pt. Mugu and Malibu (SWRCB 2014).

As discussed above, approximately 93 percent of the Project site is located within the Antelope Valley Groundwater Basin Watershed. No runoff from Project developed areas will occur in the Quail Lake Watershed. Approximately four percent of the site is in the Gorman Creek Watershed, which drains to Gorman Creek. Gorman Creek flows to Cañada de los Alamos in the Lower Hungry Valley before discharging to Pyramid Lake about six miles downstream from the Project boundary. Downstream of Pyramid Lake, Piru Creek flows south approximately 20 miles to Piru Lake, which is formed by the Santa Felicia Dam and then for approximately 6 miles south to Reach 4 of the Santa Clara River. The point of confluence with the Santa Clara River is located approximately 40 miles south of the Project site (Geosyntec 2016b). As a result, the Project site is approximately 72 miles upstream of the Pacific Ocean. The Santa Clara River discharges at McGrath State Beach in the City of Oxnard, which is approximately six miles from the northern terminus of the Laguna Point to Latigo Point ASBS. The Project will not result in point or non-point source pollutant discharges into any ASBS. There would be no impact and no mitigation is required.

**Impact Summary:** The Project will not result in point or non-point source pollutant discharges into any ASBS. There would be no impact and no mitigation is required.

**Threshold 4-4      Would the project use onsite wastewater treatment systems in areas with known geological limitations (e.g. high groundwater) or in close proximity to surface water (including, but not limited to, streams, lakes, and drainage course)?**

## On-Site Impacts (Construction and Operations)

As discussed in Section 5.19, Wastewater, the Project will include two WRFs, including one to the west of the West Branch of the California Aqueduct (WRF West) and a larger facility to the east of the Aqueduct (WRF East). Title 22 of the *California Code of Regulations* establishes criteria for recycled water, treatment, conveyance, and water quality testing, and it is administered by the SWRCB Division of Drinking Water. State surface and groundwater quality, including discharge from the WRFs, is further regulated by the Lahontan RWQCB under the Porter-Cologne Act. Each of the proposed WRFs will be required to obtain WDRs from the Lahontan RWQCB that include enforceable operational, treatment, conveyance, discharge, water quality, and monitoring requirements before wastewater treatment and recycled water operations may commence. The WDRs issued by the board will be consistent with the RWQCB's wastewater treatment requirements and the SWRCB's Recycled Water Policy (SWRCB Resolution No. 2009-0011). The proposed WRFs will not be located in or discharge to portions of the site within the boundaries of the Los Angeles RWQCB.

Both WRFs are proposed in locations that would allow for wastewater to generally flow by gravity for treatment and are sited in areas that are not adjacent to sensitive land uses. The wastewater collection system also includes locations where small sewer lift stations and force mains will be required. The proposed sewer lift stations will typically consist of a duplex, a submersible pump system equipped with aboveground electrical facilities, and generators to provide stand-by power.

The treatment facilities will consist of primary treatment using grinder pumps and by screening in channels, which can be constructed in phases, followed by secondary and tertiary treatment. The wastewater will be treated to state Title 22 unrestricted reuse standards, which requires biological oxidation clarification and filtration of treated wastewater. Membrane bioreactor (MBR) wastewater treatment technology will be utilized to meet the recycled water quality objectives. The MBR process combines a biological treatment system followed by membrane filtration. This MBR technology will provide recycled water supplies that exceed secondary and tertiary Title 22 requirements. Solids handling will be provided by anaerobic digesters to thicken the sludge followed by centrifuges or belt filter presses to further reduce the liquid content prior to being hauled to a suitable landfill or to convert it into fertilizer products. Exhibit 4-15, Treatment Methods at Project Wastewater Reclamation Facilities (WRF), in Section 4.0 Project Description, provides an overview of treatment processes and methods that would be used at each WRF.

Exhibit 5.19-2 in Section 5.19, Wastewater, shows the Project's proposed recycled water, storage, and distribution system. The WRFs and related facilities are not located in areas with high groundwater or that are in close proximity to perennial streams or lakes. As discussed in Section 5.2, Hydrology and Flood, and in Section 5.7 Biological Resources, Threshold 7-3, intermittent and ephemeral drainage courses occur within and adjacent to the Project site, including areas that are proximate to the proposed WRFs and related facilities.

Potential surface water quality impacts to drainage courses during construction and operation (i.e., post-construction) of the Project are discussed under Threshold 4-1 for

qualitatively analyzed constituents and under Threshold 4-5 for qualitatively analyzed constituents. Potential ground water quality impacts, including from the use of recycled water produced by the WRFs that could be conveyed and infiltrated by drainage courses, are discussed in Threshold 4-2. The WRFs will be required to obtain WDRs from the Lahontan RWQCB that include enforceable operational, treatment, conveyance, discharge, water quality, and monitoring requirements before wastewater treatment and recycled water operations may commence. The WDRs issued by the board will be consistent with the RWQCB's wastewater treatment requirements and will ensure compliance with the Lahontan Basin Plan's surface and ground water quality objectives and with the SWRCB's Recycled Water Policy. The proposed WRFs' wastewater treatment and recycled water systems will not be located or discharge to portions of the site within the boundaries of the Los Angeles RWQCB. MM 19-5 in Section 5.19, Wastewater, requires that, prior to the issuance of grading permits for areas served by each WRF, the County be provided with documentation demonstrating that the applicable WRF is in conformance with all Lahontan RWQCB and Title 22 requirements. During construction, including the construction of the WRFs and related facilities, the Project will comply with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit.

With the implementation of MM 4-1, MM 4-2 and MM 19-5, compliance with all WRF permit terms and conditions, and compliance with all applicable laws and regulations, including the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, the Los Angeles RWQCB General Dewatering Permit and the SWRCB Recycled Water Policy, potential Project impacts from the use of on-site wastewater treatment systems in areas with known geological limitations or in close proximity to surface water will be less than significant.

## Off-Site Impacts

Approximately 15 acres located off site would be subject to Project-related construction, including intersections with SR-138, utility connections, water wells, and Aqueduct crossings (see Section 4.0, Project Description). No wastewater treatment systems will be located off site; no impacts from the use of wastewater treatment systems in areas with known geological limitations or in close proximity to surface water will occur off site; and no mitigation is required.

**Impact Summary:** Potential Project impacts from the use of on-site wastewater treatment systems in areas with known geological limitations or in close proximity to surface water will be less than significant with the implementation of MM 4-1, MM 4-2 and MM 19-5; with compliance with all WRF permit terms and conditions; and with compliance with all applicable laws and regulations, including the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, the Los Angeles RWQCB General Dewatering Permit and the SWRCB Recycled Water Policy.

## Threshold 4-5      **Would the project otherwise substantially degrade water quality?**

## On-Site Impacts (Construction and Operations)

Potential surface water quality impacts during construction and operation (i.e., post-construction) of the Project for quantitatively analyzed constituents are discussed under Threshold 4-1 and would be less than significant with mitigation. Potential surface water quality impacts during construction and operation (i.e., post-construction) for qualitatively analyzed constituents are discussed below.

Qualitatively evaluated pollutants and other surface water quality factors during construction and operation of the Project are discussed in this section. As discussed in Section 5.4.2, post-development storm water runoff water quality impacts associated with the following pollutants of concern are qualitatively addressed due to the unavailability of flow composite sampling data based on literature information and professional judgment:

- Turbidity
- Pesticides
- Pathogens (bacteria, viruses, and protozoa)
- Petroleum hydrocarbons (oil and grease, polynuclear aromatic hydrocarbons (PAHs))
- Trash and debris
- Methylene-blue active substances (MBAS)
- Toxicity
- Emerging Contaminants

Potential construction impacts to surface and groundwater from Project development would be minimized through compliance with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit. The state Construction General Permit requires that construction period BMPs be implemented in accordance with an impact risk assessment. An SWPPP must be prepared and implemented that includes BMPs that meet or exceed the permit requirements applicable to the level of construction risk. Construction period BMPs may include erosion controls that prevent erosion, sediment controls that trap sediment carried in runoff in basins or other facilities, or BMPs that control other potential construction-related pollutants. The permit requires that BMPs incorporate the best available technology economically achievable and best conventional pollutant control technology. BMP implementation must be based on the phase of construction and current weather conditions to control erosion and sediment. A Construction Site Monitoring Program that identifies monitoring and sampling requirements during construction is a required component of an SWPPP.

Project construction is anticipated to be classified as Risk Level 2, as defined in the Construction General Permit. Water Quality BMPs will be implemented in response to the risk assessment (Geosyntec 2016b). Additional information concerning the implementation of the Construction General Permit during Project construction is provided in Threshold 4-1 and Section 5.2, Hydrology and Flood, of this EIR. As discussed in Threshold 4-1, the Project

will also comply with the Lahontan RWQCB Limited Threat Discharge Permit and the Los Angeles RWQCB General Dewatering Permit during covered construction activities. Compliance with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit during construction will not result in violation of applicable storm water NPDES permits, nor would it otherwise significantly affect surface water or groundwater quality.

The following sections discuss potential construction and operational period impacts to qualitatively analyzed constituents of concern in more detail.

### ***Turbidity***

Turbidity is a measure of suspended matter that interferes with the passage of light through the water or in which visual depth is restricted. Turbidity may be caused by a wide variety of suspended materials that range in size from colloidal to coarse dispersions, depending upon the degree of turbulence. A colloid is a system where finely divided particles are dispersed within a continuous medium in a manner that prevents them from being filtered easily or settled rapidly. In lakes or other waters that have relatively quiescent (still) conditions, most of the turbidity would be due to colloidal and extremely fine dispersions. In rivers under flood conditions, most of the turbidity would be due to relatively coarse dispersions. Erosion of clay and silty soils may contribute to in-stream turbidity. Organic materials that reach rivers serve as food for bacteria, and the resulting bacterial growth and other microorganisms that feed upon the bacteria produce additional turbidity. Nutrients in runoff may stimulate the growth of algae, which also contributes to turbidity.

Discharges of turbid runoff are primarily of concern during the construction phase of development. Construction-related impacts are summarized above. The Project will comply with the state Construction General Permit, including implementation of an SWPPP, sediment- and erosion-control BMPs, non-visible pollutant monitoring, and trash-control BMPs that meet BAT/BCT standards. These measures would reduce potential turbidity impacts to less than significant levels.

Post-development conditions will include new impervious surfaces that will stabilize soils and reduce the amount of turbidity in the runoff from the Project site. Proposed source controls such as common area landscape management and common area litter control, and the regional and distributed LID BMPs, would prevent or reduce the release of organic materials and nutrients which might contribute to algal blooms and increase turbidity in receiving waters. As discussed above under Threshold 4-1, post-development nutrient concentrations in Project runoff would be below applicable water quality objectives and result in less than significant water quality impacts. Based on compliance with the Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit during construction and with the implementation of water quality BMPS in accordance with MM 4-1 and MM 4-2, runoff from the Project would not cause increases in turbidity that result in adverse effects to beneficial uses in the receiving waters. Potential turbidity impacts would be less than significant.

### ***Pesticides***

In urban settings, pesticides are commonly applied in and around buildings (structural pest control) to control against ants and other pests and in vegetated areas to control insects, molds, and other vectors. The forms of pesticides used have evolved in response to regulatory actions. Organochlorine pesticides including Chlordane, Dieldrin, DDT and Toxaphene were some of the earliest pesticides, applied generally in the 1940s to 1960s. These pesticides were found to be persistent in the environment, bioaccumulated in the food chain of various animals, and posed a health risk to humans consuming food contaminated by these pesticides. These persistent organochlorine pesticides can be of concern where past farming practices involved their application. Historical pesticides should no longer be discharged in the watershed except in association with erosion of sediments to which these pollutants may have adhered in the past. Site development involves remedial grading, which would stabilize soils and prevent their transport from the Project site, actually reducing the potential for discharge of sediments to which historical pesticides may have adsorbed (to accumulate on the surface) in pre-development conditions. Transport of legacy pesticides adsorbed to existing site sediments may be a concern during the construction phase of development. The SWPPP must contain sediment- and erosion-control BMPs pursuant to the Construction General Permit implemented to meet the BAT/BCT standard. These sediment and erosion controls would avoid construction-related impacts associated with the transport of legacy pesticides adsorbed to existing site sediments, and impacts would be less than significant.

Under post-development conditions, pesticides would be applied to common landscaped areas and residential lawns and gardens. Organochlorine pesticides have been replaced in response to State and federal regulations by organophosphate pesticides, a class of pesticides that includes diazinon and chlorpyrifos, which have been commonly found in urban streams. Depending on the sample locations within the County, only between 0 to 13 percent of the samples in the Los Angeles County water quality database had detectable levels of diazinon (depending on the land use). Levels of chlorpyrifos were below detection limits for all land uses in all samples taken between 1994 and 2000. Other pesticides included in the County database were seldom measured above detection limits. In general, County water quality database records reflect flows that are not subject to the same level of LID and treatment controls that would be included in the Project. As a result, post-development pesticide concentrations in Project runoff would likely be lower than the sample results in the County database.

Diazinon and chlorpyrifos are pesticides of concern due to their potential toxicity in receiving waters. The USEPA banned all indoor uses of diazinon in 2002 and stopped all sales for all outdoor non-agricultural use in 2003. Changes to the use of chlorpyrifos include reductions in the residue tolerances for agricultural use; phase out of nearly all indoor and outdoor residential uses; and disallowal of non-residential uses where children may be exposed. Retail sales of chlorpyrifos ceased by December 31, 2001, and structural (e.g., construction) uses were phased out by December 31, 2005. Some uses are still allowed such as for public health purposes for fire ant eradication and mosquito control. Permissible uses of diazinon are also restricted. All indoor uses were prohibited as of December 2001

and retailers were required to end sales for indoor use on December 2002. All outdoor non-agricultural uses were phased out by December 31, 2004.

Due to legal sale and use restrictions, it is likely that diazinon and chlorpyrifos use in the Project area will be limited under post-development conditions. These pesticides can be detected as legacy constituents in water and sediment samples, although the incidence of detection is declining over time. Statewide sampling from 2008 to 2010 conducted as part of the California Surface Water Ambient Monitoring Program (SWAMP) Stream Pollution Trends sampling indicates that organophosphate pesticides detected in sediment decreased between 2008 and 2010 from 12 percent of 92 sediment sampling sites in 2008 to 0 percent in 95 sites sampled in 2010 (Geosyntec 2016b).

Organophosphate pesticides have been largely replaced with pyrethroid pesticides, which are a synthetic form of naturally occurring pyrethrins. State-wide sampling conducted as part of the SWAMP indicated 55 percent of 92 sediment sampling sites monitored in 2008 contained pyrethroid pesticides. This percentage increased to 81 percent of 95 samples taken in 2010. A recent survey of data from approximately 80 studies that focused on pyrethroid pesticides in receiving waters subject to urban runoff conducted by the California Stormwater Quality Association (CASQA) included 9,200 samples for pyrethroids. Pyrethroids were detected in 34 percent of the sediment samples and 25 percent of the water samples in the CASQA study and at concentrations exceeding levels known to cause toxicity to sensitive aquatic organisms in water. In 2012, the California Department of Pesticide Regulation (CDPR) issued new regulations limiting the outdoor non-agricultural use of 17 pyrethroids (Geosyntec 2016b).

The CASQA report also summarized 3,200 fipronil sample results. Fipronil is a non-pyrethroid pesticide that has been used as a replacement for pyrethroid pesticides in urban areas. The pesticide and related degradates (fipronil desulfinyl, fipronil sulfone, and fipronil sulfide) are increasingly detected in water and sediment in urban watercourses. Fipronil was detected in 40 percent of the water samples and 36 percent of the sediment samples, and fipronil degradates were detected in 27 percent of the water samples and 61 percent of the sediment samples in the CASQA report.

The water quality risks posed by a pesticide relate to the quantity of the pesticide used, its breakdown or degradation rate, its runoff characteristics, and its relative toxicity in water and sediment. Many pesticides exhibit toxicity at very low concentrations, the most effective control strategy is source control and compliance with CDPR regulations limiting outdoor applications (see Section 5.4.2 above). Source-control measures such as education programs for owners, occupants, and employees in the proper application, storage, and disposal of pesticides also provide post-development pesticide controls. Most pesticides, including historical pesticides that may be present at the site, are relatively insoluble in water and tend to adsorb to the surfaces of sediment, which would be stabilized with development or, if eroded, would be settled or filtered out of the water column by the Project's regional and distributed LID BMPs. These measures are required by MM 4-1 and would remove pesticides from storm water in conjunction with TSS reductions for storm water infiltration and/or biofiltration.

As discussed in PDF 4-2 and as required by MM 4-2, the Project will implement an Integrated Pest Management (IPM) program consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and the Natural Resources Statewide Integrated Pest Management Program. The IPM program will prevent or suppress pest problems (i.e., insects and diseases) through a combination of techniques including using pest-resistant plants; biological controls; cultural practices; habitat modification; and judicious use of pesticides. Pesticide management BMPs will be implemented to promote safety (e.g., Material Safety Data Sheets, precautionary statements, protective equipment); compliance with regulatory requirements; spill mitigation; groundwater and surface water protection measures associated with pesticide use; and pesticide applicator certifications, licenses, and training (i.e., all pesticide applicators must be certified by the CDPR). Pesticides are subject to degradation and vary in their ability to eradicate pests. Some pesticides break down almost immediately into nontoxic byproducts, while others can be active for longer periods of time. Pesticides that degrade rapidly are less likely to adversely affect non-targeted organisms. In some instances, longer-lasting pesticides are preferable if fewer applications or smaller amounts of pesticide use are required to control pests. The proper amount and frequency of pesticide use will be addressed in the IPM program.

Pesticide loads and concentrations in Project runoff will be reduced by the regional and distributed LID BMPs required by MM 4-1. An IPM program that will reduce pesticide requirements by controlling pests with nontoxic measures will be implemented in accordance with MM 4-2 and will ensure that unavoidable pesticide use will be managed to minimize impacts to surface and groundwater. Compliance with MM 4-1 and MM 4-2 will be reconfirmed in drainage and landscape plans to be submitted to the County with each Project tract map application. All Project pesticide use will comply with applicable laws and regulations, including USEPA and CDPR pesticide use limitations. As a result, the Project would result in less than significant impacts related to pesticides.

### ***Pathogens***

Pathogens are viruses, bacteria, and protozoa that can cause gastrointestinal or other illnesses in humans. Fecal indicator bacteria (FIB), such as total and fecal coliform, enterococci, and *E. coli*, are used by regulatory agencies as indirect measures of the presence of pathogens the risk of human illness.

The USEPA updated recreational water quality criteria in 2012 and recommended that two indicators, *E. Coli* for fresh waters and enterococci for marine or fresh waters, be used. The Los Angeles RWQCB subsequently revised the Los Angeles Basin Plan to incorporate the updated USEPA criteria. In fresh waters designated for water contact recreation (REC-1), the Los Angeles Basin Plan use *E. Coli* criteria of 126/100 milliliters (mL) for a geometric mean criterion and 235/100 mL for a single sample limit. The implementation provisions in the Los Angeles Basin Plan state that the geometric mean values should be calculated based on a statistically sufficient number of samples, generally not less than 5 samples equally spaced over a 30-day period.

The Lahontan Basin Plan contains a 20 fecal coliform units (cfu) per 100 mL water quality objective for all water bodies in the region. The Lahontan Water Board staff is engaged in a

multi-year project to assess bacteria concentrations in the region's surface waters; to evaluate the data relative to the existing bacteria water quality objective of 20 cfu/100 mL; and to modernize the objective to an E. Coli standard.

The Los Angeles Basin Plan provides that the single sample limit must be strictly applied, except in the context of a TMDL, where a "reference system/antidegradation approach" or "natural sources exclusion approach" may be used. A reference system is defined as an area and associated monitoring point that is not impacted by human activities that may potentially affect bacteria densities in the receiving water body. Under the reference system approach, a certain frequency of exceedance of the single sample objective is permitted on the basis of the observed exceedance frequency in the selected reference system or the targeted water body, whichever is less. Under the natural source exclusion approach, after all anthropogenic sources of bacteria have been controlled and are determined to not cause or contribute to an exceedance of the single sample objective and the natural sources have been identified and quantified, a certain frequency of exceedance of the single sample objective is permitted based on the residual exceedance frequency in the specific water body. These approaches recognize that there are natural sources of bacteria that may cause or contribute to exceedances of the single sample objective and acknowledge that it is not the intent of the Los Angeles RWQCB to require treatment of natural sources of bacteria from undeveloped areas.

#### ***Santa Clara River Bacteria Total Maximum Daily Load***

The Los Angeles RWQCB approved a Basin Plan amendment on July 8, 2010, to incorporate a TMDL for Indicator Bacteria for Reaches 3, 5, 6 and 7 of the Santa Clara River and for the Santa Clara River Estuary (Resolution #R10-006). The TMDL, in effect as of March 21, 2012, provides allowable exceedance day-based waste load allocations (WLAs) for MS4 dischargers for E. Coli in Reaches 3, 5, 6 and 7, and for fecal coliform, enterococcus, and total coliform in the Santa Clara River Estuary. These WLAs have been incorporated into the County MS4 Permit. The Indicator Bacteria TMDL MS4 WLAs are applied in the form of allowable exceedance days. The TMDL implementation schedule includes deadlines in 2016 and 2029. The TMDL is subject to reconsideration if one of the following occurs: (1) monitoring or any voluntary local reference system studies justify a TMDL revision; (2) the USEPA publishes revised recommended bacteria criteria that affect the TMDL; or (3) the Los Angeles RWQCB adopts a separate Basin Plan amendment, suspending recreational uses in the Santa Clara River during high flows.

#### ***Factors That Affect Fecal Indicator Bacteria Concentrations***

There are various factors that affect the reliability of FIB as pathogen indicators. One factor is that there are numerous natural or non-anthropogenic (or "zoonotic") sources of FIB in developed watersheds and in receiving water bodies, including birds and other wildlife, soils, and plant matter. Anthropogenic sources may include domesticated animals and pets, poorly functioning septic systems, sewer system overflows or spills, cross-connections between sewer and storm drains, and the utilization of outdoor areas or storm drains for human waste disposal by people without access to indoor sanitary facilities. All of these sources can contribute to the concentrations of FIB. The extent to which human health risks vary by FIB source type remains uncertain (Geosyntec 2016b).

A second factor is that FIB can multiply in the field if the substrate, temperature, moisture, and nutrient conditions are suitable. Bacteria presence and growth has been observed in various substrates such as beach sands, wrack line (accumulation of kelp and other vegetative debris in the inter-tidal area of beaches), inter/sub-tidal sediments, and material deposited in storm drains. FIB monitoring in the Santa Ana River indicate that the ubiquity of sources and potential regrowth exceed the human sources of fecal bacteria generated by the entire population in the watershed. Regrowth of bacteria downstream of a package treatment plant utilizing ultraviolet (UV) radiation to disinfect dry weather flows in Aliso Creek was considered a prime factor in the rapid rebound of FIB concentrations downstream of the plant. Recent research also implicates storm drain biofilms as another source of FIB to receiving waters (Geosyntec 2016b).

A third factor is that the persistence of FIB may differ from other pathogenic viruses, bacteria, and protozoa. Viruses, for instance, are small, low in number, and difficult to inactivate, while protozoa may form protective cysts that are resistant to destruction and render them dormant but capable of reactivating in the future. While some indicator bacteria may die off in the water column due to ultraviolet disinfection or other unfavorable environmental conditions (including predation and antagonism), pathogens occasionally may persist longer.

### ***Epidemiological Studies***

In Southern California, the Southern California Coastal Water Research Project (SCCWRP) conducted three epidemiology studies between 2007 and 2009 at Doheny Beach in Dana Point, Avalon Beach on Santa Catalina Island, and at Surfrider Beach in Malibu in an effort to document the relationship between illness rates and FIB levels, including enterococcus, fecal coliform, and total coliforms. The results from the Doheny Beach study indicate significant differences in diarrhea and other illness for swimmers compared to non-swimmers and for swimmers who experienced body immersion, head immersion, or swallowed water. When the source of FIB consistently exceeded water quality standards, enterococcus levels measured by using traditional and rapid methods were both strongly related to higher levels of illness. Fewer significant associations were measured during periods when a beach berm prevented urban runoff from flowing into the ocean. The results of the SCCWRP study indicate that the accuracy of predicting human health associations at urban runoff impacted beaches using currently available indicators remains uncertain (Geosyntec 2016b).

### ***Effects of Land Use and Runoff on Fecal Indicator Bacteria Concentrations***

Dry weather, non-storm stream flows from undeveloped watersheds tend to have lower concentrations of FIB than dry weather urban flows. A recent study by SCCWRP that monitored 15 unimpaired natural Southern California streams weekly during dry weather for a year showed that about 18 percent of the samples exceeded daily and monthly bacterial indicator thresholds, although concentrations from these unimpaired streams were one to two orders of magnitude lower than levels found in developed watersheds. The study reported an average of the geometric means for E. Coli in dry weather flows in each stream of 41 MPN/100 mL. The Santa Clara River bacteria TMDL WLAs are based on the unimpaired stream and reference beach data reported in the SCCWRP studies (Geosyntec 2016b).

During wet weather, storm water runoff can mobilize indicator bacteria from a number of watershed and instream sources, and indicator bacteria concentrations tend to increase. Median storm water runoff monitoring results for open space land uses include E. Coli concentrations of about 5,400 MPN/100 mL as reported in the 2001–2005 Los Angeles River Watershed Wet Weather Study. Open land use data from the National Storm Water Quality Database indicate a median wet weather concentration of 7,200 MPN/100 mL (Geosyntec 2016b).

Land use type and condition also affect runoff concentrations. Most studies show higher FIB concentrations in urban runoff than in open space runoff. Runoff from residential land uses from the Los Angeles River Watershed Wet Weather Study had a median E. Coli concentration of about 6,300 MPN/100 mL and about 8,300 in the National Storm Water Quality Database. The median value of four flow-weighted average results from the 2001–2005 Los Angeles River Watershed Wet Weather Study was about 6,100 MPN/100mL for E. Coli for the low density residential land use site. These data represent urban areas that generally have not implemented source and treatment controls comparable with the proposed Project regional and distributed LID BMPs (Geosyntec 2016b).

### ***Project Best Management Practices that Address Pathogen Indicators***

The primary sources of pathogen indicators from the Project development would likely be sediment, pet wastes, wildlife, and pathogen regrowth in storm drains or other favorable locations for propagation. Other sources of pathogens and pathogen indicators (e.g., such as cross connections or leakage from sanitary and storm water facilities) are unlikely given modern sanitary sewer installation methods and inspection and maintenance practices.

The levels of bacteria in runoff from the Project site would be reduced by the proposed regional and distributed source-control and LID BMPs required by MMs 4-1 and 4-2. The Project source controls will include educating pet owners and providing products and disposal containers that encourage and facilitate cleaning up after pets to control pet waste. Education regarding feeding waterfowl also assists in managing wildlife sources and reducing related wastes and FIBs.

The proposed Project infiltration and bioretention LID BMPs and filtration through soils will provide effective pathogen controls. Studies by the City of Austin, Texas showed that sand filters removed from 37 percent to 83 percent of fecal coliforms and 25 percent to 81 percent of fecal streptococci in runoff (Geosyntec 2016b). Studies by the Southwest Florida Water Management District documented that significant reductions in total and fecal coliform bacteria and other indicators were observed between inflow and outflow samples subject to sand filtration ranging from nearly 70 percent for total coliforms and between 65 percent and 100 percent for fecal coliform bacteria. Analysis of enterococcus influent and effluent data for bioretention facilities have also documented significant reductions, including median influent concentrations of 605 MPN/100 mL and median effluent concentrations of 234 MPN/100 mL (Geosyntec 2016b).

Storm water discharges from the Project site without the proposed LID BMPs could potentially exceed the Lahontan and Los Angeles Basin Plan standards for FIB. Implementation of MM 4-1 will result in regional and distributed LID BMPs consistent with

controls that have been documented to reduce FIB concentrations in developed area runoff. Source-control BMPs would be implemented in accordance with the IPM and landscaping measures required by MM 4-2, including educating pet owners; educating residents regarding feeding (and therefore attracting) of waterfowl near water bodies; and providing products and disposal containers that encourage and facilitate cleaning up after pets. The Project would not include septic systems, and the sewer system would be designed to current standards which minimizes the potential for leaks. With mitigation, the Project would not result in appreciable changes in pathogen levels in the receiving waters compared with existing conditions, and impacts would be less than significant.

### ***Petroleum Hydrocarbons***

During construction, hydrocarbons in site runoff could result from construction equipment or vehicle fueling or spills. Construction-related impacts are analyzed above and in more detail in Threshold 4-1. Compliance with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit would reduce construction water quality impacts, including from hydrocarbons, to less than significant levels.

Hydrocarbons are a broad class of compounds including oil and grease, most of which are non-toxic. Hydrocarbons are hydrophobic (low solubility in water) and have the potential to volatilize; most forms are biodegradable. Polynuclear aromatic hydrocarbons (PAHs) are a class of hydrocarbons that can be toxic depending on concentration levels, exposure history, and the sensitivity of the receptor organisms.

Hydrocarbon sources in developed settings derive principally from transportation sources, including emissions and leaks from vehicles and spill from fueling operations. These sources are located on impervious surfaces (including roads and parking lots) that generate runoff and can mobilize oil, grease, PAHs, and other hydrocarbon compounds. Hydrocarbon concentrations in developed area storm water have been reported in several studies. Runoff was sampled at 8 stations located in the Los Angeles metropolitan area near the mouths of major channels (i.e., mass emissions stations) and at 15 land use stations from 2001 through 2004. The mean flow-weighted total PAH concentration for the mass emission stations was 2,300 nanograms per liter (ng/L), compared with approximately 140 ng/L for one storm from an open space-dominated drainage. These data indicate that development increases PAH runoff concentrations. The most prevalent PAHs in developed area runoff (e.g., pyrene, fluoranthene, and chrysene) have higher molecular weights and are pyrogenic (related to combustion) (Geosyntec 2016b).

The majority of PAHs in storm water adsorb to the organic carbon fraction of particulates in runoff, including soot carbon generated from vehicle exhaust. Sediments could become contaminated with PAHs at levels considered toxic to benthic organisms. In a monitoring survey conducted as part of the SWAMP Stream Pollution Trends Project, average PAHs in stream sediments increased from 2008 to 2009 and then decreased in 2010. These data suggest that PAHs in stream sediments subject to urban runoff may decrease over time. An examination of the correlation between amphipod survival and PAH levels in 2008, 2009 and 2010 indicated that PAHs are not statistically correlated with amphipod survival.

Consequently, PAHs do not appear to be a cause of observed toxicity in SWAMP Stream Pollution Trends Project 2008–2010 data set (Geosyntec 2016b).

PAHs in urban runoff are primarily associated with transportation activities and are expected to increase with development. Source-control BMPs that reduce petroleum hydrocarbon loads include educational materials on oil disposal and recycling programs, spill control at fueling facilities, carpooling, and public transportation alternatives to driving. The proposed regional and distributed LID BMPs would further reduce PAH concentrations in runoff. As discussed above, PAHs tend to be adsorbed to particulates and are reduced by settlement, filtration, and/or adsorption LID BMPs. These forms of BMPs are required by MM 4-1. With mitigation, potential water quality impacts from petroleum hydrocarbons in Project runoff would be less than significant.

### ***Trash and Debris***

Urban development tends to generate significant amounts of trash and debris. Trash refers to any human-derived material including paper, plastics, metals, glass, and cloth. Debris is defined as any organic material transported by storm water, including leaves, twigs, and grass clippings. Trash and debris are often characterized as material retained on a five-millimeter (mm) mesh screen. These constituents contribute to the degradation of receiving waters by utilizing available oxygen as they decompose; by attracting pests; by disturbing physical habitats; by clogging storm drains and conveyance culverts; and by mobilizing nutrients, pathogens, metals, and other pollutants. Trash that is carried in runoff in developed areas can be both accidental and intentionally deposited. During wet weather events, gross debris deposited on paved surfaces can be transported to storm drains and is eventually discharged to receiving waters. Trash and debris can also be mobilized by wind or transported directly (and often illegally) into waterways.

During construction, there is potential for an increase in trash and debris loads due to lack of proper contractor good housekeeping practices at the construction site. Construction-related impacts are analyzed above and in more detail in Threshold 4-1. Compliance with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit would reduce construction water quality impacts, including from trash and debris, to less than significant levels.

The proposed source-control and LID BMPs for the Project would minimize the adverse impacts of trash and debris during long-term operations. Source controls such as street sweeping, public education, fines for littering, and storm drain stenciling are effective in reducing the amount of trash and debris that is available for mobilization during wet and dry weather events. LID BMPs trap and remove trash and debris from runoff. The implementation of source controls and LID BMPs are required by MM 4-1. With mitigation, potential water quality impacts from trash and debris in Project runoff would be less than significant. The Project would result in a less than significant impact related to trash and debris.

### ***Methylene Blue Activated Substances (MBAS)***

MBAS, which are related to the presence of detergents in runoff, may be incidentally associated with urban development due to commercial and/or residential vehicle washing or other outdoor cleaning activities. MBAS are a measure of surfactants in water; surfactants lower the surface tension of a liquid and lower the interfacial tension between two liquids. In storm water, surfactants disturb the naturally high surface tension of water, which affects insects and can affect gills in aquatic life.

The presence of MBAS and soap in runoff from the Project would be controlled through source-control BMPs, including a public education program on residential and charity car washing, and the provision of a car wash pad connected to the sanitary sewer in the multi-family residential areas. Other sources of MBAS, such as cross connections and leakage from sanitary to storm water facilities, are unlikely given modern sanitary sewer installation methods and inspection and maintenance practices. Source-control BMPs are required by MM 4-1 and, with mitigation, Project water quality impacts from MBAS in runoff will be less than significant.

### ***Other Surface Water Quality Factors***

#### Toxicity

The Lahontan Basin Plan and Los Angeles Basin Plan each contain a narrative objective for toxicity which states that waters shall be maintained free of toxic substances in concentrations that are toxic to or that produce detrimental physiological responses in human, plant, animal, or aquatic life. Pesticides, metals, PAHs, and other organic compounds (e.g., PCBs) can enter the aquatic food chain and cause acute or chronic toxicity in the form of lethal or sublethal effects to affected organisms, including adverse effects to survival, reproduction, and prey avoidance. The extent which specific concentrations of constituents of concern cause these effects is commonly measured by exposing sensitive organisms to water samples with known constituent concentrations over a period of time and assessing organism responses.

Pesticides are a primary cause of most of the observed toxicity in receiving waters when organisms are exposed to urban runoff water samples or are exposed to sediments contaminated by urban runoff. Data from the SWAMP Stream Pollution Trends Second Year Report show that the primary class of pesticides causing toxicity are pyrethroids and that the concept of “toxicity units” is an effective measure of cumulative toxicity associated with a mix of individual pyrethroids in runoff (Geosyntec 2016b). Data from streams and other receiving water bodies subject to urban runoff determined that pyrethroids were commonly found at concentrations exceeding levels that cause toxicity to sensitive aquatic organisms in water. The average reported concentrations of bifenthrin, cyfluthrin, cyhalothrin, cypermethrin, and permethrin in water samples ranged from approximately one to more than three orders of magnitude above chronic criteria values. Similar toxicity impacts were associated with pyrethroid concentrations in sediment (Geosyntec 2016b). Potential water quality impacts from pesticides in Project runoff are discussed above (see the subsection “Pesticides” under this Threshold 4-5). Other pollutants that can affect toxicity (metals and PAHs) are also addressed above. With incorporation of source-control and LID BMPs as

required by MM 4-1, potential impacts associated with acute and chronic aquatic toxicity would be less than significant.

### Constituents of Emerging Concern

Constituents of emerging concern (CEC) refer to chemicals that are potentially present in the aquatic environment subject to ongoing impact assessment methodological development. State efforts to characterize CECs include a 2012 report entitled *Monitoring Strategies for Chemicals of Emerging Concern (CECs) in California's Aquatic Ecosystems*, which included recommendations for phased monitoring and evaluation of CECs in storm water and wastewater treatment plant discharges. The report-identified CECs were based on risk-based screening criteria and recommended the following approaches (Geosyntec 2016b):

- Non-targeted analyses using advanced bioanalytical and chemical methods.
- Confirmatory biological investigations linking chemical and bioassay screening data with higher order effects (i.e., at the organism and population level).
- Environmental fate models and screening-level mass-based models that can assist in estimating the predicted environmental concentrations in effluents coupled with structure-based toxicity assessments to determine the source, occurrence, fate, and effects of CECs.
- Baseline monitoring for antibiotic resistance in wastewater treatment plant effluent.

The extent to which CECs that could occur in Project runoff could impact water quality has not yet been characterized. Most CECs would be effectively controlled by the source and LID controls required by MM 4-1, including unit processes to filter, absorb, and biologically transform CECs in storm water runoff. Other control measures may be required for CECs that are determined by the State or by other programs to pose potential water quality impacts and would be implemented to the maximum extent feasible by the Project. Subject to the analysis uncertainties discussed above, with mitigation, potential Project water quality impacts that could be associated with CECs would be less than significant.

### Pollutant Bioaccumulation

The Los Angeles Basin Plan contains a narrative objective for bioaccumulation, which states that toxic pollutants shall not be present at levels that will bioaccumulate in aquatic life to levels that are harmful to aquatic life or human health. Bioaccumulation is the net uptake and retention of a chemical in an organism from all routes of exposure (diet, dermal, respiratory) and any source (water, sediment, food). The Lahontan Basin Plan does not include an objective for pollutant bioaccumulation. Certain toxic pollutants can bioaccumulate in fish and other organisms at levels that are harmful for both the organism itself and the organisms that prey upon these species (including humans). An important pathway into the food chain is via sediments, as many bioaccumulative pollutants of concern are adsorbed to sediments. Pollutants that are known to bioaccumulate include certain pesticides, metals (i.e., lead and mercury), PAHs, and synthetic organic compounds like PCBs and dioxins. Bioaccumulative pollutants that are present in storm water runoff from the Project site may have the potential to accumulate in LID BMP vegetation and soils, potentially

increasing the risk of exposure to wildlife and the food chain. Factors that could affect the extent of potential bioaccumulation include (Geosyntec 2016b):

- The bioavailability of the pollutant.
- Conditions in the soils (e.g., pH, acid-volatile sulfide concentration, organic content) that affect the form and bioavailability of the pollutant and other environmental conditions.
- The efficiency by which pollutants in the soils are taken up and migrate up the trophic levels including plankton, zooplankton, and prey and predator species.
- The type of habitats, organisms attracted to these habitats, and their feeding habits.
- System design and maintenance.

Tests on the survival of amphipods in sediments from receiving waters in urbanized watersheds indicate that the sum of pyrethroid pesticides, PCBs, and DDT most closely correlate with adverse impacts (Geosyntec 2016b). PAHs and metals did not show a significant correlation. The Project site is unlikely to contain legacy PCBs or DDT concentrations in amounts that would be carried in runoff and cause water quality impacts. As discussed above, pyrethroid pesticides could occur in Project runoff and may cause bioaccumulation impacts.

Mercury and selenium are also known to cause bioaccumulation impacts. Selenium is not naturally present at levels of concern in the Project's watershed. Mercury sources include fossil fuel power plant emissions and exposed tailings at former mercury mines, which are also not present on or adjacent to the Project site (Geosyntec 2016b). Project bioaccumulation impacts from mercury and selenium are unlikely to occur.

Potential bioaccumulation impacts from the proposed distributed and regional LID BMPs would be minimal for several reasons. The vegetation and soil media in the LID BMPs would trap sediments and pollutants in soils which contain bacteria that metabolize and transform pollutants. This process will reduce the potential for bioaccumulative pollutants to enter the food chain. The Project will not significantly contribute to bioaccumulation of pollutants in major downstream waters, including the Santa Clara River, because these waters are located several miles from the site, and constituent concentrations in Project runoff that may discharge from on-site facilities will be significantly below all applicable Lahontan and Los Angeles Basin Plan and CTR water quality objectives. With mitigation, potential Project bioaccumulation impacts to aquatic life or human health will be less than significant.

#### Dry Weather Runoff (Nuisance Flows)

Pollutants in dry weather flows can adversely impact receiving waters and, unlike storm event runoff, are more persistent over time. The primary sources of dry weather flows in urban areas include irrigation, vehicle washing, construction dewatering, fire hydrant purging, and drainage from swimming pools and decorative fountains. Other sources may include leaks from sanitary sewers and septic tanks; wash water from laundry and vehicle wash facilities; and many types of industrial wastewaters that discharge directly (via illicit

connections) to the storm drain system. The Project will not include septic tanks, and illicit industrial discharges are unlikely to occur due to the proposed site design and land uses.

Dry weather flows are typically low in sediment because the flows are relatively low and because coarse suspended sediment tends to settle out or be filtered out by vegetation. As a consequence, dry weather flows typically include low concentrations of pollutants associated with suspended solids such as phosphorous, some bacteria, some trace metals, and some pesticides. Constituents of concern in dry weather flows tend to be dissolved or subject to mobilization in runoff, such as nitrate and trace metals, pathogens, and oil and grease.

As discussed in Section 5.2, Hydrology and Flood, and Section 5.18, Water Resources, landscaping in public and common areas would utilize drought-tolerant vegetation that requires little watering or chemical application, consistent with Section 3.3 of the *Centennial Specific Plan*. Landscape watering in common areas, commercial areas, multi-family residential areas, and in parks would use efficient irrigation technology such as evapotranspiration sensors to minimize excess watering (see Section 5.18). Source-control BMPs (e.g., educational programs and materials) would describe appropriate car washing locations (at commercial car washing facilities or the car wash pad in the multi-family residential areas) and techniques (minimizing usage of soap and water); would encourage low impact landscaping and appropriate watering techniques, appropriate swimming pool dechlorination and discharge procedures; and would discourage driveway and sidewalk washing. Illegal dumping would be discouraged by stenciling storm drain inlets and posting signs that illustrate the connection between the storm drain system and the receiving waters and natural systems downstream. The source controls are required by MM 4-1 and MM 4-2.

The proposed regional and distributed LID BMPs would infiltrate and provide treatment for dry weather flows and small storm events. Water cleansing is a natural function of vegetated areas. The LID BMPs are required by MM 4-1. Sedimentation of particulates is a primary removal mechanism in LID facilities and treatment performance is enhanced as plant and soil materials allow pollutants to come in contact with bacteria that metabolize and transform pollutants, especially nutrients and trace metals. Plants also take up nutrients in their root system. Pathogens in dry weather flows would be removed through infiltration. Oil and grease in dry weather flows would be adsorbed by the vegetation and soil within the LID BMPs. Dry weather flows and small storm flows would infiltrate into the bottom of the basin after receiving treatment in the vegetation.

With mitigation and the implementation of the source-control BMPs (which reduce the amount of dry weather runoff and constituent loads that could be carried in the runoff) and regional and distributed LID BMPs (which capture and treat dry weather runoff), the Project would result in less than significant water quality impacts related to dry weather flows.

## Off-Site Impacts

Approximately 15 acres located off site would be subject to Project-related construction, including intersections with SR-138, utility connections, water wells, and Aqueduct crossings (see Section 4.0, Project Description). The construction period and operational on-site qualitative water quality analysis includes these off-site locations. Consistent with the on-site analysis, with the implementation of MM 4-1 and MM 4-2, the Project would not otherwise degrade off-site groundwater quality; potential impacts will be less than significant with mitigation.

**Impact Summary:** The Project will implement a comprehensive system of site design, source control, low impact development, and hydromodification Best Management Practices that meet or exceed the water quality and hydrology (storm water runoff) standards for new development in the County LID Ordinance, the LID Standards Manual, and the MS4 Permit. All water quality controls, including regional, distributed and parcel-specific measures, are designed to meet or exceed the LID performance standards consistent with the requirements of the MS4 Permit, the LID Ordinance, and the LID Standards Manual. The Project will also implement integrated pest management and landscaping BMPs consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. Compliance with the LID performance standards and integrated pest management and landscaping BMP requirements will be reconfirmed in drainage and landscape plans to be submitted to the County in conjunction with each Project tract map review and approval process. These requirements are incorporated in MM 4-1 and MM 4-2. During construction, the Project will comply with the state Construction General Permit, the Lahontan RWQCB Limited Threat Discharge Permit, and the Los Angeles RWQCB General Dewatering Permit, and it will implement BMPs that comply with all applicable waste discharge requirements and applicable water quality standards. The quantitative analysis results in Threshold 4-1 show that post-development concentrations of TSS, nutrients, trace metals, and chloride would be consistent with or significantly below applicable narrative and numerical water quality objectives in the Lahontan and Los Angeles Basin Plans and in the CTR. The qualitative analysis shows that potential Project impacts related to turbidity, pesticides, pathogens (bacteria, viruses, and protozoa), petroleum hydrocarbons (oil and grease, PAHs), trash and debris, MBAS, toxicity, and emerging contaminants would be less than significant. With implementation of MM 4-1 and MM 4-2 and with compliance with applicable laws and regulations (including the state Construction General Permit and the Lahontan RWQCB Limited Threat Discharge Permit), the Project will not otherwise degrade water quality; impacts will be less than significant with mitigation.

## 5.2.7 MITIGATION MEASURES

**MM 4-1** The Project shall implement Low Impact Development (LID) and water quality control Best Management Practices (BMPs) that will achieve the following LID performance standard:

LID BMPs shall be selected and sized to retain the volume of storm water runoff produced from the higher of the 85<sup>th</sup> percentile or ¾ inch, 24-hour storm depth as determined from the Los Angeles County 85<sup>th</sup> Percentile 24-hr Rainfall Isohyetal Map (February 2004) (LID design volume). When it has been demonstrated that 100 percent of the LID design volume cannot be feasibly infiltrated within the Project, then the volume shall be harvested and reused. If that volume cannot be harvested and reused within 96 hours, then biofiltration shall be provided for 1.5 times the portion of the LID design volume that is not retained. Runoff from roadways shall be retained or biofiltered in retention or biofiltration BMPs sized to capture the design storm volume or flow, per the guidance in the U.S. Environmental Protection Agency's (USEPA's) *Managing Wet Weather with Green Infrastructure: Green Streets*. LID BMPs may be parcel-based or regional facilities.

Compliance with the LID performance standards shall be confirmed by the County based on a Drainage System Engineering and Planning Report to be submitted with each Tentative Map application. The Report shall describe applicable water quality control and LID BMPs and shall utilize approved Los Angeles County methodologies to demonstrate compliance with the LID performance standards. To the extent feasible, incorporate permeable pavement, groundcovers, and/or other measures to increase infiltration.

**MM 4-2** The Project shall implement integrated pest management (IPM) and landscaping best management practices (BMPs) consistent with the integrated pest management and pesticide and fertilizer application guidelines established by the University of California Division of Agriculture and Natural Resources Statewide Integrated Pest Management Program. The IPM and landscaping BMPs shall be confirmed in a Landscaping Plan submitted to the County during the review and approval process for each tract map application. The BMPs shall include a Planting Plan that is consistent with the plant water use requirements of Section 3.3 of the *Centennial Specific Plan*; with procedures for removing non-native vegetation and planting native vegetation; with fertilizer guidelines; and with the IPM approach for preventing or suppressing pest problems (i.e., insects and diseases). This shall be done through a combination of techniques including using pest-resistant plants; using biological controls; incorporating cultural practices; including habitat modification; and judiciously using pesticides. The IPM and landscaping BMPs shall address the following:

- Pest identification.
- Practices to prevent pest incidence and to reduce pest buildup.

- Monitoring to examine vegetation and surrounding areas for pests to evaluate trends and to identify when controls are needed.
- Establishment of action thresholds that trigger control actions.
- Pest-control methods (cultural, mechanical, environmental, biological, and appropriate pesticides).
- Pesticide management, which includes safety requirements (e.g., Material Safety Data Sheets, precautionary statements, protective equipment); regulatory requirements; spill mitigation measures; groundwater and surface water protection measures associated with pesticide use; and pesticide applicator certifications, licenses, and training (i.e., all pesticide applicators must be certified by the California Department of Pesticide Regulation).

### 5.2.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

With implementation of MM 4-1 and MM 4-2, potentially significant impacts to water quality would be reduced to levels considered less than significant.

## 5.5 LAND RESOURCES

This section of the Draft Environmental Impact Report (EIR) describes the potential impacts to agricultural, forest, and mineral resources from implementation of the Project.

### 5.5.1 INTRODUCTION

#### **Purpose**

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that agricultural, forest, and mineral resource issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### **Summary**

The Project will result in the conversion of approximately 642 acres of on-site Prime Farmland. The Project site is identified as being within the West Economic Opportunity Area (EOA), one of three EOAs established by the Antelope Valley Area Plan (AVAP). The EIR for the AVAP considered the impacts of converting a total of 6,169 acres of Important Farmland and concluded that the conversion would be a significant and unavoidable impact (DRP 2014). Although the Project is consistent with the AVAP's land use policy, the Project would not result in any new impacts to agricultural lands, and the Project would allow for continued grazing activity and small-scale agriculture and agriculture-related uses (PDF 5-1), because the Project is directly facilitating the conversion of 642 acres of Prime Farmland to non-agricultural uses, it is considered a significant impact of the Project. For the same reasons as described in the AVAP EIR, there is no feasible mitigation to reduce this impact to a less than significant level, and therefore would be a significant unavoidable impact of the Project.

The adoption of the Project will require a discretionary zone change to be made by the County that is consistent with, and would help implement, the AVAP—specifically the Rural Preservation Strategy and associated Policy LU 1.1—as it applies to the Project site. Also, there are no Williamson Act contracts onsite, or within Los Angeles County (outside of Catalina Island). Therefore, there would be no conflict with applicable agricultural land use policies if the County adopts the Project.

As discussed above, the only agricultural zoning on the Project site is the A-1-2: Light Agriculture zone located on the lands to the east of 300<sup>th</sup> Street West. This zoning allows tree crops as a permitted use. Although the remainder of the Project site is not zoned for agricultural uses under the AVAP, an approximate 13-acre area in the northwestern corner of the site is identified as containing montane hardwood resources and approximately 883 acres in the southwestern and southeastern portions of the site are identified as containing primarily mixed chaparral (approximately 553 acres) as well as blue oak woodland, blue oak-foothill pine, juniper, and pinyon-juniper resources (approximately 330 acres) on maps

prepared by the California Department of Fire and Forestry Protection's Fire and Resource Assessment Program (FRAP 2006). It is noted that the statewide mapping of forest and timber resources as part of the FRAP is separate from the vegetation mapping performed for the Project site, and is used herein solely for the determination of potential forest and timber resources. Finally, no part of the Project site is zoned as a Timberland Production Zone.

As discussed further in Section 5.7, Biological Resources, the proposed development areas of the Project site have been used for open cattle grazing for over 150 years and, as a result the majority of the on-site acreage consists of grasslands that do not support a large number of tree species. While the existing zoning in the easternmost portion of the site allows for tree crop production, these lands have never been managed for forest resources including for timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, or for other public benefits. Further, the Department of Forestry and Fire Protection regulations (Section 895.1) define commercial species of trees for each forest district. The Project site does not contain any trees listed as a "commercial species" for the applicable Southern Forest District as defined in the applicable regulations. Project implementation would not conflict with zoning for forest land or timberland as the Project site is not used for forest land or timberland resources and is not considered forest land or timberland by the County or the State. The Project will not conflict with zoning for timberland or a Timberland Production Zone, as the site has not been designated as such. There would be no impact to forest land and no mitigation is required

Project implementation would not result in impacts related to the loss of known mineral resources because there are no known mineral resources on the Project site or the off-site Project features.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Agricultural and Forest Resources
  - Relevant Plans, Policies, and Regulations
  - Environmental Setting
  - Project Design Features

- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance after Mitigation
- Mineral Resources
  - Relevant Plans, Policies, and Regulations
  - Environmental Setting
  - Project Design Features
  - Threshold Criteria
  - Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
    - On-Site Impacts
    - Off-Site Impacts
  - Mitigation Measures
  - Level of Significance After Mitigation

## 5.5.2 AGRICULTURAL AND FOREST RESOURCES

### Relevant Plans, Policies, and Regulations

#### *Federal*

There are no applicable federal plans, policies, or regulations regarding agricultural or forest resources.

#### *State*

##### Farmland Mapping and Monitoring Program

The Farmland Mapping and Monitoring Program (FMMP) is a non-regulatory program that provides a consistent and impartial analysis of agricultural land use and land use changes throughout California. The FMMP provides land use conversion information for decision makers to use in their planning for present and future use of California's agricultural resources. As part of the nationwide agricultural land use mapping effort, the U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS, formerly Soil Conservation Service [SCS]) developed a series of definitions known as Land Inventory and Monitoring (LIM) criteria. The LIM criteria classify the land's suitability for agricultural production; suitability includes both the physical and chemical characteristics

of soils and actual land use. Important Farmland Maps have been derived from the NRCS soil survey maps using the LIM criteria.

Since 1980, the State of California has assisted the NRCS in completing its mapping of the state. The FMMP was created by the California Department of Conservation (DOC) to carry out the mapping activity on a continuing basis and with a greater level of detail, which they did by modifying the LIM criteria for use in California. The California LIM criteria utilize the NRCS and Storie Index Rating systems,<sup>1</sup> and also consider other physical conditions such as the following: water moisture regimes, available water capacity, and developed irrigation water supply; soil temperature range; acid-alkali balance; water table; soil sodium content; flooding (uncontrolled runoff from natural precipitation); erodibility; permeability rate; rock fragment content; and soil rooting depth. The following farmland classifications are based on information from the Department of Conservation Division of Land Resources Protection's, *A Guide to the Farmland Mapping and Monitoring Program* (DOC 2004):

- **Prime Farmland (P).** Prime Farmland is land which has the best combination of physical and chemical characteristics for the long-term production of agricultural crops. It has the soil quality, growing season, and moisture supply needed to produce sustained high yields of crops when treated and managed (including water management) according to current farming methods. The land must have been used for the production of irrigated crops at some time during the two previous cycles prior to the mapping date.<sup>2</sup> It does not include publicly owned lands for which there is an adopted policy that prevents agricultural use.
- **Farmland of Statewide Importance (F).** Farmland of Statewide Importance is land other than Prime Farmland that has a good combination of physical and chemical characteristics for the production of crops. It must have been used for the production of irrigated crops at some time during the two previous cycles prior to the mapping date. It does not include publicly owned lands for which there is an adopted policy that prevents agricultural use.
- **Unique Farmland (U).** Unique Farmland is land that does not meet the criteria for Prime Farmland or Farmland of Statewide Importance. It must be currently used for the production of specific high-economic value crops (as listed in the last three years of *California Agriculture* produced by the California Department of Food and Agriculture). It has the special combination of soil quality, location, growing season, and moisture supply needed to produce sustained high quality or a high yield of a specific crop when treated and managed according to current farming methods. Examples of such crops may include oranges, olives, avocados, rice, grapes, and cut flowers. This land is usually irrigated, but may include non-irrigated orchards or vineyards, as found in some climatic zones in California. The land must have been cultivated at some time during the two cycles prior to the mapping date.

---

<sup>1</sup> The Storie Index provides a numeric rating (based upon a 100 point scale) of the relative degree of suitability or value of a given soil for intensive agriculture. The rating is based on four soil characteristics that represent the inherent characteristics and qualities of the soil, which are considered in the index rating. The four factors are profile characteristics, texture of the surface layer, slope, and other factors (e.g., drainage, salinity) (DOC 1997).

<sup>2</sup> A cycle is approximately two years.

- **Farmland of Local Importance (L).** Farmland of Local Importance is of importance to the local agricultural economy and is determined by each County’s Board of Supervisors and a local advisory committee. According to the DOC, Farmland of Local Importance in Los Angeles County includes producing lands that would meet the standard criteria for Prime Farmland or Farmland of Statewide Importance, but which are not irrigated (DOC 2004).
- **Grazing Land (G).** Grazing Land is land on which the existing vegetation, whether grown naturally or through management, is suitable for livestock grazing. The minimum mapping unit for Grazing Land is 40 acres.
- **Urban and Built-Up Land (D).** Urban and Built-Up Land is occupied with structures that have a building density of at least one unit to one-half acre or approximately six structures to a ten-acre parcel.<sup>3</sup>
- **Other Land (X).** This category is for land that is not included in any other mapping categories. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry, or aquaculture facilities; strip mines; borrow pits; and water bodies smaller than 40 acres. Vacant and nonagricultural land that is surrounded on all sides by urban development and is greater than 40 acres is mapped as “Other Land”.

For CEQA purposes, Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance are collectively defined as “Important Farmland”. Grazing Land is also considered a farmland category, but is not included in the “Important Farmland” definition.

### California Land Conservation Act

The California Land Conservation Act (LCA), also known as the Williamson Act, was adopted in 1965 to encourage the preservation of the state’s agricultural lands and to prevent their premature conversion to urban uses. In order to preserve these agricultural uses, the Williamson Act established an agricultural preserve contract procedure by which any California County or City can tax landowners at a lower rate, using a scale based on the actual use of the land for agricultural purposes, as opposed to its unrestricted (i.e., “fair”) market value. In return, landowners guarantee that their properties will remain under agricultural production for at least a ten-year period. The contract is renewed annually for an additional year automatically unless the owner files a notice of non-renewal. In this manner, each agricultural preserve contract (at any given date) is always operable at least nine years into the future. The only lands in Los Angeles County under Williamson Act Contract are located on Catalina Island (DOC 2016b). As such, no part of the Project site is under Williamson Act Contract.

---

<sup>3</sup> A “unit” is defined as a structure or foundation on which uses associated with development are placed. Uses may include and are not limited to residential, industrial, commercial, construction, institutional, public administration purposes, railroad yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants, water-control structures, and other development purposes. Highways, railroads, and other transportation facilities are mapped as part of this unit if they are part of a surrounding urban area.

## Right-to-Farm Ordinances

Right-to-Farm Ordinances have been adopted by several California Counties to protect farmers in established farming areas from legal action that new residents in nearby urban settings may take against nuisances associated with normal, day-to-day farming activities (e.g., odor, noise, dust). Los Angeles County does not have a Right-to-Farm Ordinance.

### *County*

#### Los Angeles County General Plan and Antelope Valley Area Plan

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, part of the County General Plan, includes goals and policies that address agricultural issues in the unincorporated County. As discussed further below, the Project site is identified in the AVAP as within the West EOA, one of three EOAs established by the AVAP where increased residential, commercial, and industrial uses are encouraged while preserving the rural character and ecological resources of the surrounding areas, including agricultural activity. The AVAP goal and policy applicable to the analysis of agriculture resources with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal LU 1:** A land use pattern that maintains and enhances the rural character of the unincorporated Antelope Valley.

**Policy LU 1.1:** Direct the majority of the unincorporated Antelope Valley's future growth to rural town center areas and identified economic opportunity areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

## **Environmental Setting**

### ***Agriculture Resource Planning in the Antelope Valley***

Development of the Antelope Valley started in 1876 and the developing communities were dependent upon stock raising, dry farming, and fruit orchards. While the years during and after World War II saw military investments come to prominence, this type of development declined, and the final decades of the 20th century saw the Antelope Valley emerge with major new housing opportunities as vast acreages were subdivided for affordable tract homes. Farming regained its status as a productive employer, but the area continued to develop without balancing the growth in housing with a corresponding growth in jobs and investment in infrastructure.

The AVAP was adopted by the County Board of Supervisors on June 16, 2015, which updates and supersedes the previous Antelope Valley Areawide General Plan adopted in 1986 (DRP 2015c). The AVAP is centered on the Rural Preservation Strategy, developed to reflect the community's desire to maintain the rural attributes of the Antelope Valley while acknowledging the "growing populations need for additional housing and employment opportunities. . ." per the AVAP's vision statement (DRP 2015a). As discussed in the AVAP,

the Rural Preservation Strategy is based on four types of environments—Rural Town Center Areas, Rural Town Areas, Rural Preserve Areas, Economic Opportunity Areas—that serve different purposes. Collectively, these environments preserve the rural character of the region, conserve environmental resources, and protect residents from potential hazards while allowing for additional growth and development (DRP 2015a). [SEP]

In Rural Town Center Areas and Rural Town Areas, the amount of potential development allowed by the AVAP will be equal to, or greater than, the amount of potential development allowed by the previous Area Plan. Therefore, those areas are likely to benefit from increased property tax revenues and developer fees, which can help fund additional infrastructure. EOAs are defined clusters of land along the routes of two new proposed major infrastructure projects in the Antelope Valley (i.e. the High Desert Corridor and the Northwest 138 Corridor Improvement Project), which are expected to indirectly generate growth and development. The EOAs maximize the investment of State and regional agencies in public infrastructure while achieving the general goal of rural preservation in the Antelope Valley. Any development induced by these two infrastructure projects is intended be guided to EOAs in order for surrounding areas to be preserved and maintained at low density or agricultural uses ( DRP 2015a). The Project site is in the West EOA.

### ***Contribution of Agriculture to the Los Angeles County Economy***

According to the most recent data from the California Department of Food and Agriculture (CDFA), the County of Los Angeles is ranked 33<sup>rd</sup> in the state for agricultural production market value, with 2013–2014 gross revenues of approximately \$230,068,000. The leading commodity crops included woody ornamental and other nursery plants, vegetables, fruits and nuts, and hay (CDFA 2015).

### ***Farmland Conversion Trends in Los Angeles County***

Agricultural land conversion has a long history in Los Angeles County; the extent of this conversion is reflected in Table 5.5-1, Los Angeles County Agricultural Acres per Crop 1970–2014.

**TABLE 5.5-1  
LOS ANGELES COUNTY AGRICULTURAL ACRES PER CROP 1970–2013**

Crop	Acreage						1970-2014 % Change <sup>c</sup>
	1970	1980	1990	2002 <sup>a</sup>	2010	2014 <sup>b</sup>	
Fruit and Nut Crops	7,829	3,032	1,889	1,692	1,913	764	(90)
Vegetable Crops	6,592	6,446	2,926	12,934	4,472	6,765	3
Nursery Products	1,972	2,280	2,160	2,240	2,071	1,530	(22)
Flowers and Foliage	656	490	235	72	81	88	(87)
Field Crops	57,890	42,298	8,683	8,458	15,985	11,147	(81)
<b>Average Change:</b>							<b>(57)</b>
<sup>a</sup> Current at time the NOP was released in 2004. <sup>b</sup> Most current information available in January 2017. <sup>c</sup> Numbers in parentheses denote negative numbers. Sources: LACFB 2014, 2010; LACAC 2000, 1990, 1980, 1970.							

As shown in Table 5.5-1, the total acreage in production for all crop types has varied over time, with an approximate average net reduction in acreage of 57 percent of these crops since 1970 as shown in the last column. The 2014 value of agricultural commodities in Los Angeles County was \$229,686,760, which includes all the crop types listed above as well as livestock production, forest products, and apiary that are not measured in acreages (LACFB 2014). However, according to the AVAP Draft EIR, agricultural production has increased in the Antelope Valley since the mid-1990s due to the increase in production of vegetable crops (mainly onions and carrots) and fruit crops (mainly peaches)—28 percent and 15 percent, respectively (DRP 2014).

In addition to considering agricultural production, the following discussion considers the coverage of FMMP-designated farmlands, which does not account for the type or amount of crops on that land. Table 5.5-2, Farmland Mapping and Monitoring Program Resources in Los Angeles County 2000–2014, provides an overview of the amount of FMMP-designated lands present in the County and the percent change in each category over that period. The 2012–2014 period is the most recent FMMP data published by the California Department of Conservation.

FMMP: Farmland Mapping and Monitoring Program; NOP: Notice of Preparation

<sup>a</sup> Current at time the NOP was released in 2004. Acreage was calculated in 2002 using the rectified imagery, which resulted in significant boundary adjustments, particularly in areas with terrain. A large reclassification from Farmland of Local Importance to Grazing Land is due to these factors and an analysis of the long-term idling of dryland farming areas.

<sup>b</sup> Most current information available in January 2017.

<sup>c</sup> Numbers in parentheses denote negative numbers.

Source: DOC 2017.

As shown in Table 5.5-2, the acreage of Important Farmland collectively decreased approximately 26 percent and Grazing Land remained stable (approximate 2 percent increase). For additional context, historic land use conversion data for Los Angeles County available for the past 20 years, from 1984 through 2014, shows a decrease in Important Farmland of 29,594 acres (49 percent) and an increase in Grazing Land of 7,306 acres (3 percent) over this period (DOC 2017). The AVAP Draft EIR identifies a total of 24,443 acres of Important Farmland within the AVAP planning area, which includes only unincorporated portions of the Antelope Valley (LACDRP 2014).

The FMMP also tracks the acres of “Land Committed to Nonagricultural Use” as an optional category and is defined as existing farmland, grazing land, and vacant areas that have a permanent commitment for development. Table 5.5-3, Lands Committed to Non-Agricultural Use in Los Angeles County 2002-2010, summarizes the lands placed in this category in each two-year mapping cycle. The land committed to non-agricultural use is not reported in the 2010-2012 or 2012-2014 data, the most recent FMMP data.

**TABLE 5.5-3  
AGRICULTURAL LANDS COMMITTED TO NON-AGRICULTURAL USE  
IN LOS ANGELES COUNTY 2002-2010**

FMMP Category	Acreage			
	2002-2004	2004-2006	2006-2008	2008-2010
Prime Farmland	46	46	46	44
Farmland of Statewide Importance	0	0	0	0
Unique Farmland	0	0	0	0
Farmland of Local Importance	0	0	0	0
<i>Subtotal Important Farmland</i>	46	46	46	44
Grazing Land	2,278	2,258	2,246	2,212
<b>Totals</b>	<b>2,324</b>	<b>2,304</b>	<b>2,292</b>	<b>2,256</b>
FMMP: Farmland Mapping and Monitoring Program Source: DOC 2017.				

As shown in Table 5.5-3, in 2010, 44 acres of Prime Farmland and slightly more than 2,200 acres of Grazing Land were developed as non-agricultural uses in Los Angeles County, which is a slight reduction when compared to previous 2-year mapping periods.

#### ***On-Site Farmland Mapping and Monitoring Program Designations and Agricultural Production***

Table 5.5-4 below summarizes the acres of FMMP-designated lands on the Project site, based on the most recent FMMP data publicly available. The Centennial Project site contains approximately 642 acres of land designated as Prime Farmland, with the majority of the site (approximately 11,616 acres) designated as Grazing Land (2016a). These acreages represent approximately 2.5 percent of the Prime Farmland and approximately 4.9 percent of the Grazing Land, respectively, designated under the FMMP in the County of Los Angeles in 2014 (DOC 2017). The Project site includes no lands that are designated as Farmland of Statewide Importance, Unique Farmland, or Farmland of Local Importance. The on-site Prime Farmland represents approximately 10.4 percent of the Important Farmland in the AVAP planning area (6,169 acres).

**TABLE 5.5-4  
FARMLAND MAPPING AND MONITORING PROGRAM DESIGNATIONS  
AND ACREAGES ON THE CENTENNIAL PROJECT SITE**

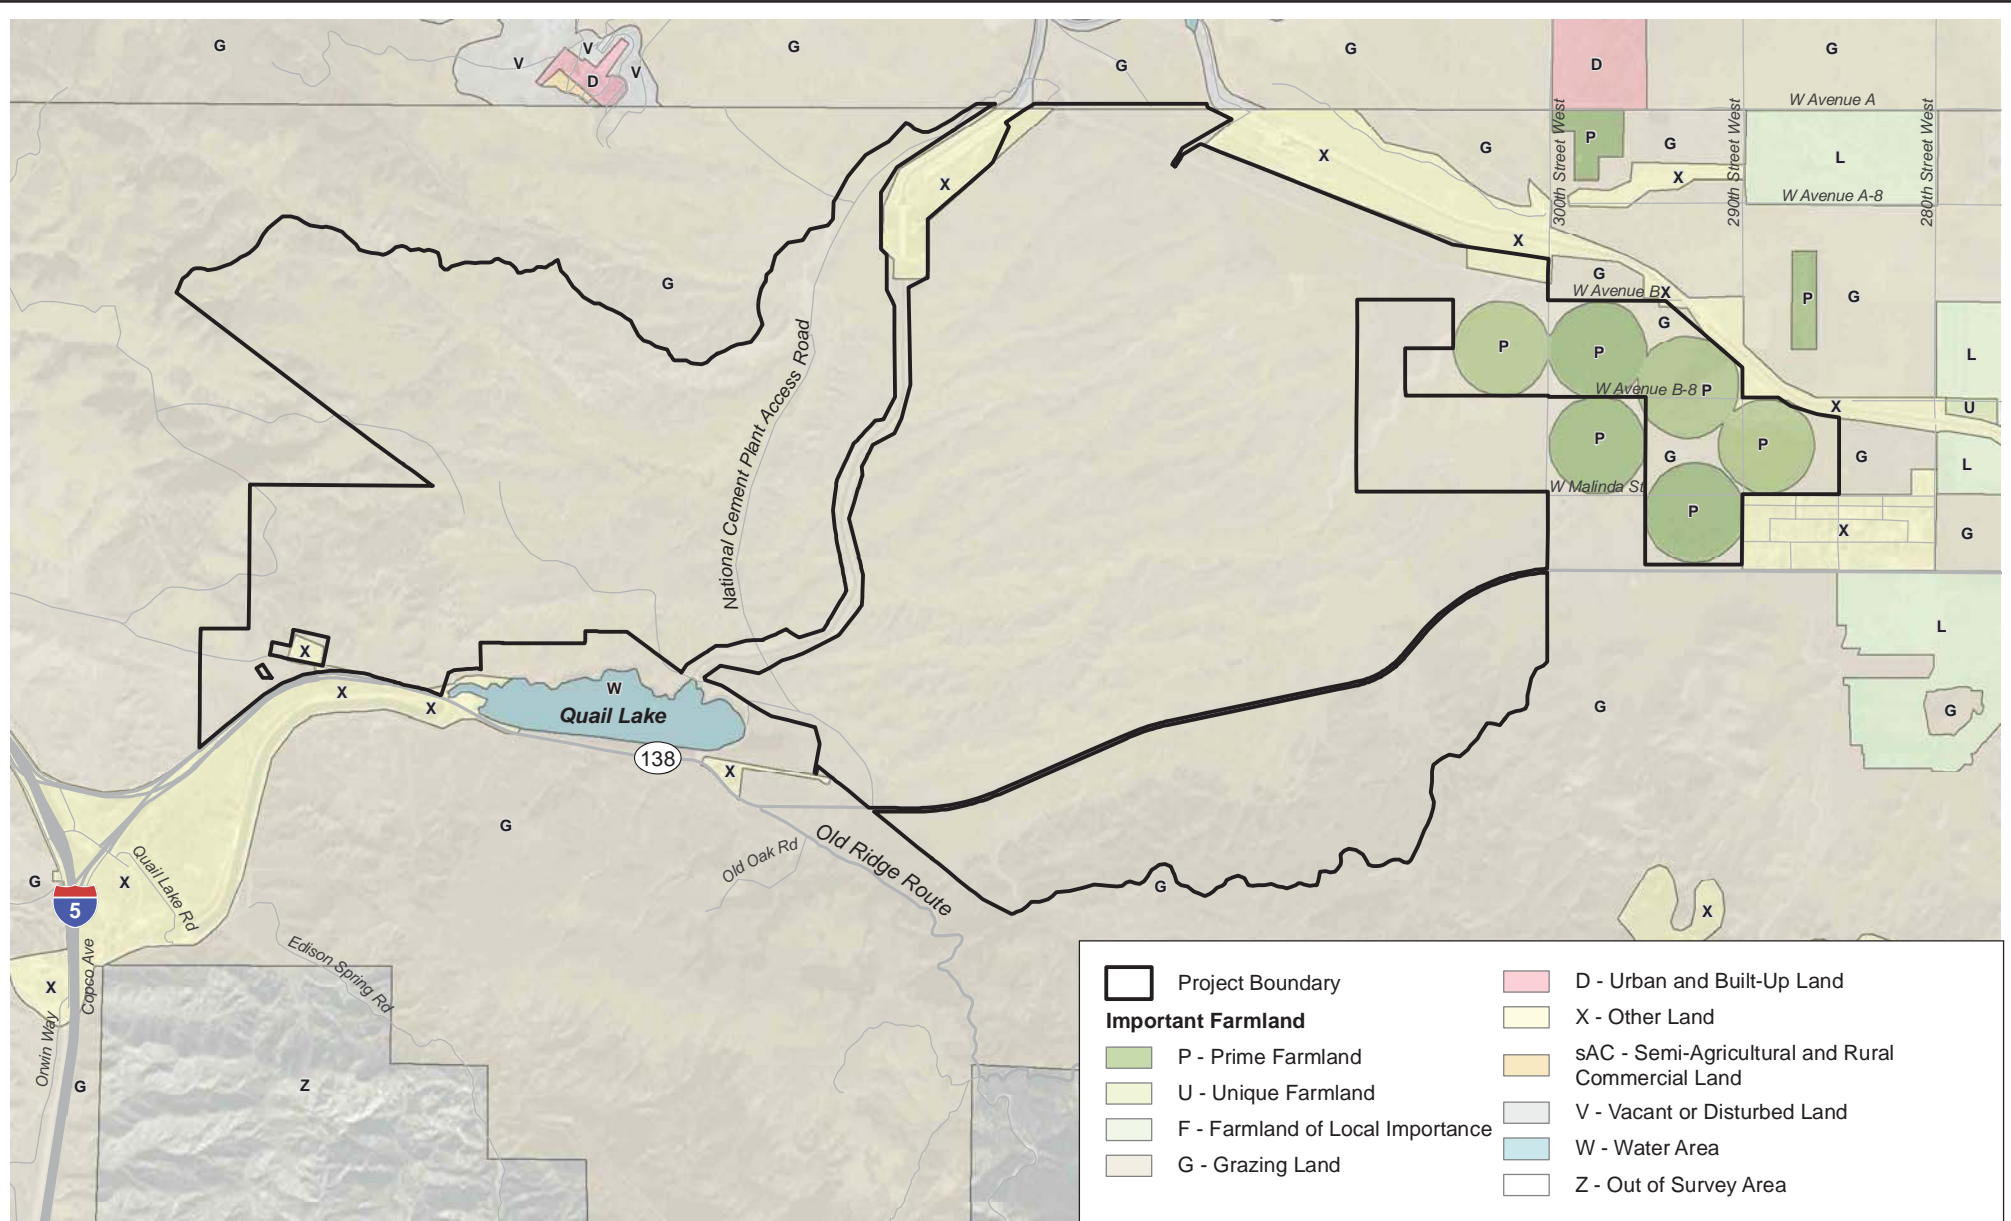

FMMP Category	Acreage
Prime Farmland	642
Grazing Land	11,616
Other Land, and Vacant and Disturbed Land	65
<b>Total</b>	<b>12,323</b>
FMMP: Farmland Mapping and Monitoring Program	
Source: DOC 2016a.	

The distribution of classified farmland on the Project site is illustrated on Exhibit 5.5-1, Important Farmland (FMMP Designations). As shown, the majority of the surrounding lands are designated as Grazing Land, and there are two small, discrete areas of Prime Farmland located off site to the northeast of the site.

Land in agricultural production is defined as either being farmed for crop production or as being used for rangeland cattle grazing. Exhibit 5.5-2, Current On-Site Agricultural Uses, shows the current agricultural uses on the Project site. The Project site has been used for open grazing for over 150 years. The Tejon Ranch Company currently leases the Project site to an independent company for grazing and agricultural uses. Approximately 10,950 acres (89 percent) of the Project site are currently used for grazing. This is somewhat less than the area designated as Grazing Land, pursuant to the FMMP, as described in Table 5.5-4. The grazing area is spread almost entirely across the site, and grazing occurs in the spring. The total area of grazing acreage on the Project site represents approximately 5 percent of the 237,069 acres of grazing land in Los Angeles County in the year 2014. To date, the grazing on site is not managed for biological resources. Cattle can graze on any portion of the site regardless of sensitive habitats or plant species that may be present.

In addition to grazing, the Tejon Ranch Company owns and cultivates approximately 1,000 acres in the eastern portion of the Project site as pivot fields.<sup>4</sup> These 1,000 acres include 5 separate pivot fields that correlate with the approximate 642 acres of Prime Farmland on the site (see Table 5.5-4 and Exhibit 5.5-1). Each pivot field is a circle within a square parcel. Therefore, each pivot field has adjacent lands in each parcel that are indirectly involved in the production activities (e.g., equipment access, water infrastructure) but do not directly produce crops. These “edge” lands outside the pivot circles comprise the difference between the 642 acres of Prime Farmland and the total of approximately 1,000 acres of land (i.e., approximately 348 acres) under cultivation Tejon Ranch Company. The pivot fields are managed for the production of either alfalfa or a three-way forage mix (e.g., barley, oats, sedan grass). The total 1,000-acre area has been cultivated by the Tejon Ranch Company since 1998. Prior to 1998, the land was used primarily for grazing.

<sup>4</sup> A “pivot field” is a circular agricultural field with a centralized “pivot” irrigation system.

# Current On-Site Agricultural Uses

# Exhibit 5.5-2

Centennial Project

### ***Agricultural Pesticide Use***

Various pesticides, some herbicides, and nitrogen fertilizers are currently used and stored on the Project site. These materials are used in the pivot fields in the eastern portion of the Project site. As agricultural activities on the site are phased out, the use of these chemicals would decline. For a more detailed discussion of current and historical on-site pesticide use, please refer to Section 5.3, Hazards and Fire Safety.

### **Project Design Features**

**PDF 5-1** Project development would allow for continued grazing operations on portions of the Open Space preserve areas as a management tool for grassland conservation, subject to the specifications of the Native Perennial Grassland and Wildflower Field Mitigation Plan to be prepared as part of the Project implementation. Additionally, the Project would accommodate a total of 50 acres of small-scale agriculture and agriculture-related uses (e.g., community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, commercial greenhouses).

### **Threshold Criteria**

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist that was in place when the Notice of Preparation (NOP) was released. The Project will result in a significant impact if it would:

- Threshold 5-1** Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.
- Threshold 5-2** Conflict with existing zoning for agricultural use, with a designated Agricultural Opportunity Area, or with a Williamson Act contract.
- Threshold 5-3** Conflict with existing zoning for, or cause rezoning of forest land (as defined in Public Resources Code, Section 12220[g]), timberland (as defined by Public Resources Code, Section 4526), or timberland zoned Timberland Production (as defined by Government Code, Section 51104[g]).
- Threshold 5-4** Result in the loss of forest land or conversion of forest land to non-forest use.
- Threshold 5-5** Involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest land use.

## Environmental Impacts

**Threshold 5-1**      **Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?**

### *On-Site Impacts*

As shown on Exhibit 5.5-1, the lands designated as Prime Farmland are located in the easternmost portion of the site. As shown on Exhibit 4-1, Centennial Project – Conceptual Land Use Plan, this land is proposed to be developed as residential, commercial, and business park uses. Therefore, Project implementation would result in the conversion of approximately 642 acres of Prime Farmland to urban and other land uses, which is a significant impact under CEQA. Lands that the California Department of Conservation has designated as Farmland of Statewide Importance or Unique Farmland are not present on the Project site. Conversion of Other Land or Grazing Land to non-agricultural uses is not considered a significant impact under CEQA. As described in PDF 5-1, the Project would allow for continued grazing operations on selected open space areas as a management tool for grassland conservation. While to date, grazing has not been specifically managed throughout the site for habitat or biological resources, once the Project is approved, all future grazing activities would be managed in an effort to protect sensitive species present on the site while providing a beneficial impact to native grassland and wildflower fields, as described in PDF 5-1.

Also, the Project would accommodate a total of 50 acres of small-scale agriculture and agriculture-related uses, including, but not limited to community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, and commercial greenhouses (PDF 5-1). However, these activities may or may not occur within the 642 acres of the site currently designated as Prime Farmland. In addition, Tejon Ranch will put an agricultural preservation easement of not less than 489 acres of Prime and Unique farmland outside of the Project site, but on the Tejon Ranch property.

The AVAP EIR considered the impacts of converting a total of 6,169 acres of Important Farmland based on the proposed land use designations considered incompatible with continued agricultural use, and maintaining 17,855 acres (or approximately 74 percent of the AVAP planning area), in land use designations considered compatible with agricultural use. By focusing future urban development in the EOAs and, to a lesser extent, the Rural Town Center Areas and Rural Town Areas, the AVAP EIR concluded that the overall rural character and agricultural uses within Antelope Valley would be preserved. However, the AVAP EIR concluded that the conversion of 6,169 acres of Important Farmland within the Antelope Valley was a significant and unavoidable impact, with no feasible mitigation measures available to reduce the impact based on current court decisions regarding agricultural mitigation as well as limited availability of land outside the AVAP planning area suitable for cultivation as Farmland in Los Angeles County (DRP 2014a).

The Project is consistent with the intent of the AVAP's land use policy that anticipates conversion of Farmland on and proximate to the site, among other areas, and the Project would not result in any new impacts to agricultural lands not previously considered in the AVAP EIR. However, Project implementation would result in the conversion of 642 acres of Prime Farmland, which is considered a direct, significant impact of the Project. Potential mitigation in the form of establishing 642 acres of new farming areas on Tejon Ranch has been investigated and determined to be infeasible with implementation of the Tejon Ranch Conservation and Land Use Agreement and other existing and proposed development on Tejon Ranch due to insufficient available land that could be cultivated to meet Prime Farmland standards.

For the same reasons as described in the AVAP EIR as well as lack of available land within Tejon Ranch that would equate to 642 acres of Prime Farmland, there is no feasible mitigation to reduce this impact to a less than significant level. Therefore, this would remain a significant unavoidable impact of the Project.

### ***Off-Site Impacts***

With the exception of isolated parcels of designated Prime Farmland areas to the northeast of the site (see Exhibit 5.5-1), all surrounding lands have been designated by the FMMP as Grazing Land and Other Land, which are both designations indicating that the land is unsuitable for agricultural cultivation. A significant impact due to conversion of Important Farmland would occur only if off-site features were to encroach on these Prime Farmland areas and convert them to non-agricultural uses. There are no lands designated as Important Farmland within any off-site Project feature sites. Therefore, a less than significant impact would occur and no mitigation is required.

***Impact Summary:*** The Project will result in the conversion of approximately 642 acres of on-site Prime Farmland, for which there is no feasible mitigation to reduce this impact to a less than significant level. Therefore, this would be significant and unavoidable impact related to conversion of farmland.

**Threshold 5-2      Would the project conflict with existing zoning for agricultural use, with a designated Agricultural Opportunity Area, or with a Williamson Act contract?**

### ***On-Site Impacts***

The AVAP land use designations on the Project site include: H5: Residential 5 (0-5 dwelling units [du]/gross acre); OS-C: Open Space Conservation; CR: Rural Commercial; RL1: Rural Land 1 (1 du/1 gross acre); IL: Light Industrial; and RL2: Rural Land 2 (1 du/2 gross acres). The AVAP zoning on the Project site includes A-1-2: Light Agriculture; OS: Open Space; RPD: Residential Planned Development; CPD-DP: Commercial Planned Development; and MPD-DP: Manufacturing industrial planned development. The A-1-2 zone is located on the lands to the east of 300<sup>th</sup> Street West. The Project site is designated on the AVAP zoning map as within the West EOA (DRP 2015a).

In its Resolution approving the AVAP, the County Board of Supervisors directed staff to prepare amendments to the Zoning Code that were consistent with, and implement, the AVAP. The AVAP also removed the Agricultural Resource Area designations on the Project site. The Zoning designations for the Project site were amended to be consistent with the AVAP as part of the routine Zoning Code update process for the AVAP.

Because the Project site is not currently zoned to support development of the specific uses proposed in the Project, a zone change is required upon adoption of the Project. The *California Government Code* establishes the authority for Cities and Counties to adopt specific plans either by resolution as policy, or by ordinance as regulation. The *Centennial Specific Plan* is a regulatory plan that would be considered for adoption by ordinance by the County of Los Angeles Board of Supervisors.

The purpose of this EIR is to assess the environmental effects from implementing the proposed land uses if the Project were adopted. As such, the adoption of the *Centennial Specific Plan* would require a discretionary zone change to be made by the County that is consistent with, and would help implement, the AVAP—specifically the Rural Preservation Strategy and associated Policy LU 1.1—as it applies to the Project site. Specifically, implementation of the Project would focus residential, employment-generating, and civic land uses (e.g., library, post office, schools) within a designated Economic Opportunity Area, thereby facilitating preservation of agricultural and other rural development. Project consistency with the AVAP and zoning code is addressed in greater detail in Section 5.8, Land Use, Planning, and Entitlements.

Also, there are no Williamson Act contracts on site, or within Los Angeles County (outside of Catalina Island). Therefore, there would be no conflict with applicable agricultural land use policies if the County adopts the Project. There would be a less than significant impact and no mitigation is required.

### ***Off-Site Impacts***

There are no lands zoned as, or being used for, agriculture, nor are there any Williamson Act contracts within any off-site Project features (intersections with SR-138, utility connections, water wells, and California Aqueduct crossings). Therefore, a less than significant impact would occur and no mitigation is required.

***Impact Summary:*** The adoption of the Project will be a discretionary zone change to be made by the County that is consistent with, and would help implement, the AVAP—specifically the Rural Preservation Strategy and associated Policy LU 1.1—as it applies to the Project site. The Project is consistent with the AVAP, and would not conflict with any local land use plans, policies, or zoning designations for agricultural use. The Project site is not subject to a Williamson Act contract. There would be a less than significant impact, and no mitigation is required.

**Threshold 5-3**      **Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code, Section 12220[g]), timberland (as defined by Public Resources**

---

**Code, Section 4526), or timberland zoned Timberland Production (as defined by Government Code, Section 51104[g])?**

***On-Site Impacts***

According to the *California Public Resources Code* (Section 12220[g]), “forest land” is defined as “land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits”.

The *California Public Resources Code* (Section 4526) defines “timberland” as follows:

land, other than land owned by the federal government and land designated by the board<sup>5</sup> as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial tree species shall be determined by the board on a district basis after consultation with the district committees and others.

The *California Government Code* (Section 51104[g]) defines “Timberland Production Zone” as an area that “is zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses”. As discussed above, the only agricultural zoning on the Project site is the A-1-2: Light Agriculture zone located on the lands to the east of 300<sup>th</sup> Street West. This zoning allows tree crops as a permitted use. Although the remainder of the Project site is not zoned for agricultural uses under the AVAP, an approximate 13-acre area in the northwestern corner of the site is identified as containing montane hardwood resources, and approximately 883 acres in the southwestern and southeastern portions of the site are identified as containing primarily mixed chaparral (approximately 553 acres) as well as blue oak woodland, blue oak-foothill pine, juniper, and pinyon-juniper resources (approximately 330 acres) on maps prepared by the California Department of Fire and Forestry Protection’s Fire and Resource Assessment Program (FRAP 2006). It is noted that the statewide mapping of forest and timber resources as part of the FRAP is separate from the vegetation mapping performed for the Project site, and is used herein solely for the determination of potential forest and timber resources. Finally, no part of the Project site is zoned as a Timberland Production Zone.

As discussed further in Section 5.7, Biological Resources, the proposed development areas of Project site have been used for open grazing for over 150 years and, as a result the majority of the on-site acreage consists of grasslands that do not support a large number of tree species. While the existing zoning in the easternmost portion of the site allows for tree crop production, these lands have never been managed for forest resources including for timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, or for other public benefits. Further, the Department of Forestry and Fire Protection regulations (Section 895.1) define commercial species of trees for each forest district. The Project site does not contain

---

<sup>5</sup> “Board” is further defined as the State Board of Forestry and Fire Protection.

any trees listed as a “commercial species” for the applicable Southern Forest District as defined in the applicable regulations.

While the Project will not allow for tree crop production as a permitted use as in the existing condition, it would allow some agricultural uses (including growth and sale of nursery stock as well as crop production for crops such as Christmas trees) as interim uses. Regardless, implementation of the Project would not conflict with zoning for forest land or timberland as the Project site is not used for forest land or timberland resources and is not considered forest land or timberland by the County or the State. Finally, the Project will not conflict with zoning for timberland or a Timberland Production Zone, as the site has not been designated as such. There would be no impact to forest land and no mitigation is required.

### ***Off-Site Impacts***

Like the Project site, the locations of off-site Project features (intersections with SR-138, utility connections, water wells, and California Aqueduct crossings) have never been managed for forest land or timberland resources. The off-site Project features are not zoned for forest, timberland, or as a Timberland Production Zone. There would be no impact to forest land and no mitigation is required.

***Impact Summary:*** While the Project will not allow for tree crop production as a permitted use as in the existing condition, it would allow some agricultural uses (including growth and sale of nursery stock as well as crop production for crops such as Christmas trees) as interim uses. Regardless, implementation of the Project would not conflict with zoning for forest land or timberland as the Project site is not used for forest land or timberland resources and is not considered forest land or timberland by the County or the State. Finally, the Project will not conflict with zoning for timberland or a Timberland Production Zone, as the site has not been designated as such. There would be no impact and no mitigation is required.

**Threshold 5-4      Would the project result in the loss of forest land or conversion of forest land to non-forest use?**

### ***On-Site Impacts***

As discussed above under Threshold 5-3, the Project site is not used for forest land or timberland resources, and it is not considered forest land or timberland by the County or the State. There is no forest land on or near the site that would be directly or indirectly converted as a result of the Project. There would be no impact to forest land and no mitigation is required.

While there are no forest lands, there are trees and woodland areas on the Project site and the impacts to these are addressed in Section 5.7, Biological Resources. Further information on carbon sequestration and how it relates to impacts to vegetation is discussed in Section 5.21, Climate Change.

### ***Off-Site Impacts***

Like the Project site, the off-site Project features (intersections with SR 138, utility connections, water wells, and California Aqueduct crossings) are not considered forest land or timberland. There would be no impact and no mitigation is required.

***Impact Summary:*** There is no forest land or timberland on or near the site that would be directly or indirectly converted as a result of the Project. There would be no impact to forest land and no mitigation is required.

**Threshold 5-5**      **Would the project involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest land?**

### ***On-Site and Off-Site Impacts***

Threshold 5-5 refers to the potential for Farmland or forest land to be converted as an indirect impact (i.e., either in another location/off-site or in the future) due to implementation of the Project. As such, both on-site and off-site impacts are addressed together. Indirect conversion of agricultural uses or forest land can occur where a Project provides infrastructure (e.g., roads, utilities) or another change in land use that provides incentive for other agricultural or forest land landowners to convert their lands to non-agricultural or non-forest land uses. All physical direct and indirect impacts of Project implementation, both on-site and off-site, are addressed under Thresholds 5-1 and 5-4 above. There would be no other changes in the environment not addressed under Thresholds 5-1 and 5-4 that would indirectly result in conversion of Farmland to non-agricultural use or forest land to non-forest land use. The potential growth-inducing impacts of the Project are discussed in Section 6.0, Growth-Inducing Impacts.

***Impact Summary:*** There would be no other changes in the environment not addressed under Thresholds 5-1 and 5-4 that would indirectly result in conversion of Farmland to non-agricultural use or forest land to non-forest land use. The potential growth-inducing impacts of the Project are discussed in Section 6.0, Growth-Inducing Impacts.

### **Mitigation Measures**

There is no feasible mitigation available to reduce significant impacts from the direct conversion of 642 acres of Prime Farmland. Potential mitigation in the form of establishing 642 acres of new farming areas on Tejon Ranch has been investigated and determined to be infeasible due to insufficient available land that could be cultivated to meet Prime Farmland standards with limitations imposed by the implementation of the Tejon Ranch Conservation and Land Use Agreement and other existing and proposed development on Tejon Ranch, as previously discussed. Therefore the conversion of Prime Farmland to non-agricultural use would be a significant and unavoidable impact.

## Level of Significance after Mitigation

The conversion of 642 acres of on-site Prime Farmland to urban uses would remain a significant and unavoidable impact.

### 5.5.3 MINERAL RESOURCES

#### Relevant Plans, Policies, and Regulations

##### *Federal*

There are no applicable federal plans, policies or regulations regarding mineral resources.

##### *State*

##### Mineral Resources and Mineral Hazards Mapping Program

The California Geological Survey (CGS) provides geologic expertise and information about California's diverse non-fuel mineral resources. As required by the Surface Mining and Reclamation Act (SMARA) of 1975, the State Geologist classifies these resources in an effort to locate economically significant mineral deposits and potential areas of deposits based on scientific data. Information relating to California's non-fuel resources, naturally occurring mineral hazards, and active and historic mining activities are collected to classify land under the Mineral Resources and Mineral Hazards Mapping Program. To date, the CGS has completed 97 mineral land classification studies that cover about 34 percent of the state. Of these, only 32 classification studies (covering approximately 25 percent of the state) include the resource areas that provide construction aggregate to over 90 percent of California's population. Construction aggregate is California's primary mineral resource (CGS 2015a).

The CGS defines several geographic areas that collectively cover a single mineral classification study as "Production-Consumption Regions" (P-C Regions). The CGS identifies Mineral Resource Zones for each P-C Region, mine/quarry, or other geographic area included in a mineral classification study. Mineral Resource Zones (MRZs) are areas classified by the presence or absence of significant sand, gravel, or stone deposits that are suitable as sources of aggregate, as described below.

- **MRZ-1:** Mineral Resource Zone where adequate information indicates that no significant mineral deposits are present or likely to be present.
- **MRZ-2:** Mineral Resource Zone where adequate information indicates that several mineral deposits are present or that there is a high likelihood of their presence so development should be controlled.
- **MRZ-3:** Mineral Resource Zone where the significance of mineral deposits cannot be determined from the available data.
- **MRZ-4:** Mineral Resource Zone where there is insufficient data to assign any other MRZ designation.

Lands not addressed by the CGS regarding their mineral content, either within a P-C Region or outside a mineral classification area, are defined as “unclassified”.

### **County**

#### Los Angeles County General Plan and Antelope Valley Area Plan

The *Los Angeles County General Plan* and the AVAP, part of the County General Plan, address mineral resource issues that affect the County. There are no goals and policies related to mineral resources applicable to the Project, as there are no County- or State-designated mineral resource areas on or near the site, as discussed further below.

### **Environmental Setting**

The Project site is not known to contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits. It is known that the National Cement Plant, located in Kern County approximately one mile north of the Project site, quarries aggregate on site as part of their operations. However, there are no records or other evidence of aggregate being located on the Project site.

According to the CGS, the Project site is within an “unclassified” area of both the Saugus-Newhall and Palmdale Production-Consumption Regions (CGS 2015b). The County General Plan and the AVAP do not identify “Mineral Resource Zones” within or near the Project site. Moreover, these documents do not identify mineral resources of interest anywhere in the northwestern quadrant of Los Angeles County. For additional information on potential oil and gas wells on site please refer to Section 5.3, Hazards and Fire Safety.

### **Project Design Features**

There are no PDFs identified for mineral resources.

### **Threshold Criteria**

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist that was in place when the NOP was released. The Project will result in a significant impact if it would:

**Threshold 5-6**      Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.

**Threshold 5-7**      Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.

### **Environmental Impacts**

**Threshold 5-6**      **Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?**

**Threshold 5-7**      **Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?**

### ***On-Site Impacts***

As discussed above, based on consultation with CGS regarding MRZ in the Project vicinity and review of the County General Plan and AVAP, the Project site is not known to contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits. As discussed above, while it is known that the Cement Plant, located north of the Project site, quarries aggregate, there is no evidence of aggregate or other mineral resources being located on the Project site itself. Therefore, Project implementation would not result in the loss of availability of a known mineral resource that would be of value to the region and residents of the State, nor would it create the loss of availability of a locally important mineral resource recovery site. Therefore, there would be no impact.

### ***Off-Site Impacts***

Because there are no known mineral resources on or in the vicinity of the Project site where off-site Project features would be located, implementation of off-site Project features would not result in an impact related to loss of availability of a mineral resource of State or local value. Additionally, because there are no known mineral resources on or in the vicinity of the Project site within Caltrans right-of-way, the Project will not result in an impact related to loss of availability of a mineral resource of State or local value.

***Impact Summary:*** The Project will not result in impacts related to the loss of known mineral resources because there are no known mineral resources on the Project site.

## **Mitigation Measures**

There would be no impacts to mineral resources; therefore, no mitigation measures are required.

## **Level of Significance After Mitigation**

Due to the lack of identified mineral resources on the Project site, implementation of the proposed development would not result in impacts to mineral resources.

## 5.5 LAND RESOURCES

This section of the Draft Environmental Impact Report (EIR) describes the potential impacts to agricultural, forest, and mineral resources from implementation of the Project.

### 5.5.1 INTRODUCTION

#### **Purpose**

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that agricultural, forest, and mineral resource issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### **Summary**

The Project will result in the conversion of approximately 642 acres of on-site Prime Farmland. The Project site is identified as being within the West Economic Opportunity Area (EOA), one of three EOAs established by the Antelope Valley Area Plan (AVAP). The EIR for the AVAP considered the impacts of converting a total of 6,169 acres of Important Farmland and concluded that the conversion would be a significant and unavoidable impact (DRP 2014). Although the Project is consistent with the AVAP's land use policy, the Project would not result in any new impacts to agricultural lands, and the Project would allow for continued grazing activity and small-scale agriculture and agriculture-related uses (PDF 5-1), because the Project is directly facilitating the conversion of 642 acres of Prime Farmland to non-agricultural uses, it is considered a significant impact of the Project. For the same reasons as described in the AVAP EIR, there is no feasible mitigation to reduce this impact to a less than significant level, and therefore would be a significant unavoidable impact of the Project.

The adoption of the Project will require a discretionary zone change to be made by the County that is consistent with, and would help implement, the AVAP—specifically the Rural Preservation Strategy and associated Policy LU 1.1—as it applies to the Project site. Also, there are no Williamson Act contracts onsite, or within Los Angeles County (outside of Catalina Island). Therefore, there would be no conflict with applicable agricultural land use policies if the County adopts the Project.

As discussed above, the only agricultural zoning on the Project site is the A-1-2: Light Agriculture zone located on the lands to the east of 300<sup>th</sup> Street West. This zoning allows tree crops as a permitted use. Although the remainder of the Project site is not zoned for agricultural uses under the AVAP, an approximate 13-acre area in the northwestern corner of the site is identified as containing montane hardwood resources and approximately 883 acres in the southwestern and southeastern portions of the site are identified as containing primarily mixed chaparral (approximately 553 acres) as well as blue oak woodland, blue oak-foothill pine, juniper, and pinyon-juniper resources (approximately 330 acres) on maps

prepared by the California Department of Fire and Forestry Protection's Fire and Resource Assessment Program (FRAP 2006). It is noted that the statewide mapping of forest and timber resources as part of the FRAP is separate from the vegetation mapping performed for the Project site, and is used herein solely for the determination of potential forest and timber resources. Finally, no part of the Project site is zoned as a Timberland Production Zone.

As discussed further in Section 5.7, Biological Resources, the proposed development areas of the Project site have been used for open cattle grazing for over 150 years and, as a result the majority of the on-site acreage consists of grasslands that do not support a large number of tree species. While the existing zoning in the easternmost portion of the site allows for tree crop production, these lands have never been managed for forest resources including for timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, or for other public benefits. Further, the Department of Forestry and Fire Protection regulations (Section 895.1) define commercial species of trees for each forest district. The Project site does not contain any trees listed as a "commercial species" for the applicable Southern Forest District as defined in the applicable regulations. Project implementation would not conflict with zoning for forest land or timberland as the Project site is not used for forest land or timberland resources and is not considered forest land or timberland by the County or the State. The Project will not conflict with zoning for timberland or a Timberland Production Zone, as the site has not been designated as such. There would be no impact to forest land and no mitigation is required

Project implementation would not result in impacts related to the loss of known mineral resources because there are no known mineral resources on the Project site or the off-site Project features.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Agricultural and Forest Resources
  - Relevant Plans, Policies, and Regulations
  - Environmental Setting
  - Project Design Features

- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance after Mitigation
- Mineral Resources
  - Relevant Plans, Policies, and Regulations
  - Environmental Setting
  - Project Design Features
  - Threshold Criteria
  - Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
    - On-Site Impacts
    - Off-Site Impacts
  - Mitigation Measures
  - Level of Significance After Mitigation

All references cited for preparation of this analysis are listed in Section 5.5.4.

## 5.5.2 AGRICULTURAL AND FOREST RESOURCES

### Relevant Plans, Policies, and Regulations

#### *Federal*

There are no applicable federal plans, policies, or regulations regarding agricultural or forest resources.

#### *State*

##### Farmland Mapping and Monitoring Program

The Farmland Mapping and Monitoring Program (FMMP) is a non-regulatory program that provides a consistent and impartial analysis of agricultural land use and land use changes throughout California. The FMMP provides land use conversion information for decision makers to use in their planning for present and future use of California's agricultural resources. As part of the nationwide agricultural land use mapping effort, the U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS, formerly Soil Conservation Service [SCS]) developed a series of definitions known as Land Inventory and Monitoring (LIM) criteria. The LIM criteria classify the land's suitability for agricultural production; suitability includes both the physical and chemical characteristics

of soils and actual land use. Important Farmland Maps have been derived from the NRCS soil survey maps using the LIM criteria.

Since 1980, the State of California has assisted the NRCS in completing its mapping of the state. The FMMP was created by the California Department of Conservation (DOC) to carry out the mapping activity on a continuing basis and with a greater level of detail, which they did by modifying the LIM criteria for use in California. The California LIM criteria utilize the NRCS and Storie Index Rating systems,<sup>1</sup> and also consider other physical conditions such as the following: water moisture regimes, available water capacity, and developed irrigation water supply; soil temperature range; acid-alkali balance; water table; soil sodium content; flooding (uncontrolled runoff from natural precipitation); erodibility; permeability rate; rock fragment content; and soil rooting depth. The following farmland classifications are based on information from the Department of Conservation Division of Land Resources Protection's, *A Guide to the Farmland Mapping and Monitoring Program* (DOC 2004):

- **Prime Farmland (P).** Prime Farmland is land which has the best combination of physical and chemical characteristics for the long-term production of agricultural crops. It has the soil quality, growing season, and moisture supply needed to produce sustained high yields of crops when treated and managed (including water management) according to current farming methods. The land must have been used for the production of irrigated crops at some time during the two previous cycles prior to the mapping date.<sup>2</sup> It does not include publicly owned lands for which there is an adopted policy that prevents agricultural use.
- **Farmland of Statewide Importance (F).** Farmland of Statewide Importance is land other than Prime Farmland that has a good combination of physical and chemical characteristics for the production of crops. It must have been used for the production of irrigated crops at some time during the two previous cycles prior to the mapping date. It does not include publicly owned lands for which there is an adopted policy that prevents agricultural use.
- **Unique Farmland (U).** Unique Farmland is land that does not meet the criteria for Prime Farmland or Farmland of Statewide Importance. It must be currently used for the production of specific high-economic value crops (as listed in the last three years of *California Agriculture* produced by the California Department of Food and Agriculture). It has the special combination of soil quality, location, growing season, and moisture supply needed to produce sustained high quality or a high yield of a specific crop when treated and managed according to current farming methods. Examples of such crops may include oranges, olives, avocados, rice, grapes, and cut flowers. This land is usually irrigated, but may include non-irrigated orchards or vineyards, as found in some climatic zones in California. The land must have been cultivated at some time during the two cycles prior to the mapping date.

---

<sup>1</sup> The Storie Index provides a numeric rating (based upon a 100 point scale) of the relative degree of suitability or value of a given soil for intensive agriculture. The rating is based on four soil characteristics that represent the inherent characteristics and qualities of the soil, which are considered in the index rating. The four factors are profile characteristics, texture of the surface layer, slope, and other factors (e.g., drainage, salinity) (DOC 1997).

<sup>2</sup> A cycle is approximately two years.

- **Farmland of Local Importance (L).** Farmland of Local Importance is of importance to the local agricultural economy and is determined by each County’s Board of Supervisors and a local advisory committee. According to the DOC, Farmland of Local Importance in Los Angeles County includes producing lands that would meet the standard criteria for Prime Farmland or Farmland of Statewide Importance, but which are not irrigated (DOC 2004).
- **Grazing Land (G).** Grazing Land is land on which the existing vegetation, whether grown naturally or through management, is suitable for livestock grazing. The minimum mapping unit for Grazing Land is 40 acres.
- **Urban and Built-Up Land (D).** Urban and Built-Up Land is occupied with structures that have a building density of at least one unit to one-half acre or approximately six structures to a ten-acre parcel.<sup>3</sup>
- **Other Land (X).** This category is for land that is not included in any other mapping categories. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry, or aquaculture facilities; strip mines; borrow pits; and water bodies smaller than 40 acres. Vacant and nonagricultural land that is surrounded on all sides by urban development and is greater than 40 acres is mapped as “Other Land”.

For CEQA purposes, Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance are collectively defined as “Important Farmland”. Grazing Land is also considered a farmland category, but is not included in the “Important Farmland” definition.

### California Land Conservation Act

The California Land Conservation Act (LCA), also known as the Williamson Act, was adopted in 1965 to encourage the preservation of the state’s agricultural lands and to prevent their premature conversion to urban uses. In order to preserve these agricultural uses, the Williamson Act established an agricultural preserve contract procedure by which any California County or City can tax landowners at a lower rate, using a scale based on the actual use of the land for agricultural purposes, as opposed to its unrestricted (i.e., “fair”) market value. In return, landowners guarantee that their properties will remain under agricultural production for at least a ten-year period. The contract is renewed annually for an additional year automatically unless the owner files a notice of non-renewal. In this manner, each agricultural preserve contract (at any given date) is always operable at least nine years into the future. The only lands in Los Angeles County under Williamson Act Contract are located on Catalina Island (DOC 2016b). As such, no part of the Project site is under Williamson Act Contract.

---

<sup>3</sup> A “unit” is defined as a structure or foundation on which uses associated with development are placed. Uses may include and are not limited to residential, industrial, commercial, construction, institutional, public administration purposes, railroad yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants, water-control structures, and other development purposes. Highways, railroads, and other transportation facilities are mapped as part of this unit if they are part of a surrounding urban area.

## Right-to-Farm Ordinances

Right-to-Farm Ordinances have been adopted by several California Counties to protect farmers in established farming areas from legal action that new residents in nearby urban settings may take against nuisances associated with normal, day-to-day farming activities (e.g., odor, noise, dust). Los Angeles County does not have a Right-to-Farm Ordinance.

### *County*

#### Los Angeles County General Plan and Antelope Valley Area Plan

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, part of the County General Plan, includes goals and policies that address agricultural issues in the unincorporated County. As discussed further below, the Project site is identified in the AVAP as within the West EOA, one of three EOAs established by the AVAP where increased residential, commercial, and industrial uses are encouraged while preserving the rural character and ecological resources of the surrounding areas, including agricultural activity. The AVAP goal and policy applicable to the analysis of agriculture resources with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal LU 1:** A land use pattern that maintains and enhances the rural character of the unincorporated Antelope Valley.

**Policy LU 1.1:** Direct the majority of the unincorporated Antelope Valley's future growth to rural town center areas and identified economic opportunity areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

## **Environmental Setting**

### ***Agriculture Resource Planning in the Antelope Valley***

Development of the Antelope Valley started in 1876 and the developing communities were dependent upon stock raising, dry farming, and fruit orchards. While the years during and after World War II saw military investments come to prominence, this type of development declined, and the final decades of the 20th century saw the Antelope Valley emerge with major new housing opportunities as vast acreages were subdivided for affordable tract homes. Farming regained its status as a productive employer, but the area continued to develop without balancing the growth in housing with a corresponding growth in jobs and investment in infrastructure.

The AVAP was adopted by the County Board of Supervisors on June 16, 2015, which updates and supersedes the previous Antelope Valley Areawide General Plan adopted in 1986 (DRP 2015c). The AVAP is centered on the Rural Preservation Strategy, developed to reflect the community's desire to maintain the rural attributes of the Antelope Valley while acknowledging the "growing populations need for additional housing and employment opportunities. . ." per the AVAP's vision statement (DRP 2015a). As discussed in the AVAP,

the Rural Preservation Strategy is based on four types of environments—Rural Town Center Areas, Rural Town Areas, Rural Preserve Areas, Economic Opportunity Areas—that serve different purposes. Collectively, these environments preserve the rural character of the region, conserve environmental resources, and protect residents from potential hazards while allowing for additional growth and development (DRP 2015a). [SEP]

In Rural Town Center Areas and Rural Town Areas, the amount of potential development allowed by the AVAP will be equal to, or greater than, the amount of potential development allowed by the previous Area Plan. Therefore, those areas are likely to benefit from increased property tax revenues and developer fees, which can help fund additional infrastructure. EOAs are defined clusters of land along the routes of two new proposed major infrastructure projects in the Antelope Valley (i.e. the High Desert Corridor and the Northwest 138 Corridor Improvement Project), which are expected to indirectly generate growth and development. The EOAs maximize the investment of State and regional agencies in public infrastructure while achieving the general goal of rural preservation in the Antelope Valley. Any development induced by these two infrastructure projects is intended be guided to EOAs in order for surrounding areas to be preserved and maintained at low density or agricultural uses ( DRP 2015a). The Project site is in the West EOA.

### ***Contribution of Agriculture to the Los Angeles County Economy***

According to the most recent data from the California Department of Food and Agriculture (CDFA), the County of Los Angeles is ranked 33<sup>rd</sup> in the state for agricultural production market value, with 2013–2014 gross revenues of approximately \$230,068,000. The leading commodity crops included woody ornamental and other nursery plants, vegetables, fruits and nuts, and hay (CDFA 2015).

### ***Farmland Conversion Trends in Los Angeles County***

Agricultural land conversion has a long history in Los Angeles County; the extent of this conversion is reflected in Table 5.5-1, Los Angeles County Agricultural Acres per Crop 1970–2014.

**TABLE 5.5-1  
LOS ANGELES COUNTY AGRICULTURAL ACRES PER CROP 1970–2013**

Crop	Acreage						1970-2014 % Change <sup>c</sup>
	1970	1980	1990	2002 <sup>a</sup>	2010	2014 <sup>b</sup>	
Fruit and Nut Crops	7,829	3,032	1,889	1,692	1,913	764	(90)
Vegetable Crops	6,592	6,446	2,926	12,934	4,472	6,765	3
Nursery Products	1,972	2,280	2,160	2,240	2,071	1,530	(22)
Flowers and Foliage	656	490	235	72	81	88	(87)
Field Crops	57,890	42,298	8,683	8,458	15,985	11,147	(81)
<b>Average Change:</b>							<b>(57)</b>
<sup>a</sup> Current at time the NOP was released in 2004. <sup>b</sup> Most current information available in January 2017. <sup>c</sup> Numbers in parentheses denote negative numbers. Sources: LACFB 2014, 2010; LACAC 2000, 1990, 1980, 1970.							

As shown in Table 5.5-1, the total acreage in production for all crop types has varied over time, with an approximate average net reduction in acreage of 57 percent of these crops since 1970 as shown in the last column. The 2014 value of agricultural commodities in Los Angeles County was \$229,686,760, which includes all the crop types listed above as well as livestock production, forest products, and apiary that are not measured in acreages (LACFB 2014). However, according to the AVAP Draft EIR, agricultural production has increased in the Antelope Valley since the mid-1990s due to the increase in production of vegetable crops (mainly onions and carrots) and fruit crops (mainly peaches)—28 percent and 15 percent, respectively (DRP 2014).

In addition to considering agricultural production, the following discussion considers the coverage of FMMP-designated farmlands, which does not account for the type or amount of crops on that land. Table 5.5-2, Farmland Mapping and Monitoring Program Resources in Los Angeles County 2000–2014, provides an overview of the amount of FMMP-designated lands present in the County and the percent change in each category over that period. The 2012–2014 period is the most recent FMMP data published by the California Department of Conservation.

**TABLE 5.5-2  
FARMLAND MAPPING AND MONITORING PROGRAM RESOURCES  
IN LOS ANGELES COUNTY 2000-2014**

Category	Acreage				2002- 2014 % Change <sup>c</sup>
	2002 <sup>a</sup>	2006	2012	2014 <sup>b</sup>	
Prime Farmland	32,187	32,611	27,733	25,427	(21)
Farmland of Statewide Importance	939	1,024	841	826	(12)
Unique Farmland	1,155	1,024	1,088	1,066	(8)
Farmland of Local Importance	8,171	8,975	5,671	3,964	(51)
<i>Subtotal Important Farmland</i>	<i>42,452</i>	<i>43,634</i>	<i>35,333</i>	<i>31,283</i>	<i>(26)</i>
Grazing Land	233,399	228,729	235,829	237,069	2
<b>Total FMMP Lands</b>	<b>275,851</b>	<b>272,363</b>	<b>271,162</b>	<b>268,352</b>	<b>(3)</b>

FMMP: Farmland Mapping and Monitoring Program; NOP: Notice of Preparation

<sup>a</sup> Current at time the NOP was released in 2004. Acreage was calculated in 2002 using the rectified imagery, which resulted in significant boundary adjustments, particularly in areas with terrain. A large reclassification from Farmland of Local Importance to Grazing Land is due to these factors and an analysis of the long-term idling of dryland farming areas.

<sup>b</sup> Most current information available in January 2017.

<sup>c</sup> Numbers in parentheses denote negative numbers.

Source: DOC 2017.

As shown in Table 5.5-2, the acreage of Important Farmland collectively decreased approximately 26 percent and Grazing Land remained stable (approximate 2 percent increase). For additional context, historic land use conversion data for Los Angeles County available for the past 20 years, from 1984 through 2014, shows a decrease in Important Farmland of 29,594 acres (49 percent) and an increase in Grazing Land of 7,306 acres (3 percent) over this period (DOC 2017). The AVAP Draft EIR identifies a total of 24,443 acres of Important Farmland within the AVAP planning area, which includes only unincorporated portions of the Antelope Valley (LACDRP 2014).

The FMMP also tracks the acres of “Land Committed to Nonagricultural Use” as an optional category and is defined as existing farmland, grazing land, and vacant areas that have a permanent commitment for development. Table 5.5-3, Lands Committed to Non-Agricultural Use in Los Angeles County 2002-2010, summarizes the lands placed in this category in each two-year mapping cycle. The land committed to non-agricultural use is not reported in the 2010-2012 or 2012-2014 data, the most recent FMMP data.

**TABLE 5.5-3  
AGRICULTURAL LANDS COMMITTED TO NON-AGRICULTURAL USE  
IN LOS ANGELES COUNTY 2002-2010**

FMMP Category	Acreage			
	2002-2004	2004-2006	2006-2008	2008-2010
Prime Farmland	46	46	46	44
Farmland of Statewide Importance	0	0	0	0
Unique Farmland	0	0	0	0
Farmland of Local Importance	0	0	0	0
<i>Subtotal Important Farmland</i>	46	46	46	44
Grazing Land	2,278	2,258	2,246	2,212
<b>Totals</b>	<b>2,324</b>	<b>2,304</b>	<b>2,292</b>	<b>2,256</b>
FMMP: Farmland Mapping and Monitoring Program Source: DOC 2017.				

As shown in Table 5.5-3, in 2010, 44 acres of Prime Farmland and slightly more than 2,200 acres of Grazing Land were developed as non-agricultural uses in Los Angeles County, which is a slight reduction when compared to previous 2-year mapping periods.

#### ***On-Site Farmland Mapping and Monitoring Program Designations and Agricultural Production***

Table 5.5-4 below summarizes the acres of FMMP-designated lands on the Project site, based on the most recent FMMP data publicly available. The Centennial Project site contains approximately 642 acres of land designated as Prime Farmland, with the majority of the site (approximately 11,616 acres) designated as Grazing Land (2016a). These acreages represent approximately 2.5 percent of the Prime Farmland and approximately 4.9 percent of the Grazing Land, respectively, designated under the FMMP in the County of Los Angeles in 2014 (DOC 2017). The Project site includes no lands that are designated as Farmland of Statewide Importance, Unique Farmland, or Farmland of Local Importance. The on-site Prime Farmland represents approximately 10.4 percent of the Important Farmland in the AVAP planning area (6,169 acres).

**TABLE 5.5-4  
FARMLAND MAPPING AND MONITORING PROGRAM DESIGNATIONS  
AND ACREAGES ON THE CENTENNIAL PROJECT SITE**

FMMP Category	Acreage
Prime Farmland	642
Grazing Land	11,616
Other Land, and Vacant and Disturbed Land	65
<b>Total</b>	<b>12,323</b>
FMMP: Farmland Mapping and Monitoring Program	
Source: DOC 2016a.	

The distribution of classified farmland on the Project site is illustrated on Exhibit 5.5-1, Important Farmland (FMMP Designations). As shown, the majority of the surrounding lands are designated as Grazing Land, and there are two small, discrete areas of Prime Farmland located off site to the northeast of the site.

Land in agricultural production is defined as either being farmed for crop production or as being used for rangeland cattle grazing. Exhibit 5.5-2, Current On-Site Agricultural Uses, shows the current agricultural uses on the Project site. The Project site has been used for open grazing for over 150 years. The Tejon Ranch Company currently leases the Project site to an independent company for grazing and agricultural uses. Approximately 10,950 acres (89 percent) of the Project site are currently used for grazing. This is somewhat less than the area designated as Grazing Land, pursuant to the FMMP, as described in Table 5.5-4. The grazing area is spread almost entirely across the site, and grazing occurs in the spring. The total area of grazing acreage on the Project site represents approximately 5 percent of the 237,069 acres of grazing land in Los Angeles County in the year 2014. To date, the grazing on site is not managed for biological resources. Cattle can graze on any portion of the site regardless of sensitive habitats or plant species that may be present.

In addition to grazing, the Tejon Ranch Company owns and cultivates approximately 1,000 acres in the eastern portion of the Project site as pivot fields.<sup>4</sup> These 1,000 acres include 5 separate pivot fields that correlate with the approximate 642 acres of Prime Farmland on the site (see Table 5.5-4 and Exhibit 5.5-1). Each pivot field is a circle within a square parcel. Therefore, each pivot field has adjacent lands in each parcel that are indirectly involved in the production activities (e.g., equipment access, water infrastructure) but do not directly produce crops. These “edge” lands outside the pivot circles comprise the difference between the 642 acres of Prime Farmland and the total of approximately 1,000 acres of land (i.e., approximately 348 acres) under cultivation Tejon Ranch Company. The pivot fields are managed for the production of either alfalfa or a three-way forage mix (e.g., barley, oats, sedan grass). The total 1,000-acre area has been cultivated by the Tejon Ranch Company since 1998. Prior to 1998, the land was used primarily for grazing.

<sup>4</sup> A “pivot field” is a circular agricultural field with a centralized “pivot” irrigation system.

# Current On-Site Agricultural Uses

# Exhibit 5.5-2

Centennial Project

### ***Agricultural Pesticide Use***

Various pesticides, some herbicides, and nitrogen fertilizers are currently used and stored on the Project site. These materials are used in the pivot fields in the eastern portion of the Project site. As agricultural activities on the site are phased out, the use of these chemicals would decline. For a more detailed discussion of current and historical on-site pesticide use, please refer to Section 5.3, Hazards and Fire Safety.

### **Project Design Features**

**PDF 5-1** Project development would allow for continued grazing operations on portions of the Open Space preserve areas as a management tool for grassland conservation, subject to the specifications of the Native Perennial Grassland and Wildflower Field Mitigation Plan to be prepared as part of the Project implementation. Additionally, the Project would accommodate a total of 50 acres of small-scale agriculture and agriculture-related uses (e.g., community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, commercial greenhouses).

### **Threshold Criteria**

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist that was in place when the Notice of Preparation (NOP) was released. The Project will result in a significant impact if it would:

- Threshold 5-1** Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.
- Threshold 5-2** Conflict with existing zoning for agricultural use, with a designated Agricultural Opportunity Area, or with a Williamson Act contract.
- Threshold 5-3** Conflict with existing zoning for, or cause rezoning of forest land (as defined in Public Resources Code, Section 12220[g]), timberland (as defined by Public Resources Code, Section 4526), or timberland zoned Timberland Production (as defined by Government Code, Section 51104[g]).
- Threshold 5-4** Result in the loss of forest land or conversion of forest land to non-forest use.
- Threshold 5-5** Involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest land use.

## Environmental Impacts

**Threshold 5-1**      **Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?**

### *On-Site Impacts*

As shown on Exhibit 5.5-1, the lands designated as Prime Farmland are located in the easternmost portion of the site. As shown on Exhibit 4-1, Centennial Project – Conceptual Land Use Plan, this land is proposed to be developed as residential, commercial, and business park uses. Therefore, Project implementation would result in the conversion of approximately 642 acres of Prime Farmland to urban and other land uses, which is a significant impact under CEQA. Lands that the California Department of Conservation has designated as Farmland of Statewide Importance or Unique Farmland are not present on the Project site. Conversion of Other Land or Grazing Land to non-agricultural uses is not considered a significant impact under CEQA. As described in PDF 5-1, the Project would allow for continued grazing operations on selected open space areas as a management tool for grassland conservation. While to date, grazing has not been specifically managed throughout the site for habitat or biological resources, once the Project is approved, all future grazing activities would be managed in an effort to protect sensitive species present on the site while providing a beneficial impact to native grassland and wildflower fields, as described in PDF 5-1.

Also, the Project would accommodate a total of 50 acres of small-scale agriculture and agriculture-related uses, including, but not limited to community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, and commercial greenhouses (PDF 5-1). However, these activities may or may not occur within the 642 acres of the site currently designated as Prime Farmland. In addition, Tejon Ranch will put an agricultural preservation easement of not less than 489 acres of Prime and Unique farmland outside of the Project site, but on the Tejon Ranch property.

The AVAP EIR considered the impacts of converting a total of 6,169 acres of Important Farmland based on the proposed land use designations considered incompatible with continued agricultural use, and maintaining 17,855 acres (or approximately 74 percent of the AVAP planning area), in land use designations considered compatible with agricultural use. By focusing future urban development in the EOAs and, to a lesser extent, the Rural Town Center Areas and Rural Town Areas, the AVAP EIR concluded that the overall rural character and agricultural uses within Antelope Valley would be preserved. However, the AVAP EIR concluded that the conversion of 6,169 acres of Important Farmland within the Antelope Valley was a significant and unavoidable impact, with no feasible mitigation measures available to reduce the impact based on current court decisions regarding agricultural mitigation as well as limited availability of land outside the AVAP planning area suitable for cultivation as Farmland in Los Angeles County (DRP 2014a).

The Project is consistent with the intent of the AVAP's land use policy that anticipates conversion of Farmland on and proximate to the site, among other areas, and the Project would not result in any new impacts to agricultural lands not previously considered in the AVAP EIR. However, Project implementation would result in the conversion of 642 acres of Prime Farmland, which is considered a direct, significant impact of the Project. Potential mitigation in the form of establishing 642 acres of new farming areas on Tejon Ranch has been investigated and determined to be infeasible with implementation of the Tejon Ranch Conservation and Land Use Agreement and other existing and proposed development on Tejon Ranch due to insufficient available land that could be cultivated to meet Prime Farmland standards.

For the same reasons as described in the AVAP EIR as well as lack of available land within Tejon Ranch that would equate to 642 acres of Prime Farmland, there is no feasible mitigation to reduce this impact to a less than significant level. Therefore, this would remain a significant unavoidable impact of the Project.

### ***Off-Site Impacts***

With the exception of isolated parcels of designated Prime Farmland areas to the northeast of the site (see Exhibit 5.5-1), all surrounding lands have been designated by the FMMP as Grazing Land and Other Land, which are both designations indicating that the land is unsuitable for agricultural cultivation. A significant impact due to conversion of Important Farmland would occur only if off-site features were to encroach on these Prime Farmland areas and convert them to non-agricultural uses. There are no lands designated as Important Farmland within any off-site Project feature sites. Therefore, a less than significant impact would occur and no mitigation is required.

***Impact Summary:*** The Project will result in the conversion of approximately 642 acres of on-site Prime Farmland, for which there is no feasible mitigation to reduce this impact to a less than significant level. Therefore, this would be significant and unavoidable impact related to conversion of farmland.

**Threshold 5-2      Would the project conflict with existing zoning for agricultural use, with a designated Agricultural Opportunity Area, or with a Williamson Act contract?**

### ***On-Site Impacts***

The AVAP land use designations on the Project site include: H5: Residential 5 (0-5 dwelling units [du]/gross acre); OS-C: Open Space Conservation; CR: Rural Commercial; RL1: Rural Land 1 (1 du/1 gross acre); IL: Light Industrial; and RL2: Rural Land 2 (1 du/2 gross acres). The AVAP zoning on the Project site includes A-1-2: Light Agriculture; OS: Open Space; RPD: Residential Planned Development; CPD-DP: Commercial Planned Development; and MPD-DP: Manufacturing industrial planned development. The A-1-2 zone is located on the lands to the east of 300<sup>th</sup> Street West. The Project site is designated on the AVAP zoning map as within the West EOA (DRP 2015a).

In its Resolution approving the AVAP, the County Board of Supervisors directed staff to prepare amendments to the Zoning Code that were consistent with, and implement, the AVAP. The AVAP also removed the Agricultural Resource Area designations on the Project site. The Zoning designations for the Project site were amended to be consistent with the AVAP as part of the routine Zoning Code update process for the AVAP.

Because the Project site is not currently zoned to support development of the specific uses proposed in the Project, a zone change is required upon adoption of the Project. The *California Government Code* establishes the authority for Cities and Counties to adopt specific plans either by resolution as policy, or by ordinance as regulation. The *Centennial Specific Plan* is a regulatory plan that would be considered for adoption by ordinance by the County of Los Angeles Board of Supervisors.

The purpose of this EIR is to assess the environmental effects from implementing the proposed land uses if the Project were adopted. As such, the adoption of the *Centennial Specific Plan* would require a discretionary zone change to be made by the County that is consistent with, and would help implement, the AVAP—specifically the Rural Preservation Strategy and associated Policy LU 1.1—as it applies to the Project site. Specifically, implementation of the Project would focus residential, employment-generating, and civic land uses (e.g., library, post office, schools) within a designated Economic Opportunity Area, thereby facilitating preservation of agricultural and other rural development. Project consistency with the AVAP and zoning code is addressed in greater detail in Section 5.8, Land Use, Planning, and Entitlements.

Also, there are no Williamson Act contracts on site, or within Los Angeles County (outside of Catalina Island). Therefore, there would be no conflict with applicable agricultural land use policies if the County adopts the Project. There would be a less than significant impact and no mitigation is required.

### ***Off-Site Impacts***

There are no lands zoned as, or being used for, agriculture, nor are there any Williamson Act contracts within any off-site Project features (intersections with SR-138, utility connections, water wells, and California Aqueduct crossings). Therefore, a less than significant impact would occur and no mitigation is required.

***Impact Summary:*** The adoption of the Project will be a discretionary zone change to be made by the County that is consistent with, and would help implement, the AVAP—specifically the Rural Preservation Strategy and associated Policy LU 1.1—as it applies to the Project site. The Project is consistent with the AVAP, and would not conflict with any local land use plans, policies, or zoning designations for agricultural use. The Project site is not subject to a Williamson Act contract. There would be a less than significant impact, and no mitigation is required.

**Threshold 5-3**      **Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code, Section 12220[g]), timberland (as defined by Public Resources**

**Code, Section 4526), or timberland zoned Timberland Production (as defined by Government Code, Section 51104[g])?**

***On-Site Impacts***

According to the *California Public Resources Code* (Section 12220[g]), “forest land” is defined as “land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits”.

The *California Public Resources Code* (Section 4526) defines “timberland” as follows:

land, other than land owned by the federal government and land designated by the board<sup>5</sup> as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial tree species shall be determined by the board on a district basis after consultation with the district committees and others.

The *California Government Code* (Section 51104[g]) defines “Timberland Production Zone” as an area that “is zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses”. As discussed above, the only agricultural zoning on the Project site is the A-1-2: Light Agriculture zone located on the lands to the east of 300<sup>th</sup> Street West. This zoning allows tree crops as a permitted use. Although the remainder of the Project site is not zoned for agricultural uses under the AVAP, an approximate 13-acre area in the northwestern corner of the site is identified as containing montane hardwood resources, and approximately 883 acres in the southwestern and southeastern portions of the site are identified as containing primarily mixed chaparral (approximately 553 acres) as well as blue oak woodland, blue oak-foothill pine, juniper, and pinyon-juniper resources (approximately 330 acres) on maps prepared by the California Department of Fire and Forestry Protection’s Fire and Resource Assessment Program (FRAP 2006). It is noted that the statewide mapping of forest and timber resources as part of the FRAP is separate from the vegetation mapping performed for the Project site, and is used herein solely for the determination of potential forest and timber resources. Finally, no part of the Project site is zoned as a Timberland Production Zone.

As discussed further in Section 5.7, Biological Resources, the proposed development areas of Project site have been used for open grazing for over 150 years and, as a result the majority of the on-site acreage consists of grasslands that do not support a large number of tree species. While the existing zoning in the easternmost portion of the site allows for tree crop production, these lands have never been managed for forest resources including for timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, or for other public benefits. Further, the Department of Forestry and Fire Protection regulations (Section 895.1) define commercial species of trees for each forest district. The Project site does not contain

<sup>5</sup> “Board” is further defined as the State Board of Forestry and Fire Protection.

any trees listed as a “commercial species” for the applicable Southern Forest District as defined in the applicable regulations.

While the Project will not allow for tree crop production as a permitted use as in the existing condition, it would allow some agricultural uses (including growth and sale of nursery stock as well as crop production for crops such as Christmas trees) as interim uses. Regardless, implementation of the Project would not conflict with zoning for forest land or timberland as the Project site is not used for forest land or timberland resources and is not considered forest land or timberland by the County or the State. Finally, the Project will not conflict with zoning for timberland or a Timberland Production Zone, as the site has not been designated as such. There would be no impact to forest land and no mitigation is required.

### ***Off-Site Impacts***

Like the Project site, the locations of off-site Project features (intersections with SR-138, utility connections, water wells, and California Aqueduct crossings) have never been managed for forest land or timberland resources. The off-site Project features are not zoned for forest, timberland, or as a Timberland Production Zone. There would be no impact to forest land and no mitigation is required.

***Impact Summary:*** While the Project will not allow for tree crop production as a permitted use as in the existing condition, it would allow some agricultural uses (including growth and sale of nursery stock as well as crop production for crops such as Christmas trees) as interim uses. Regardless, implementation of the Project would not conflict with zoning for forest land or timberland as the Project site is not used for forest land or timberland resources and is not considered forest land or timberland by the County or the State. Finally, the Project will not conflict with zoning for timberland or a Timberland Production Zone, as the site has not been designated as such. There would be no impact and no mitigation is required.

### **Threshold 5-4      Would the project result in the loss of forest land or conversion of forest land to non-forest use?**

#### ***On-Site Impacts***

As discussed above under Threshold 5-3, the Project site is not used for forest land or timberland resources, and it is not considered forest land or timberland by the County or the State. There is no forest land on or near the site that would be directly or indirectly converted as a result of the Project. There would be no impact to forest land and no mitigation is required.

While there are no forest lands, there are trees and woodland areas on the Project site and the impacts to these are addressed in Section 5.7, Biological Resources. Further information on carbon sequestration and how it relates to impacts to vegetation is discussed in Section 5.21, Climate Change.

### ***Off-Site Impacts***

Like the Project site, the off-site Project features (intersections with SR 138, utility connections, water wells, and California Aqueduct crossings) are not considered forest land or timberland. There would be no impact and no mitigation is required.

***Impact Summary:*** There is no forest land or timberland on or near the site that would be directly or indirectly converted as a result of the Project. There would be no impact to forest land and no mitigation is required.

**Threshold 5-5**      **Would the project involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest land?**

### ***On-Site and Off-Site Impacts***

Threshold 5-5 refers to the potential for Farmland or forest land to be converted as an indirect impact (i.e., either in another location/off-site or in the future) due to implementation of the Project. As such, both on-site and off-site impacts are addressed together. Indirect conversion of agricultural uses or forest land can occur where a Project provides infrastructure (e.g., roads, utilities) or another change in land use that provides incentive for other agricultural or forest land landowners to convert their lands to non-agricultural or non-forest land uses. All physical direct and indirect impacts of Project implementation, both on-site and off-site, are addressed under Thresholds 5-1 and 5-4 above. There would be no other changes in the environment not addressed under Thresholds 5-1 and 5-4 that would indirectly result in conversion of Farmland to non-agricultural use or forest land to non-forest land use. The potential growth-inducing impacts of the Project are discussed in Section 6.0, Growth-Inducing Impacts.

***Impact Summary:*** There would be no other changes in the environment not addressed under Thresholds 5-1 and 5-4 that would indirectly result in conversion of Farmland to non-agricultural use or forest land to non-forest land use. The potential growth-inducing impacts of the Project are discussed in Section 6.0, Growth-Inducing Impacts.

### **Mitigation Measures**

There is no feasible mitigation available to reduce significant impacts from the direct conversion of 642 acres of Prime Farmland. Potential mitigation in the form of establishing 642 acres of new farming areas on Tejon Ranch has been investigated and determined to be infeasible due to insufficient available land that could be cultivated to meet Prime Farmland standards with limitations imposed by the implementation of the Tejon Ranch Conservation and Land Use Agreement and other existing and proposed development on Tejon Ranch, as previously discussed. Therefore the conversion of Prime Farmland to non-agricultural use would be a significant and unavoidable impact.

## Level of Significance after Mitigation

The conversion of 642 acres of on-site Prime Farmland to urban uses would remain a significant and unavoidable impact.

### 5.5.3 MINERAL RESOURCES

#### Relevant Plans, Policies, and Regulations

##### *Federal*

There are no applicable federal plans, policies or regulations regarding mineral resources.

##### *State*

##### Mineral Resources and Mineral Hazards Mapping Program

The California Geological Survey (CGS) provides geologic expertise and information about California's diverse non-fuel mineral resources. As required by the Surface Mining and Reclamation Act (SMARA) of 1975, the State Geologist classifies these resources in an effort to locate economically significant mineral deposits and potential areas of deposits based on scientific data. Information relating to California's non-fuel resources, naturally occurring mineral hazards, and active and historic mining activities are collected to classify land under the Mineral Resources and Mineral Hazards Mapping Program. To date, the CGS has completed 97 mineral land classification studies that cover about 34 percent of the state. Of these, only 32 classification studies (covering approximately 25 percent of the state) include the resource areas that provide construction aggregate to over 90 percent of California's population. Construction aggregate is California's primary mineral resource (CGS 2015a).

The CGS defines several geographic areas that collectively cover a single mineral classification study as "Production-Consumption Regions" (P-C Regions). The CGS identifies Mineral Resource Zones for each P-C Region, mine/quarry, or other geographic area included in a mineral classification study. Mineral Resource Zones (MRZs) are areas classified by the presence or absence of significant sand, gravel, or stone deposits that are suitable as sources of aggregate, as described below.

- **MRZ-1:** Mineral Resource Zone where adequate information indicates that no significant mineral deposits are present or likely to be present.
- **MRZ-2:** Mineral Resource Zone where adequate information indicates that several mineral deposits are present or that there is a high likelihood of their presence so development should be controlled.
- **MRZ-3:** Mineral Resource Zone where the significance of mineral deposits cannot be determined from the available data.
- **MRZ-4:** Mineral Resource Zone where there is insufficient data to assign any other MRZ designation.

Lands not addressed by the CGS regarding their mineral content, either within a P-C Region or outside a mineral classification area, are defined as “unclassified”.

### **County**

#### Los Angeles County General Plan and Antelope Valley Area Plan

The *Los Angeles County General Plan* and the AVAP, part of the County General Plan, address mineral resource issues that affect the County. There are no goals and policies related to mineral resources applicable to the Project, as there are no County- or State-designated mineral resource areas on or near the site, as discussed further below.

### **Environmental Setting**

The Project site is not known to contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits. It is known that the National Cement Plant, located in Kern County approximately one mile north of the Project site, quarries aggregate on site as part of their operations. However, there are no records or other evidence of aggregate being located on the Project site.

According to the CGS, the Project site is within an “unclassified” area of both the Saugus-Newhall and Palmdale Production-Consumption Regions (CGS 2015b). The County General Plan and the AVAP do not identify “Mineral Resource Zones” within or near the Project site. Moreover, these documents do not identify mineral resources of interest anywhere in the northwestern quadrant of Los Angeles County. For additional information on potential oil and gas wells on site please refer to Section 5.3, Hazards and Fire Safety.

### **Project Design Features**

There are no PDFs identified for mineral resources.

### **Threshold Criteria**

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist that was in place when the NOP was released. The Project will result in a significant impact if it would:

**Threshold 5-6** Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.

**Threshold 5-7** Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.

### **Environmental Impacts**

**Threshold 5-6** **Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?**

**Threshold 5-7**      **Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?**

### ***On-Site Impacts***

As discussed above, based on consultation with CGS regarding MRZ in the Project vicinity and review of the County General Plan and AVAP, the Project site is not known to contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits. As discussed above, while it is known that the Cement Plant, located north of the Project site, quarries aggregate, there is no evidence of aggregate or other mineral resources being located on the Project site itself. Therefore, Project implementation would not result in the loss of availability of a known mineral resource that would be of value to the region and residents of the State, nor would it create the loss of availability of a locally important mineral resource recovery site. Therefore, there would be no impact.

### ***Off-Site Impacts***

Because there are no known mineral resources on or in the vicinity of the Project site where off-site Project features would be located, implementation of off-site Project features would not result in an impact related to loss of availability of a mineral resource of State or local value. Additionally, because there are no known mineral resources on or in the vicinity of the Project site within Caltrans right-of-way, the Project will not result in an impact related to loss of availability of a mineral resource of State or local value.

***Impact Summary:*** The Project will not result in impacts related to the loss of known mineral resources because there are no known mineral resources on the Project site.

## **Mitigation Measures**

There would be no impacts to mineral resources; therefore, no mitigation measures are required.

## **Level of Significance After Mitigation**

Due to the lack of identified mineral resources on the Project site, implementation of the proposed development would not result in impacts to mineral resources.

## 5.6 CULTURAL AND TRIBAL RESOURCES

### 5.6.1 INTRODUCTION

#### **Purpose**

State law, as substantiated in the County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that cultural and tribal resources issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### **Summary**

Both a cultural resources survey and an evaluation have been undertaken in the Project area. The survey was comprehensive, covering the entirety of the Project site. California Register of Historical Resources (CRHR) cultural resources eligibility evaluations were completed in 2012 and 2015 for sites in areas where impacts associated with development were anticipated. Also, the County of Los Angeles, as Lead Agency, completed Native American consultation under Assembly Bill (AB) 52. The Fernand o Tataviam Band of Mission Indians (Tataviam Tribe) and the Tejon Indian Tribe (Tejon Tribe) were contacted, consultation was initiated, and mitigation measures were agreed upon by all parties involved, including the Tejon Ranch Company.

There are three archaeologically significant (i.e., California Register of Historical Resources [CRHR]-eligible sites within the grading footprint (CA-LAN-3201, CA-LAN-3240 and CA-LAN-3242); therefore, grading and other construction activities, including fuel modification, would directly impact these sites. Impacts to these three sites would be mitigated through avoidance by means of monitoring by a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe during construction, and either Project redesign, preservation through restricted access or, if that is not feasible, through a Phase III data recovery program (MM 6-1 and MM 6-3). MM 6-2 requires these three sites, and two others, to be protected by fencing during construction to ensure avoidance of the resource, and MM 6-4 provides further protective measures if necessary. Excavated finds shall be offered to the County of Los Angeles and/or its designee (i.e., the Tejon Indian Tribe) on a first refusal basis (MM 6-1 and 6-3); the Tejon Indian Tribe can then make a determination whether the find is a significant tribal cultural resource and opt to accept the resource for curation in its facility). With implementation of MMs 6-1, 6-2, 6-3, and 6-4, impacts to sites CA-LAN-3201, CA-LAN-3240, and CA-LAN-3242 would be reduced to a less than significant level.

There are a total of 30 prehistoric archaeological sites within open space areas (i.e., areas outside the grading footprint). Of these. The CRHR eligibility of 18 of the 30 total sites has been determined, and 1 site (CA-LAN-3206) has been determined eligible and 17 sites have

been determine ineligible. For the 12 remaining sites, it is assumed that the sites are historically significant until, and unless, evaluation proves otherwise. Because these 12 sites are outside the development footprint, direct impacts during grading and other construction activities are not expected. However, site CA-LAN-3227 is immediately adjacent the development footprint. Because of its proximity, the site could suffer damage during grading activities. Therefore, MMs 6-1, MM 6-2, and MM 6-4 would be implemented for this site, and potential direct impacts to site CA-LAN-3227 during construction would be reduced to a less than significant level.

Long-term operation of the Project would result in potential indirect impacts to the 12 sites with unknown eligibility and the 1 site located in the open space areas that is known to be eligible (CA-LAN-3206) due to increased access, by residents and visitors, to these areas of the site compared to the existing condition, wherein the sites are located entirely on private property. Because archaeological excavation is considered an adverse effect on an archaeological resource, avoidance and preservation of resources without excavation would be the preferred method of managing these sites. Therefore, MM 6-4 requires preparation of an Archaeological Resources Site-Protection Program aimed to protect and preserve identified archaeological resources that may be vulnerable to disturbance. The Archaeological Resources Site-Protection Program must include several alternatives to restrict access to these sites (e.g., fencing, planting, and capping), thereby protecting and preserving these sites. With implementation of MM 6-4, potential indirect impacts to site CA-LAN-3227 during grading/construction would be reduced to a less than significant level.

The Paleo Environmental Associates report (2009) has classified rock units on the Project site according to their likelihood of containing resources of paleontologic importance, and geologic evidence from adjacent areas with similar sedimentary formations indicates a high likelihood of encountering such resources during Project development. Impacts, should they occur, would be reduced to a level considered less than significant through the application of MMs 6-5 through 6-9.

There is no evidence for the presence of Native American burial sites and associated human remains within the Project area because none of the sites recorded and evaluated on the Project area were found to contain human remains, nor were there any data to suggest they were present. However, the presence of known cultural resources sites increases the likelihood that they may be present. MM 6-10 is provided to address these potential occurrences, should they be realized.

## **Section Format**

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required to reduce the significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (Please refer to Section 2.0, Introduction,

and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

While all references cited in this analysis section are listed in Section 5.6.9, the primary technical references for this section are listed below.

Because of the sensitivity of archaeological resources, in accordance with the State CEQA Guidelines, (14 *California Code of Regulations* [CCR] Section 15120[d]), no information about the specific location of archaeological sites is included in this Draft EIR. Qualified persons can request verifying information through the Los Angeles County Department of Regional Planning.

## 5.6.2 RELEVANT PLANS, POLICIES AND REGULATIONS

### Federal

No federal plans or policies have been identified that relate to cultural and tribal resources.

### State

#### ***Senate Bill 18***

Senate Bill (SB) 18 (*California Government Code*, Section 65352.3) incorporates the protection of California traditional tribal cultural places into land use planning for cities, counties, and agencies. It establishes responsibilities for local governments to contact, refer plans to, and consult with California Native American tribes as part of the adoption or amendment of any general or specific plan proposed on or after March 1, 2005. SB 18 requires public notice to be sent to tribes listed on the Native American Heritage Commission's (NAHC's) SB 18 Tribal Consultation List within the geographical areas affected by the proposed changes. Tribes must respond to a local government notice within 90 days (unless a shorter time frame has been agreed upon by the tribe), indicating whether or not they want to consult with the local government. Consultations are for the purpose of preserving or mitigating impacts to places, features, and objects described in Sections 5097.9 and 5097.993 of the *California Public Resources Code* that may be affected by the proposed adoption of or amendment to a general or specific plan.

While the Project does not require consultation under SB 18 because it was proposed prior to the adoption of the 2005 law, the County and the Project Applicant are committed to affording local Native American tribes and individuals an opportunity to provide information regarding previously unknown cultural resources and to express their concerns regarding the Project's potential impact on them. To that end, in a letter dated May 20, 2011, the County notified tribes and individuals listed in the NAHC letter providing tribal contacts of the Project and subsequently provided a copy of the Draft EIR to them as part of the public review process. No responses to the May 20, 2011, notification letter were received. Further consultation has occurred in conformance with AB 52, which is discussed below.

#### ***Assembly Bill 52***

This Project is subject to Assembly Bill (AB) 52. AB 52 is applicable to projects that have filed a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Negative Declaration (ND) or Mitigated Negative Declaration (MND) on or after July 1, 2015.

AB 52 requires that the tribes ask the lead agency to be contacted for consultation. Then, the lead agency must contact the tribes to initiate consultation with California Native American Tribes that are traditionally and culturally affiliated with the geographic area of the project and have requested such consultation prior to determining the type of CEQA documentation that is applicable to the project (i.e., EIR, ND, MND). AB 52 allows Tribes 30 days after receiving notification to request consultation. The lead agency then has 30 days to initiate consultation. Significant impacts to Tribal cultural resources are considered significant impacts to the environment. A description of the County's AB 52 process for the Project is provided in the analysis below.

### ***Human Remains***

The *California Code of Regulations* (Title 14, Section 15064.5[e]) requires that, in the event of the accidental discovery or recognition of any human remains in any location other than a dedicated cemetery, the Los Angeles County Coroner must be notified of the discovery (*California Health and Safety Code*, Section 7050.5) and all activities in the immediate area of the find or in any nearby area reasonably suspected to overlie adjacent human remains must cease until appropriate and lawful measures have been implemented. If the Coroner determines that the remains are not recent, but rather of Native American origin, the Coroner must notify the Native American Heritage Commission (NAHC) in Sacramento within 24 hours to permit the NAHC to determine the Most Likely Descendent (MLD) of the deceased Native American. The designated MLD may make recommendations to the Project Applicant/Developer or the person responsible for the excavation work, for means of treating or reassignment of the human remains and any associated grave goods with appropriate dignity, as provided in *California Public Resources Code*, Section 5097.98. If any of the following occurs, the Project Applicant/Developer shall rebury the Native American remains and the associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance: (A) the NAHC is unable to identify an MLD or the MLD fails to make a recommendation within 24 hours of being notified of the discovery; (B) the MLD fails to make a recommendation; or (C) the Project Applicant/Developer or authorized representative rejects the s of the MLD and mediation by the NAHC fails to provide measures acceptable to the Project Applicant/Developer.

## **County**

### ***County of Los Angeles General Plan and Antelope Valley Area Plan***

The *County of Los Angeles General Plan and Antelope Valley Area Plan* (AVAP) address issues that affect the County and the Antelope Valley. The County General Plan has the following goal in Chapter 9, Section VIII. Historic, Cultural and Paleontological Resources:

**Goal C/NR 14:** Protect historic, cultural, and paleontological resources.

**Policy C/NR 14.1:** Mitigate all impacts from new development on or adjacent to historic, cultural, and paleontological resources to the greatest extent feasible. Policy C/NR 14.2: Support an inter-jurisdictional collaborative system that protects and enhances historic, cultural, and paleontological resources.

**Policy C/NR 14.3:** Support the preservation and rehabilitation of historic buildings.

**Policy C/NR 14.4:** Ensure proper notification procedures to Native American tribes in accordance with Senate Bill 18 (2004).

**Policy C/NR 14.5:** Promote public awareness of historic, cultural, and paleontological resources.

**Policy C/NR 14.6:** Ensure proper notification and recovery processes are carried out for development on or near historic, cultural, and paleontological resources.

The AVAP does not contain goals or policies pertaining to cultural resources (i.e., prehistoric and historic archaeology, the historic built environment, tribal cultural resources, and paleontological resources). A consistency analysis of the Project's specific goals and policies with the County's plans, goals, policies and regulations is provided in the Land Use, Entitlements, and Planning Section (Section 5.8) in this document.

### 5.6.3 ENVIRONMENTAL SETTING

The Project study area, for the purposes of the archaeological and paleontological analyses, is the entire Project site boundary and locations of off-site features. The study area covers portions of the U.S. Geological Survey's (USGS') Lebec and La Liebre Ranch 7.5-minute quadrangles.

## Methodology

### *Archaeological and Historical Resources*

For archaeology and historic resources, W & S Consultants (WSC), a qualified archaeological firm, prepared a Phase I Archaeological Survey Report in May 2002 that encompasses the entire Project site with the exception of the land on the east side of 300<sup>th</sup> Street West (Appendix 5.6-A). The report includes (1) the results of a records and literature search prepared by the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton; (2) the results of a systematic field walkover survey; and (3) field checking of all recorded sites on or immediately adjacent to the Project boundaries, as they were defined at that time (approximately 14,000 acres).

The archaeological and historical records search and literature review was conducted in 1999 by SCCIC staff and showed that only a small portion of the Project site had been previously surveyed. Therefore, field walkover surveys were conducted from July to December 2001. Vegetative cover was sparse overall, and ground visibility was generally very good to excellent, allowing for thorough examination of the surface.

Based on the results of the Phase I survey, WSC conducted Phase II Archaeological Testing at 12 sites in 2004 (Appendix 5.6-B). All sites considered during the Phase II study were first discovered during the Phase I survey and then evaluated because of the potential to incur direct impacts to these resources from Project development (these 12 sites were located within the Project's development footprint at that time). Generally, Phase II archaeological

fieldwork is intended to establish the nature and significance of an archaeological site and to provide baseline data from which a final determination of historical significance and disposition of the resource can be made. This includes (1) the collection of a representative sample of artifacts and archaeological indicators from each cultural resource site; (2) the establishment of the vertical and horizontal boundaries of each; (3) the analysis of the recovered artifact sample; and (4) the evaluation of each site using data collected and established CEQA criteria to determine historical significance.

In 2007, WSC conducted Phase II Archaeological Testing of 12 additional sites that were identified and recorded during the original WSC survey conducted in 2002. In addition, BonTerra consulted with Dr. Thomas Taylor (Manager, Natural and Cultural Resources, Environmental, Health and Safety Division, Southern California Edison [SCE]), via email on February 12, 2007, regarding the historical significance of several SCE electrical transmission towers in the southwestern portion of the Project site.

In May 2015, an intensive Phase I survey was completed by ASM Affiliates, Inc. (ASM Principal Investigator David Whitley was formerly a Principal with WSC) for an additional approximate 728 acres of contiguous unsurveyed fields in the northeasternmost portion of the Project site (i.e., to the east of 300<sup>th</sup> Street West) and about 40 acres of off-site lands that would require utility infrastructure to implement the Project, resulting in a total survey area of approximately 768 acres. No resources were discovered as a result of this effort. Also in 2015, Phase II test excavations were completed by ASM Affiliates, Inc. on 20 archaeological sites within the Project site. These studies augment the earlier Phase I surveys and Phase II test excavations on other portions of the Project area by W&S Consultants (2002, 2004, 2007) described above. All of the sites are located east of the West Branch of the California Aqueduct, on low rolling hills and ridges. Fieldwork at these sites included Global Positioning System (GPS) mapping, hand excavation of test units (TUs), shovel test pits (STPs) and surface scrapes, and the collection of all identified surface artifacts and archaeological indicators.

### ***Paleontological Resources***

A Paleontological Letter Report was prepared by Dr. Samuel McLeod of the Vertebrate Paleontology Section of the Natural History Museum of Los Angeles County (NHMLAC) on November 2, 2006 (Appendix 5.6-E1). The Letter Report included the results of a records search and literature review of known rock formations and any fossil localities that have been identified within and directly adjacent to the Project area, which is identical to the current Project site with the exception of the area to the east of 300<sup>th</sup> Street West. Paleontological sensitivity of a given area is determined by the types of rock formations and previously identified fossil localities in that area. Next, a paleontological resource inventory and impact assessment study was undertaken by Dr. Bruce Lander of Paleo Environmental Associates (PEA 2009). The study included background research of published and unpublished paleontologic and geologic literature, a field survey of the Project area, an evaluation of the Project's potential to impact paleontologically sensitive rock formations, and development of mitigation measures that would reduce the direct and indirect adverse environmental impacts on paleontological resources to a less than significant level. PEA describes four previously recorded localities and nine newly discovered localities in the

Project area (2009). This section was also reviewed by John Harris, Chief Curator of the NHMLAC. Both letters from the NHMLAC can be found in Appendix 5.6-E.

## **Cultural Resources Eligibility Criteria**

The cultural resources analysis, including that pertaining to the built environment as well as archaeological and paleontological resources, has been prepared to meet the requirements of CEQA (*California Public Resources Code*, Sections 21083.2 and 21084.1) and the State CEQA Guidelines. Specifically, the State CEQA Guidelines states “[a] project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment” (14 CCR 15064.5[b]). Substantial adverse change is defined as “physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired” (14 CCR 15064.5[b][1]). CEQA has established statutory requirements for the formal review and analysis of projects that fall under its jurisdiction. The CEQA statutes maintain that any property listed in, determined, or found eligible for listing in the CRHR is considered to be a “historical resource” and shall be considered historically significant. In addition, the *California Public Resources Code* has additional statutes regarding “unique” resources and “Tribal Cultural Resources”. The criteria below are used to determine eligibility and significant effects.

### ***Prehistoric Archaeological Resources***

Section 15064.5(a)(3) the State CEQA Guidelines states that “[g]enerally, a resource shall be considered by the lead agency to be ‘historically significant’ if the resource meets the criteria for listing in the California Register of Historical Resources” (see *California Public Resources Code*, Section 5024.1; 14 CCR 4852), including if the resource:

- A. Is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage;
- B. Is associated with lives of persons important in our past;
- C. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- D. Has yielded, or may be likely to yield, information important in prehistory or history.

Using the information outlined above, the first level of evaluation was to determine whether an archaeological resource within a development area is considered eligible for the CRHR and is, therefore, historically significant.

A significant impact would occur if grading and construction activities would result in a substantial adverse change to archaeological resources determined to be “unique” or “historical”. “Unique” resources are defined in *California Public Resources Code*, Section 21083.2(g):

As used in this section, ‘unique archaeological resource’ means an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

### ***Tribal Cultural Resources***

Pursuant to Section 21074 of the *California Public Resources Code*:

- (a) Tribal Cultural Resources are either of the following:
- (1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
    - (A) Included or determined to be eligible for inclusion in the California Register of Historical Resources.
    - (B) Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.
  - (2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.
- (b) A cultural landscape that meets the criteria of subdivision (a) is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape.
- (c) A historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a “nonunique archaeological resource” as defined in subdivision (h) of Section 21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

### **Historical Resources**

“Historical” resources are defined in *California Public Resources Code*, Section 21084.1 and the State CEQA Guidelines (14 CCR 15064.5), Section 21084.1 states:

A project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. For purposes of this section, an historical resource is a resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources. Historical resources included in a local register of historical resources, as defined in subdivision (k) of Section 5020.1, or deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1, are presumed to be historically or culturally significant for purposes of this section, unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant. The fact that a resource is not listed in, or determined to be eligible for listing in, the California Register of Historical Resources, not included in a local register of historical resources, or not deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1 shall not preclude a lead agency from determining whether the resource may be an historical resource for purposes of this section.

Section 15064.5(b) of the State CEQA Guidelines (14 CCR) states:

- (b) A project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.
  - (1) Substantial adverse change in the significance of a historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.
  - (2) The significance of an historical resource is materially impaired when a project:
    - (A) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or
    - (B) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources. . . unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
    - (C) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in

the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

A “Unique” resource is defined in *California Public Resources Code*, Section 21083.2(g) and is noted above under prehistoric archaeological resources.

### ***Paleontological Resources***

Paleontological resources are nonrenewable scientific and educational resources. As discussed previously, in compliance with State law, the County’s Environmental Checklist Form requires analysis of cultural resources, which includes paleontological resources under the general heading “Cultural Resources”. Projects subject to CEQA must determine whether a project would “directly or indirectly destroy a unique paleontological resource”.

An impact to paleontological resources would be considered a significant impact if a project results in the direct or indirect destruction of a unique or important paleontological resource or site. A resource is deemed unique or important if (1) it has fossils that have previously been recovered from a particular geologic unit; (2) there are recorded fossil localities within the same geologic units as occur within the project area; and (3) the types of fossil materials that have been recovered from the geologic unit are unique or important.

The goal of CEQA relative to prehistoric and historic cultural resources as well as paleontological resources is to facilitate their identification, evaluation, cataloging, preservation (if feasible), and curation in perpetuity. No significant impact to these resources will occur as a result of a project if the goal of CEQA is followed and the studies completed.

### **Existing Setting**

The Project site is located in northern Los Angeles County, California, at the westernmost edge of the Antelope Valley. It is north of State Route (SR) 138; it is bisected by the West Branch of the California Aqueduct, and is located south of the Tehachapi Mountains and the East Branch of the California Aqueduct. Oso Canyon Wash forms the northern limit of the Project site.

The portion of the Project site generally to the west of the Aqueduct consists of dissected topography comprising broad and relatively low east-west-trending ridge systems with small intervening drainages. Elevation ranges in this portion of the site are roughly from 3,100 to 3,400 feet (ft) above mean sea level (msl). Importantly, low ridges are typically capped by cobble lens. These lens are predominated by quartzite and igneous cobbles and gravels, but they are polygenetic in origin and they also contain small but potentially significant quantities of cryptocrystalline (CCS) and metavolcanic specimens. These are usually smaller than the quartzite and igneous cobbles. These lens appear to have an important factor in the location and nature of the studied sites. The portion of the site generally to the east of the Aqueduct consists of the open flats of the Antelope Valley. The average elevation in this portion of the Project site is about 3,000 ft above msl.

Grasslands cover most of the west side of the Project site, which has been used for many years as range land, while the flatter (east) side includes farmland in addition to grazing. It is uncertain for this reason what the environmental setting may have been prehistorically, and this is almost certain to have changed at various times in the ancient past due to paleoclimatic shifts. Prior to the introduction of livestock in the 19<sup>th</sup> century, the Project site may have been covered by a desert chaparral plant community. This is an open community predominated by chamise and bunch grasses (ASM 2015). It is also possible that Joshua Tree Woodlands may have been present; however, inasmuch as this plant community is present east of the site while a small remnant stand still occurs a few miles to the west, near the Interstate (I) 5 and SR-138 interchange.

### ***Archaeological Setting***

Initial occupation of the Tehachapi Mountains region occurred at least as early as the Paleoindian Period, which occurred prior to about 10,000 years before present (BP). The term “before present” assumes that 1950 is “present”, so in this case 10,000 years BP would be 8,050 B.C. Evidence of this early use of the region has been revealed by the discovery of characteristic fluted (grooved or furrowed) and stemmed projectile points found around the margins of Tulare and Buena Vista Lakes (both of which are in the southern San Joaquin Valley, approximately 100 miles northwest and 40 miles northwest of the Project site, respectively), in the foothills of the Sierra Nevada, and in the Mojave Desert. Archaeologists use the general term “projectile point” to refer to an object affixed to a pole or stick of some kind, which has been fashioned for use as a weapon, out of stone, metal, bone, or other material (Crow Canyon 2017). Both fluted and stemmed projectile points are particularly common around the lake margins, suggesting a terminal Pleistocene or early Holocene lakeshore adaptation similar to that found in other portions of the Far West at this same time, although little else is known about these earliest people (WSC 2002: 13–14).

Additional finds include a Clovis-like projectile point discovered in a flash-flood cut-bank near White Oak Lodge in 1953, northeast of the site. In the 1980s, a similar fluted point was found near Bakersfield, while a number are known from Edwards Air Force Base (50 miles to the east of the Project site) and the Boron area of the western Mojave Desert. Although it is now well-established that human occupation of California occurred during the Late Pleistocene Era, interpretations are, thus far, limited to the subsistence focus on large fauna found in and around terminal Pleistocene or early Holocene lakeshores (WSC 2002:14).

Substantial evidence for human occupation of California first occurs during the middle Holocene era, from roughly 7,500 to 3,500 BP. This period is known as the “Early Horizon”, and is sometimes alternatively referred to as the “Early Millingstone” along the Santa Barbara Channel and La Jolla in the San Diego region. In this southern area, populations were concentrated along the coast, with limited use of inland areas. Based on the archaeological assemblages recovered, adaptation appears to have emphasized hard seeds and nuts, with tool-kits dominated by mullers and grinding stones (manos and metates). An assemblage is a collection of items from a single database component of an archaeological site. A muller is an implement of stone or other substance with a flat base for grinding paints, powders, and other materials on a slab of stone or similar surface; a mano is the upper or hand-held stone used when grinding maize or other grains on a metate, or a flat stone that has a shallow

depression in the upper surface for holding maize or other grains to be ground with a mano. Minimal evidence of Early Horizon occupation has been found in most inland portions of the state. In part, this is due to a severe cold and dry paleoclimatic (relating to climate of some former period of geologic time) period which occurred at this time (WSC 2002:14).

Evidence for an Early Millingstone occupation of the Tehachapi Mountains region is very limited and has been found at only two sites, both located in the Santa Clara River Valley to the south. Both sites are located near Vasquez Rocks, with temporal attribution, or the assessment of time, based on the presence of a small number of *Olivella* barrel beads. This version of the bead is an *Olivella biplicata* shell from which the spire and base have been removed, leaving the middle or “barrel” portion of the shell. This bead type has subsequently proven to be an unreliable indicator of age, throwing doubt on human inhabitation of this region before about 4,000 BP. Furthermore, recent excavations at one of these presumed early locales, the Escondido Canyon Site, failed to uncover evidence for occupation prior to about 2,700 BP. Regardless, it is clear that Early Horizon population density was quite low and, if any kind of specialized adaptation existed, it was probably tied to plant food gathering rather than hunting (WSC 2002:14).

Environmental conditions conducive to human occupation improved dramatically after about 3,500 BP during the “Middle Horizon” or “Intermediate Period”. This period is known climatically as the “Holocene Maximum” and was characterized by significantly warmer and wetter conditions than were experienced previously. Archaeologically, it was marked by a large population increase and movement into new environments along the south-central California coast and the Mojave Desert. In the Delta region to the north, this same period of favorable environmental conditions was marked by the appearance of the Windmill culture, which exhibited a high degree of ritual elaboration (especially in burial practices) and perhaps even a rudimentary mound-building tradition. Along with ritual elaboration, Middle Horizon times saw increasing subsistence specialization, perhaps correlating with the appearance of acorn-processing technology. Penutian-speaking peoples (including ancestors of the Yokuts) are also believed to have entered the state roughly at the beginning of this period and, perhaps, to have brought this technology with them. Likewise, it is hypothesized that the so-called “Shoshonean Wedge” in Southern California (that is, the Takic-speaking groups that came to include the Gabrielino/Fernandeño, Tataviam, and Kitanemuk) may have moved into this region at this time, rather than at about 1,500 BP as was first thought (WSC 2002:14–15).

Evidence for the Middle Horizon occupation of the Upper Santa Clara/Agua Dulce region, located in Tataviam territory south of the Project site, has been found at a number of sites and has been based on radiocarbon, obsidian hydration, and typological dating. The Agua Dulce village complex, for example, includes occupation extending back to the Intermediate Period, at which time the population of the village may have been 50 or more people. Similarly, occupation of the Hathaway Ranch area near Lake Piru and Newhall Ranch near Valencia appears to have begun during the Intermediate Period. To the northwest, there is limited evidence for pre-Middle Horizon occupation in the upper Sisquoc and Cuyama River drainages (WSC 2002:15).

Assuming that the Tejon Ranch/Tehachapi Mountains region was first significantly occupied during the Middle Horizon, as existing evidence suggests, a parallel can be drawn to the inland Ventura County region, where a similar pattern has been identified, and possibly also to the Antelope Valley and western Mojave Desert, southern Sierra Nevada, and Coso Range. In all these areas, a major expansion in settlement, the establishment of large site complexes, and an increase in the range of exploited environments appear to have occurred around 3,500 BP. Although most efforts to explain this expansion have focused on very local circumstances and events, it is increasingly clear that this was a major Southern California-wide occurrence, and therefore any explanation of it must be sought at a regional level of analysis (WSC 2002:15).

The beginning of the “Late Horizon” is set variously at 1,500 and 800 BP, although a consensus seems to be growing in support of the more recent date. As such, the appearance of the Late Horizon correlates with another major drought (circa A.D. 1200), which decimated major portions of western North America. Known climatically as the “Little Ice Age”, it extended from about A.D. 1280 to 1860. In much of inland south-central California and the Mojave Desert, a large-scale abandonment of sites appears to have occurred at the approximate start of this period. It is not yet clear whether the abandonment was accompanied by a true reduction in population or an agglomeration (jumbled cluster or mass of varied parts) of the same numbers of people into fewer but larger villages. In either case, the Late Horizon presents a series of regional archaeological cultures that are the precursors to ethnographic Native California tribes. The Mojave Desert and Antelope Valley, however, appear to have been all but abandoned during this period. Given extreme drought-like conditions, Late Prehistoric villages tended to be firmly tied to permanent water sources (WSC 2002:15–16).

### ***Ethnographic Setting***

Ethnography is a cultural anthropologic research method that strives to answer anthropological questions about different cultures’ ways of life (University of Pennsylvania 2008), and the following described the ethnographic setting of the Project site. The Tejon Ranch region, including the Project site, was a contact point between five separate ethnolinguistic groups immediately prior to the arrival of Euro-Americans in California. Considerable confusion has existed concerning aboriginal landholdings in this area because almost no ethnographic research was conducted in this area until well after the period of Spanish missionization and, therefore, long after the original inhabitants had been removed from their traditional homelands. However, recent ethnohistorical studies have done much to clarify this situation. It is now apparent that the general Tejon region was occupied by the Kitanemuk, Interior Chumash, Tataviam, Southern Valley Yokuts, and Kawaiisu, with the first three of these groups likely to have lived in and/or used the lands comprising the Project site (WSC 2002:3). Ethnolinguistics is the study of language as an aspect or part of culture, especially the study of the influence of language on culture and of culture on language; ethnohistory is a branch of anthropology dealing with the development of cultures through the analysis of archaeological findings.

The Kitanemuk occupied the southern and central areas of the Tehachapi Mountains and the adjacent northwestern end of the Antelope Valley. As speakers of the Serran branch of the

Takic (Uto-Aztecan) language stock, they were closely related to other Serran Takic groups such as the Serrano and Vanyume, who lived along the northern front of the transverse ranges. Kitanemuk territory probably did not extend into the San Joaquin Valley, which was occupied by the Yokuts. The western edge of Kitanemuk territory appears to have fallen between Tunas and Poso Creeks, according to known village locations. The Kitanemuk may have occupied the northeastern portions of the Project site near the open flats of the Antelope Valley (WSC 2002:3-4).

The Interior Chumash (speakers of Ventureño Chumash, a Hokan language) occupied upper Piru Creek, Grapevine Canyon, and the Gorman area; the latter area is between one and two miles west of the Project site's western boundary. Their domain extended eastward beyond Castac Lake on the Tejon Ranch, where the historic village of *Kashtiq* was located; their territory then reached to the southeast to Quail Lake, which was known in Chumash as *Shraqang*. They also occupied a village at the mouth of Grapevine Canyon, *Mat'apxwelxwel*, and another at the mouth of Tecuya Creek west of Tejon Ranch. These two villages represent the only known occupation of the Chumash of the San Joaquin Valley (both of which are outside the Project boundaries). The Interior Chumash either occupied or lived very close to the western limits of the Project site, perhaps including the area immediately around Quail Lake (WSC 2002:3).

The Tataviam are believed to have primarily inhabited the upper Santa Clara River drainage from about Piru eastward to the Agua Dulce/Vasquez Rocks area; southward as far as Newhall; and northward to include the middle reaches of Piru Creek (on the west) and the Liebre Mountains and the westernmost fringe of the Antelope Valley (on the east). Their northeastern boundary most likely ran along the southern foothills of the Tehachapi Mountains (within the Project site) and then crossed to the southern slopes of the Sawmill Mountains and Sierra Pelona, extending as far east as Soledad Pass. The Tataviam also controlled Quail Lake and La Liebre Ranch. They do not appear to have controlled the San Andreas rift zone of Elizabeth Lake, Lake Hughes, or the Leona Valley, which was occupied by the Kitanemuk, who also inhabited the western side of the Antelope Valley (i.e., from about Neenach through the Fairmont Buttes area to the mouth of Soledad Pass) (WSC 2002:4).

A wedge of Tataviam speakers is thought to have extended north into the Tehachapi Mountains, separating the Chumash from the Kitanemuk, perhaps by controlling the headwaters of Pastoria Creek. Information concerning the Tataviam is very limited; however, based on a few existing word lists, the descriptions of early travelers, mission place-names, and the recollections of other native informants, Tataviam is generally accepted as a Uto-Aztecan Takic language, making it related to other Takic languages in the Los Angeles County region such as Gabrielino/Fernandeño (or Tongva) and Kitanemuk (WSC 2002:4).

Although no ethnographic fieldwork was conducted in the Tejon Ranch region until the end of the 19<sup>th</sup> century, the Tejon Ranch area became a multi-ethnic, post-Mission Period refuge for many Native Americans. Substantial Native American use of the Tejon Ranch region continued into the American Period. This reflected a number of circumstances, probably the first of which was the relative remoteness of the region from most Euro-American activities.

The multi-ethnic nature of this refuge was likewise partly a function of mission conditions, where different tribal groups lived together, which resulted in an increase in interaction and inter-marriage, as well as of the original status of this particular area, where a number of ethnolinguistic boundaries intersected. Equally important, Tejon Ranch was the location of the first Native American reservation in the United States, the Sebastian Reserve, which was created in 1853. The creation of this reservation resulted in the formal establishment of a multi-ethnic Native American enclave (WSC 2002:6).

### ***Historic Setting***

Because of its remote location in relation to the Pacific coast, the Tejon Ranch/Tehachapi Mountains area saw little Euro-American development until about the 1850s. Early explorers crossing the area included the Spaniards Pedro Fages in 1772, Friar Francisco Garcés in 1776, and Friar José María de Zaldivea in 1806 and Americans Jedediah Smith in 1827 and John C. Fremont in 1830 and 1844 (WSC 2002:16).

Four large Mexican Period land grants in this region occurred during the 1840s that would eventually be united as Tejon Ranch. The first of these grants, *Rancho Los Alamos y Agua Caliente* (“cottonwoods and hot water”), was awarded to Pedro Carrillo by Mexican Governor Manuel Micheltoarena in 1843. Less than two months later, the original *Rancho El Tejon* (“the badger”) was awarded to José Antonio Aguirre and Ignacio del Valle as a grant of nearly 100,000 acres. Also in 1843, the nearly 22,000-acre *Rancho Castac* (Chumash for “spring eye”, in Spanish “*ojo de agua*”) was acquired by José María Covarrubias. In 1846, *Rancho La Liebre* (“the hare”) was granted to José María Flores and contained nearly 49,000 acres. The Project site lies primarily within the historic borders of *Rancho La Liebre* (WSC 2002:16).

With the political upheavals associated with the transfer of California from Mexican to American control during the late 1840s, these lands went largely unused by their grantees, resulting in encroachment or “squatting” by incoming settlers who disregarded their ownership or assumed that the lands were unclaimed and therefore open to settlement. These included Dr. Darwin French who, in 1850, built an adobe on *Rancho El Tejon*; Samuel A. Bishop who, in about 1852, settled on *Rancho Castac*; and Edward F. Beale who, in 1853, created the Sebastian Indian Reservation on what he thought was unclaimed land available for government use (WSC 2002:16–17).

Between 1855 and 1865, Beale acquired all four of the former Mexican ranchos and united them as “El Tejon Ranch”. Because the original areas for these ranchos did not represent a contiguous holding, Beale realigned the boundaries of *Los Alamos y Agua Caliente* so that a unified property was formed, resulting in a ranch encompassing about 265,000 acres. Shortly after acquiring *Rancho La Liebre* in 1855, Beale built an adobe on the ranch and moved his family there. A small silver mine was discovered on the ranch in 1859, but did not experience significant production. Beale was an important figure in Southern California history, emerging as a military hero in the Battle of San Pasqual against Mexico in 1846; as a messenger to Washington, D.C. of news of the discovery of gold at Sutter’s Fort in 1848; as an accomplished businessman for Commodore Stockton and Aspinwall’s steamship company in 1851; and for his appointment as Commissioner of Indian Affairs by President Fillmore in 1852 (WSC 2002:17–18).

In the latter role, Beale established the Sebastian Reserve (as it was officially known) in 1853. The 25,000-acre reserve was located on the floor of the southern San Joaquin Valley from the mouth of Grapevine Canyon east to about the mouth of Chanac Creek, an area located some distance north of the Project site. In 1854, Beale established Fort Tejon in Grapevine Canyon about three miles north of the modern community of Lebec. As a facility for the U.S. Army, Fort Tejon acted to both protect the Indians on the Sebastian Reserve from exploitation by outsiders and to prevent raids into the Los Angeles Basin by hostile Indians from the San Joaquin Valley and desert areas to the east. The fort was abandoned after ten years of operation (WSC 2002:18).

The adobe that Beale constructed as his residence and headquarters for the ranch still stands (used by a private hunting club) and is the oldest building in the Antelope Valley. (The adobe is located south of the southeastern Project site boundary.) Eventually, Beale moved his residence to the earlier El Tejon headquarters along El Paso Creek to the north, but a fire in 1917 destroyed his adobe structure there (WSC 2002:19).

Beale went on to be appointed the first Surveyor-General of California and Nevada by President Lincoln; a Brigadier General for the State of California militia; and Minister to the Austro-Hungarian Empire by President Grant. In addition, he was instrumental in creating the U.S. Army Camel Corps under Jefferson Davis, then Secretary of War. With this appointment, Beale brought camels into the Tejon region, where they were used as pack animals (WSC 2002:19).

In 1858, the Butterfield Overland Mail stage route crossed the Tejon area, stopping at Lake Elizabeth, Cow Springs, Fort Tejon, and the “Sinks of the Tejon” (or “*Los Alamitos*”, below the confluence of Tejon and Chanac Creeks). The stage drew attacks from outlaws such as Joaquin Murrieta and Tiburcio Vasquez, who haunted the vast acreage of Tejon Ranch. The Butterfield route crossed the Project site, skirting Quail Lake before heading to Gorman Station. Quail Lake was originally known as *La Laguna Seca* (“dry lake”) and, since it presumably did not hold perennial or potable water, no stage stop was established. Gorman Station was built by Charles Johnson and his wife Isabel in 1863, who built a log cabin “public house” at that spot. When Johnson died, his wife continued to run the establishment, which became known as *Rancho La Viuda* (“widow’s ranch”). It was eventually acquired by James Gorman, Sr., a veteran of the Mexican War who worked as a meat hunter for Fort Tejon (WSC 2002:19–20).

The Southern Pacific Railroad came only as close as 50 miles to the east when the route was taken through Antelope Valley in 1876, keeping the Tejon area relatively isolated (WSC 2002:19).

The economic emphasis of the Tejon Ranch initially was sheep, with over 125,000 sheep that grazed on the ranch at its peak. Even though Beale had recorded the Tejon cattle brand—the crescent and the cross—in 1865, years of drought did not permit the introduction of cattle to the Ranch until the 1880s. By 1891, there were roughly 25,000 head of cattle and 7,500 sheep on the Ranch. Following Beale’s death in 1893, his son Truxton inherited Tejon Ranch and completed the transition to cattle. Truxton Beale sold the ranch in 1912 to a syndicate of wealthy Los Angeles businessman and developers, which formed the beginning

of what has evolved into the modern Tejon Ranch Company. Through a series of purchases, the syndicate increased the Ranch's holdings to 281,000 acres. Sales of various rights-of-way to public utilities initially aided the company's cash flow. More recently, the ranch has leased acreage to various farming, oil, and cattle interests. By 1957, approximately 70 percent of the ranch was operated under lease (WSC 2002:20).

Commercial oil exploration within the greater Tejon Ranch began in 1937; the first fields were abandoned by 1943. Shortly thereafter, the Richfield Oil Corporation discovered the "Grapevine Oil Field", now more commonly known as the "Tejon Oil Field", located on the floor of the southern San Joaquin Valley far to the north of the Project site. Oil exploration within the La Liebre Ranch area was restricted to six shallow test wells that were drilled in 1953 and 1954. The wells were abandoned as non-producers and no commercial oil production occurred on the Project site (WSC 2002:20).

Although large-scale farming, oil and gas production, and cattle operations continue on the Tejon Ranch, the primary use of the Project site has been livestock (cattle) grazing and recreational (hunting) activities (WSC 2002:20–21).

Two Southern California electrical transmission lines cross the southwestern portion of the Project site: the Big Creek lines and the Pastoria-Pardee line. The Big Creek Transmission lines are part of the Big Creek Hydroelectric Project (BCHP), (located 60 miles north of Fresno) which has a period of significance of 1911–1929; the BCHP is considered one of the world's most important engineering and technological achievements during the early portion of the 20<sup>th</sup> Century. The BCHP has been determined by consensus to be eligible for the National Register of Historic Places as a Historic District because of its contributions to the overall development of the Los Angeles metropolitan area. The Big Creek lines traverse the Los Angeles basin from Long Beach to the foothills of the San Gabriel Mountains and then over the Transverse Mountain Range into the Central Valley to the western Sierra Nevada. Over the years, many of the historically significant towers have been replaced by modern type MS and type MA lattice towers as part of ongoing maintenance of the lines, which is the case with the four lattice towers located on the Project site (Taylor 2007).

## **Cultural Resource Descriptions**

### ***Archaeological and Historic-Period Structural Resources***

The discussion below summarizes the findings of the Phase I Archaeological Survey conducted in 2002; the subsurface Phase II Archaeological Testing Program conducted in 2004; the Supplemental Phase II Archaeological Testing Program conducted in 2007 (all by WSC); the Phase I Archaeological Survey and Phase II Archaeological Testing Program conducted in 2015 by ASM Affiliates; and consultation with SCE regarding the historical significance of the electrical transmission towers in the southwestern portion of the Project site.

According to the SCCIC records search dated July 19, 1999, 36 archaeological sites and 6 isolated artifacts had been recorded within 8 miles of the Project site on the USGS Lebec 7.5-minute quadrangle, but no sites or isolated artifacts were reported for the La Liebre Ranch Quadrangle (WSC 2002). Review of historical documents indicates that one historic

building, the La Liebre/Beale Adobe, and the historical aboriginal village of *hwi'tahovea*, are known to be present south of the Project site. The two commingled sites share the trinomial designation CA-LAN-3254/H since there are both prehistoric and historic elements. The figure “#/H” denotes the presence of both prehistoric and historic site elements.

WSC conducted an archaeological field survey of the Project in 2002; the survey resulted in the identification of 57 archaeological sites within the boundaries of the Project site. Of these, 2 (CA-LAN-3218H and CA-LAN-3219H) were considered not significant based on the Phase I survey (WSC 2002:39) and an additional site (CA-LAN-3985) was discovered later. In 2004, WSC conducted Phase II Archaeological Testing at 12 sites identified during the Phase I survey. None of these 12 resources were found to contain sufficient data or integrity to qualify them for historical significance and were found not to be eligible for the CRHR. In 2007, WSC conducted a supplemental testing of 12 additional archaeological sites that were identified and recorded during the 2002 survey. This supplemental study determined that sites CA-LAN-3201 and CA-LAN-3206 represent significant/unique cultural resources and are eligible for inclusion on the CRHR.

In 2015, ASM Affiliates conducted an archaeological field survey of 768 acres, and no resources were noted during the survey. ASM Affiliates also conducted test excavations at 20 sites east of the California Aqueduct. Two of these sites were determined to include small, low-density subsurface archaeological deposits. These are CA-LAN-3240 and CA-LAN-3242, both of which are camps or small seasonal habitations, most likely occupied by single families. Both of these sites have the potential to yield information useful for understanding prehistory, and they are recommended as significant and potentially eligible for the CRHR. It is recommended that they be preserved in place or that Phase III data recovery be conducted at these sites. Two of the remaining 18 sites addressed in the 2015 study, that had been originally recorded as possible cairns, were determined to be surface exposures of decomposing bedrock cobbles and, as natural features, do not constitute cultural resources and are not significant or eligible for the CRHR. The remaining 16 sites were all determined to consist exclusively of surface scatters of tools and stone tool manufacturing waste. They are all small quarry workshops associated with natural cobbles lenses with one suggesting plant processing activities. Phase II studies resulted in the recovery of all archaeological specimens at these locations, thereby constituting scientifically consequential information from and about these resources. None of these sites contains temporally diagnostic artifacts. Based on this last fact, they are recommended as not significant or eligible for the CRHR.

Two aboveground electrical transmission lines consisting of four steel lattice towers cross the southwestern portion of the site. Consultation with SCE indicates that all of the towers are modern MS or MA type towers and are not, therefore, contributors to the historically significant Big Creek Hydroelectric District.

## Summary of Findings

### Archaeological Study Findings

As a result of the Phase II testing at the Project site in 2004, 2007, and 2015, a total of four archaeological sites (CA-LAN-3201, CA-LAN-3206, CA-LAN-3240, and CA-LAN-3242) appear eligible for listing in the CRHR.

The sites identified during the surveys conducted on the Project site are summarized in Table 5.6-1, and include the site's trinomial identifier; temporary field number; type of site; whether the site was evaluated and, if so, if it is CRHR eligible; whether the site is within the development footprint or in open space; and an impact significance finding. The cultural resource site location and significance finding is summarized in the setting to streamline the presentation of the data by including all relevant data in one place. The significance findings presented in Table 5.6-1 are discussed further later in this section. Aside from their listing in Table 5.6-1, the temporary site numbers assigned to resources as they were discovered in the field will not be used further. Brief descriptions of each resource and discussions regarding the assessment of CRHR eligibility are also provided in greater detail below and following Table 5.6-1.

**TABLE 5.6-1  
ARCHAEOLOGICAL AND HISTORIC RESOURCES WITHIN  
THE PROJECT SITE BOUNDARIES**

<b>Trinomial</b>	<b>Temporary Field Number<sup>a</sup></b>	<b>Site Type</b>	<b>CRHR Eligibility</b>	<b>Location</b>	<b>Potential Impact to "Historical Resource"<sup>?b</sup></b>
CA-LAN-3195	CT-2	Lithic scatter and midden	Not evaluated <sup>c</sup>	Open Space Area	None
CA-LAN-3196	CT-3	Lithics, hearth feature, 2 meter deep midden	Not evaluated <sup>c</sup>	Open Space Area	None

<p>CRHR: California Register of Historic Resources</p> <p>Note: In accordance with the <i>California Code of Regulations</i> (Title 14, Section 15120[d]), no information about the location of archaeological sites is included in this Program EIR.</p> <p><sup>a</sup> Temporary site numbers are included in this table in the event that comparison between trinomials and field numbers in earlier reports is necessary.</p> <p><sup>b</sup> Mitigation measures for potential impacts identified are listed in Section 5.6.7.</p> <p><sup>c</sup> Eligibility of these sites for listing in the CRHR has not yet been determined. Therefore, any impacts to these sites are assumed to be significant until proven otherwise. See Mitigation Measure 6-4.</p> <p>Source: WSC 2002, 2004, 2007; ASM 2015.</p>					

### Description of Known Archaeological Resources within the Project Site

**CA-LAN-3195:** This site is characterized by a possible prehistoric midden deposit on a stream bench associated with a spring. A midden is a mound or deposit containing shells, animal bones, and other refuse that indicates the site of a human settlement. Materials observed included a flaked stone tool, fire-cracked rock, and possible midden soil. This site is estimated to be approximately 75 by 15 meters (m, 246 by 49 ft) in size. The age of the site is unknown, and the site appears to be in good condition. CA-LAN-3195 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3196:** This site is characterized by a buried prehistoric midden deposit evident at the confluence of two seasonal drainages. The midden is as much as 2 meters (6.5 ft) deep and is visible in both sides of a steep arroyo cut. The midden is overlain by about 40 centimeters (cm, 16 inches [in]) of non-cultural soil. Materials observed included lithics,

fire-cracked rock, and a possible hearth feature that is eroding from the cut. This site is estimated to be approximately 25 by 75 m (82 by 246 ft) in size. The age of the site is unknown, and the site appears to be in good condition. CA-LAN-3196 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3197:** This site is marked by a single shallow prehistoric bedrock mortar on a low granodiorite (course-grained igneous rock) boulder measuring approximately one m (three ft) in diameter. The age of the site is unknown, and the site appears to be in good condition. CA-LAN-3197 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3198:** This site is characterized by a large prehistoric midden deposit in a canyon area. The midden is covered in some areas by about 40 cm (16 in) of colluvium. Materials observed include a high density of fire-cracked rock, flaked stone artifacts, and a “broken” small boulder containing a bedrock mortar. This site is estimated to be approximately 150 by 50 m (492 by 164 ft) in size. The age of the site is unknown, and the site appears to be in good condition. CA-LAN-3198 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3199:** This site is marked by a single shallow prehistoric bedrock mortar on a low granodiorite boulder measuring approximately one m (three ft) in diameter. The age of the site is unknown, and the site appears to be in good condition. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates that the site is not significant. The site is not considered a unique resource or eligible for listing in the CRHR

**CA-LAN-3200:** This site is characterized by a small prehistoric midden deposit with a low density of artifacts. Materials observed included midden soil, fire-cracked rock, and flaked stone artifacts. This site is estimated to measure approximately 100 m (328 ft) in diameter. The age of the site is unknown, and the site appears to be in good condition. CA-LAN-3200 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3201:** This site is marked by a large sandstone outcrop that contains 11 prehistoric cupule petroglyphs (small abraded pits) arranged in short lines. Cupule sites in this region appear to have been used ethnographically in rituals for adolescent girls. This site is estimated to measure approximately 10 m (33 ft) in diameter. A broken white quartz cobble was observed nearby on the ground. The age of the site is unknown and, aside from natural erosion of the sandstone, the site appears to be in good condition. Test excavations of this site were conducted by WSC in 2007; these excavations failed to identify a subsurface component associated with the petroglyphs. However, the significance of the site, due to its association with Native American religious rites, has since been established. The site is considered a unique resource and is eligible for listing in the CRHR.

**CA-LAN-3202H:** Results of the Phase I survey characterized the site as a historic ranch homestead within a side canyon. Materials observed include the remnants of a fallen water tower and at least 2 wood-framed structures along with framing timber; wire nails; 55-gallon

drums; sheet and galvanized metal; wire mattress springs and coils; car seat coil springs; fragments of purple glass; metal stove pipe; electrical parts; iron hay rake; and a sheet metal brooder box, which is a heated box where chicks or other baby birds are kept. A small associated trash pit was observed to contain tire rubber, two enamel pots, a stove top, and broken glass. This site was estimated to be approximately 100 by 50 m (328 by 164 ft) in size, dates from the Depression era, and is in fair condition.

Phase II testing was conducted at CA-LAN-3202H in 2004. The site was divided into two loci: Locus A (containing eight discrete features) and Locus B (comprised of one discrete feature). Mapping of the site's components expanded the overall dimensions to 125 by 86 m (410 by 282 ft). A systematic surface collection of diagnostic artifacts was followed by the excavation of four 1-m by 1-m (3-ft by 3-ft) subsurface units. All recovered materials (684 specimens) date to the 20<sup>th</sup> century and were found in disturbed contexts. Therefore, the site does not contain an intact subsurface component from which to derive reliable data. The site is thought to be the seasonally occupied headquarters for the Pyramid Ranch, an operation that was not part of Tejon Ranch. CA-LAN-3202H is not significant in local history and is therefore not eligible for listing in the CRHR. The Phase II assessment resulted in the mapping and recording of all extant surface features. This action resulted in the collection of all scientific information from and about the site; therefore, the site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3203:** This site is characterized by a small prehistoric midden deposit, lithic scatter, and bedrock mortar feature. A large sandstone outcrop was observed to contain 11 mortar holes and an unshaped pestle. Midden soil was observed and included two hammerstones, calcined (heated to a high temperature so that it is oxidized, reduces, or loses water) animal bone, fire-cracked rock, and a *Haliotis* (abalone) shell. Possible hearth features eroding from a low ridge along one edge of the site were also observed. This site is estimated to measure approximately 75 m by 100 m (246 ft by 328 ft) in size. The age of the site is unknown, and the site appears to be in good condition. CA-LAN-3203 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3204H:** Results of the Phase I survey characterize the site as a historic rubbish dump at the foot of a steep slope. Materials observed include a dense concentration of glass bottles (e.g., Clorox, vinegar, ketchup, ginger ale, club soda, and whiskey); a chipped beef jar; cone-top and church-key beer cans; an early car engine cover and headlight reflector pans; sanitary seal cans; AA batteries; one-gallon kerosene cans; sardine cans; boot soles; pots; galvanized roofing; tire rubber; wire and sheet metal; and car seat springs. This site was estimated to be approximately 10 m by 25 m (33 by 82 ft) in size and may be associated with site CA-LAN-3202H as it is located approximately 250 m (820 ft) away. The site appeared to date from the Depression Era and was in good condition.

CA-LAN-3204H was archaeologically tested in 2004 (Phase II testing). The site was divided into three discrete surface features. Site mapping expanded the overall dimensions slightly to 10 m by 28 m (33 ft by 92 ft). A systematic surface collection of diagnostic artifacts was followed by the excavation of one 1-m by 1-m (3-ft by 3-ft) subsurface unit in an area most conducive to the accumulation of buried remains. The recovered materials (87 specimens)

date primarily to the late Depression/post-Depression time frame. The site does not have an intact subsurface deposit. The site is likely a trash dump associated with the Pyramid Ranch site (CA-LAN-3202H, described above). As with CA-LAN-3202H, CA-LAN-3204H is not a significant or unique resource and is not eligible for listing in the CRHR. The Phase II assessment resulted in the mapping and recording of all extant surface features. This action resulted in the collection of all scientific information from and about the site; therefore, the site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3205:** This site is marked by a prehistoric bedrock mortar feature within a wide canyon. A low sandstone outcrop was observed to contain five mortar holes of variable depths. This site is estimated to be approximately 1 m by 4 m (3 ft by 13 ft) in size. The age of the site is unknown, and the site appears to be in good condition. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates the site does not constitute a significant/unique cultural resource; therefore, the site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3206:** This site is characterized by a buried prehistoric midden deposit evident in the sidewall of a deeply cut arroyo. The midden is as much as one m (three ft) deep and is overlain by about one m (three ft) of colluvium. Materials observed include ground and flaked stone artifacts and fire-cracked rock. This site is estimated to be approximately 20 m by 75 m (66 ft by 246 ft) in size. The age of the site is unknown, and the site appears to be in good condition, despite the presence of an erosional gully. WSC conducted subsurface testing of this site in 2007. Testing established the vertical and horizontal extent of the buried deposit. Based on the site's integrity, its deep midden, and evaluation of the recovered artifact assemblage indicates the site represents a significant/unique cultural resource.

**CA-LAN-3207:** This site is marked by a single prehistoric bedrock mortar on a large sandstone boulder measuring approximately 2 m by 3 m (6.5 ft by 10 ft) in size. The boulder is situated in a streambed. The age of the site is unknown and the site appears to be in good condition. CA-LAN-3207 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3208:** This site is marked by a single prehistoric bedrock mortar on a low sandstone boulder measuring approximately one m (three ft) in diameter. The boulder is situated within a drainage bottom. The age of the site is unknown, and the site appears to be in good condition. CA-LAN-3208 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3209:** This site is marked by a large prehistoric bedrock mortar location within a drainage. Four separate granodiorite boulders were observed to contain nine mortar holes in total. No midden or artifacts were observed, but the concentration of mortars indicates that they may be present. This site is estimated to be approximately 75 m (246 ft) in diameter overall. The age of the site is unknown and the site appears to be in good condition. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates the site is not significant. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3210:** This site is marked by a single shallow prehistoric bedrock mortar on a low sandstone boulder that measures approximately one m (three ft) in diameter. The boulder is along the edge of a small channel. The age of the site is unknown, and the site appears to be in good condition. CA-LAN-3210 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3211:** Results of the Phase I survey characterize the site as a low density deposit of prehistoric flaked stone artifacts. Materials observed include angular chert (compact rock comprised of microcrystalline quartz) shatter, a quartzite flake, and two quartzite cobble tools. The deposit was estimated to measure approximately 30 m (98.5 ft) in diameter. The age of the site was unknown and appeared to be in good condition. CA-LAN-3211 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (three lithic artifacts) shows that the site area is much smaller than originally estimated. Three 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. All extant archaeological materials were collected as a part of Phase II testing. This action has resulted in the collection of all scientific information from and about the site; therefore, the site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3212:** This site is a prehistoric cobble quarry and workshop location characterized by a low-density deposit of flaked stone artifacts on a small knoll. Materials observed include quartzite angular shatter and cobble cores. The deposit is estimated to measure approximately 30 m by 60 m (98.5 ft by 197 ft) in size. The age of the site is unknown and the site appears to be in good condition. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates the site is not significant. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3213:** This site is a prehistoric cobble quarry and workshop location characterized by a medium-density deposit of flaked stone artifacts along a small ridge line. Materials observed include angular shatter, cores, and cobble tools made primarily of quartzite. The deposit is estimated to measure approximately 30 m by 50 m (98.5 ft by 164 ft) in size. The age of the site is unknown and the site appears to be in good condition. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates the site is not significant. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3214:** This site is a prehistoric cobble quarry and workshop location characterized by a medium-density deposit of flaked stone artifacts along a small ridgeline. Materials observed included quartzite angular shatter, cores and cobble tools, and two chert flakes. The deposit is estimated to measure approximately 90 m by 125 m (295 ft by 410 ft) in size. The age of the site is unknown and the site appears to be in good condition. CA-LAN-3214 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3215:** This site is a large prehistoric cobble quarry and workshop location and is characterized by a low-density deposit of flaked stone artifacts occurring in discontinuous

concentrations on a long, narrow ridgeline. Materials observed included quartzite cobble cores, flakes, and angular shatter. The deposit is estimated to measure approximately 60 m by 450 m (197 ft by 1,476 ft) in size. The age of the site is unknown and the site appears to be in good condition. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates the site is not significant. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3216H:** This site represents the location of a jet aircraft crash that is known to have occurred in 1949. The site is situated along one boundary of the Project site and appears to extend outside the site. Crash debris observed in the study area consists of jet engine turbine blades, a fuel line connector with safety wire, and aluminum airframe structural fragments. Military records obtained during preliminary research shows that the crash involved two F-86 Sabre jets representing the second generation of jet fighters made for the U.S. Air Force immediately after World War II. The jets involved in the crash were stationed at March Air Force Base and were participating in a bomber-intercept training exercise. The area of the site within the Project site is estimated to measure approximately 75 m by 175 m (246 ft by 574 ft) in size, but no preliminary assessment of its condition was made. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates the site is not significant. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3217:** This site is a prehistoric cobble quarry and workshop location characterized by a low-density deposit of flaked stone artifacts on a low ridge. Materials observed included quartzite debitage (i.e., flakes and lithic waste), angular shatter, cores, and cobble tools. The deposit is estimated to measure approximately 125 m (410 ft) in diameter. The age of the site is unknown and the site appears to be in good condition. CA-LAN-3217 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR.

**CA-LAN-3218H:** This site is a silted-in reservoir (i.e., a destroyed dam) with a concrete spillway and water intake structure. The dam and spillway appear to have been destroyed by flooding. Large trees are growing in the spillway bottom, suggesting that some time has passed since the feature was constructed. This site is estimated to measure approximately 50 m (164 ft) in diameter overall. Its age is uncertain and its condition is very poor. Based on the site's poor condition and low data potential, the site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3219H:** This site is characterized as an oil-drilling location in an open valley bottom. Materials observed include a low-to-moderate density scatter of fire bricks, a sanitary seal can, a glass condiment bottle, sheet metal, wire nails, a metal pipe, wooden beams, a large metal bolt, wire cable, three asphalt concentrations, a small concrete foundation, a capped two-inch metal pipe, and a low earthen berm. Fire bricks are embossed with "LAPCO" over three stars. This site is estimated to be approximately 150 m by 50 m (492 ft by 164 ft) in size. The site dates from 1953–1954 (the period of oil exploration on La Liebre Ranch) and is in poor condition. Preliminary examination indicated that the site has low data potential. At the time of the Phase I survey, the site was less than 50 years old and did not meet the minimum-age threshold for historical significance and was not considered

to be historically significant. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates the site is not significant. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3220:** Results of the Phase I survey characterize the site as a low density deposit of prehistoric flaked stone artifacts on a low saddle and was described as a cobble quarry and workshop location. Materials observed included angular shatter, cores, and cobble tools made primarily of quartzite. The deposit was estimated to measure approximately 75 m by 300 m (246 ft by 984 ft) in size. The age of the site was unknown, and the site appeared to be in good condition.

CA-LAN-3220 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (four specimens including a biface chopper, a cobble hammerstone, a multiplatform core, and one piece of angular shatter debitage) shows that the site area is much smaller than originally estimated. Six 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. All extant (existing) archaeological materials were collected as a part of Phase II testing. This action has resulted in the collection of all scientific information from and about the site. CA-LAN-3220 is not considered a unique resource or eligible for listing in the CRHR, as the site no longer retains any historical significance.

**CA-LAN-3223:** Results of the Phase I survey characterize the site as a prehistoric cobble quarry and workshop location with a medium-density deposit of flaked stone artifacts occurring in discontinuous concentrations. Materials observed include angular shatter, cores, and cobble tools made primarily of quartzite. The deposit was estimated to measure approximately 100 m by 150 m (328 ft by 492 ft) in size. The age of the site was unknown and the site appeared to be in good condition.

CA-LAN-3223 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (12 specimens, including 3 multi-platform cores, 4 flakes, 3 uniface flake tools, 1 core/hammerstone, and 1 uniface chopper) shows that the site area is much smaller than originally estimated. Five 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. The Phase II assessment has resulted in the mapping and recording of all extant surface features. This action has resulted in the collection of all scientific information from and about the site. CA-LAN-3223 is not considered a unique resource or eligible for listing in the CRHR, as the site no longer retains any historical significance.

**CA-LAN-3224:** Results of the Phase I survey characterize the site as a prehistoric cobble quarry and workshop location with a medium-density deposit of flaked stone artifacts occurring in discontinuous concentrations on a broad knoll. Materials observed include angular shatter, cores, and cobble tools made primarily of quartzite. The deposit was estimated to measure approximately 150 m by 200 m (492 ft by 656 ft) in size. The age of the site was unknown and the site appeared to be in good condition.

CA-LAN-3224 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (12 surface specimens, including 6 flakes, 2 biface choppers, 2 scraper planes, and 1 multiplatform core) shows that the site area is much smaller than originally estimated. Five 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. The Phase II assessment resulted in the mapping and recording of all extant surface features. This action has resulted in the collection of all scientific information from and about the site. CA-LAN-3224 is not considered a unique resource or eligible for listing in the CRHR, as the site no longer retains any historical significance.

**CA-LAN-3225:** Results of the Phase I survey characterize the site as a prehistoric cobble quarry and workshop location characterized by a low-density deposit of flaked stone artifacts along a narrow ridgeline. Materials observed included quartzite angular shatter and cobble cores. The deposit is estimated to measure approximately 30 m by 150 m (98.5 ft by 492 ft) in size. The site area has been impacted by an underground communication cable that was placed in the center of the site. The age of the site is unknown. WSC conducted subsurface testing of this site in 2007. Evaluation of the recovered artifacts indicates the site is not significant. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3226:** Results of the Phase I survey characterize it as a prehistoric cobble quarry and workshop area marked by a low-density deposit of flaked stone artifacts on a small ridge line. Materials observed include quartzite angular shatter and a hammerstone. The deposit was estimated to measure approximately 30 m (98.5 ft) in diameter. The age of the site was unknown and the site appeared to be in good condition.

CA-LAN-3226 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (three archaeological specimens, including one multi-platform core, one cobble hammerstone, and one flake) shows that the site area is much smaller than originally estimated. Two 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but neither yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. All extant archaeological materials were collected as a part of Phase II testing. This action resulted in the collection of all scientific information from and about the site. CA-LAN-3226 is not considered a unique resource or eligible for listing in the CRHR, as the site no longer retains any historical significance.

**CA-LAN-3227:** This site is a large prehistoric cobble quarry and workshop location and is characterized by a medium-density deposit of flaked stone artifacts occurring in discontinuous concentrations on a large knoll. Materials observed include angular shatter, cores, flakes, and cobble tools made primarily of quartzite. The deposit is estimated to measure approximately 125 m by 215 m (410 ft by 705 ft) in size. The age of the site is unknown and the site appears to be in good condition. CA-LAN-3227 has not been archaeologically tested or evaluated for significance under CEQA as of the preparation of this EIR. Although the site lies in the preserved open space area, it is very close to the development area; therefore, it is assumed significant unless later proven otherwise.

**CA-LAN-3229:** Results of the Phase I survey characterize the site as a prehistoric cobble quarry and workshop location with a low-density deposit of flaked stone artifacts along one edge of a large broad ridgeline. Materials observed include quartzite cobble cores and a flake. The deposit was estimated to measure approximately 30 m (98.5 ft) in diameter. The age of the site was unknown, and the site appeared to be in good condition.

CA-LAN-3229 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (four surface specimens, including one multiplatform core, one flaked hammerstone, one cobble hammerstone, and one core scraper plane) shows that the site area is much smaller than originally estimated. Three 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. The Phase II assessment resulted in the mapping and recording of all extant surface features. This action resulted in the collection of all scientific information from and about the site. CA-LAN-3229 is not considered a unique resource or eligible for listing in the CRHR, as the site no longer retains any historical significance.

**CA-LAN-3230:** The Phase I survey characterizes the site as a small prehistoric cobble quarry and workshop location with a medium-density deposit of flaked stone artifacts that occurred along one edge of a large broad knoll. Materials observed include quartzite angular shatter, cores, and cobble tools. The deposit was estimated to measure approximately 15 m (49 ft) in diameter. The age of the site was unknown, and the site appeared to be in good condition.

CA-LAN-3230 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (13 archaeological specimens including 6 flakes, 4 multi-platform cores, 2 hammerstones, and 1 cobble chopper) shows that the site area is comparable to what was originally estimated. Two 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. The Phase II assessment resulted in the mapping and recording of all extant surface features. This action resulted in the collection of all scientific information from and about the site. CA-LAN-3230 is not considered a unique resource or eligible for listing in the CRHR, as the site no longer retains any historical significance.

**CA-LAN-3231:** The Phase I survey characterized this site as a prehistoric cobble quarry and workshop location with a low-density deposit of flaked stone artifacts occurring along one edge of a ridge line. Materials observed included quartzite cores, a cobble tool, and a hammerstone. The deposit was estimated to measure approximately 60 m (197 ft) in diameter. The age of the site was unknown and the site appeared to be in good condition.

CA-LAN-3231 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (ten surface specimens including six hammerstones, three flakes, and one multi-platform core) shows that the site area is much smaller than originally estimated. Three 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. The Phase II assessment resulted in the

mapping and recording of all extant surface features. This action resulted in the collection of all scientific information from and about the site. CA-LAN-3231 is not considered a unique resource or eligible for listing in the CRHR, as the site no longer retains any historical significance.

**CA-LAN-3232:** The Phase I survey noted that the site was a prehistoric cobble quarry and workshop location characterized by a low-density deposit of flaked stone artifacts occurring in discontinuous concentrations on a narrow ridgeline. Materials observed include quartzite cobble cores. The deposit was estimated to measure approximately 30 m by 150 m (98.5 by 492 ft) in size. The age of the site was unknown and the site appeared to be in good condition.

CA-LAN-3232 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (six surface artifacts, including four multi-platform cores and two flakes) shows that the site area is much smaller than originally estimated. Five 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. The Phase II assessment resulted in the mapping and recording of all extant surface features. This action resulted in the collection of all scientific information from and about the site. CA-LAN-3232 is not considered a unique resource or eligible for listing in the CRHR, as the site no longer retains any historical significance.

**CA-LAN-3233:** This site is a low-density cobble quarry/workshop measuring about 30 m in diameter that is associated with a small cobble concentration. Two quartzite cobble tools, two quartzite cores, two quartzite flakes, and one igneous flake were observed at this location, which is of unknown age. The site is located approximately 300 m east of the paved two-lane National Cement Road along the southern toe slope of an east-west-trending ridgeline.

CA-LAN-3233 was archaeologically tested in 2015. A systematic surface collection of artifacts (four surface artifacts, including a cobble core and three flakes) was completed. Based on the distribution of these artifacts, the site area is oriented 21 m southeast/northwest by 13 m southwest/northeast. One subsurface TU, two subsurface STPs, and one surface shovel scrape were excavated on the site. No cultural material was recovered from any of the excavation units or the scrape. The site is a small, low-density surface lithic scatter that lacks a subsurface component. All identified artifacts are quartzite, which occurs naturally in an exposed cobble lens on the site surface. The site is best interpreted as an expedient quarry/workshop, used sporadically or, perhaps, on only one occasion. Its age is unknown. CA-LAN-3233 is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3234:** This site was recorded in 2002 as a low-density cobble quarry/workshop associated with a small cobble concentration. Its size was estimated at 30 m in diameter. When recorded, it contained four quartzite cores, and it is of unknown age. The site is located roughly 300 m east of the paved two-lane National Cement Road along the southern toe slope of an east-west trending ridgeline that is 300-m north of SR-138.

CA-LAN-3234 was archaeologically tested in 2015. A systematic surface collection of artifacts (three surface artifacts including two cobble cores and one flake) was completed. The artifact distribution indicates that the site area is oriented 27 m southeast/northwest by 11 m southwest/northeast. One subsurface TU, two subsurface STPs, and one surface shovel scrape were excavated on the site. No cultural material was recovered from any of the excavation units or the scrape. Site CA-LAN-3234 is a small, low-density surface lithic scatter that is associated with a small cobble concentration. It represents quarry/workshop activities, perhaps from a single use. The site does not contain a subsurface deposit and its age is unknown. CA-LAN-3234 is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3235:** This site was described in 2002 as a rock cairn containing mixed igneous clasts ranging from fist to boulder size, measuring 2 m by 3 m in overall area. The site is located approximately 490 m east of the Aqueduct on the west side of a north/south trending drainage. It was in good condition, but of unknown age and function. At the time of its recording, it was uncertain whether the site represented a prehistoric (Native American) or historic (Euro-American) feature or a natural (non-cultural) concentration of cobbles.

CA-LAN-3235 was archaeologically tested in 2015. A systematic surface collection of artifacts was completed. No surface artifacts were identified. One subsurface TU was excavated on the site. No cultural material was recovered and decomposing granite sediments were encountered within the first ten centimeters of excavation. CA-LAN-3235 appears to represent a natural concentration of exposed, but heavily decomposing bedrock cobbles, not a cairn resulting from human actions. It does not constitute a cultural resource.

**CA-LAN-3236:** This site was described in 2002 as a low-density cobble quarry/workshop associated with a small cobble concentration. Its size was estimated at about 30 m east/west by 100 m north/south orientation. At the time of recording, five quartzite cores were noted at this location. Its age is unknown. It is located approximately 60 m southeast of CA-LAN-3237 and 360 m north of SR-138 on the same east/west-trending ridgeline that contains sites CA-LAN-3237 and CA-LAN-3235.

CA-LAN-3236 was archaeologically tested in 2015. A systematic surface collection of artifacts (three cobble cores were collected) was completed. One subsurface TU, four subsurface STPs, and two surface shovel scrapes were excavated at the site. No cultural material was encountered in the subsurface. CA-LAN-3236 is a surface lithic quarry workshop associated with a cobble exposure. It does not contain a subsurface component. Its age is unknown, and it represents ephemeral exploitation, perhaps only a single use of this location. The age of the site is unknown. CA-LAN-3236 is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3237:** This site was described in 2002 as a small, low-density cobble quarry/workshop associated with small cobble concentration. Three quartzite cores and one quartzite flake were observed at this location. The site is located approximately 60 m northwest of CA-LAN-3236 and 480 m north of SR-138, on the same east/west-trending ridgeline that contains sites CA-LAN-3235 and CA-LAN-3236.

CA-LAN-3237 was archaeologically tested in 2015. A systematic surface collection of artifacts (three cobble cores, one flake) was completed. One subsurface TU, two subsurface STPs, and two surface shovel scrapes were excavated at the site. No cultural material was encountered in the subsurface. Site CA-LAN-3237 consists of a small, low-density surface quarry/workshop associated with an exposed cobble lens. It does not contain a subsurface deposit. Its age is unknown, but it appears to represent ephemeral use of the cobble resource, perhaps consisting of only a single quarrying event. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3238:** This site was recorded in 2002 as a medium density cobble quarry/workshop consisting of lithic scatter and associated cobble concentration. It measured approximately 20 m east/west by 40 m north/south orientation. Approximately 30 archaeological specimens were noted at this location, consisting of quartzite angular shatter, cores, cobble tools, one quartzite flake, and four jasper flakes. The site is located about 450 m north of SR-138 and 250 m north of CA-LAN-3235, along the southern edge of a long east-west trending saddle.

CA-LAN-3238 was archaeologically tested in 2015. A systematic surface collection of artifacts (one cobble cores, five flake) was completed. One subsurface TU, two subsurface STPs, and two surface shovel scrapes were excavated at the site. No cultural material was encountered in the subsurface. The TU resulted in the recovery of one flake. This originated in the first few centimeters (i.e., topsoil) of the unit, essentially in the first shovel scrape layer. Rodent disturbance was noted in the excavation. Site CA-LAN-3238 is a small surface lithic scatter. The presence of angular shatter, a core, and a primary flake indicate its use as a quarry/workshop. This appears to have the exploitation of both quartzite and CCS in the cobble lens that is present on the site surface. The single piece of debitage recovered in TU-1 is essentially a surface specimen that was covered by a thin coating of soil, and the site lacks a subsurface archaeological deposit. The age of the site is unknown. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3239:** This site was identified in 2002 as a medium density cobble quarry/workshop consisting of discontinuous lithic scatters and associated cobble concentrations. Its size was estimated at 60 m east/west by 300 m north/south orientation. About 30 archaeological specimens were observed on the site, including quartzite angular shatter, cores, cobble tools, and three flakes. It is located about 600 m north of SR-138 and 900 m northeast of CA-LAN-3238, along the top of a large east-west-trending ridgeline.

CA-LAN-3239 was archaeologically tested in 2015. A systematic surface collection of 17 artifacts (6 flakes, 2 flake tools, 4 cobble cores, 3 cobble tools, and 2 hammerstones) was completed. One subsurface TU, six subsurface STPs, and four surface shovel scrapes were excavated at the site. No cultural material was encountered in the subsurface. Site CA-LAN-3239 is a surface lithic scatter containing a variety of materials. These include rhyolite, metavolcanic (perhaps also basalt), CCS, and, predominantly, locally available quartzite. The site appears to have served as an occasionally employed quartzite quarry as well as a more general workshop, based on the presence of cobble tools (potentially used for plant pulping or other heavy chopping tasks). No subsurface deposit is present at the site. The age of the

site is unknown. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3240:** This site was recorded in 2002 as a low-density lithic scatter measuring about 90 m east/west by 350 m north/south orientation. It contained 12 jasper flakes and a granitic metate at the time of recording, thereby contrasting with the cobble/quarry workshops that represent the majority of the study area sites. The site was also noted as sitting on a well-oxidized sandy loam, suggesting that this location may differ in age from the other sites, potentially being older. The site is located on a north-south-trending bluff that is situated on the southern edge of the Oso Creek Wash, near the northern limit of the 2015 study area.

CA-LAN-3240 was archaeologically tested in 2015. A systematic surface collection of 6 formal artifacts (4 flake tools, 1 cobble core, 1 biface fragment) and 37 flakes was completed. Five subsurface TUs, ten subsurface STPs, and six surface shovel scrapes were excavated at the site. A total of eight flakes were recovered from the TUs; no artifacts were recovered from the STPs; and four flakes were recovered from the shovel scrapes.

Site CA-LAN-3240 appears to represent a small campsite with a small, low-density subsurface deposit. A metate, used for grinding plant foods (probably seeds) had been observed on the site when originally recorded, but could not be relocated during the Phase II test. Along with the other artifacts, this nonetheless suggests that a wide range of activities may have occurred at this location, including plant processing and tool maintenance and manufacture as well as quarrying, and that the site may have served as a small camp. The wide range of lithic materials, some of which are not local to the study area, support the interpretation of the site as a camp; obsidian almost certainly originated in the Coso source, 130 miles to the northeast. The low density and shallow subsurface deposit (maximum depth, approximately 20 cm) likewise suggests periodic but low intensity use of this site. No temporally diagnostic artifacts were recovered and the site's age is unknown. The presence of a single obsidian flake, however, may indicate that the site pre-dates roughly AD 1200, when the obsidian trade from eastern California collapsed. Ongoing hydration analysis of this specimen will allow an evaluation of this interpretation. The site is considered a unique resource and is eligible for listing in the CRHR.

**CA-LAN-3241:** This site was recorded in 2002 as a plant processing station associated with a small cobble concentration. Two bifacial igneous manos, three quartzite cobble cores, one hammerstone, one granitic metate, one jasper uniface flake tool, and one piece of jasper angular shatter were observed on the site. As at nearby CA-LAN-3240, soils here comprised of well-oxidized sandy loam, suggesting that the site may be the same (potentially early) age as this previous locality. This site is located 200 m east of CA-LAN-3240, on the northern end of a broad northeast-southwest-trending ridge that is situated on the southern edge of, and overlooking, the Oso Creek wash.

CA-LAN-3241 was archaeologically tested in 2015. A systematic surface collection of 11 artifacts (2 metates, 2 cobble cores, 2 manos, a core, a flake tool, a biface, and 2 flakes) was completed. Four subsurface TUs, five STPs, and four surface shovel scrapes were excavated at the site. A total of two flakes were recovered from the Tus; no artifacts were recovered

from the STPs; and two flakes were recovered from the shovel scrapes. CA-LAN-3241 yielded a surface artifact assemblage that includes a small number of groundstone tools (manos and metates) used for plant processing; cores, flakes, and shatter resulting from tool manufacture; and flake tools used for a variety of cutting and piercing tasks. No subsurface deposit is, however, present at the site. The nature of the artifacts suggests that the site jointly served as a plant processing station and quarry/workshop. Given its proximity to CA-LAN-3240, it is likely that CA-LAN-3421 served as a special activity area associated with that nearby campsite. Assuming this is correct, the two sites would be the same age, although this has not yet been fully established. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3242:** This site was described in 2002 as a low-density cobble quarry/workshop associated with a small cobble concentration. It measured about 90 m east/west by 150 m north/south orientation. Artifacts noted at the time of recording included one rhyolite uniface cobble tool, one quartzite hammerstone fragment, one jasper core, and one jasper flake. The site is located approximately 30 m northeast of benchmark Pipe-3062, along the northeastern toeslope of the same northeast-southwest-trending ridgeline that contains sites CA-LAN-3243 and CA-LAN-3244 (below). This places it immediately overlooking the open flats of the western Antelope Valley, to the east.

CA-LAN-3242 was archaeologically tested in 2015. A systematic surface collection of eight artifacts (two cores, two core tools, a cobble tool, and three flakes) was completed. One subsurface TU, five STPs, and two surface shovel scrapes were excavated at the site. A total of four flakes were recovered from the TUs; no artifacts were recovered from the STPs; and no artifacts were recovered from the shovel scrapes. CA-LAN-3242 appears to be represent a small and very low density subsurface deposit extended to approximately 20 cm bd. Artifacts on the site surface, though limited in number, are indicative of quarrying and primary reduction (cores and angular shatter), while the core tools are most likely the result of heavy pounding activities, perhaps plant processing. The artifact assemblage, in general terms, is similar to many of the other quarry workshops tested for this Project, which lack subsurface deposits. The presence of such a deposit in this case appears to represent a unique geomorphological context, at the toeslope of a low ridgeline, which would provide an upslope source of soil for the slow burial of artifacts below the ground. The small assemblage, furthermore, includes 30 percent core/cobble complex tools, and three of the five pieces of debitage are obsidian tertiary flakes, suggesting that at least some habitation occurred at this locale inasmuch as tertiary flakes are typically associated with tool maintenance rather than production.

The variety of kinds of lithic materials, including obsidian, almost certainly originating at the Coso source, over 130 miles to the northeast, is indicative of trade. The low density of subsurface materials suggests that the site was sporadically used, but potentially over a long period of time. The age of the site is unknown. Based on the presence of obsidian, it is believed to pre-date roughly AD 1200; this hypothesis may be clarified by obsidian hydration dating. The site is considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3243:** This site was recorded in 2002 as a medium-density cobble quarry/workshop associated with a large continuous cobble concentration. It was thought

to cover an area measuring 60 m east/west by 180 m north/south orientation. About 35 archaeological specimens were noted, including quartzite cobble cores, hammerstones, flakes, and 1 jasper flake. It is located about 180 m southwest of benchmark Pipe-3062, along the top of the same northeast-southwest-trending ridgeline that contains site CA-LAN-3244. The site was in good condition, but is of unknown age.

CA-LAN-3243 was archaeologically tested in 2015. A systematic surface collection of 17 artifacts (1 mano, 8 cobble cores, 1 cobble core tool, 3 cores, 5 flakes, and a hammerstone) was completed. One subsurface TU, six STPs, and four surface shovel scrapes were excavated at the site. No artifacts were recovered from any of the TUs, STPs, or shovel scrapes. Site CA-LAN-3243 is a moderate-density surface lithic scatter exhibiting two primary activities: quarrying the quartzite and other cobbles available on-site and, to a lesser extent, plant processing. No subsurface deposit is present at this site. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3244:** This site was recorded in 2002 as a low-density cobble quarry/workshop associated with a large discontinuous cobble concentration. It was measured at approximately 60 m north/south by 700 m east/west orientation, and about 50 specimens were observed on it, including quartzite cobble cores, hammerstones, flakes and jasper cores. It is located about 450 m southwest of benchmark Pipe-3062, on the same northeast-southwest-trending ridge line that contains site CA-LAN-3243.

CA-LAN-3244 was archaeologically tested in 2015. A systematic surface collection of 23 artifacts (6 flakes, 3 cores, 1 core tool, 1 flake tool, 9 cobble cores, 2 cobble tools, and 1 hammerstone) was completed. One subsurface TU, eight STPs, and four surface shovel scrapes were excavated at the site. No artifacts were recovered from any of the TUs, STPs, or shovel scrapes. Site CA-LAN-3244 is a moderate density surface lithic scatter consisting of a quarry/workshop associated with a natural quartzite cobble lens. The site lacks a subsurface deposit and its age is unknown. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3245:** This site was described in 2002 as a medium-density cobble quarry/workshop associated with a large continuous cobble concentration. It measures about 32 m northwest/southeast by 151 m northeast-southwest orientation. In 2002, about 35 archaeological specimens were noted, including quartzite cobble cores, hammerstones, and flakes. The site is located about 800 m southwest of benchmark Pipe-3062 and 95 m south of site CA-LAN-3244.

CA-LAN-3245 was archaeologically tested in 2015. A systematic surface collection of 9 artifacts (4 cobble cores, 1 cobble tool, 1 core, and 3 flakes) was completed. One subsurface TU, six STPs, and four surface shovel scrapes were excavated at the site. No artifacts were recovered from any of the TUs, STPs, or shovel scrapes. Site CA-LAN-3245 is a surface lithic scatter consisting of a quarry/workshop. This primarily involved the exploitation of a lens of natural quartzite cobbles, but the presence of CCS cores and flakes demonstrate that imported lithic materials were also worked at the site. No subsurface deposit is present and the age of the site is unknown. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3246:** This site was recorded in 2002 as another low-density cobble quarry/workshop associated with a small cobble concentration. It covers an area estimated at about 30 m in diameter. Two quartzite hammerstones and two quartzite flakes were observed on the site, which is located approximately 135-m northeast of Quail Lake along the southwestern edge of a large broad bluff that is immediately west of the paved two-lane National Cement access road.

CA-LAN-3246 was archaeologically tested in 2015. A systematic surface collection of two artifacts (two cobble cores) was completed. One subsurface TU, two STPs, and one surface shovel scrape were excavated at the site. One flake was recovered from the TU, and no artifacts were recovered from the STPs or shovel scrape. Site CA-LAN-3246 is a very small, low density surface lithic scatter, probably resulting from a single prehistoric visit. No subsurface deposit is present at this site and its age is unknown. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3247:** This site was recorded in 2002 as a low-density cobble quarry/workshop associated with a small cobble concentration. It measures about 15 m north/south by 45 m east/west orientation. Two cores, one uniface cobble tool, and one piece of angular shatter, all made of quartzite, were observed at this site. This site is located in a saddle at the top of a large knoll (map elevation 3,154 ft above msl) approximately 350 m south of site CA-LAN-3245, and thus towards the eastern side of the study area.

CA-LAN-3247 was archaeologically tested in 2015. A systematic surface collection of four artifacts (one cobble core, one core, and two flakes) was completed. One subsurface TU, two STPs, and one surface shovel scrape were excavated at the site. No artifacts were recovered from any of the TUs, STPs, or shovel scrapes. Site CA-LAN-3247 is a very small, low-density surface lithic scatter resulting from quarrying the locally available quartzite cobble lens. No subsurface deposit is present and the site age is unknown. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3248:** The Phase I survey noted the site as a large prehistoric cobble quarry and workshop location that is characterized by a medium-density deposit of flaked stone artifacts that occur in a continuous concentration. Materials observed include quartzite cobble cores, tools, and angular shatter. The deposit was estimated to measure approximately 60 m by 200 m (197 ft by 656 ft) in size. The age of the site was unknown and the site appeared to be in good condition.

CA-LAN-3248 was archaeologically tested (Phase II) in 2004 as a single continuous feature. A systematic surface collection of artifacts (20 specimens) shows that the site area is much smaller than originally estimated. Five 1-m by 1-m (3-ft by 3-ft) subsurface units were excavated, but none yielded any cultural materials. The site does not contain a subsurface component from which to derive informative data. The Phase II assessment resulted in the mapping and recording of all extant surface features. This action resulted in the collection of all scientific information from and about the site. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3249:** This is the second possible rock cairn discovered during the 2002 Phase I survey. It measured about 1 m by 2 m in size and contained mixed igneous clasts ranging from fist to boulder size. The cairn is located about 490 m east of the East Branch of the California Aqueduct canal and 350 m north of site CA-LAN-3250. CA-LAN-3249 was archaeologically tested in 2015. A systematic surface collection was not completed as no surface artifacts were observed. One subsurface TU was excavated at the site. No artifacts were recovered, and it is determined that the site is natural in origin and does not constitute a cultural resource.

**CA-LAN-3250:** This was described in 2002 as a low-density cobble quarry/workshop associated with a small cobble concentration. It covered an area estimated at 30 m in diameter. Three artifacts, including one core, one hammerstone, and one uniface cobble tool, all made of quartzite, were noted on the site. It is located approximately 380 m east of the East Branch of the California Aqueduct on the north side of an east/west drainage north of a spring.

CA-LAN-3250 was archaeologically tested in 2015. A systematic surface collection of two artifacts (one cobble core, one biface/projectile point) was completed. One subsurface TU, two STPs, and one surface shovel scrape were excavated at the site. No artifacts were recovered from any of the TUs, STPs, or shovel scrapes. Site CA-LAN-3250 is a very low-density surface lithic scatter with a limited artifact assemblage consisting of an assayed quartzite cobble/core and an obsidian biface fragment. The paucity of artifacts is indicative of ephemeral site use, perhaps a single episode. No subsurface deposit is present, and the site age is unknown, though the obsidian is suggestive of a roughly pre-AD 1200 date. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3251:** This is another recorded low-density cobble quarry/workshop associated with a large discontinuous cobble concentration. In 2002, it measured about 150 m north/south by 350 m east/west orientation and contained a total of about 30 specimens, including quartzite cobble cores, cobble tools, and angular shatter. It is located 80 m east of the East Branch of the California Aqueduct.

CA-LAN-3251 was archaeologically tested in 2015. A systematic surface collection of 11 artifacts (5 cobble cores, 4 flakes, 1 assayed cobble, and 1 core tool) was completed. One subsurface TU, six STPs, and four surface shovel scrapes were excavated at the site. No artifacts were recovered from any of the TUs, STPs, or shovel scrapes. Site CA-LAN-3251 is a large but low-density quarry/workshop associated with a natural quartzite cobble lens. The site lacks a subsurface archaeological deposit and its age is unknown. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3252:** This was described in 2002 as a low-density cobble quarry/workshop associated with a large discontinuous cobble concentration. It measured about 35 m north/south by 96 m east/west orientation. About two dozen archaeological specimens were noted on the site, including quartzite cobble cores, cobble tools, and angular shatter. It is located 120 m east of the East Branch of the California Aqueduct canal.

CA-LAN-3252 was archaeologically tested in 2015. A systematic surface collection of six artifacts (two cobble cores, two core tools, and two flakes) was completed. One subsurface TU, four STPs, and two surface shovel scrapes were excavated at the site. No artifacts were recovered from any of the TUs, STPs, or shovel scrapes. Site CA-LAN-3252 is a low-density surface lithic scatter/quarry workshop. It lacks a subsurface archaeological deposit and its age is unknown. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3253:** This site was recorded in 2002 as a low-density cobble quarry/workshop associated with a small cobble concentration. It was estimated to be about 60 m north/south by 90 m east/west orientation in size. At the time of recording, one basalt flake, one basalt uniface cobble tool, and one quartzite uniface cobble tool were noted on the site. It is located on a long narrow east-west-trending ridgeline that is approximately 340 m northeast of the paved, two-lane National Cement access road. CA-LAN-3253 was archaeologically tested in 2015. A systematic surface collection of two artifacts (one flake and one flake tool) was completed. One subsurface TU, four STPs, and two surface shovel scrapes were excavated at the site. No artifacts were recovered from any of the TUs, STPs, or shovel scrapes. The site is not considered a unique resource or eligible for listing in the CRHR.

**CA-LAN-3985H:** This site is characterized as an oil drilling location similar to the previously identified CA-LAN-3219H. This site is estimated to be approximately 42 m by 22 m (138 ft by 72 ft) in size. According to California Division of Oil, Gas, and Geothermal Resources' records, the well was operated by Alexander N. Campbell. It was drilled to 3,756 feet in 1956, plugged, and abandoned due to the absence of oil or gas. At the time of the Phase I survey, the site was less than 50 years old and did not meet the minimum-age threshold for historical significance and therefore was not considered to be historically significant.

WSC conducted an evaluation of the site in 2007. Materials observed include a low-density scatter of sheet metal, mesh screening, a ring bearing, 1-inch wire cable, a few galvanized bolts, and a 55-gallon drum. Non-metal artifacts include milled lumber, a two-inch rubber hose, a rubber gasket, and three cement concentrations as a result of abandoned cement sacks. The site is not considered a unique resource or eligible for listing in the CRHR.

### ***Paleontological Resources Findings***

#### Literature Review

According to the paleontological records search and literature review conducted by the NHMLAC in November 2006, there was no record of any previously identified vertebrate fossil localities within the Project site (McLeod 2006), nor had any vertebrate fossil localities been discovered in the general vicinity within the same rock formations that occur on the Project site.

The NHMLAC literature review reveals that two of the three rock formations identified on the Project site are sensitive for the presence of fossil resources. They include (1) the marine Late Miocene Quail Lake Formation, exposed in the elevated parts of the southwestern portion of the Project site (north of SR-138 and northwest of Quail Lake) and in part of the elevated areas of the southeastern portion of the Project site (south of SR-138) and (2) the

terrestrial Late Miocene Oso Canyon Formation that grades into the Quail Lake Formation. The third formation, the Neenach Volcanic Formation, exposed in the southeastern portion of the Project site (on the west side of Tentrock Canyon) and northeast of La Liebre Ranch is expected to lack fossils. Older Quaternary terrace deposits, of Pleistocene age, occurring around the exposures of the Oso Canyon Formation may contain significant fossils, probably similar to those from the famous Rancho La Brea asphalt deposits in Los Angeles (i.e., La Brea Tar Pits). Younger Quaternary Alluvium in the drainages in the lower lying areas is unlikely to contain any fossil deposits.

The 2006 investigation did not include a search for invertebrate species. The records search and literature review do not contain information that indicates that the Project site had been subjected to a comprehensive paleontological field survey. Therefore, a paleontological survey was conducted for the Project (PEA 2009) and is described below.

### Survey

A paleontological resource inventory and impact assessments study was undertaken by Dr. Bruce Lander of Paleo Environmental Associates (PEA 2009). The study included background research of published and unpublished paleontologic and geologic literature; examination of geologic maps; a field survey of the Project site; an evaluation of the Project's potential to impact paleontologically sensitive rock formations; and development of mitigation measures that would reduce the direct and indirect adverse environmental impacts on paleontological resources to a less than significant level.

This study is in general agreement with McLeod (2006) in the description and evaluation of the relative sensitivity of the rock units in the Project area. PEA goes further by assigning each unit a level of paleontological importance; identifying potential fossil localities; and evaluating the Project's potential to adversely affect fossils in them. These are presented in Table 5.6-2, Geologic Formations and Paleontological Sensitivity within the Project Site Boundaries, and are described below. As with the discussion of archeological and historical resources above, the significance finding for each geologic unit is provided here in the setting discussion to streamline the presentation of data. The significance findings are discussed further in the impact analysis later in this section. Exhibit 5.6-1, Geological Formations, depicts the distribution of geologic formations within the Project site.

Centennial Project

**TABLE 5.6-2  
GEOLOGIC FORMATIONS AND PALEONTOLOGICAL SENSITIVITY WITHIN THE  
PROJECT SITE BOUNDARIES**

<b>Geologic Formation</b>	<b>Importance</b>	<b>Impact</b>
Intrusive Igneous Rocks	No paleontologic importance	No Project impacts
Neenach Volcanic Formation	No paleontologic importance	No Project impacts
Quail Lake Formation	High paleontologic importance	Highly significant development-related impacts without mitigation
Oso Canyon Formation	Undetermined, but potentially high paleontologic importance	Undetermined, but potentially highly significant development-related impacts without mitigation
Older Quaternary Alluvium	Undetermined (but likely moderate) paleontologic importance	Undetermined development-related impacts without mitigation
Younger Quaternary Alluvium	Undetermined (but likely moderate) paleontologic importance at depths more than 5 feet from the current ground surface. Low paleontological importance at depths less than 5 feet below the current ground surface	Undetermined development-related impacts without mitigation. Above 5 feet: low potential of significant impacts above 5 feet
Note: Mitigation measures for the potential impacts identified above are listed in Section 5.6.7. Source: PEA 2009.		

### *Intrusive Igneous Rocks*

Intrusive igneous rocks are exposed only at the northwestern corner of the Project site. These igneous rocks consist of plutonic rocks that do not contain fossils because of their origin from a molten state deep within the Earth's crust (PEA 2009). Consequently, there is no potential for any previously unrecorded fossil site or remains occurring where this rock unit underlies the Project site. Therefore, the igneous rocks are of no paleontologic importance.

### *Neenach Volcanic Formation*

The Neenach Volcanic Formation is exposed only at the southeastern corner of the Project site. The formation consists of extrusive igneous rocks, primarily andesitic lava flows; because of their origin from a molten state, this formation does not contain fossils (PEA 2009). Consequently, there is no potential for any previously unrecorded fossil site or remains occurring where the Project site is underlain by this rock unit. Therefore, the Neenach Volcanic Formation is of no paleontologic importance.

### *Quail Lake Formation*

The Quail Lake Formation comprises intervals of light gray to tan, massive to bedded, medium- to coarse-grained sandstone that commonly are conglomeratic at the base and silty siliceous shale (PEA 2009). It is exposed only in the western half of the western portion of the Project site. The literature review and field survey conducted in support of this inventory documented the occurrence of a number of previously recorded sites and one previously unrecorded fossil site in exposures of the Quail Lake Formation in the Project area. Six such sites are mapped in the Project site, several of which were relocated as a result of the field survey and still found to be productive, and a seventh just outside the northwestern corner of the Project site (Exhibit 5.6-1). These sites produced fossilized remains representing extinct species of calcareous marine algae, bryozoans (moss animals), sand dollars, and marine snails and clams (PEA 2009). Petrified wood was found at the one previously unrecorded site discovered during the survey.

These fossil occurrences indicate that there is a high potential for additional similar fossil remains being encountered at previously recorded sites and at currently unrecorded fossil sites where the Project site is underlain by this rock unit. Therefore, the Quail lake Formation is potentially of high paleontologic importance.

### *Oso Canyon Formation*

The Oso Canyon Formation comprises layers of pebble and cobble conglomerate; gray to red, fine- to coarse-grained or conglomeratic sandstone; and greenish-gray to red sandy or pebbly siltstone (PEA 2009). This formation is exposed in much of the Project site. The archival search conducted in support of this inventory did not document the occurrence of any previously recorded fossil site in the Oso Canyon Formation. However, a fossil-bearing limestone bed near the base of the Oso Canyon Formation yielded the remains of fresh-water snails and ostracods (bivalved crustaceans) near La Liebre Ranch, which lies at the southeastern corner of the Project site. The fossil remains and the species they represent have been critical in determining the fresh-water origin of the fossil-bearing strata. Petrified wood was documented at a number of newly recorded fossil sites discovered as a result of the field survey conducted in support of the inventory.

Pending further investigation, occurrences indicate that there is an undetermined (but possibly high) potential for additional similar fossil remains being encountered at previously recorded and currently unrecorded fossil sites where the Project site is underlain by this rock unit. Therefore, the Oso Canyon Formation is of undetermined (but possibly high) paleontological importance.

### *Older Quaternary Alluvium*

The Older Quaternary Alluvium comprises dissected and unconsolidated to weakly consolidated alluvial deposits, including alluvial fan gravel and poorly bedded, alluvial gravel and sand (PEA 2009). This rock unit is exposed in much of the Project site. The literature review, archival search, and field survey conducted in support of this inventory did not document the occurrence of any previously recorded fossil site in the Older Quaternary Alluvium in the Project site or its immediate vicinity. However, several sites in the Older

Alluvium near Barrel Springs in Palmdale have yielded fossilized bones and teeth representing a taxonomically diverse faunal assemblage that includes mostly extinct species of early to middle Pleistocene (Ice Age) land mammals. The remains from the Older Quaternary Alluvium are scientifically highly important because of their taxonomic diversity and, particularly with regard to those of the packrat, have allowed the determination of the age of the formation.

Pending further investigation, the occurrence of several previously recorded fossil sites in the Project region indicates that there is an undetermined (but probably no more than a moderate) potential for additional similar fossil remains being encountered at unrecorded fossil sites where the Project site is underlain by this rock unit. Therefore, the Older Quaternary Alluvium is of undetermined (but likely no more than moderate) paleontological importance.

#### *Younger Quaternary Alluvium*

The Younger Quaternary Alluvium comprises undissected and unconsolidated layers of alluvial gravel, sand, and silt of valley areas (PEA 2009). This rock unit is exposed within much of the Project site. The literature review, archival search, and field survey conducted in support of this inventory did not document the occurrence of any previously recorded fossil site in the Younger Quaternary Alluvium within the Project site or the immediate vicinity. However, several sites—including fossils of a leopard lizard, gopher, and a large land mammal—lie east of Little Rock Wash in Palmdale and near General William J. Fox Airfield in Lancaster, from 0 to 10 feet below the surface and, like the Project site, are at elevations above 2,325 feet above msl, which is the highstand of ancient Lake Thompson (including Rosamond Lake).

Pending further investigation, the occurrence of several previously recorded fossil sites in the Project region indicates that there is an undetermined (but probably no more than a moderate) potential for additional similar fossil remains being encountered at unrecorded fossil sites where the Project site is underlain by this rock unit and at depths greater than five feet below the current ground surface. Therefore, the Younger Quaternary Alluvium is of undetermined (but likely no more than moderate) paleontological importance at such depths (more than five feet below ground surface).

On the other hand, at depths less than five feet below the current ground surface, any remains probably would be too young to be considered fossilized. Therefore, the Younger Quaternary Alluvium is of low paleontological importance at such shallow depths.

### **5.6.1 PROJECT DESIGN FEATURES**

No project design features for cultural resources have been identified. However, design of the Project incorporated data from the archaeological and paleontological evaluations performed on the site. Specifically, identified archaeological and historical sites are known to be, or are assumed to be, eligible for the CRHR and were avoided wherever feasible, and are outside the development footprint in open space areas. Sites were assumed CRHR-eligible without evaluation to provide a conservative assessment. Sites within the 50-foot construction buffer zone were also evaluated for CRHR eligibility. The specific

locations of these sites cannot be disclosed in the EIR because of confidentiality issues associated with archaeological sites.

### 5.6.2 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact related to cultural resources if it would:

- Threshold 6-1** Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5 of the CEQA Guidelines.
- Threshold 6-2** Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5 of the CEQA Guidelines.
- Threshold 6-3** Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, or contain rock formations indicating potential paleontological resources.
- Threshold 6-4** Disturb any human remains, including those interred outside of dedicated cemeteries.
- Threshold 6-5** Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k).
- Threshold 6-6** Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

### 5.6.3 ENVIRONMENTAL IMPACTS

- Threshold 6-1** Would the project cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5 of the CEQA Guidelines?
- Threshold 6-2** Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5 of the CEQA Guidelines?
- Threshold 6-5** Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?
- Threshold 6-6** Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

#### **On-Site Impacts**

As discussed previously, archaeological field surveys resulted in the identification of 57 archaeological sites (see Table 5.6-1, Archaeological and Historic Resources within the Project Boundaries). As noted in Table 5.6-1, sites are distinguished by location either within the development footprint or within open space areas, as discussed further below.

#### ***Sites Located within the Development Footprint***

As identified in Table 5.6-1 above, there are a total of 26 prehistoric and historic archaeological sites within the development footprint. The archaeological testing of these sites concluded that three prehistoric sites (CA-LAN-3201, CA-LAN-3240 and CA-LAN-3242) are eligible for CRHR listing. As such, these sites are considered to be significant archeological resources pursuant to Section 15064.5(a)(3) of the State CEQA Guidelines. Each of these three sites is discussed further below.

Sites CA-LAN-3240 and CA-LAN-3242 both have archaeological deposits that extend to about 20 cm in depth. Site CA-LAN-3240 had the largest artifact assemblage recovered, including 5 flake tools, used for small cutting and scraping tasks; 27 secondary and tertiary waste flakes, resulting from lithic tool manufacture and maintenance; and 1 core. The predominance of smaller (secondary and tertiary as opposed to larger primary) waste flakes, the limited number of cores, and the absence of angular shatter indicate that quarrying and primary lithic reduction were not significant activities at this site. Although it could not be relocated in 2015, a metate was present when this site was originally recorded in 2002, indicating that some amount of plant processing also occurred at this location.

Site CA-LAN-3201 is marked by a large sandstone outcrop that contains 11 prehistoric cupule petroglyphs arranged in short lines. Cupule sites in this region appear to have been used ethnographically in rituals for adolescent girls. Test excavations of this site were conducted by WSC in 2007; these excavations failed to identify a subsurface component associated with the petroglyphs; however, due to its association with Native American religious rites, the site is considered significant.

Lithic materials present at CA-LAN-3240 were diverse. Many of these are locally available, though not necessarily on the site per se, but one obsidian flake was recovered. The closest obsidian source to the Project site is in the Coso Mountains, roughly 130 miles to the northeast, making this the most likely source for this material and, in any case, indicating that the site's occupants were involved in some degree of long-distance trade. No temporal diagnostics were recovered from the site. The Coso obsidian trade in this portion of California primarily occurred between about 4000 to 800 Years Before Present (YBP), or mostly during the Middle Horizon, however. This suggests (but does not prove) that this site may be 800 years old or more. The low subsurface artifact density of this site, regardless of its age, suggests occasional but non-intensive occupation, probably by a small group (such as a single family). Site CA-LAN-3240 can be interpreted as a dispersal phase campsite based on this fact, most likely associated with the Spring-season exploitation of locally available plant resources.

Site CA-LAN-3242, had a small artifact assemblage, limited to ten specimens, including two cores, five secondary and tertiary flakes, two pieces of angular shatter, and three core/cobble complex tools. Despite the limited size of this assemblage, it contains a high diversity of kinds of artifacts relative to many of the other sites. The cores and angular shatter are indicative of quarrying and primary lithic reduction, whereas the three obsidian tertiary flakes are more characteristic of tool maintenance, found at occupation sites. This suggests that the site served as a campsite, with the subsurface deposition of lithic materials resulting from the site's location, at the toeslope of a ridge, providing a natural upslope source for soil deposition. As noted above in reference to CA-LAN-3240, the presence of obsidian at CA-LAN-3242 is indicative of long distance trade, and suggests that the site may have been occupied sometime between roughly 4000 and 800 YBP.

#### Tribal Cultural Resources (AB 52 Consultation)

Consistent with AB 52 requirements, the County, as lead agency, initiated the offer of consultation to the tribes that have submitted to the County of Los Angeles a request to be consulted. Subsequently, the County received correspondence from both the Fernandeño

Tataviam Band of Mission Indians (Tataviam Tribe) dated November 17, 2016 and the Tejon Indian Tribe (Tejon Tribe) dated October 25, 2016 regarding consultation concerning topics such as the assessment of tribal resources, Project impact to tribal resources, mitigation measures, and access to surveys and reports related to the assessment. Prior to submittal of these written correspondences, both Tribes communicated with the County via email regarding the status of their responses to the consultation request and the communications between the two Tribes regarding the Project. In addition, the Tejon Ranch Company (TRC) has coordinated extensively with the Tejon Tribe separate from, and prior to, the consultation required by CEQA. Based on this and the associated review by the Tejon Tribe of the Project cultural resources studies, the written correspondence from the Tejon Tribe states that the Tataviam Tribe has “deferred to the Tejon Tribe’s support of the adequacy of the cultural resource studies...”. The Tataviam Tribe has recommended the Tejon Tribe be the lead tribal consultants, and that the Tataviam will provide future comments through the Tejon (Tataviam Tribe 2016). The Tejon Tribe reports that current considerations to protect tribal resources include, but are not limited to, employing Native American monitors from the Tejon Tribe and the permanent curation of any prehistoric artifacts/Tribal Cultural Resources collected during construction of the Project (Tejon Tribe 2016). Consistent with the expectations of the Tejon Tribe through coordination with the TRC, the MMs for the Project incorporate Native American monitoring by the Tejon Tribe and recovered archaeological resources shall be offered on a first refusal basis to the County (as Lead Agency) and/or its designee, which shall be the Tejon Indian Tribe.

### Conclusion

Because these three archaeologically significant sites are within the grading footprint, grading and other construction activities, including fuel modification, would directly impact these sites. This represents a significant environmental impact and mitigation would be required. Impacts to these three sites would be mitigated through avoidance by means of monitoring by a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe during construction, and either Project redesign, preservation through restricted access or, if that is not feasible, through a Phase III data recovery program (MM 6-1 and MM 6-3). MM 6-2 requires these three sites, and two others, to be protected by fencing during construction to ensure avoidance of the resource, and MM 6-4 provides further protective measures if necessary. Excavated finds shall be offered to the County of Los Angeles and/or its designee (i.e., the Tejon Indian Tribe) on a first refusal basis (MM 6-1 and 6-3); the Tejon Indian Tribe can then make a determination whether the find is a significant tribal cultural resource and opt to accept the resource for curation in its facility). With implementation of MMs 6-1, 6-2, 6-3, and 6-4, impacts to sites CA-LAN-3201, CA-LAN-3240, and CA-LAN-3242 would be reduced to a less than significant level.

Implementation of the Project would result in a less than significant impact to the 24 sites within the development footprint that have been determined ineligible for CRHR or are not cultural resources, and no mitigation is required; however, as testing may not have recovered all significant materials, these sites and a reasonable radius around them will be monitored during grading.

Table 5.6-3 lists the mitigation measures that will reduce all impacts to resources within the development footprint to a less than significant level.

### ***Sites Located within the Open Space Areas***

As identified in Table 5.6-1 above, there are a total of 30 prehistoric archaeological sites within open space areas (i.e., areas outside the development footprint), including 27 prehistoric archaeological sites and 3 historic-period sites. The CRHR eligibility of 18 of the 30 total sites located within Open Space-designated areas has been determined through archaeological testing. Of the 18 sites evaluated, 1 site (CA-LAN-3206) has been determined eligible and 17 sites have been determine ineligible. The CRHR eligibility of the remaining 12 sites has not been evaluated to date, as these sites have never been within an anticipated

development (i.e., grading) footprint during the evolution of the Project design. For the 12 sites whose eligibility for the CRHR is unknown, because these resources have not yet been formally evaluated, it is assumed that the sites are historically significant until, and unless, evaluation proves otherwise. Because these 12 sites are outside the development footprint, direct impacts during grading and other construction activities are not expected. However, site CA-LAN-3227 is immediately adjacent the development footprint. Because of its proximity, the site could suffer damage during grading activities. Because site CA-LAN-3227 is assumed CRHR-eligible, this would be considered a potential significant direct impact. Therefore, MM 6-1 requires monitoring by a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe (pursuant to AB 52 consultation as described above) when grading is in the vicinity of these sites (MM 6-1); MM 6-2 requires the sites to be fenced off during construction to ensure avoidance of the resource; and MM 6-4 provides further protective measures if necessary. Excavated finds shall be offered to the County of Los Angeles and/or its designee (i.e., the Tejon Indian Tribe) on a first refusal basis (MM 6-1); the Tejon Indian Tribe can then make a determination whether the find is a significant tribal cultural resource and opt to accept the resource for curation in the Tejon Tribe's facility. With implementation of MM 6-1, MM 6-2, and MM 6-4, potential direct impacts to site CA-LAN-3227 during construction would be reduced to a less than significant level.

Long-term operation of the Project would result in potential indirect impacts to the 12 sites with unknown eligibility and the 1 site located in the open space areas that is known to be eligible (CA-LAN-3206) due to increased access, by residents and visitors, to these areas of the site compared to the existing condition, wherein the sites are located entirely on private property. Because archaeological excavation is considered an adverse effect on an archaeological resource, avoidance and preservation of resources without excavation would be the preferred method of managing these sites. Therefore, MM 6-4 requires preparation of an Archaeological Resources Site-Protection Program aimed to protect and preserve identified archaeological resources that may be vulnerable to disturbance. The Archaeological Resources Site-Protection Program must include several alternatives to restrict access to these sites (e.g., fencing, planting, and capping), thereby protecting and preserving these sites. With implementation of MM 6-4, potential indirect impacts to site CA-LAN-3227 during grading/construction would be reduced to a less than significant level.

For the 17 sites determined to be ineligible, Project implementation would result in no impacts to these sites and no mitigation is required.

Table 5.6-4 lists the mitigation measures that would reduce all direct and indirect impacts to archaeological resources in open space areas to a less than significant level.

## Off-Site Impacts

No known significant cultural resources are associated with the proposed off-site access roads, off-site utility connections, and California Aqueduct crossings; therefore, no impacts are anticipated. However, the potential for these resources to be present is the same as those for other aspects of the Project.

There are no existing structures at any of the proposed off-site well locations, and there are no known historical or archaeological resources based on cultural resources records

searches conducted for the Project site and surrounding area, including the well sites. However, construction of the proposed wells would involve rotary drilling into native soils, and would have the potential to impact unknown archeological resources if such resources were directly beneath the well site. Also, installation of the proposed pipelines would involve trenching to depths of approximately five feet. Implementation of MM 6-1, requiring a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe to observe excavation activities for evidence of archeological resources, would reduce potential impacts to a less than significant level. Therefore, impacts would be reduced to a less than significant level with the incorporation of MM 6-1.

Off-site work requires the construction of a bridge crossing the West Branch of the California Aqueduct as well as improvements to two existing bridges. As proposed, the bridge construction and improvements will have no adverse effect on the potentially historically significant canal. The architectural design of the new bridge will be similar in character to the other bridges that already span the channel. While the Project would add a new bridge over the canal, in the context of the Aqueduct being a long linear feature, there would be no direct or indirect adverse effect and no cumulative effect due to the length of the property. Further, the footings and abutments of the new bridge will be located outside the potential National Register of Historic Places (NRHP) boundaries of the historic canal. The short bridge crossings over the canal do not diminish the historic character nor significant qualities that may qualify the West Branch of the California Aqueduct for NRHP eligibility.

***Impact Summary:*** A combination cultural resources survey/evaluation has been undertaken on the Project site. The survey was comprehensive, covering the entirety of the Project area. CRHR-eligibility evaluations were limited largely to sites in areas where impacts associated with the proposed development impact area are anticipated, although some of the sites within the preserved open space areas were also evaluated early in the Project development phase when site impacts were different. CRHR-eligible resources within the development impact area (CA-LAN-3201, CA-LAN-3240 and CA-LAN-3242) or that are within an open space area, but adjacent to the grading footprint and may be indirectly impacted by Project implementation (CA-LAN-3227) were defined and mitigation measures developed (MM 6-1, MM 6-2, MM 6-3, and MM 6-4, below), which will reduce all direct and indirect impacts to a less than significant level. Less than significant impacts are associated with those resources found not to be a “unique” or “historical resource” through Phase II testing and evaluation, and are therefore not eligible for listing in the CRHR.

Resources outside the development impact area (i.e., those contained within the preserved open space areas that have been evaluated as eligible ( CA-LAN-3206) or those not yet evaluated [CA-LAN-3195, CA-LAN-3196, CA-LAN-3197, CA-LAN-3198, CA-LAN-3200, CA-LAN-3203, CA-LA-3207, CA-LAN-3208, CA-LAN-3210, CA-LAN-3214, and CA-LAN-3217] are assumed significant and are subject to preservation until such time as formal evaluation is necessitated and completed.

Mitigation measures developed (MM 6-4) will reduce direct and indirect impacts to these resources to a less than significant level.

**Threshold 6-3**      **Would the project directly or indirectly destroy a paleontological resource or site or unique geologic feature, or contain rock formations indicating potential paleontological resources?**

### **On-Site Impacts**

As previously discussed, the Project site is underlain by four sedimentary units that potentially contain fossil resources: Older and Younger Quaternary Alluvium, the Quail Lake Formation, and the Oso Canyon Formation. The presence of fossil localities and sedimentary units known to contain fossil materials indicates that there is a potential for unidentified, significant, non-renewable paleontological resources. Damage to an important paleontological resource is a significant impact under CEQA. As such, implementation of the Project would have a potentially significant direct impact on paleontological resources during construction (i.e., brushing, grading, trenching, and other earth-moving activities) and a potentially significant indirect impact due to increased accessibility, which would result in unauthorized fossil collecting and removal. Mitigation of these potential Project impacts includes measures for salvage of presently exposed fossils prior to and during grading; for monitoring during earth-moving activities; for temporary isolation of discovered fossil resources; and for fossil recovery, preservation, reporting, and curation (see MMs 6-5, 6-6, 6-7, 6-8, and 6-9). With implementation of these mitigation measures, potential direct and indirect impacts would be reduced to a less than significant level.

### **Off-Site Impacts**

While there are no known paleontological resources at the locations of proposed off-site intersections with SR-138, utility connections, and California Aqueduct crossings, the potential for these resources to be present exists, as it does throughout much of the Project site. Construction of the proposed wells would involve rotary drilling into native soils, which would have the potential to impact unknown paleontological resources if such resources were directly beneath the well site. Also, installation of the proposed off-site pipeline would involve shallow trenching to depths of approximately five feet. Implementation of MMs 6-5, 6-6, 6-7, 6-8, and 6-9—which require a Paleontological Monitor, evaluation of significant fossils if recovered, and a museum storage agreement if fossils are discovered—are also applicable to off-site locations and their implementation would reduce potential impacts to a less than significant level.

**Impact Summary:** Direct evidence indicates the presence of paleontological resources in the Project area, and geologic evidence from adjacent areas with similar sedimentary formations indicates a high likelihood of encountering additional resources during Project development. Potential direct and indirect impacts would be reduced to a less than significant level with implementation of MM 6-5, MM 6-6, MM 6-7, MM 6-8, and MM 6-9.

**Threshold 6-4**      **Would the project disturb any human remains, including those interred outside of dedicated cemeteries?**

**On-Site Impacts**

No direct evidence of human remains has been found as a result of the Phase I survey and Phase II testing and evaluation of identified archaeological sites. Based on these data, no disturbance of human remains is anticipated as a result of the Project. However, the presence of substantial numbers of prehistoric archaeological sites within the Project site, especially those with buried deposits, increases the likelihood that human remains may be present. Implementation of MM 6-10, which ensures adherence to State regulations, would reduce potential impacts related to the discovery of unknown human remains to a less than significant level.

**Off-Site Impacts**

There are no known burial grounds or evidence of them at the locations of proposed off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings. However, there is always the potential to encounter unknown remains. As with Project implementation, MM 6-10 ensures adherence to State regulations and would reduce potential impacts to a less than significant level.

***Impact Summary:*** No direct evidence of human remains has been found as a result of archaeological surveys. However, the presence of prehistoric archaeological sites within the Project site, especially those with buried deposits, increases the likelihood that burials may be present. Implementation of MM 6-10, which ensures adherence to State regulations, would reduce potential impacts related to the discovery of unknown human remains during implementation of the Project and off-site features to a less than significant level.

**5.6.4 MITIGATION MEASURES**

**MM 6-1**      The Project Applicant/Developer shall retain a qualified Archaeologist who shall oversee archaeological monitoring of topsoil grading and removals (including clearing, grubbing, and trenching) in the immediate vicinity of the following 25 archaeological sites that are within the grading footprint and 1 site in the open space area that is immediately adjacent to the development impact area: CA-LAN-3201, CA-LAN-3202H, CA-LAN-3219H, CA-LAN-3227, CA-LAN-3230, CA-LAN-3232, CA-LAN-3233, CA-LAN-3234, CA-LAN-3236, CA-LAN-3237, CA-LAN-3238, CA-LAN-3239, CA-LAN-3240, CA-LAN-3241, CA-LAN-3242, CA-LAN-3243, CA-LAN-3244, CA-LAN-3245, CA-LAN-3246, CA-LAN-3247, CA-LAN-3248, CA-LAN-3250, CA-LAN-3251, CA-LAN-3252, CA-LAN-3253, and CA-LAN-3985H. CA-LAN-3227 is the site immediately adjacent to the grading footprint. Additionally, a Native American monitor representing the Tejon Indian Tribe shall be present during topsoil grading and removals in the vicinity of the 26 above-listed archaeological sites.

The Project Applicant/Developer shall provide written evidence to the County that a qualified Archaeologist has been retained; shall be present at the pre-grading meeting; shall establish procedures for archaeological resource surveillance, including coordination with representatives of the Tejon Indian Tribe on the location and schedule of Native American monitoring; and shall establish (in cooperation with the Project Applicant/Developer and/or County as well as the Tejon Indian Tribe) procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of any artifacts found, as appropriate.

The qualified Archaeologist shall develop and submit an Archaeological Resource Monitoring Plan to the County for sites in development areas. The qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe shall be retained to attend pre-grade meetings and to monitor earth-moving activities, including clearing, grubbing and trenching, in the vicinity (i.e., the area of a site reasonably expected to contain archaeological resources plus a buffer of at least 10 meters [33 feet]) of any and/or all cultural resource sites. The Archaeologist and Native American monitor shall carefully inspect these areas to assess the potential for significant prehistoric or historic remains. If potentially significant archaeological resources are uncovered, a subsurface test and/or evaluation shall be performed to assess the discovery. Further subsurface investigation or data recovery shall be undertaken if the resource is determined unique or historically significant (i.e., important for its prehistoric or historic information) and therefore eligible for the California Register of Historical Resources (CRHR).

The archaeological procedures shall be incorporated as a note on the Grading Plan cover sheet. If additional or unexpected archaeological features are discovered, the qualified Archaeologist shall report such findings in writing to the County and/or the Tejon Indian Tribe. If archaeological resources are found to be of possible significance, the qualified Archaeologist shall determine appropriate actions, in cooperation with the County and the Tejon Indian Tribe, for further exploration and/or salvage.

The Archaeologist shall submit a Follow-up Report to the County. The Follow-up Report shall include the period of inspection; an analysis of any artifacts found; and the present repository of the artifacts. Recovered finds shall be offered to the County of Los Angeles and the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts.

These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the County.

The Project Applicant/Developer shall retain a certified Archaeologist who will perform a Phase II subsurface test-level investigation and surface collection for archaeological resource sites of undetermined CRHR eligibility discovered during monitoring. A Phase II Test-level Report shall be completed that evaluates the sites; includes a discussion of the sites' significance (depth, nature, condition, and extent of the resources); and contains recommendations for final mitigation and cost estimates (if required) to fully mitigate significant impacts. Should the Phase II subsurface test-level investigation and surface collection determine the potential presence of significant subsurface resources, the site shall be mitigated to a less than significant level through the implementation of one of the mitigation options discussed below.

- a. Relocation of grading boundaries and fuel modification zones to completely avoid disturbance to the site(s). Should boundary relocation be infeasible, a qualified Archaeologist shall be present in the vicinity of archaeological resources during grading and fuel modification brush clearance. (**NOTE:** confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the South Central Coastal Information Center [SCCIC] at California State University, Fullerton. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) Fencing shall be erected outside the sites to visually depict the areas to be avoided during construction.
- b. If it is determined that avoidance and/or preservation are not feasible, then prior to grading in the vicinity of archaeological resources, Phase III data recovery (salvage excavations) shall be conducted for these archaeological sites or any other sites within the potential impact area of development that cannot be avoided. (**NOTE:** confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) The Phase III work shall provide sufficient scientific information to fully mitigate the impacts of development on these sites to a level considered less than significant and shall be performed in accordance with the standards of the State Historic Preservation Office (SHPO).

Excavated assemblages shall be offered to the County and/or the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer

provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts. Final mitigation shall be carried out based upon the recommendations in the Phase II Test-Level Report, and the County of Los Angeles Department of Regional Planning shall make a determination as to the site's disposition based on the recommendations of the qualified Archaeologist. Possible determinations include, but are not limited to, preservation, salvage, partial salvage, or no mitigation necessary.

**MM 6-2** Archaeological sites CA-LAN-3201, CA-LAN-3206, CA-LAN-3227, CA-LAN-3240, and CA-LAN-3242 shall be surrounded with high visibility construction fencing with a buffer of approximately 50 feet around each site to ensure that the archaeological sites are completely avoided during construction-related activities. A qualified Archaeologist shall work with surveying teams and the Construction Supervisor to fence the area to be avoided prior to the commencement of grading.

**MM 6-3** The Project Applicant/Developer shall retain a qualified Archaeologist to mitigate impacts to eligible archaeological sites within the development impact area. Additionally, and a Native American monitor representing the Tejon Indian Tribe shall be present during ground-disturbing activities (i.e, topsoil grading and removals) in the vicinity of the three below-listed archaeological sites. Impacts to these eligible sites (CA-LAN-3201, CA-LAN-3240, and CA-LAN-3242) shall be mitigated to a less than significant level through the implementation of one of the mitigation options described below.

- a. Relocation of grading boundaries and fuel modification zones to completely avoid disturbance to the site(s). Should boundary relocation be infeasible, a qualified Archaeologist and a Native American monitor representing the Tejon Indian Tribe shall be present in the vicinity of archaeological resources during grading and fuel modification brush clearance to monitor all activities and ensure that archaeological resources are not impacted. (**NOTE:** confidential archaeological mapping is on file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) Fencing shall be erected outside the sites to visually depict the areas to be avoided during construction. Any temporary fencing materials (i.e., plastic web, chain link, etc.) placed during construction should not become permanent. Any permanent fencing erected to protect the sites should be visually pleasing and consistent with the overall aesthetic experience of the community of Centennial.
- b. If avoidance and/or preservation are not feasible, then prior to grading in the vicinity of archaeological resources, Phase III data recovery (salvage excavations) shall be conducted for these archaeological sites or any other sites within the potential impact area of development that cannot be avoided. (**NOTE:** confidential archaeological mapping is on

file at the Natural History Museum of Los Angeles County and the SCCIC. Review of this material is restricted to qualified individuals and project proponents on a need to know basis.) The Phase III work shall provide sufficient scientific information to fully mitigate the impacts of development on these sites and shall be performed in accordance with the standards of the SHPO.

Excavated finds shall be offered to the County and/or the Tejon Indian Tribe on a first refusal basis. If the artifacts are refused, the Project Applicant/Developer may retain said finds if written assurance is provided that they will be properly preserved in Los Angeles County, unless (1) said finds are of special significance or (2) a museum in the County of Los Angeles indicates a desire to study and/or display them, in which case the items shall be donated to the County or its designee. If the Project Applicant/Developer provides no such assurance, the County shall retain the artifacts and shall be subject to the same stipulations set forth in this mitigation measure for disposition of artifacts. Final mitigation shall be carried out based upon the recommendations in the Phase II Test-Level Report, and the County shall make a determination as to the site's disposition based on the recommendations of the qualified Archaeologist and the Native American monitor representing the Tejon Indian Tribe. Possible determinations include, but are not limited to, preservation, salvage, partial salvage, or no mitigation necessary.

**MM 6-4** The Project Applicant/Developer shall develop and implement an Archaeological Resources Site-Protection Program aimed to protect and preserve identified archaeological resources vulnerable to disturbance. This program shall be prepared by the qualified monitoring Archaeologist familiar with the resources present within the Project boundaries and approved by the County and shall include implementation of one or more of the following:

- a. Fencing and/or other access-restriction methods shall be placed around the archaeologically sensitive areas of the Project site to inhibit human access. This is especially applicable to site CA-LAN-3227.
- b. Non-invasive plant species with thorns (e.g., prickly pear cactus [*Opuntia* spp.]) or other deterrent characteristics shall be planted in areas close to known resources in order to discourage human presence; this is generally applicable to the majority of sites to be preserved in areas of native vegetation.
- c. Known resources shall be capped with a layer of chemically inactive soil/sediment, in consultation with a qualified Archaeologist. This is especially applicable to sites CA-LAN-3201, CA-LAN-3206, CA-LAN-3240, and CA-LAN-3242.

The above-mentioned mitigation shall be implemented prior to the completion of construction activities and shall be overseen by the County

and/or the Tejon Indian Tribe. The qualified Archaeologist shall prepare a written statement documenting appropriate site-protection measures. Additionally, a Native American monitor representing the Tejon Indian Tribe shall be present during all initial surface grubbing, initial ground surface grading, and any excavation greater than one-half foot in depth. For implementation of each tract map, if no subsurface Native American or archaeological remains are identified during that initial grading, continuous monitoring will no longer be required but the Native American monitor shall spot-check all additional subsurface excavations at least once a week for the duration of grading and excavation activities or until monitor deems site clear. The Project Archaeologist shall be responsible for coordinating the location and schedule of Native American monitors.

**MM 6-5** For the exposed paleontological resources discovered during the Paleo Environmental Associates (PEA) 2009 study (as detailed in the document entitled *Paleontologic Resource Inventory and Impact Assessment Technical Report prepared in support of Centennial Specific Plan, western Antelope Valley, northern Los Angeles County, California*) and any paleontological resources uncovered during grading or excavation activities in or out of the presence of a Monitor, grading activities will be stopped and diverted to a part of the site reasonably away from the find (highly dependent on the size and complexity of the resource), and a qualified Paleontologist shall (1) ascertain the significance of the resources; (2) establish protocol with the Project Applicant/Developer to protect (or mitigate impacts to) such resources; (3) ascertain the presence of additional resources; and (4) provide additional monitoring of the site, if the Monitor deems it appropriate.

**MM 6-6** A Paleontological Treatment and Monitoring Plan (PTMP) shall be developed by a qualified Paleontologist retained by the Project Applicant/Developer. The PTMP shall be reviewed and approved by the County. This plan shall include a protocol for examining, evaluating, and (if necessary) salvaging known fossil localities identified during the PEA (2009) study (as detailed in the document entitled *Paleontologic Resource Inventory and Impact Assessment Technical Report prepared in support of Centennial Specific Plan, western Antelope Valley, northern Los Angeles County, California*); a grading observation schedule shall be maintained when grading occurs within sedimentary rock units so that the Paleontologist may identify and evaluate fossil resources within the Project site. This qualified Paleontologist shall be retained to attend pre-grade meetings and to monitor deep earth-moving activities (including grading, cutting, and trenching) at the site. Paleontological monitoring shall be conducted by a qualified Paleontologist during grading and other excavation work. Recommended hours for monitoring activities shall be established by the qualified Paleontologist and shall be outlined in the PTMP. It shall be the responsibility of the qualified Paleontologist to demonstrate, to the satisfaction of the County, the appropriate level of monitoring necessary based on the tentative map-level grading plans. The qualified Paleontologist shall carefully inspect PTMP-identified areas in order to assess the potential for

significant fossil remains. If potential paleontological resources are uncovered, a subsurface evaluation will be performed to assess the discovery. Further subsurface investigation will be undertaken if the resource is determined unique or important for its paleontological information. Because of the potential for producing small fragments of vertebrate microfossils, the Paleontologist shall conduct reasonable, periodic screening of sands from cuts in these units. Such material may be removed in bulk and screened off site for further analysis.

**MM 6-7** The qualified Paleontologist retained by the Project Applicant/Developer shall coordinate with appropriate construction contractor personnel to provide information concerning the protection of paleontological resources. Contractor personnel shall be informed that unauthorized fossil collecting is prohibited. The contractor's heavy equipment operators shall be briefed on procedures to be followed in the event that fossil remains and a fossil site are encountered during earth-moving activities (grading or blasting). The briefing shall be presented to new contractor personnel as necessary. Names and telephone numbers of the Monitor and other appropriate mitigation program personnel shall be provided to appropriate contractor personnel and to the County.

**MM 6-8** The qualified Paleontologist shall initiate and coordinate recovery operations with the Project Applicant/Developer and the County of Los Angeles for any significant fossil localities identified in the Paleo Environmental Associates 2009 document entitled *Paleontologic Resource Inventory and Impact Assessment Technical Report prepared in support of Centennial Specific Plan, western Antelope Valley, northern Los Angeles County, California* as well as if significant fossils are exposed during any Project-related grading pursuant to the PTMP. To initiate recovery operations, the Paleontologist shall be allowed to divert or direct grading in the area of exposure to facilitate evaluation and, if identified as potentially significant, to recover significant fossils. The qualified Paleontologist shall notify the Construction Foreman of the discovery of fossil resources and shall discuss recovery methods and the timeline needed to evaluate the find. If a fossil discovery occurs during grading operations when the Paleontologist is not present, grading shall be diverted a reasonable distance away from the area until the qualified Paleontologist can survey the area, conduct recovery operations, and make an assessment on the significance of the find.

**MM 6-9** A formal museum storage agreement shall be developed between the Project Paleontologist and an accredited institution. Any fossils and their contextual stratigraphic data that are collected during development shall be prepared and identified by a qualified Paleontologist. Excavated significant fossil finds shall be donated with funding for stabilization, identification, and curation on a first right-of-refusal basis to an appropriate, accredited institution that has a retrievable collection system and an educational and research interest in the materials (e.g., the Natural History Museum of Los Angeles County). A final

report prepared by the qualified Paleontologist that details the discovery, recovery, laboratory analysis, and findings and disposition of specimens shall be submitted to the County.

- MM 6-10** In accordance with *California Code of Regulations* (Title 14, Section 15064.5[e]), in the event of the accidental discovery or recognition of any human remains in any location other than a dedicated cemetery, the Los Angeles County Coroner must be notified of the discovery (*California Health and Safety Code*, Section 7050.5) and all activities in the immediate area of the find or in any nearby area reasonably suspected to overlie adjacent human remains must cease until appropriate and lawful measures have been implemented. If the Coroner determines that the remains are not recent, but rather of Native American origin, the Coroner shall notify the Native American Heritage Commission (NAHC) in Sacramento within 24 hours to permit the NAHC to determine the Most Likely Descendent (MLD) of the deceased Native American. The designated MLD may make recommendations to the Project Applicant/Developer or the person responsible for the excavation work, for means of treating or reassignment of the human remains and any associated grave goods with appropriate dignity, as provided in *California Public Resources Code*, Section 5097.98. If any of the following occurs, the Project Applicant/Developer shall rebury the Native American remains and the associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance: (1) the NAHC is unable to identify an MLD; (2) the MLD fails to make a recommendation within 48 hours of being notified of the discovery; or (3) the Project Applicant/Developer /Landowner rejects the recommendation of the MLD and mediation by the NAHC fails to provide acceptable measures.

#### 5.6.4 LEVEL OF SIGNIFICANCE AFTER MITIGATION

With implementation of specified mitigation measures, significant impacts to archaeological, tribal, historical, and paleontological resources from implementation of the Project would be reduced to a less than significant level.

## 5.7 BIOLOGICAL RESOURCES

### 5.7.1 INTRODUCTION

#### Purpose

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that biological resources issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### Summary

Development and implementation of the Project would result in significant direct and indirect impacts to special status plants; special status wildlife; nesting birds; native grasslands, wildflower fields and other special status vegetation types; jurisdictional drainages, wetlands, and riparian vegetation; wildlife movement and wildlife habitat; and regulated oak trees. Some, but not all, of these impacts would be reduced to less than significant levels with implementation of the Project's mitigation measures (MMs) and Mitigation Monitoring and Reporting Program (MMRP).

Significant impacts to special status plants, special status wildlife, and nesting birds that would result from implementing the Project would be reduced to a level considered less than significant through implementation of MMs 7-1 through 7-9.

Significant impacts to native grasslands and wildflower fields and other special status vegetation types that would result from implementing the Project would be reduced to less than significant levels with implementation of MMs 7-10 and 7-11.

Significant impacts to jurisdictional drainages, wetlands, and riparian vegetation that would result from implementing the Project would be reduced to less than significant levels with implementation of MM 7-12, which states that all lost functional values shall be replaced; appropriate regulatory agency permits and/or agreements shall be obtained; and the mitigation measures stipulated in those permits/agreements shall be implemented.

Significant impacts to wildlife movement and general wildlife habitat that would result from implementing the Project would be reduced to less than significant levels with implementation of MM 7-14 through MM 7-18.

Significant impacts to oak tree resources that would result from implementing the Project would be reduced to less than significant levels with implementation of MM 7-11 and MMs 7-18 through 7-20 in accordance with the County of Los Angeles Oak Tree Ordinance and in compliance with the Los Angeles County Oak Woodlands Conservation Management Plan. For the impacts to oak woodlands, mitigation is proposed in accordance with these

County documents and California State law by creating, enhancing, and/or restoring oak habitats and by preserving existing oak woodlands.

There would be no development within (including roads and fuel modification zones), and therefore, no direct impacts on Significant Ecological Areas (SEAs), or on any lands for which a habitat conservation plan (HCP) or a natural community conservation plan (NCCP) has been adopted as there are no HCPs or NCCPs on the Project site or off-site impact areas. To further ensure SEA impact avoidance, MM 7-21 is included, which prohibits fuel modification zones from encroaching on the adjacent SEA. The Project's designation of open space in the northwest portion of the site is consistent with the Tehachapi Upland Multiple Species Habitat Conservation Plan (TU MSHCP) located immediately adjacent to the north.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of a mitigation program, if required, to reduce the impacts; and level of significance after mitigation. This information is presented in the following format:

1. Introduction
  - Purpose
  - Summary
  - Section Format
  - References
2. Relevant Plans, Policies, and Regulations
3. Environmental Setting
4. Project Design Features and Standard Conditions of Approval
5. Threshold Criteria
6. Environmental Impacts—A separate analysis is provided for each of the following two categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
7. Mitigation Measures
8. Level of Significance After Mitigation
9. References

## References

Plant and wildlife compendia for the Project site, including the off-site component and a glossary of all plant and wildlife names used in the document are included in Appendix 5.7-A. Although all references cited for preparation of this analysis are listed in Section 5.7.9, the primary technical references are listed below:

1. Natural Resource Consultants (NRC). 2007 (March). *2006 Field Studies, Statistical Analyses and Modeling of Native Perennial Bunchgrass Distribution and Quality on the Approximately 11,680-Acre Centennial Specific Plan Site, Los Angeles County, California*. Laguna Beach, CA: NRC (see Appendix 5.7-B, No. Plant-6).
2. Natural Resource Consultants (NRC). 2007 (June). *2007 Grassland and Wildflower Community Composition and Distribution in the South Tehachapi Study Area*. Laguna Beach, CA: NRC (see Appendix 5.7-B, No. Plant-5).
3. Tree Life Concern. 2003 (December). *Oak Tree Report: "Centennial"*. Canoga Park, CA: Tree Life Concern (see Appendix 5.7-B, No. Plant-1).

5. BonTerra Consulting. 2009. *Oak Tree Supplemental Report: Centennial Specific Plan*. (see Appendix 5.7-B, No. Plant-11).

For expanded discussions, detailed methodologies, and the biological surveys conducted within the Project site and off-site component, refer to these reports contained in Appendix 5.7-B. The Mitigation Preserve Review is presented in Appendix 5.7-C.

## 5.7.2 RELEVANT PLANS, POLICIES AND REGULATIONS

### Federal

#### *Endangered Species Act*

The Federal Endangered Species Act of 1973 (FESA) protects plants and animals that the government has listed as “Endangered” or “Threatened”. The FESA is implemented by enforcing Sections 7 and 9 of the Act. A federally listed species is protected from unauthorized “take” pursuant to Section 9 of the FESA. “Take”, as defined by the FESA, means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or to attempt to engage in any such conduct. All persons are presently prohibited from taking a federally listed species unless and until (1) the appropriate Section 10(a) permit has been issued by the U.S. Fish and Wildlife Service (USFWS) or (2) an Incidental Take Statement is obtained as a result of formal consultation between a federal agency and the USFWS pursuant to Section 7 of the FESA and the implementing regulations that pertain to it (50 *Code of Federal Regulations* [CFR] 402). “Person” is defined in the FESA as an individual, corporation, partnership, trust, association, or any private entity; any officer, employee, agent, department or instrument of the federal government; any State, Municipality, or political subdivision of the State; or any other entity subject to the jurisdiction of the United States. The Project Applicant is a “person” for purposes of the FESA.

#### *Section 401 and 404 of the Clean Water Act of 1972 (33 United States Code 1251 et seq.)*

Section 404 of the Clean Water Act (CWA) regulates the discharge of dredge and fill material into “Waters of the U.S.” including wetlands. Dredge and fill activities are typically associated with development projects; water-resource related projects; infrastructure development

and wetland conversion to farming; forestry; and urban development. The U.S. Army Corps of Engineers (USACE) is the designated regulatory agency responsible for administering the 404 permit program and for making jurisdictional determinations.

Under Section 401 of the CWA, an activity requiring a USACE Section 404 permit must obtain a State Water Quality Certification (or waiver thereof) to ensure that the activity will not violate established State water quality standards. The State Water Resources Control Board (SWRCB), in conjunction with the nine California Regional Water Quality Control Boards (RWQCBs), is responsible for administering the Section 401 water quality certification program.

Under Section 401 of the federal CWA, an activity involving discharge into a water body must obtain a federal permit and a State Water Quality Certification to ensure that the activity will not violate established water quality standards. The U.S. Environmental Protection Agency (USEPA) is the federal regulatory agency responsible for implementing the CWA. However, it is the SWRCB in conjunction with the nine RWQCBs who essentially have been delegated the responsibility for administering the water quality certification (401) program.

The U.S. Supreme Court has issued three decisions that provide context and guidance in determining the appropriate scope of “waters of the U.S.” In *United States v. Riverside Bayview Homes*, the Court upheld the inclusion of adjacent wetlands in the regulatory definition of “waters of the U.S.”. In *Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers* (SWANCC), the Court held that the use of “isolated” non-navigable intrastate ponds by migratory birds was not, by itself, sufficient basis for the exercise of federal regulatory authority under the CWA. In *Rapanos v. United States* (Rapanos),<sup>1</sup> a majority of the U.S. Supreme Court overturned two Sixth Circuit Court of Appeals decisions, finding that certain wetlands constituted “waters of the U.S.” under the CWA. In his plurality opinion, Justice Scalia argued that “waters of the U.S.” should not include channels through which water flows intermittently or ephemerally or channels that periodically provide drainage for rainfall. He also stated that a wetland may not be considered “adjacent to” remote “waters of the U.S.” based on a mere hydrologic connection. Justice Kennedy authored a separate concurring opinion concluding that wetlands are “waters of the U.S.” if they, either alone or in combination with similarly situated lands in the region, significantly affect the chemical, physical, and biological integrity of other covered waters more readily understood as “navigable”. Lacking a majority opinion, regulatory jurisdiction under the CWA exists over a water body if either the plurality’s or Justice Kennedy’s “significant nexus” standard is satisfied.

In May 2015, in response to these Supreme Court decisions, the USACE and the U.S. Environmental Protection Agency (USEPA) published a Final Clean Water Rule (Water Rule) clarifying the scope of “waters of the U.S.” protected under the CWA (USACE and USEPA 2015). They define “waters of the U.S.” to include eight categories of jurisdictional waters. The first four types of waters are considered jurisdictional by rule in all cases: (1) Traditional Navigable Waters (TNWs); (2) interstate waters, (3) territorial seas, and (4) impoundments of jurisdictional waters. The next two types of waters are jurisdictional by rule, as defined,

---

<sup>1</sup> Consolidated cases: *Rapanos v. United States* and *Carabell v. United States* refer to the U.S. Supreme Court’s decision concerning USACE jurisdiction over “waters of the U.S.” under the CWA.

because the science confirms that they have a significant nexus to TNWs, interstate waters, or territorial seas: (5) tributaries and (6) adjacent waters. The final two types of jurisdictional waters require a case-specific analysis to determine if they have a significant nexus to TNWs, interstate waters, or territorial seas: (7) five subcategories of waters considered to be “similarly situated”—Prairie potholes, Carolina and Delmarva bays, pocosins, western vernal pools in California, and Texas coastal prairie wetlands—that must be analyzed “in combination” when making a significant nexus analysis and (8) waters within the 100-year floodplain of a TNW, interstate water, or territorial sea and waters within 4,000 feet from the high tide line or the Ordinary High Water Mark (OHWM) of a TNW, interstate water, territorial sea, impoundment, or covered tributary.

Based on the Final Clean Water Rule, the USACE and the USEPA will apply the significant standard as follows:

1. Waters are “waters of the U.S.” if they, either alone or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of TNWs, interstate waters, or the territorial seas.
2. Waters are considered “similarly situated” where they function alike and are sufficiently close to function together in affecting the nearest TNW, interstate water, or territorial sea.
3. The “region” is considered to be the single point of entry watershed (i.e., the drainage basin within whose boundaries all precipitation ultimately flows to the nearest single TNW), interstate water, or territorial sea.
4. The functions of a water that affect the chemical, physical, or biological integrity of a TNW, interstate water, or territorial seas must be “significant” and more than “speculative or insubstantial”. To determine whether there is a significant nexus, the following functions should be considered: sediment trapping; nutrient recycling; pollutant trapping, transformation, filtering, and transport; retention and attenuation of floodwaters; runoff storage; contribution of flow; export of organic matter; export of food resources; and provision of life-cycle dependent aquatic habitat for species.

On August 27, 2015, the United States District Court for the District of North Dakota enjoined the USEPA from implementing the Final Clean Water Rule, the result of lawsuit filed by several states that challenged the statutory authority of the USEPA and USACE to issue these new regulations. Therefore, currently the USACE is not implementing the definitions in the Final Clean Water Rule.

## **State**

### ***California Endangered Species Act***

Pursuant to the California Endangered Species Act (CESA) and Section 2081 of the *California Fish and Game Code*, an incidental take permit from the California Department of Fish and Wildlife (CDFW) is required for projects that could result in the take of a State-listed Threatened or Endangered species. Under the CESA, “take” is defined as an activity that would directly or indirectly kill an individual of a species, but the definition does not include

“harm” or “harass”, as the federal act does. As a result, the threshold for a take under the CESA is higher than that under the FESA. A CDFW-authorized Incidental Take Permit under Section 2081(b) is required when a project could result in the take of a State-listed Threatened or Endangered Species. The application for an Incidental Take Permit under Section 2081(b) has a number of requirements, including the preparation of a conservation plan, generally referred to as a Habitat Conservation Plan.

### ***California Fish and Game Code***

#### **Section 1602**

State law confers upon the CDFW the trustee responsibility and authority for the public trust resource of wildlife in California. The CDFW may play various roles under the CEQA process. By State law, the CDFW has jurisdiction over the conservation, protection, and management of the wildlife, native plants, and habitat necessary to maintain biologically sustainable populations. The CDFW shall consult with lead and responsible agencies and shall provide the requisite biological expertise to review and comment upon environmental documents and impacts arising from project activities.

As a trustee agency, the CDFW has jurisdiction over certain resources held in trust for the people of California. Trustee agencies are generally required to be notified of CEQA documents relevant to their jurisdiction, whether or not these agencies have actual permitting authority or approval power over aspects of the underlying project (14 *California Code of Regulations* [CCR] Section 15386). The CDFW, as a trustee agency, must be notified of CEQA documents regarding projects involving fish and wildlife of the state as well as Rare and Endangered native plants, wildlife areas, and ecological reserves. Although, the CDFW cannot approve or disapprove a project since it is a trustee agency, lead and responsible agencies are required to consult with them. The CDFW, as the trustee agency for fish and wildlife resources, shall provide the requisite biological expertise to review and comment upon environmental documents and impacts arising from project activities and shall make recommendations regarding those resources held in trust for the people of California (*California Fish and Game Code*, Section 1602).

#### **Sections 1600–1616**

All diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake in California that support wildlife resources and/or riparian vegetation are subject to CDFW regulations, pursuant to Section 1600 through Section 1603 of the *California Fish and Game Code*. Under Section 1602, it is unlawful for any person to substantially divert or obstruct the natural flow or substantially change the bed, channel or bank of any river, stream, or lake designated by CDFW as waters within their jurisdiction, nor can a person use any material from streambeds without first notifying the CDFW of such activity. For a project that may affect stream channels and/or riparian vegetation regulated under Sections 1600 through 1603, CDFW authorization is required in the form of a Streambed Alteration Agreement.

### **California Porter-Cologne Water Quality Control Act**

Pursuant to the California Porter-Cologne Water Quality Control Act, the SWRCB and the nine RWQCBs may require permits (known as waste discharge requirements or WDRs) for the fill or alteration of “waters of the State”. The term “waters of the State” is defined as “any surface water or groundwater, including saline waters, within the boundaries of the state” (*California Water Code*, Section 13050[e]). The State and Regional Boards have interpreted their authority to require WDRs to extend to any proposal to fill or alter “waters of the State”, even if those same waters are not under USACE jurisdiction. Pursuant to this authority, the State and Regional Boards may require the submission of a “report of waste discharge” under Section 13260, which is treated as an application for WDRs.

### **Oak Woodland Conservation Act (2001) and California Public Resources Code (Section 21083.4)**

The Oak Woodland Conservation Act (*California Fish and Game Code*, Sections 1360 et seq.), passed by the California Legislature in 2001, established an Oak Woodland Conservation Fund administered by the Wildlife Conservation Board (WCB) to help and encourage local governments, park and open space districts, resource conservation districts, nonprofit organizations and private property owners to protect and enhance oak woodlands. “It offers landowners, conservation organizations, and cities and counties an opportunity to obtain funding for projects designed to conserve and restore California’s oak woodlands. It authorizes the Wildlife Conservation Board (WCB) to purchase oak woodland conservation easements and provide grants for land improvements and oak restoration efforts” (McCreary 2004). The Act defines oak woodlands as “an oak stand with a greater than 10 percent canopy cover or that may have historically supported greater than 10 percent canopy cover” (*California Fish and Game Code*, Section 1361[h]).

Section 21083.4 of the *California Public Resources Code* (PRC) (Senate Bill [SB] 1334), which references the Oak Woodland Conservation Act, provides an additional layer of protection for oak woodlands. Section 21083.4 requires that Counties determine if a project may result in a conversion of oak woodlands that will have a significant impact on the environment. If it is determined that it would, the County must require one or more of the following to mitigate the significant effect of the conversion of oak woodlands:

1. Conserve oak woodlands, through the use of conservation easements;
2. (A) Plant an appropriate number of trees, including maintaining plantings and replacing dead or diseased trees
  - (B) The requirement to maintain trees pursuant to this paragraph terminates seven years after trees are planted.
  - (C) Mitigation pursuant to this paragraph shall not fulfill more than one-half of the mitigation requirement for the project.
  - (D) The requirements imposed pursuant to this paragraph also may be used to restore former oak woodlands.
3. Contribute funds to the Oak Woodlands Conservation Fund. A project applicant that contributes funds under this paragraph shall not receive a

grant from the Oak Woodlands Conservation Fund as part of the mitigation for the project; and

4. Other mitigation measures developed by the County.

## County

### ***County of Los Angeles Oak Tree Ordinance (CLAOTO)***

In unincorporated areas of Los Angeles County, the County of Los Angeles Oak Tree Ordinance (No. 88-0157) protects any tree of the oak genus which is 25 inches or more in circumference (8 inches in diameter) as measured 4.5 feet above mean natural grade; in the case of oaks with more than 1 trunk, the ordinance protects those trees with a combined circumference of any 2 trunks of at least 38 inches (12 inches in diameter), as measured 4.5 feet above mean natural grade. All potential impacts to oak trees regulated by this ordinance must be preceded by an application to the County that includes a detailed Oak Tree Report. Mitigation for impacts to oak trees is usually required as a condition of an Oak Tree Permit.

### ***Significant Ecological Area (SEA) Program***

The *County of Los Angeles General Plan* of 1976 originally characterized Significant Ecological Areas (SEAs) as areas that contain unique, dwindling, or other rare plant and animal resources that need to be more specifically studied for the purpose of public education, research, and other non-disruptive outdoor uses (England and Nelson Environmental Consultants 1976). The SEA boundary maps are general in nature and broadly outline the biological resources included in each area.

In 2015, the County Department of Regional Planning adopted updates to the SEA Program that retains a number of existing SEAs, but also incorporates many smaller, existing SEAs into several major SEAs that cover much larger areas. The revised SEAs for the Antelope Valley Area have been approved and adopted into the *County of Los Angeles General Plan* and the *Antelope Valley Area Plan*. The newly adopted San Andreas Rift Zone SEA (SEA No. 17) largely incorporates the areas of former SEA Nos. 58 and 59, located in the Project region, making it the second largest SEA in Los Angeles County (see Exhibit 5.7-15, Significant Ecological Areas). The range of SEA 17 encompasses a small portion of the western Tehachapi foothills, then stretches in a southeasterly direction to include Quail Lake; the northern foothills of Liebre and Sawmill Mountains; large portions of Portal Ridge; Leona Valley; Ritter Ridge; Fairmont and Antelope Buttes; Anaverde Valley; and Lake Palmdale. It terminates at Barrel Springs near the City of Palmdale.

The primary resources in SEA 17 are wildlife movement and the mosaic of habitats along the San Andreas Fault Zone. The area encompasses an important linkage between the San Gabriel Mountains and the Tehachapi Mountains, representing the only mountain linkage from the Transverse Ranges or the Pacific Coast Range to the Sierra Nevada Range (PCR et al. 2000). SEA 17 is identified as significant as a region where multiple diverse biomes (a community of plants and animals) and wildlife corridors come together. It contains a unique mosaic of vegetation types that represent a transitional area between the Mojave Desert, the Coast Ranges, and the Tehachapi Mountains.

---

***County of Los Angeles General Plan and Antelope Valley Area Plan***

The *County of Los Angeles General Plan* and *Antelope Valley Area Plan* address biological resources issues that affect the County. Relevant goals and policies in the *Antelope Valley Area Plan* include the following:

Biological Resources

**Goal COS 4:** Sensitive habitats and species are protected to promote biodiversity

**Policy COS 4.1:** Direct the majority of the unincorporated Antelope Valley's future growth to rural town centers and economic opportunity areas, minimizing the potential for habitat loss and negative impacts in Significant Ecological Areas.

**Policy COS 4.2:** Limit the amount of potential development in Significant Ecological Areas, including the Joshua Tree Woodlands, wildlife corridors, and other sensitive habitat areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy COS 4.5:** Subject to local, state or federal laws, require new development to provide adequate buffers from preserves, sanctuaries, habitat areas, wildlife corridors, State Parks, and National Forest lands, except within Economic Opportunity Areas.

**Policy COS 4.6:** Encourage connections between natural open space areas to allow for wildlife movement.

**Policy COS 4.7:** Restrict fencing in wildlife corridors. Where fencing is necessary for privacy or safety, require appropriate development standards that maximize opportunities for wildlife movement.

**Policy COS 4.8:** Ensure ongoing habitat preservation by coordinating with the California Department of Fish and Game to obtain the latest information regarding threatened and endangered species.

**Goal COS 16:** Native vegetation thrives throughout the Antelope Valley, reducing erosion, flooding, and wind-borne dust and sand.

**Policy COS 16.1:** Except within Economic Opportunity Areas, require new development to minimize removal of native vegetation. Discourage the clear-scraping of land and ensure that a large percentage of land is left in its natural state.

**Policy COS 16.2:** Maximize the use of native vegetation in landscaped areas, provided that vegetation meets all applicable requirements of the Fire Department and the Department of Public Works.

A consistency analysis of the Project's specific goals and policies with the County's relevant plans, policies, and regulations is provided in the Land Use, Entitlements, and Planning Section (Section 5.8) in this document.

### ***Los Angeles County Oak Woodlands Conservation Management Plan***

The final *County of Los Angeles Oak Woodlands Conservation Management Plan* (OWCMP) is dated May 2011. The primary purpose of the OWCMP is to develop a consistent policy for oak woodland management that can be incorporated into the County's General Plan and other relevant planning documents. A secondary purpose of the OWCMP is to meet eligibility requirements for funding under the Oak Woodland Conservation Act. The OWCMP is divided into two parts. Part I contains a voluntary oak woodland conservation strategy that could be adopted by resolution by the Board of Supervisors to make the County eligible for Oak Woodland Conservation Fund grants. Part II contains planning and implementation recommendations designed to assist the County in formulating policies for eventual incorporation into County codes. Several recommendations contained in OWCMP Part II are relevant to CEQA analysis, including but not limited to Section V.2 (addressing CEQA evaluation of oak woodland conversion and providing recommendations regarding thresholds of significance and impact magnitude evaluation); Section V.3 (providing recommendations regarding cumulative impact evaluation); Section V.7 (providing recommendations for restoration mitigation); and Section V.8 (providing recommendations for successful mitigation monitoring strategies) (LACDRP 2011).

### **5.7.3 ENVIRONMENTAL SETTING**

#### **Characteristics of the Site**

The Project site is located south of the Tehachapi Mountains and north of Liebre Mountain and the Angeles National Forest at the northwestern end of the Antelope Valley. Ranching, cattle grazing, and hunting are the current primary land uses in the Project area. Existing development is limited to a few paved access roads to the California Aqueduct and through the site to the National Cement Plant, which is located approximately one mile north of the Project site. There are also unpaved ranch roads, fencing, stock ponds, and a few electrical transmission lines. Vegetation on the site consists predominately of grasslands, with oak woodlands at higher elevations and scattered patches of riparian habitat along larger drainages, as further described below.

In the far eastern portion of the Project site, adjacent to 300<sup>th</sup> Street West, approximately 602 acres are actively farmed and irrigated. It is noted that the acreage provided for farmed acres is based on field mapping and, therefore, differs from the designated number of farming acres based on State mapping of agricultural lands used in the remainder of this Draft EIR. Also, while not a part of the actual Project site, the West Branch of the California Aqueduct runs in a narrow corridor through the Project site. The southern portion of the site is crossed by State Route (SR) 138 in an east-west alignment. The northern edge of the eastern portion of the site parallels the off-site East Branch of the California Aqueduct. Part of the northern boundary of the site follows the Los Angeles County/Kern County line.

#### ***Vegetation***

There are many different vegetation types (38 types were identified, see "Vegetation Types" section below for more information) in the Project's on-site and off-site study areas with the vast majority of the acreage consisting of grasslands. There is considerable variation in

species composition within the grasslands based on soil type, grazing pressure, slope and aspect, available groundwater, and disturbance history. As is typical in California, both native and non-native species occur within the mosaic of grassland types. Wildflower fields are a component within portions of the grasslands and occur throughout most of the Project's on-site and off-site study areas.

Riparian and wetland vegetation types occur in association with the drainages, springs, and seeps located on the Project site. Oak woodland vegetation types are dominant in the western portion of the Project site and in the southern portion of the Project site mainly in the areas south of SR-138. These consist of dense stands of both deciduous and evergreen oak species, such as blue oak (*Quercus douglasii*) and Tucker's oak (*Quercus john-tuckeri*). Scrub vegetation types (primarily chaparral) are generally found in the western portion of the Project site on somewhat eroded, steep slopes. Rabbitbrush scrub is present on the lower elevations of the Project site. Vegetation types are described further below, and a list of dominant species in each vegetation type is also included in Appendix 5.7-A.

### ***Geology and Topography***

The topography of the Project site ranges from steep to flat but, in general, the site is characterized by gently rolling hills. Steeper hillsides that gradually decrease to more moderate slopes occur to the west, while flat topography occurs on the easternmost portion of the site. Elevations range from approximately 3,635 feet above mean sea level (msl) along a ridge overlooking Quail Lake to approximately 2,975 feet above msl in the alluvial drainage area in the east portion of the site.

Erosion is a major element of many land features and is seen throughout the site, particularly on steeper slopes where vegetation is lacking and deep eroded gullies have formed. Meandering watercourses have also created numerous gullies ranging in depth from a few inches to over ten feet.

Several major topographic and other physical features are located on the Project site. Two primary drainages are located on site. Tentrock Creek is an east-west trending drainage that parallels SR-138. The other is Oso Creek, which enters the site from the northwest and meanders southeast and east in the northern portion of the site.

A series of high ridges in the Project site separate a number of intermittent or ephemeral streams that have high flows following winter storm events.

The California Aqueduct splits into the West and East Branches just north of the Project site. The Aqueduct's East Branch is located just north of and adjacent to the northeastern segment of the Centennial boundary. The West Branch bisects the Project site into an eastern portion and a western portion. The West Branch leads to Quail Lake, which is a former natural pond on the San Andreas Fault that has been reconfigured into a reservoir as part of the Aqueduct system. Quail Lake is situated adjacent to the southwest portion of the Project site. Although several streams cross under the Aqueduct via culverts, the Aqueduct itself does not connect to any on-site drainages.

Tentrock Canyon Creek, a nearly perennial stream that flows in a northerly direction, crosses SR-138 near the southeastern corner of the Project site and flows into the lower portion of

the drainage that is parallel to SR-138. In addition, eight ephemeral to intermittent creeks located on site west of Tentrock Canyon drain from Liebre Mountain (of the San Gabriel Mountain Range) northward, crossing under SR-138 via culverts.

The National Cement Plant Road provides access from SR-138 to the National Cement Plant, which is located just north of the Project site in Kern County. This paved road includes a bridge that crosses the West Branch of the California Aqueduct near the southern end of the site, and the road parallels the Aqueduct's West Branch across the remainder of the site.

Numerous unpaved ranch roads and fence lines cross the Project site. One single-family residence is located adjacent to the West Branch's eastern side along the northern boundary of the Project site.

### **Soil Series and Characteristics**

Soils in the Project site, as mapped by the U.S. Department of Agriculture, Natural Resource Conservation Service (2008 data available in Geographic Information System [GIS] format), are primarily sand or sandy loam. These soils are relatively deep and generally do not retain water in the upper layers. Table 5.7-1, Soil Types and their Hydrological Characteristics, describes the major on-site soil types in more detail.

**TABLE 5.7-1  
SOIL TYPES AND THEIR HYDROLOGICAL CHARACTERISTICS**

<b>Soil Type (soil classification)</b>	<b>Soil Characteristics<sup>a</sup></b>	<b>Hydric (NRCS)<sup>b</sup></b>	<b>Inclusions of Soils Possible</b>	<b>Associated Vegetation On The Site</b>
Chino loam (Co)	<ul style="list-style-type: none"> <li>• Somewhat poorly drained soils formed in mixed alluvium that is dominantly granitic.</li> <li>• Runoff is very slow and likely to pond in places.</li> <li>• Erosion potential is from none to slight.</li> <li>• Moderately slow permeability.</li> </ul>	Non-hydric (but the matrix color meets the USACE hydric soil criteria)	Hanford loam, Mocho loam, and Sorrento loam	Rushes ( <i>Juncus</i> spp.), giant wild-rye ( <i>Elymus condensatus</i> ), and other hydrophytic herbaceous species
Gaviota rocky sandy loam (GaE2)	<ul style="list-style-type: none"> <li>• Well-drained soils to somewhat excessively well-drained soils formed in weathered hard sandstone.</li> <li>• Runoff is medium.</li> <li>• Erosion potential is moderate.</li> <li>• Moderately rapid permeability.</li> </ul>	Non-hydric	Millsholm rocky loam	Oak woodlands and grasslands
Millsholm rocky loam (MhE2, MhF2)	<ul style="list-style-type: none"> <li>• Well-drained soils formed from weathered hard shale and fine sandstone. Ranges from a heavy sandy loam to a heavy coarse sandy loam and light loam.</li> <li>• Runoff is rapid, depending on topography.</li> <li>• Erosion potential is high.</li> <li>• Moderate permeability.</li> </ul>	Non-hydric	Gaviota rocky sandy loam	Oak woodland

**TABLE 5.7-1  
SOIL TYPES AND THEIR HYDROLOGICAL CHARACTERISTICS**

<b>Soil Type (soil classification)</b>	<b>Soil Characteristics<sup>a</sup></b>	<b>Hydric (NRCS)<sup>b</sup></b>	<b>Inclusions of Soils Possible</b>	<b>Associated Vegetation On The Site</b>

### ***Drainage Patterns***

Most of the watersheds in the Project vicinity generally begin in the western portion of the site, flow east toward Antelope Valley, and historically dissipated into the ground. However, with the construction of the California Aqueduct and its connection to Quail Lake, five short streams in the northwest of the Project site are now tributaries to Quail Lake. East of the Aqueduct, these old drainages dissipate into the ground near 300<sup>th</sup> Street West or continue off site to the northeast. The drainages on the Project site are discussed in more detail in Jurisdictional Resources section below.

### ***Fire***

Evidence of historical fire events is found throughout the Project site. The most obvious and common sign of past fire damage is the presence of charred tree trunk cavities at the point where the trunk meets the ground. When fires pass under and around an established oak tree, the bark and living tissue beneath the canopy are burned. This wound becomes an opening for primary and secondary wood decay organisms, thus creating a cavity at the base of the trunk. These wounds were only found on larger, older trees (typically 24 inches diameter at breast height [dbh] or larger). There is little evidence of fire damage to lower scaffold branch structures due to the general absence of understory shrubs that could carry fire into the canopies (Tree Life Concern 2003).

### **Characteristics of Surrounding Areas**

The Project site is located in a region that is at the confluence of several major geographic features and associated biomes, including the Tehachapi Mountains, Coast Ranges, Transverse Ranges (San Gabriel Mountains and Liebre Mountain), Antelope Valley of the Mojave Desert, Central Valley, and the San Andreas Fault Zone. Lands immediately surrounding the Project site are used primarily for cattle grazing, agriculture and ranching, with scattered rural residences. Quail Lake is located just outside the southern edge of the Project site, and an off-site electrical substation is located near the southwestern corner of the Project site. The California Department of Water Resources (DWR) operates an approximate 70-acre afterbay (a short stretch of stream, conduit, pond, or reservoir) just north of the Project site, and the National Cement Plant, an aggregate mining and processing facility, is also located approximately one mile north of the Project site. The Project site is approximately five miles east of the communities of Gorman and Frazier Park and three miles west of the community of Neenach.

### ***Regional Land Uses***

Lands immediately to the north and west of the Project site are privately owned and are part of the Tejon Ranch, which is largely open space and includes some grazing at lower elevations. The National Cement Plant is located approximately one mile north of the site's northern boundary in Kern County and is leased as a gravel and lime quarry. Irrigated agricultural fields owned by Tejon Ranch and other, arid, lands exist east of the site in the Antelope Valley. To the south of the site are a hunting club (leased from Tejon Ranch) and privately held lands that contain a variety of rural residential development, orchards, cattle

and sheep grazing areas, and open spaces. Forested lands in the Angeles National Forest are located further to the south, and the Los Padres National Forest is located to the west.

Interstate (I) 5 is located approximately one mile to the west of the Project site's westernmost boundary; SR-138 runs in an east-west direction and passes through the southern portion of the site. The West Branch of the California Aqueduct traverses the site from north to south near its center. The Aqueduct also widens toward the southwestern portion of the Project site and fills Quail Lake, which is located just off site to the south. The East Branch of the Aqueduct passes just north of the site and continues eastward.

### ***Regional Vegetation***

Vegetation types found in the Project's on- and off-site study areas occur to varying degrees within the Project region. The bordering region has oak woodlands to the west, north, and south; sagebrush and rubber rabbitbrush scrub to the southwest; and annual and perennial grasslands, along with a few irrigated agricultural lands, to the east. All these vegetation types are represented within the Project site.

### ***Regional Open Space Areas***

Large areas of open space occur adjacent to the Project site. Several of these areas are dedicated as permanent open space, including the Los Padres National Forest to the west and the Angeles National Forest to the south and southeast.

The Hungry Valley State Vehicular Recreation Area is located just to the southwest of the Project site; this open space area is highly disturbed by off-road vehicles. Extensive open spaces are also located north of the site in the Tehachapi Mountains, with a large portion of them occurring on the Tejon Ranch property.

The Tehachapi Mountains to the north of the site are characterized by mosaics of oak woodlands, savannas, scrub/shrub lands, perennial/annual grasslands, and some developed areas. On the south are privately owned lands, which consist of forest and grassland open spaces as well as some rural residential development. The Angeles National Forest encompasses much of the land further to the south.

Approximately 10 miles northwest of the site, portions of the Tehachapi area and the San Joaquin Valley floor are in the Wind Wolves Preserve, which conserves more than 97,000 acres of open space.

As previously stated, a portion of the California Aqueduct's West Branch bisects the Project site and continues off the site and downstream to the southwest. The Aqueduct's East Branch splits from a channel just north of the Project site and flows east into Antelope Valley. Where the Aqueduct bisects the Project site, the State maintains a wide easement that is fenced with no public access. As previously mentioned, the DWR operates an afterbay on approximately 70 acres just north of the Project site.

Quail Lake (adjacent to and just south of the Project site) is part of the Aqueduct system and is available for public uses, including shore fishing and hiking. A public rest area and parking lot are located adjacent to the southwestern side of Quail Lake, and a private airstrip is

located southeast of the lake (known as Quail Lake Sky Park). The entire perimeter of Quail Lake is fenced. Although this area is off site, an assessment of the resources associated with Quail Lake is included as part of this analysis due to its immediate proximity.

### ***Regional Conservation Plans***

#### **Tejon Ranch Conservation and Land Use Agreement (TRCRWA)**

As discussed in greater detail in the Project Description (Section 4.5.7), on June 17, 2008, the Tejon Ranch Company (TRC) entered into a Conservation and Land Use Agreement (Conservation Agreement) with Audubon California, the Endangered Habitats League, the Natural Resources Defense Council, the Planning and Conservation League, the Sierra Club (Resource Groups), and the then newly formed, independent non-profit Tejon Ranch Conservancy (Conservancy). The Conservation Agreement covers the Centennial Project site and the remainder of Tejon Ranch. The Conservation Agreement allows TRC and its development partners to pursue approvals from permitting agencies to develop portions of the Tejon Ranch (Ranch), including the Project site, while providing for the designation and permanent protection of approximately 145,000 acres of contiguous open space areas immediately north of the Project site to protect the biological resources and wildlife connectivity of the 270,000-acre Tejon Ranch. The Conservation Agreement also established options for the dedication or sale of approximately 62,000 acres in 5 additional areas of the Ranch for further open space preservation. In addition, 33,000 acres of designated open space within the development areas have been preserved. Collectively, these open space dedication and acquisition areas comprise approximately 240,000 acres, or approximately 90 percent, of the 270,000-acre Ranch. The open space preservation and development constraints in the Conservation Agreement have been recorded on title, and comprise the reasonable foreseeable land uses on Tejon Ranch. No public agency is a party to the Conservation Agreement, although the federal and State agencies responsible for administering biological protection laws and regulations confirmed that lands under the Conservation Agreement continue to be eligible mitigation lands. Agency review and approval of mitigation lands as compensatory mitigation for project impacts is part of the responsible agency permit process. The Centennial Project site is not within a dedication or acquisition area; all proposed mitigation areas for the project are within acquisition areas. The Conservancy will oversee managed public access to conserved lands and will provide interpretive and environmental education programs for local communities, focusing in particular on underserved populations. Conservancy activities are subject to all applicable federal, State and local laws and regulations.

#### **Tehachapi Upland Multiple Species Habitat Conservation Plan**

The Tehachapi Upland Multiple Species Habitat Conservation Plan (TU MSHCP or MSHCP), developed by TRC (the legal entity that owns Tejon Ranch), was finalized in April 2013. The TU MSHCP meets the requirements for a U.S. Fish and Wildlife Service (USFWS) permit pursuant to Section 10(a)(1)(B) of the FESA, as amended (16 *United States Code* [USC] Sections 1531–1544), for incidental take of the 25 Covered Species. The requested term of the Incidental Take Permit (ITP) is 50 years. The MSHCP's Covered Lands encompass 141,886 acres (222 square miles) of the 270,365-acre (422 square miles) Ranch. Los Angeles County lands, including the Centennial Project site, are located adjacent to and immediately

south of the Covered Lands. The MSHCP requires the permanent dedication of conservation easements over 91 percent of the Covered Lands to protect biological resources including wildlife connectivity.

Covered species for the MSHCP include the following:

1. round-leaved filaree (*California macrophyllum*)
2. Kusche's sandwort (*Eremogone macradenia* var. *arcuifolia*)
3. Tehachapi buckwheat (*Eriogonum callistum*)
4. Fort Tejon woolly sunflower (*Eriophyllum lanatum* var. *hallii*)
5. striped adobe lily (*Fritillaria striata*)
6. Tejon poppy (*Eschscholzia lemmonii* ssp. *kernensis*)
7. Tehachapi slender salamander (*Batrachoseps stebbinsi*)
8. Yellow-blotched ensatina (*Ensatina eschscholtzii croceator*)
9. western spadefoot (*Spea hammondi*)
10. coast horned lizard (*Phrynosoma blainvillii*)
11. two-striped garter snake (*Thamnophis hammondi*)
12. tricolored blackbird (*Agelaius tricolor*)
13. burrowing owl (*Athene cunicularia*)
14. golden eagle (*Aquila chrysaetos*)
15. western yellow-billed cuckoo (*Coccyzus americanus occidentalis*)
16. white-tailed kite (*Elanus leucurus*)
17. little willow flycatcher (*Empidonax traillii brewsteri*)
18. southwestern willow flycatcher (*Empidonax traillii extimus*)
19. American peregrine falcon (*Falco peregrinus anatum*)
20. California condor (*Gymnogyps californianus*)
21. bald eagle (*Haliaeetus leucocephalus*)
22. purple martin (*Progne subis*)
23. yellow warbler (*Setophaga petechia*)
24. least Bell's vireo (*Vireo bellii pusillus*)
25. Tehachapi pocket mouse (*Perognathus alticolus inexpectatus*)

Activities covered by the MSHCP generally include ongoing Ranch operations (but exclude hunting) and potential future development of designated areas on and adjacent to I-5, including Tejon Mountain Village. Tejon Ranch and the Covered Lands are situated between existing public lands (both west and east). Addressing the needs of Covered Species in the Tehachapi Mountains uplands through the MSHCP benefits biological resources both within the Covered Lands and also nearby and adjacent public lands. The MSHCP includes measures to minimize and mitigate remaining impacts on Covered Species and measures that contribute to conservation and recovery.

The MSHCP protects current opportunities for wildlife movement beyond the Ranch by preserving existing landscape linkages as a federal permit condition that is independent of the Conservation Agreement described above.

## **Methodology to Document Biological Resources**

### ***Literature Review***

In order to evaluate the natural resources potentially found in the Project's on-site and off-site study area and to inform the scope of site-specific field studies, literature searches and database reviews were conducted. Available literature describing the biology, geology, soils, and hydrological resources in the region was examined prior to field surveys. The literature examined included the following:

1. *National List of Plant Species that Occur in Wetlands: California, Region 0* (USFWS 1988).
2. The CDFW's California Natural Diversity Database (CNDDDB) Rarefind report (CDFW 2015a) for the following U.S. Geological Survey (USGS) 7.5-minute topographic quadrangles: Grapevine, Pastoria Creek, Winters Ridge, Liebre Twins, Frazier Mountain, Lebec, La Liebre Ranch, Neenach School, Alamo Mountain, Black Mountain, Liebre Mountain, and Burnt Peak.
3. The California Native Plant Society's (CNPS') Locational Inventory of Rare and Endangered Vascular Plants of California (2015) for the following USGS 7.5-minute topographic quadrangles: Grapevine, Pastoria Creek, Winters Ridge, Liebre Twins, Frazier Mountain, Lebec, La Liebre Ranch, Neenach School, Alamo Mountain, Black Mountain, Liebre Mountain, and Burnt Peak.
4. The CDFW's list of special status plants (CDFW 2017).
5. U.S. Department of Agriculture, Natural Resources Conservation Service (2008) Antelope Valley Area, California soil surveys.
6. County of Los Angeles Significant Ecological Area Study, prepared for the County of Los Angeles, Department of Regional Planning and Environmental Systems Research Institute (England and Nelson Environmental Consultants 1976).
7. Los Angeles County General Plan and Antelope Valley Area Plan (LACDRP 2015a, 2015b).
8. Various literature specific to descriptions of the habitat, vegetation types, and special status species occurring in the County of Los Angeles (see Section 5.7.9, References).
9. Aerial photographs from 1999, 2001, 2004, 2005, and 2006 (Aerials Express).
10. The USGS 7.5-minute topographic quadrangle maps: La Liebre Ranch and Lebec.

### ***Field Surveys***

Biological field surveys of the Project's on-site and off-site components or portions of them have been conducted by biological resource experts including BonTerra Consulting (doing

business as BonTerra Psomas),<sup>2</sup> Bruyeya Biological Consulting, Dave Crawford, Ecological Sciences, Glenn Lukos Associates, Impact Sciences, Natural Resource Consultants, Vollmar Consulting, Paul Beier, Paul Pruett & Associates, and Tree Life Concern. As recently as 2015, BonTerra Psomas Biologists conducted vegetation mapping surveys and focused surveys for the Swainson's hawk (*Buteo swainsoni*), tricolored blackbird, and special status plants on the Project Site. Additionally, an update to the 2009 California Condor Assessment was conducted by BonTerra Psomas in 2015. Summaries of survey dates, surveyors, and methods are provided in Table 5.7-2, Biological Surveys Conducted on the Project Site (1999–2015). Field survey data were collected by qualified biologists, typically working in teams. Habitat and species observations were noted on data sheets, aerial photographs, and maps. Specific information concerning special status species observations was recorded on maps and appropriate data sheets. Reports resulting from the site-specific studies listed in Table 5.7-2 are provided as Appendix 5.7-B.

**TABLE 5.7-2  
BIOLOGICAL SURVEYS CONDUCTED  
ON THE PROJECT SITE (1999–2015)**

<b>Taxonomic Group</b>	<b>Surveyor</b>	<b>Survey Dates/ Season</b>	<b>Methods</b>
<b>Plants</b>	BonTerra Psomas	March 23–April 5; May 25–June 5, 2015	Focused special status plant surveys throughout the impact area during the spring and summer (BonTerra Psomas 2015b).
		August 4, 2015	Vegetation mapping of the newly incorporated portion of the Project site (east of 300 <sup>th</sup> St W).
	BonTerra Consulting	January–March 2009	Supplemental oak tree surveys south of SR-138 (BonTerra Consulting 2009a).
		March 2007	Vegetation mapping of the off-site impact areas (results provided in this document).
		August–September 2005	Vegetation mapping of areas west of the Aqueduct and the 262-acre portion south of SR-138 (results provided in this document).
	Natural Resource Consultants	April–August 2008	Special status plant surveys in the Project site and off-site mitigation areas (NRC 2008a).
		spring 2008	Grassland composition studies on the Project site and in off-site mitigation areas (NRC 2008b).
		spring 2007	Second year of grassland sampling of Project site (NRC 2007c).
		spring 2007	Regional grassland distribution assessment (NRC 2007a).
		April–June 2006	Grassland sampling study on the Project site (NRC 2006a, 2007b).
		April–June 2006	Special status plant survey of previously mapped populations (NRC 2006b).

<sup>2</sup> Surveys conducted prior to January 1, 2014 were performed as BonTerra Consulting; all activities after this date performed as BonTerra Psomas.

**TABLE 5.7-2  
BIOLOGICAL SURVEYS CONDUCTED  
ON THE PROJECT SITE (1999-2015)**

<b>Taxonomic Group</b>	<b>Surveyor</b>	<b>Survey Dates/ Season</b>	<b>Methods</b>
	Tree Life Concern	June 2006–February 2007	Oak tree survey updated based on new impact area (Tree Life Concern 2008).
		July 2001–November 2001	Survey of all oak trees measuring 8 inches or greater in dbh, inside of or within 200 feet of identified Project grading boundary (Tree Life Concern 2003).
	Vollmar Consulting	April 1–11, June 23–27, 2003; April 15–24, June 10–13, 2004	Focused plant surveys throughout the site for special status species during the spring and summer (Vollmar Consulting 2004, revised 2006).
	Impact Sciences	March 2001–September 2001	Surveys for common and special status plant species concurrently with wildlife surveys and during the wetland and streambed delineation throughout many portions of the site (Impact Sciences 2002a, 2003).
	Paul Pruett & Associates	March 23, 27, April 3, June 15, 1999; April 25, 29, May 18, 2000	Focused plant surveys for special status species throughout the site (Impact Sciences 2003).
<b>Jurisdictional Waters and Wetlands</b>	BonTerra Psomas	June 2015	Updated jurisdictional delineation and functional assessment/CRAM including new areas (BonTerra Psomas 2015a)
	Glenn Lukos Associates	2008	Updated functional assessment of jurisdictional features (GLA 2009a).
		2008	Updated jurisdictional delineation assessment and report (GLA 2009b).
		May 2006–July 2006	Jurisdictional delineation of Phase One unimpacted areas and Future Phase areas; functional assessment of jurisdictional features (GLA 2006c).
		October 2005–November 2005	Jurisdictional delineation of Phase One areas (GLA 2005c).
	Impact Sciences	April 2001–August 2001	Preliminary jurisdictional delineation of Project site using USACE/CDFG delineation protocols (Impact Sciences 2002b).
<b>Invertebrates</b>	Glenn Lukos Associates	September 2006–January 2007	Dry-season protocol surveys for listed fairy shrimp species in 8 seasonal depressions (GLA 2007).
		October 2005–April 2006	Wet- and dry-season protocol surveys for listed fairy shrimp species in potentially suitable locations in the impact area west of the Aqueduct and the 262-acre portion south of SR-138 (GLA 2006a, 2006d).

**TABLE 5.7-2  
BIOLOGICAL SURVEYS CONDUCTED  
ON THE PROJECT SITE (1999–2015)**

<b>Taxonomic Group</b>	<b>Surveyor</b>	<b>Survey Dates/ Season</b>	<b>Methods</b>
		October 2005	Habitat assessment surveys for listed fairy shrimp species throughout the proposed impact area west of the Aqueduct and the 262-acre portion south of SR-138 (GLA 2005b).
		2004/2005 Wet Season	Wet-season protocol surveys for listed fairy shrimp species at 2 locations (GLA 2005a).
	Guy Bruyea	May 2004– September 2004	Same goals and emphasis as the 2001 surveys (see below), but a larger geographic area was surveyed (Bruyea Biological Consulting 2004).
		May 2003–August 2003 (5 days)	Same goals and emphasis as the 2001 surveys (see below), but a larger geographic area was surveyed (Bruyea Biological Consulting 2003).
		May 2001–August 2001 (5 days)	Surveys within potentially suitable areas of the site for special status butterfly species and adult and larval host plants potentially occurring on or near the site (Bruyea Biological Consulting 2001).
	Impact Sciences	March 2001	Non-protocol surveys for fairy shrimp at select locations. Under a USFWS permit, sampled several areas of potentially suitable habitat (i.e., vernal or seasonal pools and cattle ponds). Collected specimens with hand nets and identified them using a hand lens. Specimens were sent to Mr. Brent Helm, a fairy shrimp expert, for species confirmation (Impact Sciences 2001c).
<b><i>Herpetofauna</i></b>	BonTerra Consulting	February 2006 – June 2006	Focused protocol surveys for arroyo toad, red-legged frog, and Tehachapi slender salamander in areas west of the Aqueduct and the 262-acre portion south of SR-138 (results provided in this document).
		Spring and Summer 2005	Focused surveys for western spadefoot in potentially suitable areas west of the Aqueduct and the 262-acre portion south of SR-138 (BonTerra Consulting 2005).
	Impact Sciences	June 2004	Surveys for western spadefoot in potentially suitable areas of the site (Impact Sciences 2004b).
		June 2–6, June 30– July 3, July 7–12, 2003	Surveys and specific searches for special status amphibian and reptile species in potentially suitable areas of the site (Impact Sciences 2003).
		March 23, April 12, 23, 30, May 12, August 2001	Surveys and specific searches for special status amphibian and reptile species. USFWS protocol-level surveys for California red-legged frog.

	Trust for Public Lands	2004–2005	Review of Tejon Ranch lands to develop a proposed 100,000 acre preserve (TPL 2004).
	Pioneer Environmental Services	2004	Wildlife movement study of Tejon Ranch lands including the Project site (Pioneer Environmental Services 2004).
	Dr. Paul Beier	2002	Tejon Ranch landscape connectivity study, including the Project site (Beier 2003).
	Impact Sciences	September and October 2001	Regional habitat connectivity assessment conducted with use of aerial photographs, topographic maps, and field reconnaissance. Track surveys in riparian zones (Impact Sciences 2001b).
SR: State Route; dbh: diameter at breast height; CRAM: California Rapid Assessment Method; USACE: U.S. Army Corps of Engineers; USFWS: U.S. Fish and Wildlife Service			
Sources: The survey reports listed in this table are included in Appendix 5.7-B.			

As identified in the table above, several biological surveys/assessments were updated in 2015, including California condor assessment, special status plant survey, jurisdictional delineation with functional assessment/California Rapid Assessment Method (CRAM) analysis, and tricolored blackbird surveys and analysis. Resources surveys were not updated where previous data remains accurate due to one or more of the following reasons: new Project areas are not expected to contain the resource; lack of measurable change in site conditions; past surveys were conducted within acceptable timeframe typical for that

resource; surveys have been repeated in the past with identical results; regulatory status/survey requirements have not changed in a manner that would require a survey update; and/or drought conditions have contributed to general consistency of site conditions over the past 5 to 6 years.

### ***Vegetation Mapping***

With the exception of an agricultural area, paved roads, mixed oak woodland polygons, and the 262-acre area (in a 0.5 x 1.0 mile configuration) (see Exhibit 5.7-1) in the southwestern corner of the Project site, vegetation mapping for areas east of the West Branch of the Aqueduct and south of SR-138 is mainly based on general field surveys conducted in 2001 by Impact Sciences (Impact Sciences 2003). BonTerra mapped the circular agricultural field (located west of 300<sup>th</sup> Street West) as an agricultural area and paved roads as developed based on aerial photographs taken in April 2005, and also reclassified some areas located south of SR-138 (mapped originally by Impact Sciences as scrub oak chaparral) as mixed oak woodland during an October 2008 field survey. Descriptions for vegetation types mapped in these areas are taken from Impact Sciences (2003) and Vollmar Consulting (2004). Although areas of wildflower fields have been observed and are known to occur, this component of the grassland vegetation type was not mapped due to its ephemeral nature and high variability between years depending on weather patterns. Based on field observations and data collected during grassland studies, in general, varying densities of wildflower fields occur amidst the grassland vegetation throughout the site.

The portion of the Project site located east of 300<sup>th</sup> Street West was mapped on August 4, 2015, by BonTerra Psomas Biologist Sarah Thomas. This area consists of agriculture fields; dirt access roads; small disturbed/developed areas associated with agricultural operations; and grassland vegetation. Descriptions for these vegetation types are taken from Impact Sciences (2003) and Vollmar Consulting (2004).

BonTerra mapped vegetation types within areas west of the West Branch of the Aqueduct, including the 262 acres south of SR-138, by utilizing aerial photographs printed at a scale of 1 inch equals 200 feet with an overlay of topographic lines. All accessible dirt roads were driven, and biologists also hiked to inaccessible areas and vantage points located throughout the area. Vegetation mapping was directed by BonTerra Senior Botanist Pam De Vries, who was assisted by BonTerra Biologists Andrea Warniment, David Hughes, and Jeff Wheeler, and Consulting Biologists Scott White and Travis Cooper. Vegetation mapping of these areas was conducted in the field on August 25, 26, and 31 and September 1, 6, 7, 8, 9, 12, and 13, 2005.

Nomenclature for vegetation types in the areas described in the paragraph above generally follows that of The Vegetation Classification and Mapping Program: *List of California Terrestrial Natural Communities Recognized by the California Natural Diversity Database* (CDFG 2010). The CNDDDB classification system is based on *A Manual of California Vegetation* (Sawyer and Keeler-Wolf 1995) and is structured to be compatible with *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986). The CNDDDB numeric code most closely associated with each vegetation type is also provided; where a specific numeric code for a described vegetation type is not designated in the CNDDDB classification system, the most appropriate general code is shown. Because of the Project

site's proximity to Kern County, references to the most similar vegetation types described in *A Flora of Kern County, California* (Twisselman and Moe 1995) are also provided.

Prior to field mapping, rules for defining vegetation types based on structure were established. The minimum mapping unit was set at approximately one acre, and patches of vegetation smaller than this were generally not mapped except for observed seeps and ephemeral ponds.

#### Delineation of Grasslands

Grasslands were delineated using a standard practice mapping protocol (consistent with the needs of a CEQA-level analyses) during the vegetation mapping field surveys. These grassland areas range widely from areas nearly completely dominated by non-native annual grassland species to areas with relatively high concentrations of both native perennial bunchgrasses and native forbs. Preliminary work was conducted in 2003 to identify the types of grasslands present and their composition on the Project site (Vollmar Consulting 2004). This work suggests that native perennial grass species do occur in various portions of the site, especially on ridge tops with well-drained soils; however, in most areas where they occur, native perennial grass species exist in a mosaic with annual grassland species and native and non-native forbs.

There is no official operational definition of "native perennial grassland" that has been published by the CDFW, CNPS, or California Native Grass Association (CNGA). Since all California's native grasslands were invaded by non-native plants prior to any full botanical description, it is difficult to define "native grassland". In fact, native grassland composed of 100 percent native species no longer applies to grasslands in California. Some definitions of native grasslands often rely on the presence or dominance of one of the species of needlegrass (*Stipa* spp.) or other native bunchgrasses typical for a region. A commonly accepted standard is to identify native grasslands as those where native grasses comprise between 10 to 20 percent of the cover in areas of very few shrubs or trees. However, because of the scientific uncertainty regarding the historical composition and distribution of native grasslands, especially in Southern California (Hamilton 1997), and because of the varying range of definitions of "native grassland" in use in California today, a definition that incorporates regional and site-specific information for the Project site has been used in this analysis.

The initial 2003 study conducted by Vollmar Consulting (2004) focused on presumed locations of native grasslands and found that the "threshold for determining dominance of combined perennial bunchgrasses versus annual grass was 20 percent relative cover" with the latter dominated by non-native species. Relative cover is the measure of the contribution of plant species (often expressed for each species) to the total cover of vegetation in a standardized area, excluding bare ground. The initial study was limited to 55 sampling plots over the entire Centennial study area. A subsequent field effort in 2004 expanded the observations to 278 plots, but only focused on sampling the highest quality grasslands. This latter study found that areas with the highest density of bunchgrasses were concentrated in areas with thinner, eroded soils including ridge tops, terrace tops, upper slopes, and lower convex slopes. Other landscape positions with deeper, accumulated soils, including floodplains, lower slopes, and upper concave slopes tend to be dominated by non-native

annual grasses and have a low to very low bunchgrass cover. Other considerations, including soil types, slope, aspect, and presence of native annual forbs can also be used to assist in characterizing and defining the native grassland vegetation type. The field study conducted in 2004 was based on a limited number of transects that were not placed randomly. Sampling points were chosen from a select portion of the site that was “restricted to the weathered ridge system in the central-eastern region of the study area”, and was identified as “supporting high-quality perennial bunchgrass community” (Vollmar Consulting 2004). The two-year study did not map the entire Centennial Project site, and it was not directed at characterizing the amounts or proportions of desirable native or undesirable non-native plant species for purposes of open space site selection or future grassland management planning.

More detailed grassland studies conducted by Natural Resource Consultants (NRC) in the spring of 2006 were designed to determine the distribution and composition of grasslands on the site using statistical methods to model the distribution and absolute cover of native perennial bunchgrasses (NPBG) in the Project site (NRC 2006a, 2007b). Absolute cover is the measure of the total plant cover (often expressed for each species) over a standardized area and includes an estimate of bare ground. Absolute cover is the primary means used to collect field data and is the most accurate way to express the field data and used for statistical analysis and scientific reporting. Additionally, because NPBG was found to be highly correlated with diversity and native species cover, this study provides information pertaining to the diversity and “nativeness”, defined as the cover of all native species relative to all cover, of these grasslands. A Scientific Review Committee monitored all aspects of this study including study design, data acquisition, and statistical analyses. The independent Scientific Review Committee consisted of three members:

1. Dennis Murphy, PhD, Director of the Graduate Program in Ecology, Evolution, and Conservation Biology at the University of Nevada, Reno, provided in depth review of the grassland studies and other aspects of the Project.
2. Bruce Pavlik, PhD, Professor of Biology at Mills College, provided botanical expertise on development of methods and analysis of results of all grassland and wildflower field studies.
3. Michael N. Josselyn, PhD provided assistance in study method design for grassland and wetland restoration and reviewed other aspects of the Project. Dr. Josselyn is a recognized expert in the field and has served on national advisory committees to the U.S. Army Corps of Engineers (USACE), the U.S. Environmental Protection Agency (USEPA), the U.S. Fish and Wildlife Service (USFWS), the National Oceanic and Atmospheric Administration (NOAA), and the National Wetlands Technical Council in the development of federal wetland policy and research.

The study involved detailed grassland sampling procedures and utilized site-specific geographic information system (GIS) modeling to complete a Project-wide mapping of grassland communities. Surveyors collected spatially explicit botanical data that described the species diversity and percent cover of all native and non-native plants at over 300 precise locations on the Project site. The locations sampled were distributed randomly over the entire Project site. The analysis produced a quantitative assessment of the grassland areas

and provided a detailed characterization of various non-native and native grassland vegetation, including native plant species richness and abundance (NRC 2007b, 2007c, 2006a).

The study was based on over 320 samples, each containing 100 data points, during approximately 150 man-hours of field work that was conducted during the height of plant cover in the spring of 2006. The study was conducted in conjunction with GIS analysis using a digital elevation model. Field data were related to various parameters and indices that affect the distribution of native grass species, as first noted in the Vollmar Consulting 2004 study. Statistical analyses were undertaken to develop a best fit multiple regression to predict NPBG distribution. The modeling uses the relationships between several topographic variables (i.e., slope, terrain curvature, terrain complexity, slope position) and NPBG absolute cover. This information provided the basis for a GIS model that predicts the distribution of native grasslands over the entire site. To examine variability of the grassland sampling, 96 plots from the 2006 study were resampled in April 2007. Using a simplified classification system of two categories (Category A: <10 percent, Category B: ≥10 percent), the overall prediction success was 69 percent, which is considered to be a high level of accuracy (NRC 2007c). NRC also used the data to investigate the distribution of other native and non-native plant species relative to native perennial bunchgrass cover. These studies provide the map predicting the distribution of native perennial grasslands. This map was used to assess impacts associated with the Project. The most recent grassland study report prepared by NRC summarizes 2006 to 2008 data collection and predictive model analysis, including analysis of variance (ANOVA) with repeated measures and Pearson's correlation coefficient ( $\rho$ ), and all statistical analyses performed for regression and general linear procedures using SAS/STAT® 2003 software (NRC 2008b). The model has also been applied to assess grasslands in the proposed mitigation sites described in Section 5.7.7 below.

#### Off-Site Areas

BonTerra Biologists Andrea Edwards and Rebecca Tyra performed a biological constraints survey and mapped the vegetation on a portion of the proposed off-site well locations in Kern County on April 21, 2011. As shown in Exhibit 4-25, Centennial Project – Off-Site Project Components, the off-site wells are located between just west of 300<sup>th</sup> Street West and just west of 290<sup>th</sup> Street West. On August 4, 2015, BonTerra Psomas Biologist Sarah Thomas mapped the previously unmapped portions of the off-site well locations and additional off-site features such as utilities; the water line and access road to the Water Treatment Facility; the alternative water line and access road to the Water Treatment Facility; the bridge locations; and the utilities and intersection improvements along SR-138. These additional off-site areas are shown on Exhibit 4-25 and are located along SR-138, the West Branch California Aqueduct, and along 300<sup>th</sup> Street West.

Vegetation was mapped by utilizing aerial photographs printed at a scale of 1 inch equals 200 feet. All accessible dirt roads were driven, and biologists also hiked to inaccessible areas and vantage points located throughout the area. Nomenclature generally follows that of List of Vegetation Alliances and Associations, Vegetation Classification and Mapping Program (CDFG 2010). The minimum mapping unit was set at approximately one acre, and patches of

vegetation smaller than this were generally not mapped except for observed seeps and ephemeral ponds.

### **Oak Tree Surveys**

An initial oak tree survey was completed in 2001 by Registered Consulting Arborist Robert W. Wallace of Tree Life Concern (Tree Life Concern 2003). Revisions to the Project footprint boundary required subsequent oak tree surveys by Tree Life Concern in 2007 (Tree Life Concern 2008) and BonTerra Consulting in 2009 (BonTerra Consulting 2009a). Each oak tree survey considered all oak trees that qualified under the County of Los Angeles Oak Tree Ordinance (CLAOTO) that are located within the identified Project grading boundary, as well as a 200-foot buffer area outside the grading boundary. The surveys included the identification, tagging, measurement of trunk diameter at breast height (dbh), and health characterization of each qualifying tree and followed all survey protocols described in CLAOTO.

### **Jurisdictional Delineations**

A preliminary planning-level jurisdictional delineation of waters and streambeds covering most of the Project site was conducted by Impact Sciences in 2001 (Impact Sciences 2002b). In 2005 and 2006, a detailed Project-level jurisdictional delineation of the entire Project site was conducted by Glenn Lukos Associates Biologists Ingrid Chlup and Dave Moskovitz (Glenn Lukos Associates 2006c). Surveys were conducted in 2005 on October 10, 13, 19–21, and 26–27 and in 2006 on January 11 and 20; February 3 and 16; March 2, 15, and 29; April 14 and 25; May 8, 10, 15, 22–23, and 30–31; June 5–7; and July 5. Suspected jurisdictional areas were field-checked for indicators of an ordinary high water mark (OHWM); presence of definable channels; potential wetland vegetation; soils and hydrology; and potential riparian vegetation. In some cases, the Impact Sciences mapped limits were refined and, where appropriate, field measurements were provided where previously not recorded. Suspected wetland areas on the site were evaluated using the method set forth in USACE's *1987 Wetland Delineation Manual* (Environmental Laboratory 1987). When the distinction between channel bank and non-jurisdictional uplands was clearly visible on an aerial photograph, the jurisdictional limits were digitized based on the aerial image. When they were not clearly visible on the photograph, field measurements were recorded on the photograph or on a Trimble GeoXT Global Positioning System (GPS) data logger and later used to digitize the limits (GLA 2006c). In addition, a preliminary jurisdictional delineation was also conducted in proposed off-site mitigation areas as discussed further in Section 5.7.7 below.

On January 18, February 1 and 14, and December 9, 2008, the site was re-evaluated by Glenn Lukos Associates in accordance with the 2006 *Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Supplement* (Arid West Supplement) as well as the May 30, 2007 USACE jurisdictional guidance document entitled *U.S. Army Corps of Engineers Jurisdictional Determination Form Instruction Guidebook*.

BonTerra Psomas Senior Regulatory Specialist David Hughes, Biological Resources Manager Marc Blain, Biologist Nathan Moffett, and Biologist Sarah Thomas performed a survey of the Project site on July 9 and 10, 2015 to (1) identify and document jurisdictional waters in a

newly included parcel to the Project site and (2) determine if any changed conditions were evident since the previous delineation field surveys were conducted in 2006 and 2008. The results of the previous delineation surveys were taken into the field and various drainages were measured to determine if any significant changes in site conditions could be detected.

#### Wetland Functional Assessment

A wetland functional assessment of jurisdictional areas was conducted by Glenn Lukos Associates in order to characterize and evaluate the functions of the site's drainages and riparian habitats. Glenn Lukos Associates created a Hybrid Functional Assessment (HFA) method by combining components of three different functional assessment methods (the Hydrogeomorphic [HGM] approach, the Landscape Level Functional Assessment, and CRAM). These three methods were adapted for use to perform a functional assessment at the Project site (GLA 2006b).

At the time the combined functional assessment was developed, CRAM was a method still in the process of development. Since that time, CRAM has become a widely accepted functional assessment by all regulatory agencies. For this reason and because the combined functional assessment approach was never formally approved by the regulatory agencies, BonTerra Psomas utilized the observations and findings of the Glenn Lukos Associates survey and combined them the observations during the 2015 field surveys to perform a CRAM evaluation of the various jurisdictional features on the site.

#### ***Wildlife Surveys***

Methods used for the various wildlife surveys shown in Table 5.7-2 are described in focused survey reports included in Appendix 5.7-B. Additional surveys were general in nature, were conducted concurrently with other focused surveys, and consisted of recording observations of wildlife and potential wildlife habitat areas.

#### ***Special Status Species Surveys***

##### Special Status Plants

Focused surveys for special status plant species were conducted throughout the Project site during April 1–11 and June 23–27, 2003, by biologists John Vollmar, John Hale, Vir McCoy, Michele Disney, and Shannon Hickey (Vollmar Consulting 2004). Additional focused botanical surveys were conducted during April 14–24 and June 10–13, 2004, by Vollmar Consulting Biologists Mr. Vollmar, Jon Kelsey, Ms. Hickey, Gretchen Vos, and Mr. McCoy (Vollmar Consulting 2004). Reconnaissance-level surveys were conducted using all-terrain vehicles; areas identified as having the ability to potentially support special status species were surveyed on foot. Surveys were floristic in nature. Species that could not be identified in the field were collected and identified using field manuals. Occurrences of special status species were mapped using a GPS unit (GeoXT). The surveys were comprehensive, but did not represent complete presence/absence surveys of the entire Project site (Vollmar Consulting 2004).

In 2006, NRC conducted special status plant surveys across the site (NRC 2006b). The surveys occurred from April 10 to 28 and on June 1, 2006, by Biologists Andrew Sanders,

Kemp Anderson, Kelly Herbinson, Kip Kermoian, Mary Ann Hasskamp, Michael Honer, Patty Kermoian, Russell Kokx, Rachel Woodard, and Teresa Salvato. Survey areas included all suitable habitats for special status plant species with special emphasis on locations and habitats where they had been recorded in previous years, and areas that may experience seasonal ponding of water.

In 2008, NRC repeated special status plant surveys across the site and also in the North and South Mitigation Areas (NRC 2008a). The surveys occurred from April 3 to 29, 2008, by Biologists Mr. Sanders, Caroline Inwood, David Hadersbeck, Kathy Baumberger, Mitchell Provance, Renee Galeano-Popp, Stephen Reynolds, and Ms. Salvato. Survey areas again included all suitable habitats for special status plant species with special emphasis on locations and habitats where they had been recorded in previous years and areas that may experience seasonal ponding of water.

In 2009, BonTerra conducted special status plant surveys in the California Department of Transportation (Caltrans) right-of-way survey area for all special status plant species with potential to occur based on the presence of suitable habitat; in addition, on-site areas with chaparral were surveyed for Tehachapi buckwheat, a species that was described to science in 2006, and therefore not known to exist when previous on-site surveys were conducted (BonTerra Consulting 2009b). Special status plant surveys were conducted for the Caltrans right-of-way survey area on April 16 and June 11, 2009, by BonTerra Consulting Botanists Ms. Edwards and Jeff Crain. Surveys were conducted for the Tehachapi buckwheat survey area on June 10, 2009, by Mr. Crain and Ecologist David Hughes.

In 2015, BonTerra Psomas conducted focused special status plant surveys within the Project impact footprint (BonTerra Psomas 2015b). The surveys occurred from March 23–April 5 and from May 25–June 5, 2015; surveys were led by BonTerra Psomas Botanist Jordan Zylstra, with support from BonTerra Psomas and Consulting Biologists including Chez Brungraber, Griffin Brungraber, Ian Cain, Michelle Cloud-Hughes, Michael Couffer, Sandy Leatherman, Kier Morse, Jennifer Pareti, Allison Rudalevige, Cecile Shohet, Sarah Thomas, and Cedrick Villaseñor. The entire survey area provided potentially suitable habitat for one or more special status plant species, so a systematic survey using transects spaced 130 feet apart was conducted throughout the survey area. Based on input from Centennial Founders LLC, the round two (late spring/summer) survey was conducted using a larger disturbance area and a buffer of 100 feet was surveyed. Areas containing less than a five-percent slope and that were not associated with a drainage feature were not surveyed during the round two survey because of a lack of potential for special status plants to occur in those areas during that time of year. These areas were generally in the northeastern portion of the site. Transects spaced 130 feet apart were surveyed throughout the rest of the survey area. The only small portion of the round one (early spring) and round two survey areas where transects were not feasible due to topography was the chaparral habitat in the far southwestern corner, directly north of SR-138. Binoculars were used in these areas when necessary. All plant species observed were recorded in field notes. Plant species were identified in the field or collected for later identification. Plants were identified to the taxonomic level necessary to determine whether or not they were special status species. Plants were identified using taxonomic keys, descriptions, and illustrations in Baldwin et al.

(2012), Hickman (1993), and Munz (1974). Taxonomy and nomenclature follows the Jepson Herbarium (2015) and Baldwin et al. (2012) for scientific and common names.

### Special Status Wildlife

As previously mentioned, methods used for the various wildlife surveys listed in Table 5.7-2 are described in the focused survey reports included in Appendix 5.7-B. Some surveys were general in nature, conducted concurrently with other focused surveys, and consisted of recording observations of wildlife and potential wildlife habitat areas.

### **Experts Consulted**

Independent scientific reviews of many field survey methods and results were conducted by Dennis Murphy, PhD, Director of the Graduate Program in Ecology, Evolution, and Conservation Biology at the University of Nevada, Reno and Daniel Dawson, Director of the Sierra Nevada Aquatic Research Laboratory–Valentine Camp at the University of California, Santa Barbara. The reviews consisted of an evaluation of the various available reports along with site tours and review of documents describing regional resources. Additional assistance with grassland studies was provided by Bruce Pavlik, PhD of Mills College.

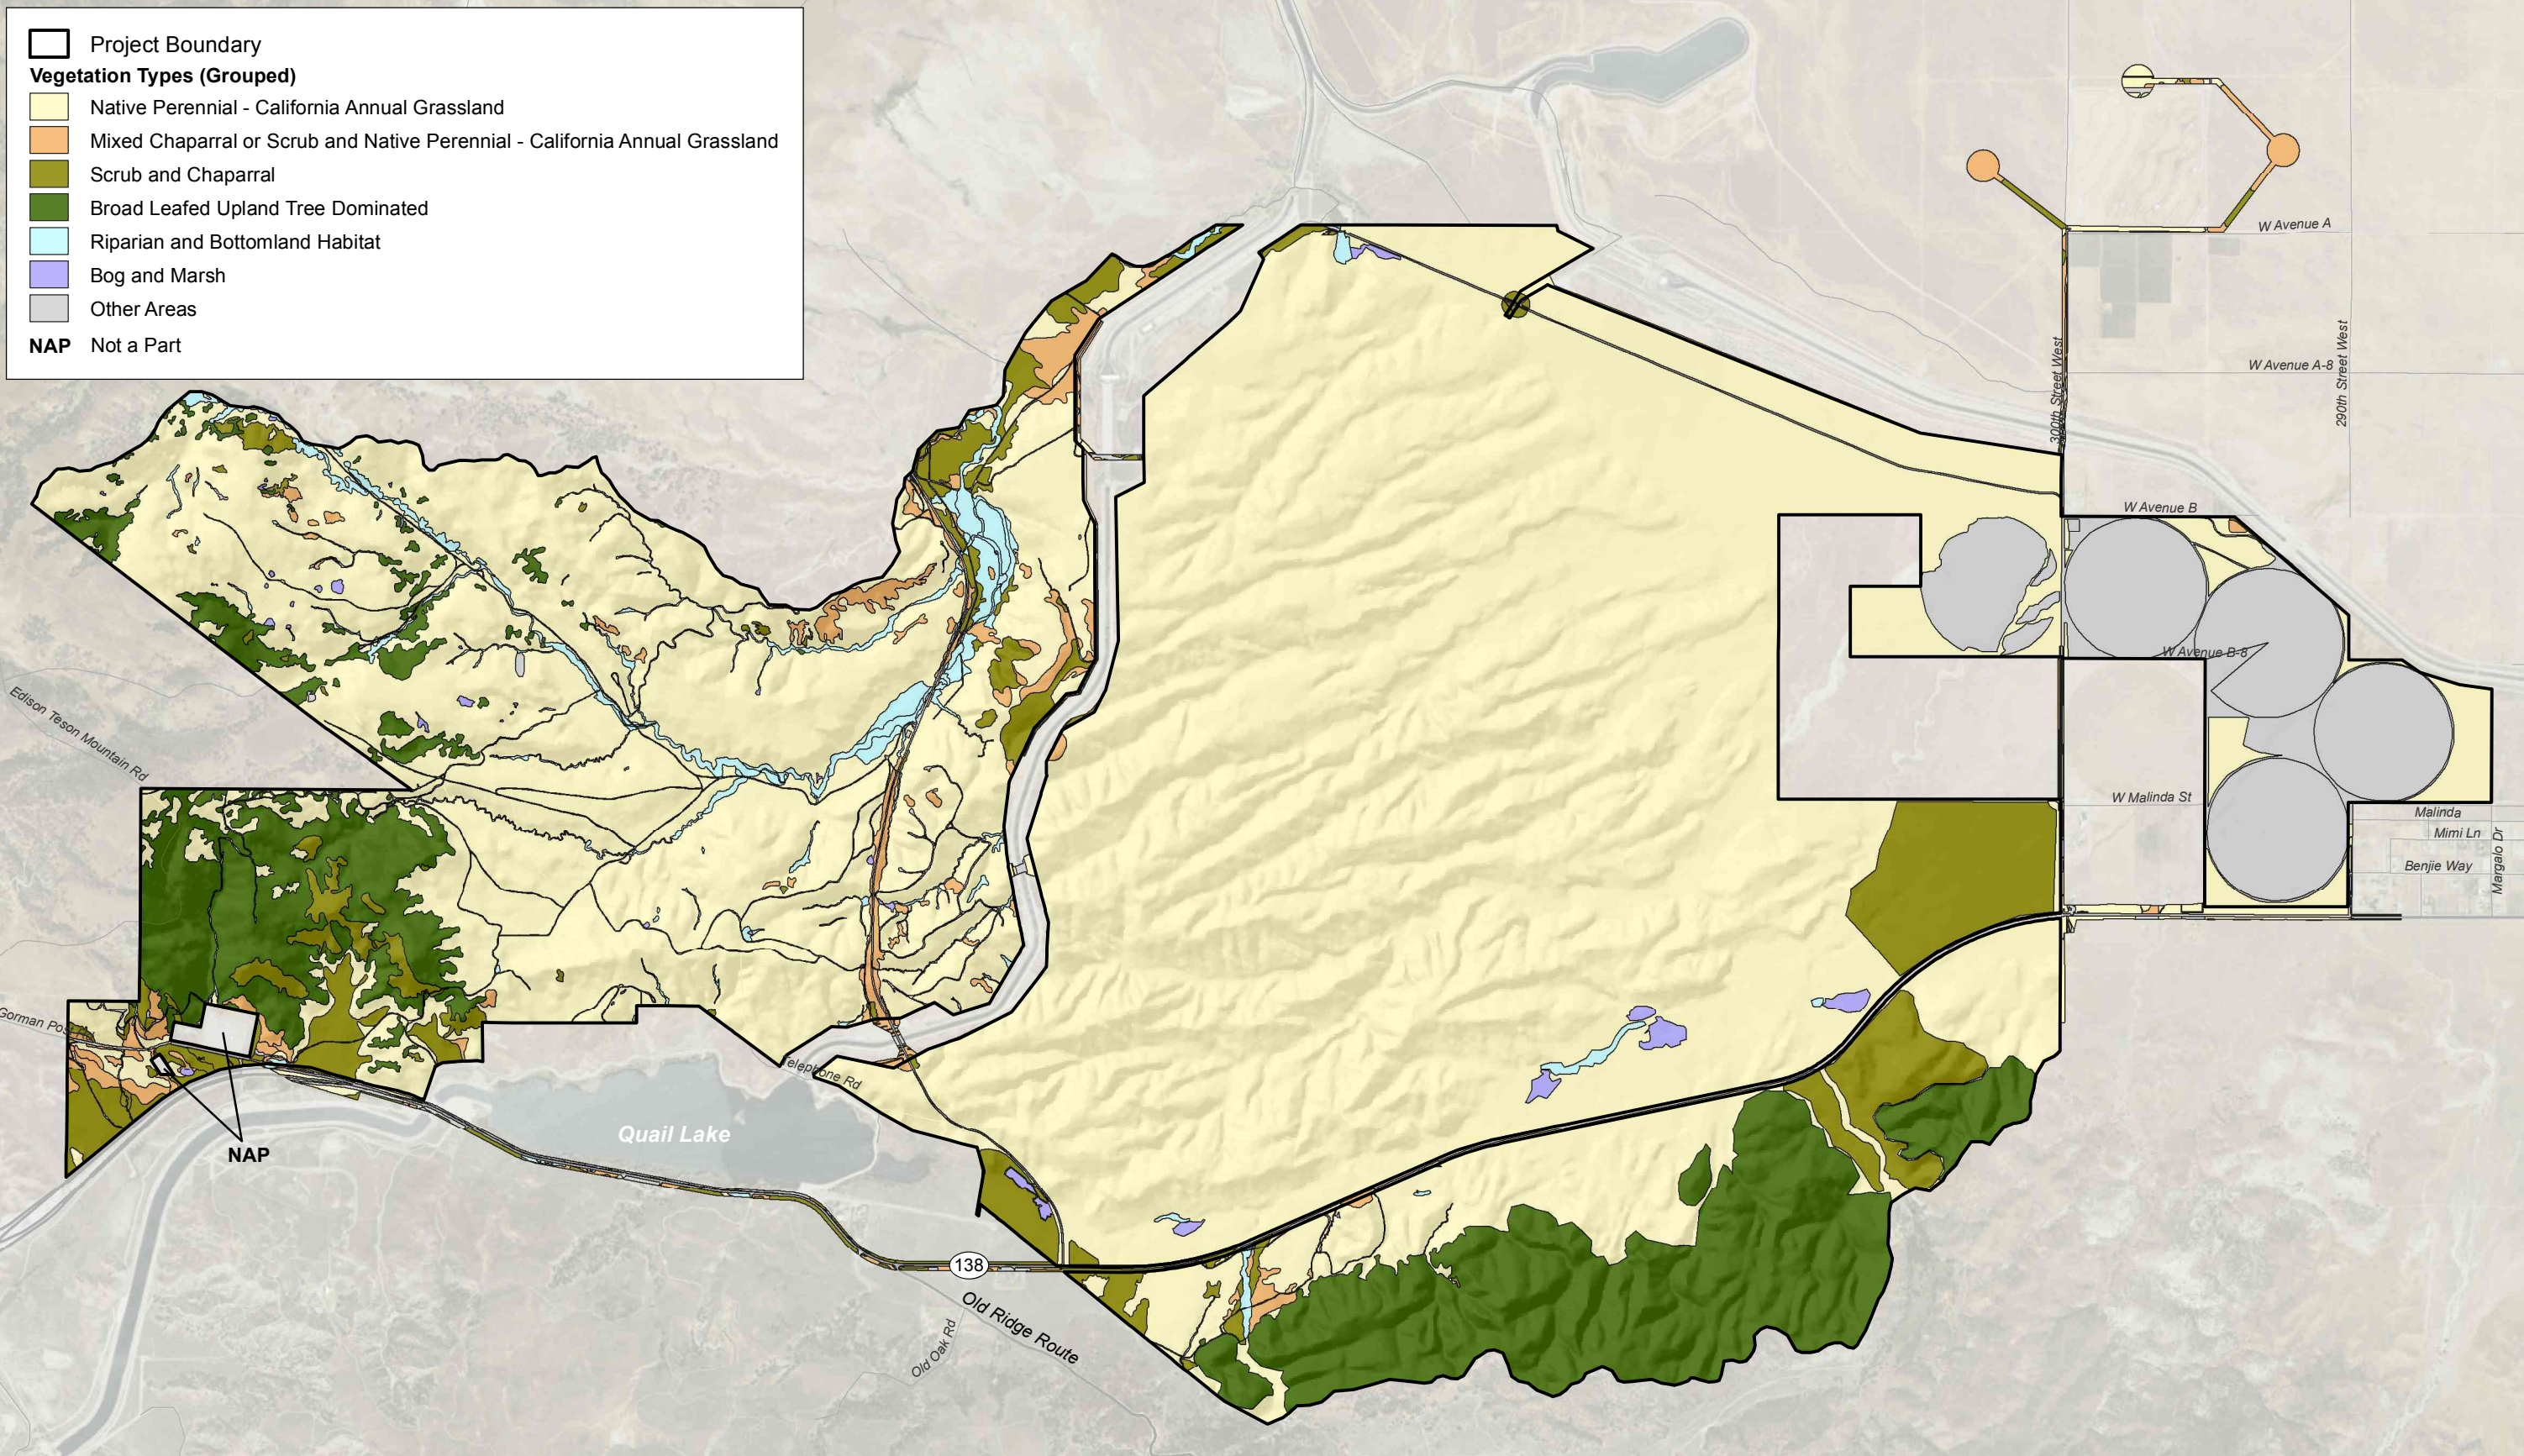

### **Vegetation Types**

The Project site is located near the convergence of three major geographical regions: the Mojave Desert, the San Gabriel Mountains, and the Tehachapi Foothills; this position has resulted in high vegetation type diversity throughout the area (England and Nelson Environmental Consultants 1976). Five main groups of vegetation types were identified on the Project site: (1) scrub and chaparral; (2) broad-leafed upland tree-dominated; (3) riparian and bottomland habitat; (4) bog and marsh; and (5) grass- and herb-dominated; (6) mixed chaparral or scrub and grassland (7) and other areas. The predominant vegetation type is grassland. Wildflower fields (dominated by annual forbs) occur in varying concentrations and are considered a subset of the grassland vegetation type. The grouped vegetation types are shown in Exhibit 5.7-1, Grouped Vegetation Types. Due to the large size of the site, detailed maps showing all vegetation types on the Project site are included separately as Exhibit 5.7-17, Detailed Vegetation Map.

Table 5.7-3, Vegetation Type Acreages, lists the acreage the vegetation types and other areas that exist on the Project site and in off-site impact areas. The agricultural, developed, and mixed oak woodland areas identified by BonTerra are also included below.

Detailed descriptions of each vegetation type are provided below. The CNDDDB numeric code most closely associated with each vegetation type is indicated in parenthesis following the vegetation type title; where a specific numeric code for a described vegetation type is not designated in the CNDDDB classification system, the most appropriate general code is shown. A list of all plant species reported from within the Project's study area is included in Appendix 5.7-A (Plant and Wildlife Compendia).

## ***Scrub and Chaparral Vegetation Types***

### **Bladderpod Scrub (30.000.00)**

This vegetation type is dominated by bladderpod (*Peritoma arborea*). It occurs in only one small area, on a northeast-facing slope in the northwestern portion of the Project site. Other species commonly found in this vegetation type include California buckwheat (*Eriogonum fasciculatum* var. *polifolium*), our Lord's candle (*Hesperoyucca whipplei*), and interior goldenbush (*Ericameria linearifolia*). This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the bladderpod-California ephedra-narrowleaf goldenbush series and Twisselmann and Moe's (1995) upper Sonoran subshrub plant association.

### **Bush Lupine Scrub (30.000.00)**

This vegetation type is dominated by mountain bush lupine (*Lupinus excubitus* var. *austromontanus*). It occurs in only one small area, on a northwest-facing slope in the northeastern portion west of the Aqueduct. Other species commonly found in this vegetation type include California buckwheat, our Lord's candle, and interior goldenbush. This vegetation type most closely resembles Twisselmann and Moe's (1995) arid shrub plant association. A corresponding vegetation type for mountain bush lupine scrub is not described in Sawyer and Keeler-Wolf (1995).

### **California Buckwheat Scrub (32.040.00)**

This vegetation type is dominated by California buckwheat. It generally occurs on slopes, mainly in the southwestern portion of the Project site, west of the Aqueduct. Other species commonly found in this vegetation type include our Lord's candle and interior goldenbush. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the California buckwheat series and Twisselmann and Moe's (1995) upper Sonoran subshrub plant association.

### **California Buckwheat Scrub/Yucca Scrub (32.040.00)**

This vegetation type is a mixed vegetation type that has characteristics of both California buckwheat scrub and yucca scrub. These two vegetation types are present in approximately equal proportions within the mixed vegetation type. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the California buckwheat series and Twisselmann and Moe's (1995) upper Sonoran subshrub plant association.

Vegetation mapping within areas east of the Aqueduct and south of the SR-138 (except for the 262-acre portion) was conducted at a more general programmatic level, while mapping in areas west of the Aqueduct and the 262-acre portion south of SR-138 was conducted at a Project level with greater detail. Also, due to rounding error (a miscalculation that results from rounding off numbers to a convenient number of decimals), figures may not add exactly to total shown.</p>			

California Juniper/California Buckwheat Scrub (89.100.10)

This vegetation type is dominated by California juniper (*Juniperus californica*) and California buckwheat. It generally occurs on south- and west-facing slopes in the southwestern portion of the site west of the Aqueduct. Other species commonly found in this vegetation type include our Lord's candle. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the California juniper and California buckwheat series and Twisselmann and Moe's (1995) upper Sonoran subshrub plant association.

Chamise/Bigberry Manzanita Chaparral (37.101.01)

This vegetation type is dominated by chamise (*Adenostoma fasciculatum*) and bigberry manzanita (*Arctostaphylos glauca*). It generally occurs on hilltops and south-facing slopes in the southwestern portion of the site west of the Aqueduct. Other species commonly found in this vegetation type include our Lord's candle, California buckwheat, California juniper, and occasional oak species (*Quercus* spp.). This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the chamise-bigberry manzanita series and Twisselmann and Moe's (1995) chaparral plant association.

Coffeeberry Scrub (37.000.00)

This vegetation type is dominated by hoary coffeeberry (*Frangula tomentella* ssp. *cuspidata*) and oak gooseberry (*Ribes quercetorum*). It generally occurs on north- and northeast-facing slopes in the northwestern portion of the site west of the Aqueduct. Other species commonly found in this vegetation type include Mojave woollystar (*Eriastrum densifolium* ssp. *mohavense*), sand wash butterweed (*Senecio flaccidus*), and scarlet bugler (*Penstemon centranthifolius*). This vegetation type most closely resembles Twisselmann and Moe's (1995) chaparral plant association. A corresponding vegetation type for coffeeberry scrub is not described in Sawyer and Keeler-Wolf (1995).

Goldenbush Scrub (30.000.00)

This vegetation type is dominated by interior goldenbush. It generally occurs on slopes that are located mainly in the southwestern portion of the site west of the Aqueduct. Other species commonly found in this vegetation type include California buckwheat and our Lord's candle. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the bladderpod-California ephedra-narrowleaf goldenbush series and Twisselmann and Moe's (1995) upper Sonoran subshrub plant association.

Great Basin Scrub (35.000.00)

Great Basin scrub is dominated by rubber rabbitbrush (*Ericameria nauseosa*). This vegetation type is particularly common in areas immediately adjacent to SR-138. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the rubber rabbitbrush series and Twisselmann and Moe's (1995) arid shrub plant association.

Rabbitbrush Scrub (35.300.00)

This vegetation type is dominated by rubber rabbitbrush. It generally occurs in bottomlands and on gentle slopes throughout the site west of the Aqueduct. Other species commonly

found in this vegetation type include California aster (*Corethrogyne filaginifolia*), virgate buckwheat (*Eriogonum roseum*), golden aster (*Heterotheca sessiliflora*), interior goldenbush, bladderpod, and black mustard (*Brassica nigra*). This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the rubber rabbitbrush series and Twisselmann and Moe's (1995) arid shrub plant association.

#### Wand Buckwheat Scrub (30.000.00)

This vegetation type is dominated by wand buckwheat (*Eriogonum elongatum*). It generally occurs on slopes, mainly in the southwestern portion of the site west of the Aqueduct. Other species commonly found in this vegetation type include California buckwheat, our Lord's candle, and interior goldenbush. This vegetation type most closely resembles Twisselmann and Moe's (1995) upper Sonoran subshrub plant association. A corresponding vegetation type for wand buckwheat scrub is not described in Sawyer and Keeler-Wolf (1995).

#### Wright's Buckwheat Scrub (32.041.00)

This special status vegetation type is dominated by Wright's buckwheat (*Eriogonum wrightii* var. *trachygonum*). It occurs on a hilltop and west-facing slope near the eastern edge of the site west of the Aqueduct. Other species commonly found in this vegetation type include needlegrass, Sandberg bluegrass (*Poa secunda*), mountain bush lupine, and interior goldenbush. This vegetation type most closely resembles Twisselmann and Moe's (1995) upper Sonoran subshrub plant association. A corresponding vegetation type for Wright's buckwheat scrub is not described in Sawyer and Keeler-Wolf (1995).

#### Yucca Scrub (30.000.00)

This vegetation type is dominated by our Lord's candle. It generally occurs on south-facing slopes throughout the site west of the Aqueduct. Other species commonly found in this vegetation type include California buckwheat and interior goldenbush. This vegetation type most closely resembles Twisselmann and Moe's (1995) upper Sonoran subshrub plant association. A corresponding vegetation type for yucca scrub is not described in Sawyer and Keeler-Wolf (1995).

### ***Broad Leafed Upland Tree-Dominated Vegetation Types***

#### Mixed Oak Woodland (71.100.00)

Although the areas were originally mapped by Impact Sciences (2003) as scrub oak chaparral dominated by scrub oak (*Quercus berberidifolia*), field surveys conducted in October 2008 by BonTerra Consulting concluded that the hills south of SR-138 should be reclassified as mixed oak woodland. It generally occurs on slopes, mainly in the southwestern portion of the site, with additional areas present in the northwestern portion of the site. This special status vegetation type is dominated by blue oak, Tucker's oak, and interior live oak (*Quercus wislizenii*). Other species commonly found in this vegetation type include gray pine (*Pinus sabiniana*) and California juniper with a variable understory, including several shrub species such as California buckwheat and our Lord's candle. In addition, other oak species and hybrids occur in this vegetation type. On the lower, gentle slopes of the foothills, blue oak is dominant, while the steep upper slopes support a mixture

of the species mentioned above. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the mixed oak series and Twisselmann and Moe's (1995) Douglas oak woodland plant association.

### ***Riparian and Bottomland Vegetation Types***

#### **Alluvial Scrub (32.070.00)**

This special status vegetation type is dominated by tarragon (*Artemisia dracunculus*) and rubber rabbitbrush. It occurs specifically along the north-south-trending drainage that crosses through the Project site south of SR-138. Other species commonly found in this vegetation type include scale-broom (*Lepidospartum squamatum*), Great Basin sagebrush (*Artemisia tridentata*), thick-leaf yerba santa (*Eriodictyon crassifolium*), annual bursage (*Ambrosia acanthicarpa*), California buckwheat, sand wash butterweed, and one-sided bluegrass. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the scalebroom series and Twisselmann and Moe's (1995) arid shrub plant association.

#### **Cottonwood Woodland (61.130.00)**

This special status vegetation type is dominated by Fremont cottonwood trees (*Populus fremontii*). It occurs in one discrete location along the north-south-trending drainage at the northern border of the Project site just east of the California Aqueduct, and north of 300<sup>th</sup> Street West. Shrub cover is generally low due to closed cottonwood canopy. Various herbaceous species are commonly found in the understory such as broad-leaved peppergrass (*Lepidium latifolium*), common horseweed (*Erigeron canadensis*), and hoary nettle (*Urtica dioica* ssp. *holosericea*). This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the Fremont cottonwood series and Twisselmann and Moe's (1995) streambank plant association.

#### **Riparian Herb (45.000.00)**

This special status vegetation type is dominated by tarragon, western sunflower (*Helianthus annuus*), rushes (*Juncus* spp.), prickly lettuce (*Lactuca serriola*), dock (*Rumex* sp.), toad rush (*Juncus bufonius*), beardless wild-rye (*Elymus triticoides*), willow weed (*Polygonum lapathifolium*), cocklebur (*Xanthium strumarium*), and hoary nettle. It occurs along drainages throughout the site west of the Aqueduct. Other species commonly found in this vegetation type include water bentgrass (*Agrostis viridis*), annual beard grass (*Polypogon monspeliensis*), seep monkeyflower (*Mimulus guttatus*), wreath plant (*Stephanomeria* sp.), hairgrass (*Deschampsia* sp.), salt heliotrope (*Heliotropium curassavicum*), broad-leaved peppergrass, white water cress (*Nasturtium officinale*), and common horseweed. This vegetation type most closely resembles Twisselmann and Moe's (1995) freshwater marsh plant association. A corresponding vegetation type for the riparian herb vegetation type is not described in Sawyer and Keeler-Wolf (1995).

#### **Rush Riparian Grassland (45.560.00)**

This special status vegetation type is dominated by rushes and beardless wild-rye. It generally occurs along lower Oso Creek. Other species commonly found in this vegetation

type include cocklebur, western sunflower, dock, toad rush, and narrow-leaved milkweed (*Asclepias fascicularis*). This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the creeping ryegrass and spikerush series and Twisselmann and Moe's (1995) freshwater marsh plant association.

#### Southern Arroyo Willow Riparian (61.201.02)

The southern arroyo willow riparian vegetation type is dominated by arroyo willow (*Salix lasiolepis*). Various segments of this special status vegetation type are found along several sections of drainages on the site. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the mixed willow series and Twisselmann and Moe's (1995) streambank plant association.

#### Southern Cottonwood Willow Woodland (61.130.02)

The southern cottonwood willow woodland vegetation type is codominated by Fremont cottonwood (*Populus fremontii*) and arroyo willow. This type occurs in a few areas immediately north of SR-138. This vegetation most closely resembles Sawyer and Keeler-Wolf's (1995) description of the mixed willow series and Twisselmann and Moe's (1995) streambank plant association.

#### Southern Willow Scrub (61.208.00)

This special status vegetation type is dominated by arroyo willow, red willow (*Salix laevigata*), black willow (*Salix gooddingii*), and narrow-leaved willow (*Salix exigua*). It generally occurs along drainages west of the Aqueduct. Other species commonly found in this vegetation type include hoary nettle and western sunflower. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the mixed willow series and Twisselmann and Moe's (1995) streambank plant association.

#### Unvegetated Wash (99.900.01)

Washes are the scoured beds of smaller channels and stream courses and were generally unvegetated at the time of the survey; however, some wash areas supported a sparse cover of riparian species such as western sunflower, cocklebur, and beardless wild-rye. Although scoured wash areas are not a vegetation type, they are included on the vegetation map because they are naturally occurring features of drainages.

#### Valley Oak Riparian Woodland (74.040.07)

This special status vegetation type is dominated by valley oak (*Quercus lobata*) and occurs along upper Oso Creek. Other species commonly found in this vegetation type include arroyo willow, red willow, black willow, narrow-leaved willow, and willow weed. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the valley oak series and Twisselmann and Moe's (1995) streambank plant association.

#### Willow Riparian Forest and Willow Riparian Woodland (61.200.00)

These special status vegetation types are dominated by arroyo willow, red willow, and black willow. The tree canopy of the willow riparian forest is generally considered to be closed

(e.g., 80 percent cover or greater) compared to the more open canopy of willow riparian woodland (e.g., 60 to 80 percent cover). These vegetation types generally occur along drainages throughout the site west of the Aqueduct. Other species commonly found in these vegetation types include narrow-leaved willow, Fremont cottonwood, and hoary nettle. These vegetation types most closely resemble Sawyer and Keeler-Wolf's (1995) description of the mixed willow series and Twisselmann and Moe's (1995) streambank plant association.

### ***Bog and Marsh Vegetation Types***

#### **Alkali Meadow (45.500.00)**

The alkali meadow vegetation type is dominated by saltgrass (*Distichlis spicata*) and occurs only in one small area: an apparent borrow pit immediately west of the National Cement Plant Road; this location is in the southern portion of the Project site, just north of SR-138 (Impact Sciences 2003). This special status vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the saltgrass series and Twisselmann and Moe's (1995) alkali sink plant association.

#### **Baltic Rush (45.562.00)**

The Baltic rush vegetation type is dominated by Baltic rush (*Juncus balticus*), giant wild rye (*Elymus condensatus*), and beardless wild-rye. This special status vegetation type occurs in the headwater seeps and adjacent to drainages throughout the area; it most closely resembles Sawyer and Keeler-Wolf's (1995) description of the creeping ryegrass and spikerush series and Twisselmann and Moe's (1995) freshwater marsh plant association.

#### **Coastal and Valley Freshwater Marsh (52.100.01)**

The coast and valley freshwater marsh vegetation type is dominated by Pacific mosquito fern (*Azolla filiculoides*) and water lentil/lesser duckweed (*Lemna minor*). This special status vegetation type occurs in a small pond adjacent to the northern property line and in the area to the east of the Aqueduct. This vegetation type most closely resembles Sawyer and Keeler-Wolf's (1995) description of the mosquito fern and duckweed series and Twisselmann and Moe's (1995) freshwater marsh plant association.

#### **Seeps and Ephemeral Ponds (45.000.00)**

Seeps and ephemeral ponds generally cover small areas on the site (i.e., less than one acre) and are scattered throughout the site west of the Aqueduct. This vegetation type is dominated by rushes, beardless wild-rye, western sunflower, dock, narrow-leaved milkweed, and hoary nettle. Other species commonly found in this vegetation type include mallow (*Malva* sp.), salt heliotrope, sedge (*Carex* sp.), spike rush (*Eleocharis* sp.), hairgrass, water lentil/lesser duckweed, cattail (*Typha* sp.), cocklebur, common horseweed, toad rush, and annual beard grass. At the time of the surveys, some ephemeral ponds consisted of only standing water and did not support any associated vegetation. This vegetation type most closely resembles Twisselmann and Moe's (1995) freshwater marsh plant association and Sawyer and Keeler-Wolf's (1995) creeping ryegrass and spikerush series.

### **Grass- and Herb-Dominated Vegetation Types**

#### Native Perennial Grassland (41.100.00)/California Annual Grassland (42.040.00)

Grasslands are composed of a mix of two vegetation types: native perennial grassland and California annual (non-native dominated) grassland. Shrub and tree cover was less than 30 percent in these vegetation types. These two grassland types occur as a mosaic across the varied topography of the landscape and include intermixed, seasonal wildflower fields that vary in density from year to year. Wildflower fields are a component of the grasslands that are temporally visible depending chiefly on rainfall amounts and timing. The California annual grassland vegetation type is characterized by wild oats (*Avena* spp.), bromes (*Bromus* spp.), fescues (*Festuca* spp.), doveweed (*Croton setigerus*), and virgate buckwheat and often intergrades with native perennial grasslands or other vegetation types. Other species commonly found in this California annual grassland vegetation type are native and non-native forbs (herbaceous, non-grass species) including flax-flowered linanthus (*Linanthus liniflorus*), western sunflower, black mustard, shortpod mustard (*Hirschfeldia incana*), and filarees (*Erodium* spp.). The California annual grassland most closely resembles Sawyer and Keeler-Wolf's (1995) description of the California annual grassland series and Twisselmann and Moe's (1995) upper Sonoran grassland plant association.

The native perennial grassland vegetation type includes varying cover of perennial bunchgrasses (needlegrass and Sandberg bluegrass) and beardless wild-rye, a perennial rhizomatous species that occurs both adjacent to drainages and on slopes with other native perennial grasses. Native perennial grassland occurs often intergrades with California annual grasslands or other vegetation types. Other species commonly found in the native perennial grassland vegetation type include squirreltail (*Elymus* sp.), desert needlegrass (*Stipa speciosa*), locoweed (*Astragalus* sp.), California aster, golden aster, flax-flowered linanthus, wild oats, fescue, virgate buckwheat, doveweed, bromes, black mustard, shortpod mustard, and filarees. As noted above, native perennial bunchgrass cover varies substantially across the site. In addition, quality of perennial grassland, based on percentage native species cover and diversity, is positively correlated with the relative cover of native bunchgrass and with wildflower species cover. Species diversity appears to be associated with topography (which varies across the landscape, from slopes of all aspects to floodplains, ridges, and mesas) as suggested by the Vollmar Consulting (2004) grassland study and as found by NRC (NRC 2007a). Other trends and associations with abiotic elements, such as soil type and geology, are likely to be factors in determining the distribution and "quality" of native perennial grasslands on the site. Native perennial grassland most closely resembles Sawyer and Keeler-Wolf's (1995) description of the one-sided bluegrass and needlegrass series and Twisselmann and Moe's (1995) upper Sonoran grassland plant association. The native perennial grassland component of the grassland mosaic is a special status vegetation type.

Wildflowers are comprised of a large number of native forb species, including multiple species of lupine (*Lupinus* spp.), California poppy (*Eschscholzia californica*), California goldfields (*Lasthenia californica*), needle goldfields (*Lasthenia gracilis*), several species of fiddleneck (*Amsinckia* spp.), and owl's clover (*Castilleja exserta*). Wildflower fields occur throughout grasslands on the site, and botanical studies conducted over several years have shown that they are seasonal and intermixed with other native and non-native grassland

species. Wildflowers are typical for this type of vegetation, and their density varies from year to year. Abundance of wildflowers is influenced by multiple environmental factors such as rainfall amounts and rainfall timing.

***Mixed Chaparral or Scrub and Grassland (Native Perennial/California Annual)  
Vegetation Types***

Mixed chaparral or scrub and grassland vegetation types are vegetation types that are composed of 30 to 60 percent cover of shrubs and 60 to 30 percent cover of grasses, as described previously in the methods description. Dominant species in these vegetation types include those described for the chaparral, scrub, or grassland vegetation types previously discussed. The mixed chaparral or scrub and grassland vegetation types found on the site west of the Aqueduct (and the 262-acre portion south of SR-138) include mountain bush lupine scrub/native perennial grassland/California annual grassland, California buckwheat scrub/native perennial grassland/California annual grassland, goldenbush scrub/native perennial grassland/California annual grassland, rabbitbrush scrub/native perennial grassland/California annual grassland, wand buckwheat scrub/native perennial grassland/California annual grassland, Wright's buckwheat scrub/native perennial grassland/California annual grassland, and yucca scrub/native perennial grassland/California annual grassland. Wright's buckwheat scrub is a special status vegetation type. Due to the native perennial component of the grassland mosaic, all the mixed chaparral or scrub and grassland vegetation types are special status vegetation types.

***Other Areas***

Agricultural

Agricultural areas are present on the Project site. Areas under regular irrigated cultivation are, in general, considered disturbed since they are actively managed and relatively lack of native plant species. The agricultural areas are located along the northeastern edge of the Project boundary. The acreage in agricultural use (602.76 acres, as mapped in 2007 and 2015) represents the approximate ground area covered by crops at the time the aerial photograph was taken (2007) or the survey was conducted (2015). The circular cultivated agricultural fields in the northeastern corner of the Project site is shown on Exhibit 5.7-1, Grouped Vegetation Types.

Developed

Using aerial photographs, the paved roadways in the Project site areas were first mapped as developed by BonTerra Consulting, then verified in subsequent site visits. These roads occupy approximately 41 acres.

Developed/Disturbed, Disturbed, and Disturbed (Landslide) Areas

Developed/disturbed, disturbed, and disturbed (landslide) areas occur where there is a mix of development (such as roads) and disturbed areas. Disturbed areas (such as dirt roads, cattle enclosure areas, and recent landslides) occur throughout the site. Disturbed areas generally lack of vegetation.

### Open Water/Developed

Open water/developed areas represent portions of the project that cross the California Aqueduct. These areas occupy approximately 1.51 acres.

### Ornamental

Areas mapped as ornamental on the Project site are generally associated with roadsides or abandoned cropland. Species consist of non-native trees such as fruit trees, cypress (*Cupressus* sp.) and pine trees (*Pinus* sp.).

### **Off-Site Project Feature Areas**

Previously unmapped vegetation types and other areas in the off-site areas were delineated in March 2007 and October 2008 by BonTerra Consulting. Vegetation types present in the off-site areas include great basin scrub, rabbitbrush scrub, alluvial scrub, riparian herb, rush riparian grassland, southern willow scrub, unvegetated wash, willow riparian woodland, coastal and valley freshwater marsh, seeps and ephemeral ponds, native perennial grassland/California annual grassland, rabbitbrush scrub/native perennial grassland\*/California annual grassland, developed, developed/disturbed, disturbed, open water/developed, and ornamental. These vegetation types and other areas are the same as those described above.

### **Results of Grassland Study**

Grasslands in the region and on the Project site have been recognized as having native and non-native plant species composition of varying degrees. Defining native grasslands is more complicated than most vegetation types because the dominant species may be non-native, may be non-grass species, and may be seasonally variable. Furthermore, native grasslands have become rare statewide and are therefore considered sensitive. In an effort to better understand the composition and distribution of grasslands on the Project site so that an adequate assessment of impacts could be made, a series of studies were conducted over the course of many years. Initial field studies were conducted by Vollmar Consulting in 2003 and 2004 to describe the species composition of native perennial grasslands relative to different landscape positions (Vollmar Consulting 2004). The results of the studies indicate differences in species composition and distribution relative to landscape position as defined by slope, aspect, and elevational position. The results for cover on north- and south-facing slopes, floodplains, and ridge/terrace tops are summarized in Table 5.7-4, Summary of Results of the 2003–2004 Grassland Study. These results are summarized from descriptive statistics tables included in the study report (Vollmar Consulting 2004).

**TABLE 5.7-4  
SUMMARY OF RESULTS OF 2003-2004 GRASSLAND STUDY**

Landscape Position	Native Perennial Bunch Grasses <sup>a</sup>	Native Perennial Sod Grasses <sup>a</sup>	Native Annual Grasses <sup>a, b</sup>	Non-Native Annual Grasses <sup>a, b</sup>	Native Forbs <sup>a, c</sup>	Non-Native Forbs <sup>a, c</sup>	Total <sup>a</sup>

N/A: not applicable							
<p><sup>a</sup> All values are reported in percent relative cover.</p> <p><sup>b</sup> Separate mean cover values for native and non-native annual grasses were not given for the 2004 data; however, the annual grass cover values were almost exclusively non-native species. The values presented here as non-native cover for 2004 include minimal cover of a native annual grass species (0.25% cover in floodplain and 0.13% cover in south-facing lower convex slopes). No other native annual grass cover values were recorded for 2004.</p> <p><sup>c</sup> Mean cover values for forbs were not given for the 2004 data.</p>							
Source: Vollmar Consulting 2004.							

The 2003-2004 studies, which surveyed select locations with higher native grassland cover, found that the relative cover of native perennial bunchgrass species ranged from 19 to 33 percent on north-facing slopes and from 5 to 21 percent on south-facing slopes. The relative cover of native bunchgrasses was found to be low in floodplain areas (a range of 1 to 2 percent) and higher along ridge tops and terraces (a range of 16 to 33 percent). Data for

cover values on east- and west-facing slopes were not collected during the 2003–2004 grassland studies.

In general, differences in vegetative cover between north-slope and south-slope exposures are apparently due to the different amounts of solar energy the slopes receive. In the northern hemisphere, south-facing slopes receive the most energy, and are consequently hotter and drier than north-facing slopes; therefore, vegetative cover tends to be higher on north-facing slopes. Although the effect may not be as pronounced, west-facing slopes are generally warmer and drier than east-facing slopes (Smith 1996). Cover values on east-facing slopes, therefore, are expected to be higher than those on west-facing slopes.

As the results of the 2003–2004 grassland studies indicate, the density of native bunchgrasses is closely associated with the topography, which is variable throughout the Project site. Other factors that may contribute to the “quality” of native perennial grasslands, such as wildflower density, are expected to vary substantially and are likely also to depend on topography. The result of local topography, combined with effects of livestock and other disturbances, is a high degree of heterogeneity in the grassland vegetation types.

In an effort to substantiate the results of previous studies and to develop a better understanding of the relationships between grassland “quality” and abiotic factors, NRC completed an extensive grassland assessment in spring 2006 to determine the distribution and quality of native perennial grasslands within the grasslands (including both native and non-native grasslands) that had been previously identified on the site (NRC 2007b). For quality assurance purposes, NRC worked cooperatively with a designated Scientific Review Committee that monitored the study design, data acquisition, statistical analysis, and reporting.

Grassland quality was based on native perennial bunchgrass (NPBG) cover, a conventional metric of grassland quality in California. Percent canopy cover of plant species (e.g., native perennial grass, non-native annual grass, native annual forbs) was measured at over 300 grassland sampling locations. All NPBG cover values presented in the remainder of the Grassland Assessment section refer to absolute cover as used in the NRC grassland studies reports. These data were analyzed to create a predictive model describing the distribution of NPBG and to quantify relationships between NPBG and other vegetation guilds, species diversity, and other community characteristics (NRC 2007a, 2007b, 2007c, 2006a).

The resulting multiple linear regression was then used in conjunction with GIS analysis to generate a predictive map describing NPBG distribution and overall grassland quality. These results describe NPBG cover based on topographic variables including terrain curvature, a slope-aspect index, terrain complexity, easting, and the interaction between terrain curvature and easting. The term “easting” is a GIS term which refers to a rectangular (x, y) coordinate measurement of distance east from a north-south reference line, usually a meridian used as the axis of origin within a map zone or projection.

Predicted grassland quality was classified into four categories based on absolute cover ranges: NPBG with absolute cover of less than 4.99 percent, between 5.00 and 9.99 percent,

between 10.00 and 14.99 percent, and greater than 15.00 percent. Independent validation data collected in June 2006 supports the model's ability to predict NPBG cover values.

The NPBG model provides a reliable method for determining potential impacts to grassland communities on the site. When supplemented by field data, this information can also be effective in determining the value of on-site and off-site mitigation alternatives, the potential benefits of habitat restoration, and long-term management strategies. The grassland distribution in this study is based on absolute canopy cover as measured in April 2006 and identified the topographic and locational conditions that are likely to be important to the distribution of native grassland communities in general (NRC 2007b, 2007c, 2006a).

The regression analysis used to develop this model confirmed several observations about NPBG cover: (1) bunchgrass cover is positively associated with increasing landscape convexity (ridgetops); (2) bunchgrass cover is positively associated with increasing "easting" coordinates; and (3) the relationship between cover and landscape convexity is dependent upon easting. The most influential parameter in the model is convexity. Consequently, the map depicting predicted NPBG cover values is very similar to a map of topographic curvature with slight influence from easting, the slope-aspect illumination index, terrain roughness, and degree of slope (NRC 2007b, 2007c, 2006a).

Results of the data analysis match previous observations by Vollmar (2004) that NPBG cover was highest on ridgetops and decreased down slope towards valley floors; this relationship between convexity and NPBG cover may be indirectly related to the decreased soil depth and reduced productivity of soils found on ridgetops, as remnant stands of native grass on poor sites may exhibit some resistance to invasion of introduced species and historic agriculture and grazing operations (NRC 2007b). Also, NPBG diversity and quality were found to be the highest on steep slopes.

To explore the predictive capability of the 2006 NPBG model across years and subsequently refine and improve upon the existing model, NRC re-examined NPBG stands in 2007. In addition to validating the 2006 NPBG model, the 2007 assessment (1) examined correlations in NPBG cover and distribution between the 2006 and 2007 growing seasons; (2) determined the predictive capabilities and suitability of the 2006 NPBG model to predict NPBG cover in 2007 (with particular attention given to the relationship between NPBG cover and precipitation); and (3) proposed suggestions to improve upon limitations of the 2006 and 2007 models (NRC 2007b, 2007c).

A randomly chosen subset (approximately 30 percent) of the 2006 sampling points were used for 2007 sampling to investigate between-year variation in NPBG cover. The degree of classification error arising from the 2006 NPBG model was examined by comparing the observed NPBG cover class and the predicted NPBG cover class for each plot.

By classing absolute NPBG cover into four categories (Category 1: <5 percent, Category 2: 5 to <10 percent, Category 3: 10 to <15 percent, Category 4: ≥15 percent), the 2006 NPBG model correctly predicted the cover class of 37 percent of all 2006 plots. After simplifying this classification system into two categories (Category A: <10 percent, Category B: ≥10 percent), overall prediction success increased to 69 percent. Regardless of the number

of classes used, the 2006 NPBG model overestimates the number of high quality (i.e., >10 percent NPBG) grassland plots by approximately 7 percent. This error is largely due to the overemphasis of slope position and, potentially, curvature in the model and can be minimized using a weighted regression model (NRC 2007b, 2007c).

For the four-class classification system, the 9,005 acres of grasslands present on the Project site and off-site impact areas (at that time) were distributed as follows: Category 1: 3,305 acres, Category 2: 3,315 acres, Category 3: 2,095 acres, and Category 4: 290 acres. A higher proportion of 2006 plots with low NPBG cover were classified correctly than were plots with high cover values; the number of plots predicted to have more than ten percent NPBG absolute cover were greater than the number of plots observed with greater than ten percent NPBG absolute cover. Regional rainfall in the 2007 growing season (2.5 inches) was significantly less than that in the 2006 growing season (13.6 inches) which also followed an above normal rainfall year in 2005. As a result NPBG cover was significantly less in 2007 due to the drier conditions which caused a decrease in total biomass production and an increased allocation of energy to roots and decreased stem production. NRC (2007c) states the following:

... because change in NPBG cover was greater along ridgetops than off of ridgetops it is suggested that high cover NPBG stands along ridgetops respond more strongly to drought. The data are consistent with the concept that ridgetops with high NPBG cover, reduced competition by non-native species, and shallow, low capacity soils are more responsive to variations in rainfall than are valley bottoms with deep, high-capacity soils and elevated competition with nonnative species.

NRC (2007c) also determined the following:

The results of this analysis also indicate that topographic variables can provide reliable predictions of NPBG distribution within a single year under normal, non-drought conditions. However, the utility of a single-year model is limited between years if environmental variables, including precipitation, are not constant ... of the two created models, the 2006 model is better than the 2007 model at predicting the typical distribution and quality of NPBG ... and this model can be improved to better predict across years by incorporating temporal variation of rainfall into the model.

Grassland field sampling point selection is depicted on Exhibit 5.7-2, Grassland Field Sampling Point Selection; a grassland category map is presented on Exhibit 5.7-3, Grassland Category Map; grassland sampling points are shown on Exhibit 5.7-4, Grassland Sampling Points; and points with predicted NPBG cover are included in Exhibit 5.7-5, Points with Predicted Native Perennial Bunchgrass (NPBG) Cover.<sup>3</sup> The model was 69 percent accurate

---

<sup>3</sup> Although the Project site boundary has expanded since the grassland studies were conducted, additional grassland studies were deemed unnecessary. The purpose of the studies was to develop a model for estimating native

in predicting percent cover between a moderate rainfall year and a very dry rainfall year (NRC 2007b, 2007c). According to the grassland Scientific Advisory Committee, for biological systems, a model with 69 percent accuracy is generally considered above average. The model was untested for ability at prediction of composition in new areas not used to form the model, so accuracy of the overall predicted values is hard to judge with so much apparent year-to-year variability. Variability from year-to-year could influence the accuracy of the estimates. However, these estimates represent the best scientific data currently available for the site (NRC 2007b, 2007c; Josselyn et al. 2009).

## **Wildlife**

All wildlife species observed within the Project site are listed in the wildlife compendium included in Appendix 5.7-A. The term “expected” is used in this section to indicate a high likelihood of occurrence while the term “may” is used to indicate a moderate-to-low likelihood.

### ***Invertebrates***

A total of 27 relatively common and widely distributed butterfly species were observed on the Project site during field surveys conducted by a variety of consulting biologists. Nearly all of the Project site provides potentially suitable foraging habitat for butterflies, and much of the site provides suitable topography for hill-topping butterfly species, as do adjacent properties (Bruyey Biological Consulting 2004). Common hill-topping species such as checkered white (*Pontia protodice*), common hairstreak (*Strymon melinus*), and west coast lady (*Vanessa annabella*) were observed on the site in association with a low elevation hilltop area in the northwestern portion of the site. Other hilltops and ridgelines are present near this hilltop on and adjacent to the Project site, and are probably equally utilized by butterfly species in the vicinity. Common aquatic invertebrates are also expected to occur where potentially suitable areas exist. The versatile fairy shrimp (*Branchinecta lindahli*) was detected in two ephemeral ponds during fairy shrimp wet and dry season surveys (GLA 2005a, 2005b).

### ***Fish***

Most creeks and waterways in Southern California are subject to periods of high water flow in winter and spring, and little to no flow in summer and fall. During wetter years, flows in some drainages may persist for longer periods and experience ponding. These creeks and waterways can support a variety of suitable habitats for fish species. However, the amount of water flow can vary substantially from year to year. The herbaceous cover present typically varies by season from little to no cover during periods of high water flow to high cover in late summer and fall. Native fish species that inhabit Southern California drainages have adapted to living in the naturally fluctuating conditions of the area; however, natural and man-made events and circumstances (such as drought, alteration of habitat, and

---

composition in a given topographic location, and data gathered during the 2006 and 2007 studies is considered a sufficient analysis of the composition of grasslands on the current Project site.

introduced species) have contributed to the decline of native fish populations in Southern California.

Because most watercourses in the area are ephemeral and infiltrate into sandy desert soils on the site and east of the Project site, fish habitat is extremely limited and only the most ubiquitous and tolerant fish species, such as the non-native mosquito fish (*Gambusia affinis*), are expected to occur. No stocked fish have been reported in the Project site. Common freshwater fish are present in adjacent off-site areas, such as Quail Lake and the Aqueduct; according to the DWR, Quail Lake contains striped bass (*Morone saxatilis*), channel catfish (*Ictalurus punctatus*), blackfish (*Orthodon microlepidotus*), tule perch (*Hysterocarpus traski*), threadfin shad (*Dorosoma petenense*), and hitch (*Lavinia exilicauda*) (DWR Public Affairs 2009).

### **Amphibians**

Amphibians require moisture for at least a portion of their life cycle and many require standing or flowing water for reproduction. Although nearly all of the Project site is dry for much of the year, a number of amphibian species occur or may occur on the Project site within the few areas of perennial surface moisture. There are a number of terrestrial species that may or may not require standing water for reproduction. These species are able to survive in dry areas by remaining beneath the soil in burrows, leaf litter, or under logs, and emerging only when temperatures are appropriate and humidity is high. Many of these species' habitats are associated with water, and the species emerge to breed once the rainy season begins. Soil moisture conditions can remain high throughout the year within some habitat types depending on factors such as amount of vegetation cover, elevation, and slope aspect.

The Project site provides habitat for common amphibian species such as the California toad (*Anaxyrus boreas halophilus*) and Baja California treefrog (*Pseudacris hypochondriaca hypochondriaca*), which were both observed during surveys (BonTerra Consulting 2005). The black-bellied salamander (*Batrachoseps nigriventris*) is expected to be present in the scrub and woodland vegetation types at the western and southern edges of the Project site.

### **Reptiles**

Reptilian diversity and abundance typically varies with vegetation type and substrate characteristics. Many species occur in only one or two vegetation types; however, most will forage in a variety of situations. Most species that occur in open areas use rodent burrows for cover, protection from predators, and shelter during extreme weather conditions.

Common reptile species observed or expected to occur in the Project site include the western fence lizard (*Sceloporus occidentalis*), side-blotched lizard (*Uta stansburiana*), western whiptail (*Aspidoscelis tigris*), gopher snake (*Pituophis catenifer*), California kingsnake (*Lampropeltis californiae*), red racer (*Coluber flagellum piceus*), and southern Pacific rattlesnake (*Crotalus oreganus helleri*). Other species that may occur include the Skilton's skink (*Plestiodon skiltonianus skiltonianus*), western red-tailed skink (*Plestiodon gilberti rubricaudatus*), southwestern threadsnake (*Rena humilis humilis*), western yellow-bellied

racer (*Coluber constrictor mormon*), and California glossy snake (*Arizona elegans occidentalis*).

### **Birds**

A variety of bird species are expected to reside in the Project site throughout the year. Other species are present only during certain seasons. For example, the white-crowned sparrow (*Zonotrichia leucophrys*) occurs on the site during the winter season and then migrates north in the spring to breed during the summer.

Scrub vegetation types in the Project site supports bird species adapted to the dense, low vegetation that typifies these areas. Although large numbers of individuals can often be found inhabiting these vegetation types, species diversity is usually low to moderate. Common breeding residents of these habitats include California quail (*Callipepla californica*), Bewick's wren (*Thryomanes bewickii*), California thrasher (*Toxostoma redivivum*), spotted towhee (*Pipilo maculatus*), and California towhee (*Melospiza crissalis*). During winter months, the scrub vegetation provides potential areas where a number of species may be found that migrate from breeding grounds further north. Hermit thrush (*Catharus guttatus*), fox sparrow (*Passerella iliaca*), white-crowned sparrow, and golden-crowned sparrow (*Zonotrichia atricapilla*) are expected to be common winter residents in this vegetation in the Project site. By March, migratory birds (such as warblers and vireos) return from wintering grounds and begin to appear in the Project region.

Grassland vegetation types support fewer bird species than most other vegetation types in the Project site. However, these areas do support breeding residents including the mourning dove (*Zenaidura macroura*), Say's phoebe (*Sayornis saya*), horned lark (*Eremophila alpestris*), lark sparrow (*Chondestes grammacus*), and western meadowlark (*Sturnella neglecta*). Migratory birds expected to use this vegetation type on the site, either during the summer or winter, include species such as western kingbird (*Tyrannus verticalis*) and American pipit (*Anthus rubescens*).

Woody and herbaceous vegetation along pools, seeps, streams, ponds, and other watercourses can be extremely important to birds by providing food, cover, and breeding habitat. The riparian vegetation types in the Project site provide potential resources for a wide variety of resident and migratory birds. Resident species observed include the acorn woodpecker (*Melanerpes formicivorus*), northern flicker (*Colaptes auratus*), black phoebe (*Sayornis nigricans*), western scrub-jay (*Aphelocoma californica*), bushtit (*Psaltriparus minimus*), western bluebird (*Sialia mexicana*), and song sparrow (*Melospiza melodia*) (Impact Sciences 2003). Summer residents observed during surveys of these vegetation types in the Project site include the ash-throated flycatcher (*Myiarchus cinerascens*), black-headed grosbeak (*Pheucticus melanocephalus*), blue grosbeak (*Passerina caerulea*), and Bullock's oriole (*Icterus bullockii*) (Impact Sciences 2003). During spring and fall migration, a variety of migratory birds are expected to use these vegetation types on the site. Some migrants include the pacific-slope flycatcher (*Empidonax difficilis*), warbling vireo (*Vireo gilvus*), Cassin's vireo (*Vireo cassinii*), yellow warbler, black-throated gray warbler (*Setophaga nigrescens*), Townsend's warbler (*Setophaga townsendi*), MacGillivray's warbler (*Geothlypis tolmiei*), and Wilson's warbler (*Cardellina pusilla*).

Common raptors observed within the Project site include the golden eagle, red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), and American kestrel (*Falco sparverius*) (Impact Sciences 2003). Other raptors observed or expected to occur in the Project site include the northern harrier (*Circus cyaneus*), Cooper's hawk (*Accipiter cooperi*), and sharp-shinned hawk (*Accipiter striatus*).

### **Mammals**

Rodents and other small mammals are expected to be among the most diverse and widespread mammals in the Project site. Deer mouse (*Peromyscus maniculatus*), California ground squirrel (*Otospermophilus beecheyi*), and California pocket mouse (*Chaetodipus californicus*) are common rodents that are expected to occur throughout the Project site. Woodrats (*Neotoma* sp.) typically occur in woodlands and may occur throughout the woodland and chaparral vegetation on the property. Open grassy areas appear to provide suitable habitat for the western harvest mouse (*Reithrodontomys megalotis*), Pacific kangaroo rat (*Dipodomys agilis agilis*), brush mouse (*Peromyscus boylii rowleyi*), and the Botta's pocket gopher (*Thomomys bottae*).

Bats occur throughout most of Southern California and may use portions of the Project site to forage. The oak woodland and riparian vegetation in several areas on the site provides potential roosting habitat for many bat species. Many of the bats that could potentially occur on the site are not observable during the winter due to either hibernation or migration, depending on the species. Common bat species that may forage or roost on the site include the big brown bat (*Eptesicus fuscus*), Mexican free-tailed bat (*Tadarida brasiliensis*), California myotis (*Myotis californicus*), Yuma myotis (*Myotis yumanensis*), canyon bat (*Parastrellus hesperus*), and hoary bat (*Lasiurus cinereus*).

Carnivores may be common throughout the Project site and include many predatory and omnivorous species. The coyote (*Canis latrans*) was observed (Impact Sciences 2003) and is expected to occur throughout the Project site, while the gray fox (*Urocyon cinereoargenteus*) may occur more specifically in the vicinity of the riparian vegetation. Other carnivores that are expected to occur include the raccoon (*Procyon lotor*), American badger (*Taxidea taxus*), striped skunk (*Mephitis mephitis*), and bobcat (*Felis rufus*). Larger mammals such as the pronghorn antelope (*Antilocapra americana americana*), black bear (*Ursus americanus*), and mountain lion (*Felis concolor*) frequent the foothills above the Project site and are expected to occasionally forage at lower elevations, including within the Project site. Open grassland vegetation types and the understory of scrub and woodland vegetation types provide foraging opportunities for herbivorous mammals. Common herbivores observed during field surveys include the desert cottontail (*Sylvilagus audubonii*), feral pigs (*Sus scrofa*), and mule deer (*Odocoileus hemionus*).

## **Wildlife Movement**

### **Introduction**

The following describes the existing landscape conditions on the Project site used for wildlife dispersal at both the local and regional scale. A number of wildlife species disperse through or use the Project site at the local scale for either foraging or nesting, integrating some

landscape areas into their extended home ranges. However, in general, a lack of vegetation cover and the presence of significant existing barriers to wildlife dispersal combine to make the Project site an area of limited opportunity for regional wildlife movement. The wildlife movement discussion acknowledges that individual animals move on and off the site and travel across portions of it; this discussion also recognizes that some species may cross significant portions of or the entire site on occasion.

Regional and local wildlife movement can be organized into three major categories: (1) movement within home ranges (e.g., foraging for food or water, defending territories, or searching for mates, breeding areas, or cover); (2) dispersal that serves to extend range distributions; and (3) seasonal migration. In addition, the transfer of genes and the enhancement of genetic variability in populations of less agile wildlife are important to consider.

Another important concept of wildlife movement involves separating wildlife into five ecological groupings or guilds of species that share similar life histories, home ranges, and dispersal capabilities. These five guilds are (1) high mobility ground-dwelling species; (2) moderate mobility ground-dwelling species; (3) low mobility ground-dwelling species; (4) high mobility aerial species; and (5) moderate mobility aerial species.

The high mobility ground-dwelling guild consists of large to moderately sized mammals such as black bear, bobcats, coyotes, mountain lions, and mule deer, which require large home ranges. The moderate mobility ground-dwelling guild includes species such as the American badger, raccoon, and western gray squirrel (*Sciurus griseus*) that have smaller home ranges. Small wildlife with small home ranges that were placed in the low mobility ground-dwelling guild include amphibians, reptiles and rodents, which frequently can be limited in their movements by man-made physical obstructions. The high mobility aerial guild includes most birds and bats, which are typically not constrained by physical obstructions such as roads and buildings. The moderate mobility aerial guild includes birds with relatively weak flight abilities (i.e., the wrentit [*Chamaea fasciata*]), which are unable to cross or move into areas of unsuitable habitat.

A number of terms are used in this discussion of wildlife movement to refer to areas through which wildlife move from one landscape location to another. To simplify concepts, to clarify terminologies, and to facilitate discussion of wildlife movement in this analysis, definitions for these terms are provided:
