**Travel Route:** A landscape feature (such as a ridgeline, drainage, canyon, or riparian strip) within a larger open space that warrants use to move frequently and access necessary resources (e.g., water, food, cover, den sites). Travel routes can be used frequently during more or less daily activities to move back and forth within an individual's home range or territory (an area which organisms occupy and defend, usually to protect offspring and other members of the same species or their breeding and living quarters). A specific travel route may be repeatedly used by wildlife because it provides the least topographic resistance to animals moving from one area to another. It contains adequate food, water, and/or cover for individuals during movement between open space habitats.

**Wildlife Corridor:** A portion of landscape, usually linear and generally a smaller scale that connects two or more habitat patches that would otherwise be isolated. Wildlife corridors frequently are bound by urban land areas or other areas that are unsuitable for wildlife. A wildlife corridor generally supports suitable cover, food, water, or other resources to support individuals moving through the corridor. The value of a corridor varies among the species that use it since different species require different habitats that may or may not be present within a given corridor. Large, landscape-level corridors (often referred to as landscape linkages, which are described further below) can simultaneously provide both transitory habitat for all five mobility guilds including wide-ranging species and resident habitat values for a diversity of less mobile species.

**Landscape Linkage:** A segment of land with similar characteristics and habitat that connects similar habitats, thereby facilitating dispersal of species that occupy such habitat types. These linkages connect the natural processes that are associated with the habitat. Linkages are typically associated with larger scale connectivity.

**Wildlife Crossing:** A narrow or otherwise limited area, relatively short in length and generally constricted in nature, that allows wildlife to pass under or through a physical obstacle or barrier that otherwise hinders or prevents wildlife movement, but which otherwise lacks most or all of the habitat values required by an individual. Wildlife crossings typically are man-made and include culverts, underpasses, drainage pipes, and tunnels. These structures provide access across or under roads, highways, pipelines, or other physical obstacles. Such areas often represent “choke points” along a wildlife movement corridor, impeding wildlife movement and increasing the risk of predation; although, absent such crossing, the man-made obstacles (e.g., a freeway) might make movement very difficult for terrestrial wildlife.

**Landscape Area:** An area of land that has a particular quality or activity and similar characteristics. The scale can vary depending on the application but typical is used in regard to larger scale concepts.

**Home Range:** The area to which an animal usually confines its daily activities.

Landscape linkages used by wildlife of all five mobility guilds can serve to provide dispersal corridors between areas that provide wildlife habitats and that are otherwise separated by impassable terrain, vegetation, developed lands, or other disturbances. The fragmentation of open spaces resulting from urbanization can create isolated “islands” of wildlife habitat imbedded in a suitable matrix. Landscape linkages mitigate the effects of fragmentation by allowing animals to move between otherwise isolated habitats, thereby permitting depleted populations to be replenished; promoting genetic exchange; and providing wildlife with potential escape routes from fire, predators, and human disturbances. These linkages thus provide opportunities to reduce the likelihood that catastrophic events (such as fire or disease) may result in extirpation of populations of susceptible species. Landscape linkages also may serve as travel routes for individual animals as they disperse across their home ranges in search of food, water, mates, and other necessary resources.

In large, continuous open space areas where there are few or no man-made or naturally occurring physical constraints to wildlife movement, wildlife corridors, as defined above, may not exist or be determinable. Given an open space area that is both large enough to maintain viable populations of certain species and to provide a variety of local travel routes (e.g., canyons, ridgelines, trails, riverbeds), individuals of all five mobility guilds will use those local routes while searching for food, water, shelter, and mates and may not cross into other large open space areas to access additional habitats. Within the project region, the Tehachapi Mountains east and north of I-5 represent an example of an area that is sufficiently extensive and open (with few current barriers to movement), allowing resident individuals for many species living there adequate habitat and space to satisfy virtually all life-history requirements (e.g., nesting, foraging, breeding) (Beier 2004; Penrod et al. 2004, 2005).

For a subset of the guilds or species that occur in the region, landscape linkages may play a greater role. Based on their size, location, vegetation cover and composition, and availability of food resources, some landscape areas (such as large drainages and canyons) may be occupied by dispersing wildlife (such as lower mobility guilds) for longer periods, and may even serve as habitat patches, particularly for small- and medium-sized animals (low and medium mobility guilds). This is especially true if a wildlife corridor is located in a larger open space area with differing types of surrounding habitat or other landscape features. However, once open space areas become constrained and/or fragmented as a result of urban development or construction of physical obstacles, the remaining landscape features or travel routes that connect the larger open space areas can become movement “corridors”. To fulfill this corridor role, they must provide adequate space, cover, food and water, and must not support barriers or behavioral obstacles (e.g., human-generated noise, lighting) that could hinder wildlife movement.

Higher mobility guilds, including species such as such as mule deer, bear, mountain lion, gray fox, and coyote and medium mobility guilds including species such as raccoon, skunk, badger, and opossum [*Didelphis virginiana*]) have relatively large home ranges through which they move to secure adequate food, water, and breeding and wintering habitat. Corridors that serve higher mobility guilds may also serve low mobility guilds including species such as such as reptiles, amphibians, and rodents) as long as suitable live-in habitat attributes are also present. Regional movement for these species can facilitate gene flow among populations. Lower mobility guilds may require local “stepping stone” movement of individuals between populations. It may take several separate movements of individuals or even generations of individual species to traverse an entire corridor.

Ideally, a wildlife corridor or a landscape linkage should encompass a heterogeneous mix of vegetation types to accommodate the ecological requirements of a multiple mobility guilds and a wide variety of resident species in any particular region. Most species require adequate vegetation cover to protect against weather and predators during dispersal activities and when foraging for necessary food. Drainages, riparian areas, and forested canyon bottoms normally serve as natural movement corridors because these features provide cover, food, and often water for a variety of species. The Project region contains many natural and man-made features which contribute to a large degree of isolation and narrow landscape linkages. The mountainous habitats and associated species are restricted due to the stark contrast with lower foothill and valley habitats. Very few species in the Project region tend to move

across open or otherwise exposed landscape areas unless individuals are compelled to move under duress and the open areas are the only subregional dispersal option available. However, some species adapted to lower elevation foothills or valley floor habitats in the region, including the Project Site, may readily use such landscapes using different modes of travel and having different tolerances to exposure. The high degree of separation due to terrain and elevation and habitat in the Project region has resulted in a concentrated area of evolutionary divergence. The project region, consequently, represents the edge of many species or subspecies ranges. Similarly, natural landscape features of the region, such as the Tehachapi Mountains, form a natural linkage or corridor on a regional scale. Many of these features are further constrained by anthropogenic barriers such as I-5 and the California Aqueduct resulting in small wildlife crossings where passage for some species is one of a small number of remaining linkages in the region.

For smaller animals or low mobility guilds (such as rodents and reptiles), wildlife corridors must be able to provide adequate food and cover to survive for sustained rather than just brief periods. In areas with large expanses of grassland and little cover, typical medium- and large-bodied animals, or low to medium mobility guilds, are generally adapted otherwise. Larger animals are fleet-footed (pronghorn antelope, and coyote) and typical of a high mobility guild. Some, like the badger, can dig into hiding in less than a minute. Smaller animals, typically of the low mobility guild, usually are fossorial (inhabit burrows or holes dug into the ground) regardless of the habitat they inhabit. Such species are typical of those which inhabit the Project site, and an open-space corridor for these species might require wider spaces than one for animals that require cover.

Wildlife and plant diversity is nearly always enhanced by the maintenance of naturally occurring open space linkages in the face of land development, but there are other critical considerations for development and open space design. So, while naturally occurring landscape linkages should be maintained wherever they exist, it is important to note that many open spaces do not facilitate dispersal for low mobility guilds or otherwise types of wildlife that require cover because of inadequate vegetation cover or physical constraints or impediments. Not all areas through which wildlife move contribute positively to regional species persistence (some areas draw individuals from higher quality habitats to lower quality ones). Some species of high mobility aerial guilds, such as birds and bats for example, do not require landscape linkages to realize dispersal between open spaces, and many species (including most insects) can persist regionally in multiple large but circumscribed populations. Constrained landscape linkages may subject wildlife to higher mortality from edge effects and increased contact with humans, and constraints on the linkage can result in lower (not greater) likelihoods of regional persistence. In most circumstances, open space linkages within development, especially linear narrow corridors, have not been shown to enhance survival of the species that are most in need of conservation attention.

In development adjacent to wildlands, where development is of such a density that only limited movement corridors are an option, designs that separate development from protected open spaces by use of hardened edges are the preferred design strategies (MacArthur and Wilson 1967; Soule 1987; Harris and Gallagher 1989; Bennett 1990). The dominant conservation planning strategy for most areas in Southern California and elsewhere in the West is to focus development in one area and expand the open space

available for movement with minimal animal-human interaction, rather than to incorporate limited movement corridors in the developed areas at the expense of adjoining open space (Bolger 2007; Crooks et al. 2004). The strategy is most applicable to areas where corridors with limited sparse development would face multiple other restrictions to movement such as (in the case of the Project) roadways, aqueducts, and otherwise disturbed areas. Development projects in areas that are mostly surrounded by large contiguous open spaces in all directions with few or no restrictions to movement do not need to rely on such limited corridor strategies to maintain linkages. However, planners should look at the surrounding areas to determine where development is possible and consider wildlife corridor provision in each project, especially if the surrounding areas are also subject to development.

### ***Methodology***

The analysis of wildlife movement within the Project site and vicinity considers substantial scientific literature regarding wildlife movement corridor principles; landscape linkage considerations from island biogeographic theory; and site characteristics from ground surveys, topographic maps, and aerial photographs. Regional wildlife linkage studies, including those conducted by the South Coast Wildlands Project (Penrod et al. 2004, 2005) were reviewed. Further evidence was gleaned from site-specific and Tejon Ranch-wide studies, including assessments of Tejon Ranch lands for the ranch-wide agreement that identified Tejon Ranch lands with the highest wildlife dispersal value; the proposed reserve design for Tejon Ranch that was prepared by the Conservation Biology Institute and South Coast Wildlands Project; a motion-sensitive camera study of I-5 underpasses by the Tejon Ranch Company; an assessment of the site's wildlife movement value from Dr. Dennis Murphy from the University of Nevada, Reno (Murphy 2002); a linkage analysis of the Project region that was conducted by Paul Beier (2003); a wildlife movement study by Tejon Ranch, which included the Project site (Pioneer Environmental Services 2004); and a linkage modeling study designed to replicate and refine the South Coast Wildlands Project's Tehachapi Linkage modeling (Dudek 2013).

Potentially existing landscape linkages between large open space areas in the region were identified and characterized by BonTerra Consulting, as were potential wildlife crossing points across existing major impediments to wildlife movement, specifically along I-5, SR-138, and the California Aqueduct. In addition, BonTerra evaluated wildlife movement between the Project site and regional open space areas using the sources described above and additional site-specific field reconnaissance surveys searching for evidence of presence and movement.

Additional field data were collected during various surveys of the Project site (see Table 5.7-2, Biological Surveys Conducted within the Project Site [1999–2015]) and were used to identify probable animal movement corridors on the Project site. Those data include assessment of the type and extent of vegetation on the site that may facilitate wildlife movement; the location and characteristics of on-site riparian drainages and channels; identification of animal signs (primarily scat and tracks); characterization of the physical attributes of potential physical and biotic wildlife movement barriers and choke points; and determination of type and extent of surrounding land uses and landscape conditions. Because the Project site is mostly surrounded by undeveloped open space, the focus of the

analysis was on potential regional open space connections since wildlife species that exhibit large home ranges, when unimpeded, can move somewhat freely to available open space in search of food, water, and shelter.

The most extensive and recent of these various studies of regional connectivity was the modeling study conducted by Dudek (2013), which focuses on wildlife movement through the I-5 corridor in the Tejon Ranch area. The study uses multiple survey methods, including use of a motion-sensitive camera placed at several I-5 underpasses. Pre-modeling analysis included identifying species present in the Tehachapi Mountains and the Sierra Nevada that would be potentially recorded at the study sites, then assigning them into the five different guilds.

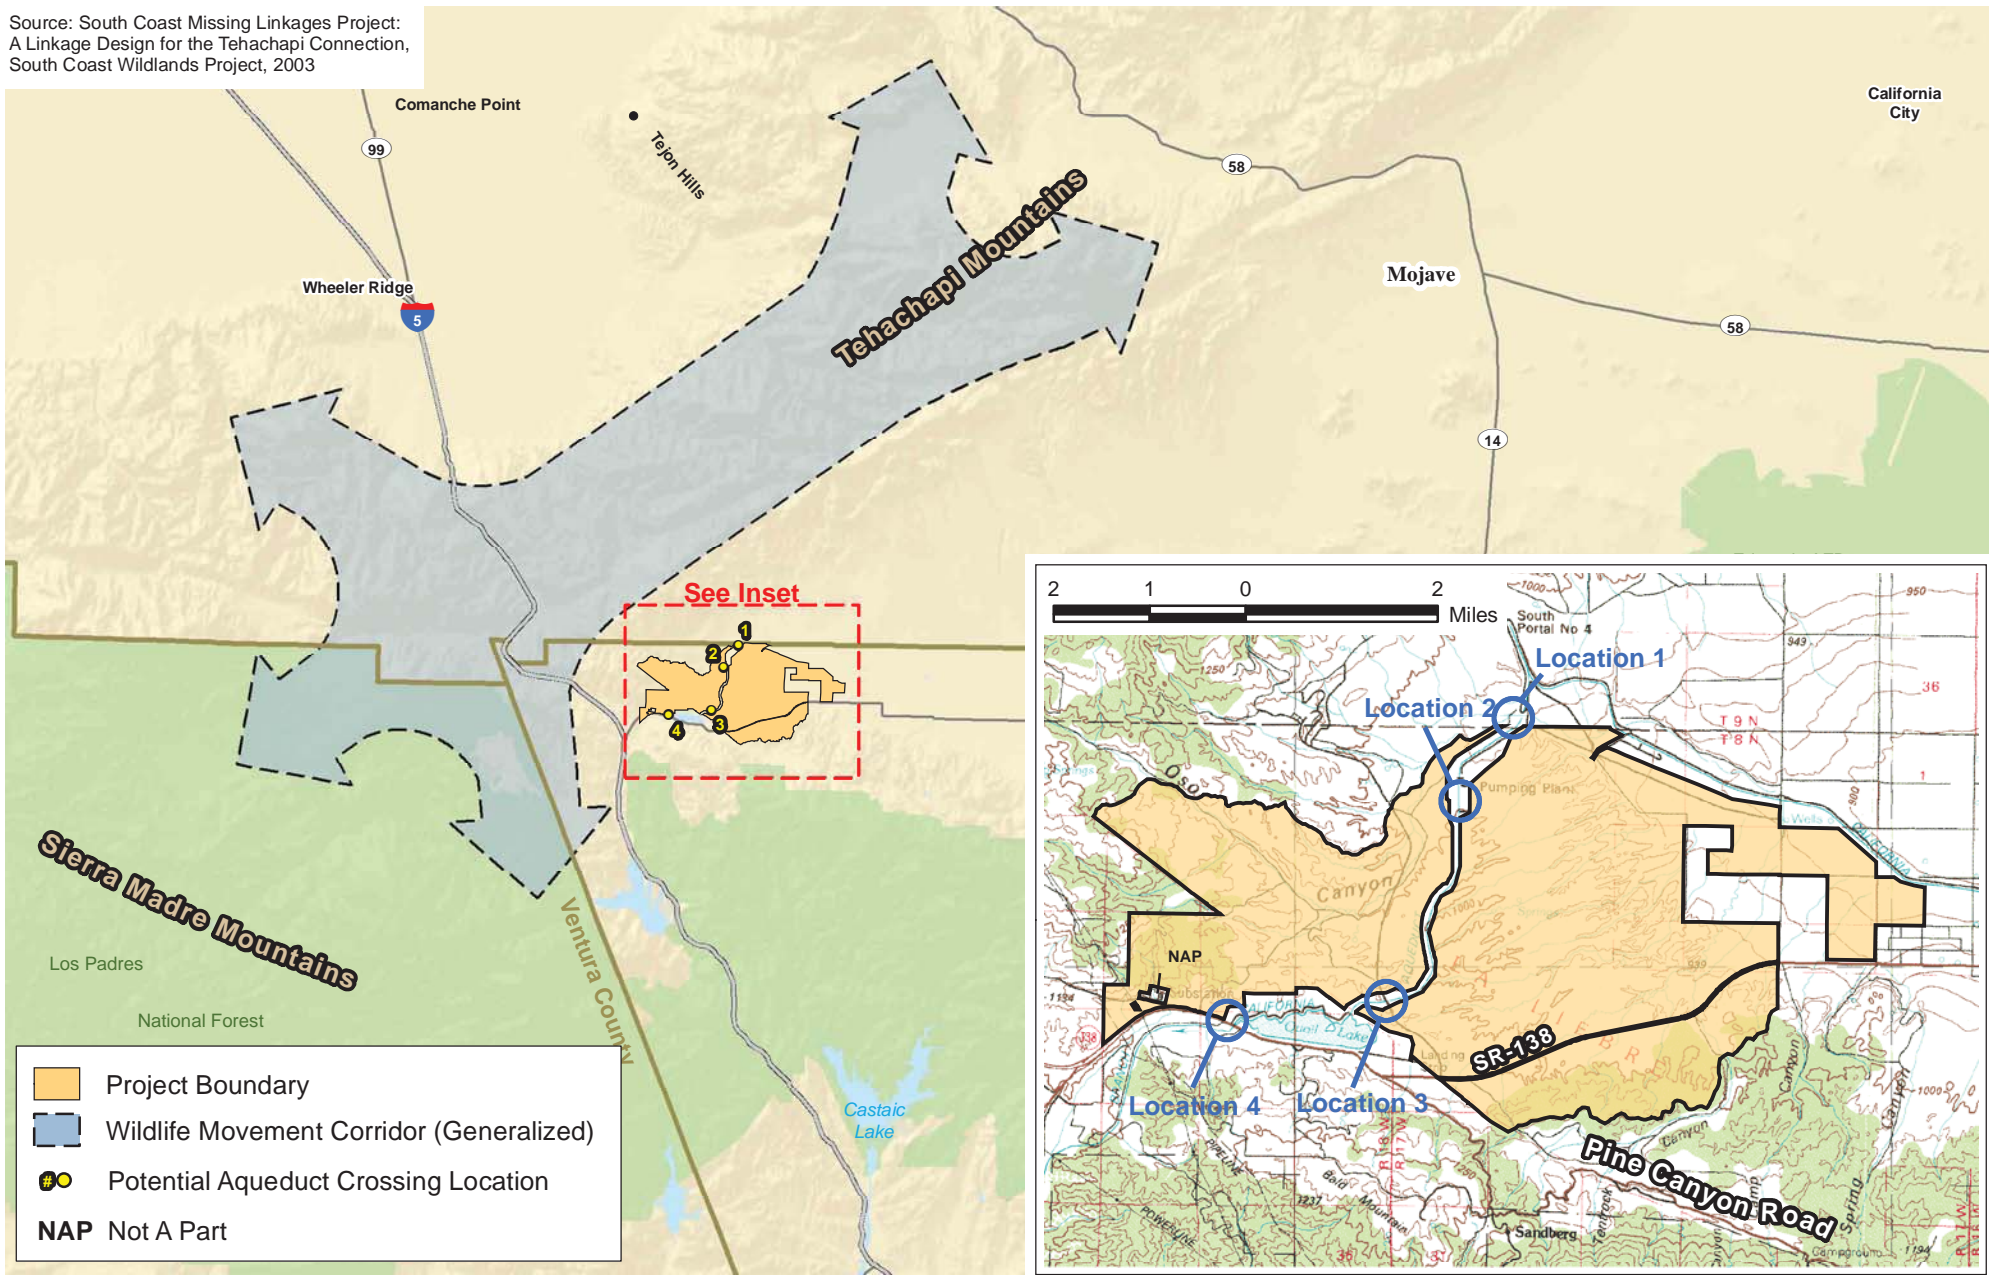

The Dudek study included a more recent and refined analysis of the Missing Linkages permeability modeling study and proposed linkage (Penrod et al. 2003). The study re-examined the permeability modeling analysis that was used as the basis for identifying proposed linkages (Majka et al. 2007). Dudek updated the model based on current conditions and used more refined site data for the permeability modeling analysis. The analysis showed that wildlife movement occurs at least at some level through the whole study area, but the northern portions of the study area provide the most permeable (available) wildlife movement routes. This study as well as the original Missing Linkages study reviewed the entire project region, inclusive of the Project site, and focused on more mountainous areas in subsequent detail study based on preliminary results indicating highest permeability within these areas. While these corridors are considered to be the highest importance for regional wildlife preservation, other wildlife corridors or landscape linkages occur to lesser degree elsewhere in the region.

In the analysis of wildlife movement within the project region, one additional method was utilized. Literature regarding several representative species from each guild grouping was reviewed. Specific points of review included preferred habitat, known species range, known local distribution, and known population locations with the western Antelope Valley. This data was then compared to regional scale vegetation maps (USGS California Gap Vegetation Data) to determine if habitat, such as foothill grasslands, on the project represent a highly constrained linkage in habitat surrounding the Antelope Valley and if such a restriction would likely effect regional populations of these species occupying such habitats.

### ***Regional Wildlife Movement***

Recent reports that discuss the biotic resources in the vicinity of the Tehachapi Mountains (including the Project region) describe the importance of these mountains as a landscape linkage between the Sierra Nevada and the Coast Ranges (see Exhibit 5.7-6, Regional Wildlife Movement). Typically, landscape linkages facilitate wildlife movement between large areas of similar terrain, vegetation types, or habitats. Because of the unique adaptations required of wildlife species that inhabit the low elevations of the San Joaquin Valley to the north of the Tehachapi Mountains and the Antelope Valley and adjacent Mojave Desert to the south of the mountain range, most species that occupy these geographically separate and distinct ecosystems do not venture south or north, into or over, the Tehachapi Mountains. As noted above, wildlife species within the mountains surrounding the project site are expected to move freely within the mountains to satisfy their life history requirements. Accordingly,

## Regional Wildlife Movement

Exhibit 5.7-6

Centennial Project

D:\Projects\3CEN\Centennial\WXD\EIR\Ex\_Regional\_Wildlife\_20151119.mxd

most wildlife movement in the mountains probably occurs within large landscape areas in upland portions of the Tehachapi range, and to the south of the Centennial property within the western extent of the San Gabriel Mountains much more than between these areas. The same can be expected of movement on the valley floor and surrounding low foothills, where the proposed project is located.

The Biological Resources Assessment of SEAs in the Project vicinity states that the region encompasses “an important linkage between the San Gabriel Mountains and the Tehachapi Mountains”, and that “this linkage to the Tehachapi Mountains is important because it represents a link to the western-most extent of the Sierra Nevada Mountains . . . represent[ing] the only mountain linkage from the Transverse Ranges or the Coast Ranges to the Sierra Nevada Range” (PCR et al. 2000). The Biological Assessment also suggests that lands within SEA 17 may be an important topographic reference for migrating birds, with essential high elevation foraging grounds along the route. The Assessment does not, however, address the significant constraints on movement posed by I-5 and the Aqueduct. The assessment also does not reference any studies that demonstrate that the Project site serves a significant element of the regional landscape linkage.

Habitat types in the Tehachapi Mountains vary significantly with elevation and directional orientation. Their lower elevation foothills, for example, are characterized by scrub and woodland plant communities, while higher elevations support conifer-dominated habitats. Abiotic factors (e.g., topography, soil type, and temperature) also vary across the range. As a result, movement of certain groups of wildlife or mobility guilds (as either individual events or over multiple generations) occurs within the habitats to which the group or particular species are best adapted. For example, species adapted to scrub communities are expected to move through the Tehachapi Mountains in the lower elevation areas (foothill slopes) that support scrub communities, while species adapted to pinyon forest would be more likely to move through the higher elevation zone. Wildlife corridor assessments conducted by Paul Beier (2003) and Tejon Ranch (Pioneer Environmental Services 2004) generally confirm that wildlife movement occurs within, but not across, the various habitat types and elevation zones within Tehachapi uplands, foothills, and the adjacent plains and desert areas to which particular species are associated.

I-5 presents a formidable obstacle to animals attempting to move east or west along the Tehachapi Mountains since it is a primary and heavily traveled transportation corridor that is elevated in some areas and is bordered by fences and dividers along extensive stretches. While I-5 provides a substantial barrier to wildlife dispersal, individuals of a variety of species are expected to occasionally attempt to make highway crossings at grade and more frequently through underpasses and overpasses with reduced traffic. The at-grade crossings are less likely to be successful. Occasional movement is not likely to occur frequently enough to link continuous ecological areas on either side of I-5.

A number of culverts, underpasses, and overpasses occur along I-5 from approximately the Tejon Ranch headquarters in Lebec to the intersection with SR-138 and represent potentially more suitable pathways for navigating the I-5 obstacle. Ongoing evaluations of photographs taken from remote cameras positioned in all 11 underpasses and culverts under I-5 between the California Aqueduct undercrossing in the Grapevine area and the

intersection of I-5 with SR-138 indicate that certain of these underpasses facilitate movement under I-5 by larger, wide-ranging high mobility species (e.g., deer, coyote, bobcat, and fox) (Impact Sciences 2003; Pioneer Environmental Services 2004). Additional data gathered in more recent years indicate that some underpasses are used on a fairly regular basis by some species such as deer, coyote, and bobcat. The importance of such areas was recognized in the choice of lands for preservation in the Ranch-wide Agreement.

For species attempting to move from the Tehachapi Mountains (east of I-5) in a south-southwest direction to the Angeles National Forest, open spaces to the east of I-5 and west of the Aqueduct offer a potential wildlife corridor extending at least as far south as SR-138. These areas, which include the riparian communities along Oso Canyon and its tributaries and the oak woodlands along the western portion of the Project site (which continues farther to the west), may be suitable areas for some wildlife movement given available forest or shrubland vegetation cover, which may serve as shelter and protection from predators.

SR-138 currently does not pose a substantial hindrance for most medium to high mobility groups or medium to large wildlife species trying to cross it because it is a two-lane surface road with no fencing or dividers and because it is not as heavily traveled by auto and truck traffic as I-5. Additionally, small culverts may allow for passage of at least smaller animals under SR-138. However, this highway is expected to become a more formidable barrier in the near future due to Caltrans' pending plans to slightly realign and increase it to a six-lane divided freeway that includes a 22-foot median to accommodate area growth; this SR-138 expansion is expected to occur regardless of the Project (refer to Section 4.5.5 in the Project Description).

The West Branch of the California Aqueduct extends from the north and through the center of the Project site south to Quail Lake, crosses underneath SR-138, and reappears immediately south of SR-138, where it continues in a southwesterly direction to its intersection with I-5. Because the Aqueduct channel has steep, smooth rounded sides, often has high velocity water flows, and is fenced on both sides with a relatively high chain-link fence, it represents a significant wildlife barrier. Animals that might travel down the open spaces to the east of I-5 and west of the Aqueduct (across the western portion of the site), and then successfully cross SR-138 west of Quail Lake would likely be funneled into the intersection of the Aqueduct with I-5; the small culvert at this intersection is fenced and impassable to wildlife. The intersection of the SR-138 and the Aqueduct is passable by a narrow 50 foot gap, and some individuals may cross by following the SR-138 shoulder eastward. Alternatively, wildlife could move north to a large underpass which conveys a tributary to Gorman Creek, which is regularly used by wildlife.

Wildlife movement to the east of the Aqueduct, particularly in a north-south direction, is also problematic. The East Branch of the Aqueduct, which runs off site near the northern boundary of the Project site, forms an essentially impassable barrier to animals moving north and south. Drainages are oriented west-east with little cover of vegetation other than grasses and an occasional tree. While extensive open space is found in these areas through which wildlife presumably can move freely, both the West Branch and the East Branch of the Aqueduct significantly preclude north-south regional wildlife movement from the Tehachapi

Mountains through the site to the Angeles National Forest. The West Branch of the Aqueduct and the formidable fencing that surrounds it severs east-west regional dispersal options through the site except for four crossings or “choke points” (listed below). Given that the east-west drainages dissipate into porous soils at the eastern portion of the site and given that areas to the east of the site are in agricultural use, the value of the portion of the site east of the Aqueduct for wildlife dispersal is expected to be minimal.

Four minor gaps in the West Branch of the California Aqueduct provide opportunities for wildlife to move across the Project site, as depicted on Exhibit 5.7-6, Regional Wildlife Movement. Specifically, wildlife may cross the Aqueduct just to the north of the northern site boundary where the Aqueduct is underground (Location 1); at the Oso Pumping Plant where the Aqueduct is located underground (Location 2); where the National Cement Plant Road bridges the Aqueduct (Location 3); and to the west of Quail Lake where the Aqueduct crosses under SR-138 (Location 4). Wildlife that might cross the West Branch of the Aqueduct at any of these locations might proceed southward to the Angeles National Forest or northward to the western end of the Tehachapi Mountains. Potential use and limitations of each of the Aqueduct crossings are discussed below.

**Location 1:** Location 1 is at the far northern boundary of the Project site. This crossing is not fenced and wildlife may be able to move across the road that bridges the Aqueduct. Wildlife that cross the Aqueduct at this location would have to traverse open areas to reach the crossing from the north or east, then traverse over three miles of relatively open grassland and cross SR-138 to reach cover provided by woodlands south of SR-138. As a result, this crossing is likely to provide occasional wildlife movement opportunities for a subset of species of the region typical of grassland dominated landscapes similar to the project site.

**Location 2:** A barbed-wire fence, an Aqueduct security requirement, surrounds Location 2 (at the Oso Pumping Plant) and poses a barrier to the movement of larger wildlife species of the ground dwelling high mobility guild. Some larger mammal species of this guild (e.g., coyote, fox, or bobcat) may successfully pass through, under, or around the fence and cross the Aqueduct. The fence probably does not pose a barrier to the movement of ground dwelling low and moderate mobility fluids or smaller wildlife species (e.g., insects, rodents, and reptiles) that may pass through the fence and then cross the Aqueduct. Wildlife may travel along the Oso Creek corridor while approaching (or departing) from west of Location 2, and then traverse approximately 1,700 feet of grassland to reach the Aqueduct crossing. Wildlife approaching or departing from east of Location 2 would again have to traverse a large grassland area (approximately three miles) and SR-138 to reach the shelter provided by the woodlands south of SR-138. For similar reasons, As a result, this crossing is likely to provide occasional wildlife movement opportunities for a subset of species of the region typical of grassland dominated landscapes similar to the project site.

**Location 3:** The bridge on the National Cement Plant Road is not fenced on the northern and southern sides of the Aqueduct; large and small wildlife species may move across the road that bridges the Aqueduct. Wildlife approaching Location 3 from woodlands in the southern portion of the Project site may cross SR-138 at grade, proceed along the large drainage that parallels the north side of SR-138, then traverse approximately 2,600 feet of open grassland. Wildlife may travel along Oso Creek and its tributaries while approaching (or departing) from the north of Location 3, then traverse approximately 3,300 feet of open grassland to

reach the Aqueduct crossing. Wildlife use of this crossing is likely limited at certain times due to truck traffic to and from the National Cement Plant, which occurs during the day. More favorable conditions for wildlife to cross the Aqueduct at this location occur at night when there is little or no truck traffic. This crossing is also likely to provide occasional wildlife movement opportunities for a subset of species of the region typical of grassland dominated landscapes similar to the project site.

**Location 4:** Location 4 has a chain-link fence where there is a gravel embankment between the Aqueduct and the road. Larger wildlife species unable to cross the chain-link fence would have to move further down the highway to an area where the fence line transitions to a more permeable barbed wire fence. Wildlife (both large and small species) would have to move diagonally across SR-138 to cross the Aqueduct. It is expected that ground dwelling high mobility guilds have better chances of successfully crossing the highway than animals of low mobility guilds. To approach Location 4 from Oso Canyon, wildlife may move through the oak woodland and areas of scattered oaks, and then traverse approximately 750 feet of open grassland. To approach Location 4 from the woodlands south of SR-138, wildlife may move along one of the drainages then traverse approximately 1,000 feet of open grassland. Similarly, this crossing is likely to provide limited wildlife movement opportunities for a subset of species of the region typical of grassland dominated landscapes similar to the project site.

Although individual direct movement across the site may be limited for larger species, it is possible for insects, plants, birds, bats, and other small-bodied species to pass through some of the low elevation “choke points” described above. Such movement over many generations may contribute to gene flow between subpopulations on different parts of the site or on opposite sides of the site. However, this type of movement is expected to occur more readily in other areas in the vicinity, but off site where there are fewer restrictions. Individual dispersal events by wildlife from adjacent open spaces onto the site, with individuals returning to an original location, are expected to occur as species utilize the site for foraging. This type of movement is discussed in the “Local Wildlife Movement” section below.

The analysis of representative plant and wildlife species from each guild (described in the Wildlife Movement Methodology section above) provided similar results. Areas providing connectivity—specifically, adjacent areas of similar habitat, were generally available to a greater degree outside the Project’s proposed development footprint. Most representative species occurring on the Project site occupy scrub and/or grassland vegetation with varying degrees of annual and scrub cover. Grouping the two vegetation communities reveals a large degree of connectivity throughout the Antelope Valley, as expected, because the grasslands and scrublands of the Project site occur as remnant patches and are scattered across the valley floor. The regional Southcoast Missing Linkages study similarly reviewed vegetation types for the purposes of determining regional species movement opportunities. The study report includes a map of aggregated vegetation types showing that grasslands do not ring the Antelope Valley but are instead concentrated at the western end. Moving in a northwesterly direction from the site along the Tehachapi foothills, grasslands transition to scrub and woodland as you go beyond the project mitigation lands. Although vegetation types in the region may not be classified with the same name, the structures are similar and there are likely to be many shared species making the areas suitable for occupation and

movement. Most of the representative wildlife species that were reviewed fell into this category including desert stink beetles (*Eleodes* sp.), short horned-grasshopper (*Melanoplus* sp.), monarch butterfly, side-blotched lizard, southern pacific rattlesnake, horned lark, western meadowlark, northern harrier, coyote, and cottontail rabbit. These species will traverse, breed, or forage in the surrounding vegetation types such as rubber rabbitbrush scrub, desert scrub, and undifferentiated grasslands. Some wildlife species occurring in the Project region may have more specific habitat requirements such as the Tehachapi pocket mouse and the coast horned lizard. Based on current CNDDDB records, although historically ranging wider, the current distribution for the Tehachapi pocket mouse is limited to the Tehachapi Mountains slopes. The coast horned lizard is more widely distributed currently extending from the southern coastal ranges into the Tehachapis and the southern Sierra Nevada range as well as the Central Valley. Plant species reviewed in this analysis had a similar set of results with some common species from the Project site occurring in a variety of habitats throughout the Antelope Valley such as the California poppy bristly fiddleneck (*Amsinckia tessellata*), Mojave suncup (*Camissonia campestris*), rubber rabbitbrush, little gilia (*Gilia minor*), needle goldfields, Veatch's blazingstar (*Mentzelia veatchiana*). Some plant species with narrower habitat requirements such as desert larkspur (*Delphinium parishii*), variable linanthus (*Leptosiphon parviflorus*), creamcups (*Platystemon californicus*), and thistle sage (*Salvia carduacea*) may have a more fragmented distribution reflective of the location of the specific microhabitat type. Desert larkspur is known to occur in creosote bush scrub, Joshua tree woodland, pinyon-juniper woodland, and chaparral which are scarce or non-existent vegetation communities on the site and not within the Project impact area (Jepson 2015, CCH 2016). This species occurs within scattered remnant patches of Joshua tree woodland and creosote bush scrub on the valley floor, but occurs to a much greater degree in higher elevation mountains and foothills in the Project region. The distribution of variable linanthus indicates a tendency for more mountainous or foothill habitat where it occurs in sandy washes, mesas, meadows and openings of coastal sage scrub (Jepson 2015; Prigge, B.A. and Gibson, A.C. 2007). This type of habitat occurs within adjacent higher elevations to a much greater degree than on the Project site, which is consistent with this species' known distribution (CCH 2016). Creamcups reportedly have some degree of affinity for serpentine soils, and the known distribution does not indicate any specific connection through the Project area (Safford et al. 2005). Populations have been recorded in all directions from the Project site (CCH 2016). Thistle sage occurs in sandy or gravelly, open places in creosote bush scrub, coastal sage scrub, and valley grassland in the region and beyond. Similar to the variable linanthus, known occurrences of this species have a preponderance to occur in foothills similar to the upper portions of the Project site and the surrounding areas. Populations of this species are known from all directions of the Project site and would indicate that higher elevation foothills provide connectivity to a greater degree and are more readily available than lower elevation areas such as occurs on most of the Project development area (CCH 2016; Jepson Herbarium 2015; CCH 2016; Lady Bird Johnson Wildflower Center 2017).

The results of the analysis indicate no particular identifiable bottle neck through the Project area for species occurring on the site and within adjacent foothills of the Antelope Valley. For species that are restricted to grasslands and do not utilize scrub habitat, loss of grasslands on the site would result in loss of habitat but would not result in a break in an otherwise contiguous band of grasslands with large populations of these species occurring on either side. For species with more flexible habitat requirements allowing both grasslands and scrub, or species restricted to scrub, would not become disconnected from scrub/grassland habitats on either sides of the Antelope Valley due to the post-project persistence of scattered areas of contiguous habitat across the Western Antelope Valley floor and continuing further to the east. This conclusion can be applied to all ground dwelling mobility guilds and with aerial mobility guilds to an even greater extent due to greater ability to traverse areas of otherwise unsuitable habitat. Little is known about the pollinators of the specific rare plant impacts by the project other than round leaved filaree which is known to be self-pollinating. However, pollinators of both common and rare plants of the region are expected to fit into one or more of the five mobility guilds and all have been shown to have linkages which would persist after Project buildout and would not result in negative effects on regional populations.

#### Long-Term Sustainability of Regional Linkage

As previously described, the Tehachapi Mountains provide a regional landscape linkage between the Sierra Nevada, the Coast Ranges, and the San Gabriel Mountains to the south. Although I-5 and the California Aqueduct substantially reduce the permeability of the linkage for many wildlife species, it remains functional for many species to some degree. This is largely due to the limited amount and sparse nature of development in the vicinity of the remaining wildlife crossings and elsewhere in the Tehachapi Mountains. Keeping the Tehachapi linkage functional is important for the long-term viability of many species and for the overall health of the plant and wildlife communities in the region.

It is widely recognized that Tejon Ranch, the largest single-owner landholding west of central Texas, constitutes an unmatched conservation acquisition opportunity that can greatly benefit wildlife in Southern California. Private holdings in an area the size of the Tehachapi Mountains typically would include many landowners; however, in the case of the Tehachapis, the breadth of the mountain range is owned by a single private entity, the TRC.

Two regional conservation plans will assist in sustaining the functionality of the regional landscape linkage for future wildlife populations. These plans offer elements for long-term sustainability and management of a Tehachapi Mountains landscape linkage: the Tejon Ranch Conservation and Land Use Agreement (TRCRWA) and the Tehachapi Upland Multiple Species Habitat Conservation Plan (TU MSHCP).

Under the TRCRWA, the Tejon Ranch Conservancy will adopt, update, monitor and enforce implementation of the Ranch-Wide Management Plan (RWMP) on dedicated conservation areas and option areas subject to conservation, preservation, mitigation, and enhancement measures, as required under applicable law or imposed by federal, State or local agencies as part of any permit or approval for the Ranch or projects within the Ranch. Maintenance of the open space or conserved lands will be the responsibility of the Conservancy, funded in large part by a fee based on a portion of the purchase price for each residential parcel on

Tejon Ranch. Since Centennial constitutes over 75 percent of the currently planned residential units on the Ranch, it will bear the substantial costs of funding the Conservancy and maintaining wildlife movement corridor areas through the Ranch. As mentioned previously in 5.7.2, no public agency is a party to the Ranchwide agreement, although the federal and State agencies responsible for administering biological protection laws and regulations confirmed that lands under the RWMP continue to be eligible mitigation lands.

In addition, the TU MSHCP ensures the persistence of covered species, including sustaining viable populations of those species, providing for (within property dispersal) and protecting current opportunities for wildlife movement beyond the Ranch by preserving existing landscape linkages. Lands to be conserved as part of the TU MSHCP are adjacent to other lands within Tejon Ranch ownership and are also slated to be protected as part of the TRCRWA. The sum of these interconnected open space commitments, development restrictions, and mitigation measures is a conservation commitment that is, by design, consistent with conservation biology principles calling for large, interconnected blocks of habitat that support the life history requirements of Covered Species and other resident wildlife. The TU MSHCP, if fully implemented, will sustain crucial landscape linkages across cismontane Southern California.

The TU MSHCP will be a major contributor to ensuring the viability of the Tehachapi Landscape linkage into the future. Through the various conditions and measures stipulated by the TU MSHCP for the various covered species, habitat for these and many additional species will be preserved and enhanced, which will promote healthy plant and wildlife communities throughout the region. Although the focus of the TU MSHCP is on the California condor and other species of the montane upland communities, many of the same species occur in the foothills and lowland areas as well, including the Centennial site. These species will benefit from the TU MSHCP in addition to the Centennial Mitigation Preserve program described in this document.

### ***Local Wildlife Movement***

Oso Canyon and its many tributaries west of the Aqueduct and the east-west-oriented drainages that are located east of the Aqueduct undoubtedly are used by some animals as local travel paths as they move across their home range areas on the Project site; however, the Aqueduct probably effectively serves to block east-west movement on the Project site for most ground-dwelling wildlife. As discussed above, limited opportunities for wildlife to cross the Aqueduct have been identified at four locations, but wildlife movement across that formidable barrier is probably a rare event.

Because of the presence of cover and canopy provided by trees and shrubs, and because of the availability of seasonal water, the drainage area immediately north of SR-138 and east of the Aqueduct on the Project site may serve as a valuable foraging resource area. Tracks of mountain lion, bobcat, black bear, and numerous small mammal species were observed along this drainage during the wetland delineation study conducted on the site (Impact Sciences 2002b). Most wildlife using this area likely access it for water and/or to forage by crossing SR-138 from the more vegetated upland areas to the south of SR-138. Because individuals of many of the larger wildlife species in the region tend not to cross large expanses with sparse shrub cover (typical of the majority of the Project site), the central and

eastern portions of the Project site are not likely to be used by them to disperse between and within the regional open space areas in the site vicinity. The Project site does provide unobstructed local movement opportunities for small animals and aerially dispersing plants and animals that reside in the area.

## Special Status Biological Resources

This section addresses special status biological resources that have been observed, reported, or that have the potential to occur on the Project site. These resources include plant and wildlife species that have been afforded special status and/or recognition by federal and State resource agencies (principally the USFWS and the CDFW) and by the California Native Plant Society (CNPS). The CNPS is a conservation organization commonly relied upon for plant distribution and occurrence information. In general, the principal reason an individual taxon (i.e., species, subspecies, or variety) is given such recognition is the documented or perceived decline of its population size, geographic range, and/or distribution. Decline has resulted, in most cases, from habitat loss.

Tables 5.7-6 and 5.7-8 provide a summary of each special status plant and wildlife species, respectively, known to occur in the Project region and shown on adjacent USGS 7.5-minute quadrangle maps. The Project region is chiefly considered to be the western Antelope Valley and associated watersheds west of 90<sup>th</sup> Street West. This includes the slopes of the surrounding ranges that face the Antelope Valley and represents the western edge of the desert biome of the Mojave Desert. The Project vicinity is considered to be the surrounding area within approximately a one-mile radius of the Project site. The Project is located on the USGS Lebec and La Liebre Ranch 7.5-minute quadrangle maps. Ten surrounding quadrangles are the Grapevine, Pastoria Creek, Winters Ridge, Liebre Twins, Frazier Mountain, Neenach School, Alamo Mountain, Black Mountain, Liebre Mountain, and Burnt Peak 7.5-minute quadrangles. Table 5.7-5, Special Status Plant Species, and Table 5.7-8, Special Status Wildlife Species, also include information on the likelihood for each species to occur on the Project site along with definitions for the various status designations. In addition, special status biological resources include vegetation types and habitats that are either unique, of relatively limited distribution in the region, or of particularly high wildlife value. These resources have been defined by federal, State, and local government conservation programs. Sources used to determine the special status of biological resources are as follows:

**Plants.** Locational Inventory of Rare and Endangered Vascular Plants of California (CNPS 2015); the CDFW's California Natural Diversity Database (CNDDDB) (CDFW 2015a); various Federal Register notices from the USFWS regarding listing status of plant species; and the CDFW's *Special Vascular Plants, Bryophytes, and Lichens List* (CDFW 2016b).

**Wildlife.** The CDFW's California Wildlife Habitat Relationships Database System (CDFW BDB 2014); the CNDDDB; various USFWS Federal Register notices regarding listing status of wildlife species; and the CDFW's Special Animals List (CDFW 2017b).

**Vegetation Types.** The CDFW's List of Natural Communities (CDFG 2010); the CNDDDB; and the County of Los Angeles Oak Tree Ordinance (County of Los Angeles 1988).

## Definitions

A federally Endangered species is one facing extinction throughout all, or a significant portion of, its geographic range. A federally Threatened species is one likely to become Endangered in the foreseeable future throughout all or a significant portion of its range. The presence of any federally Threatened or Endangered species in a study area generally imposes severe constraints on development, particularly if development would result in “take” of the species or its habitat. The term “take” means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct. Harm, in this sense, can include any disturbance to habitats used by the species during any portion of its life history.

Proposed species or Candidate species are those officially proposed by the USFWS for addition to the federal Threatened and Endangered species list. Because proposed species may soon be listed as Threatened or Endangered, these species could become listed prior to or during implementation of a proposed project. The presence of a Proposed or Candidate species in a project impact area may impose constraints on development if they are listed prior to issuance of project permits, particularly if a project would result in “take” of the species or its habitat.

The State of California considers an Endangered species to be one whose prospects of survival and reproduction are in immediate jeopardy; a Threatened species as one present in such small numbers throughout its range that it is likely to become an Endangered species in the near future in the absence of special protection or management; and a Rare species as one present in such small numbers throughout its range that it may become Endangered if its present environment worsens. “Rare species” only applies only to California native plants. State-listed Threatened and Endangered species are protected against take unless an Incidental Take Permit is obtained from the resource agencies. The presence of any State-listed Threatened or Endangered species in a project impact area generally imposes severe constraints on development, particularly if a project would result in “take” of the species or its habitat.

California Species of Special Concern is an informal designation used by the CDFW for some declining wildlife species that are not State Candidates for listing. This designation does not provide legal protection, but signifies that these species are recognized as special status by the CDFW. In recent years, the CDFW has downlisted several species from Species of Special Concern to the Watch List.

Species that are California Fully Protected and Protected include those protected by special legislation for various reasons, such as the mountain lion and white-tailed kite. Fully Protected species may not be taken or possessed at any time. California Protected species include those species that may not be taken or possessed at any time except under special permit from the CDFW issued pursuant to the *California Code of Regulations* (Title 14, Sections 650 and 670.7) or Section 2081 of the *California Fish and Game Code*.

Species of Local Concern are those that have no official status with the resource agencies, but are being watched because there is either a unique population in the region or the species is declining in the region.

Special Animal is a general term that refers to species that the CNDDDB is interested in tracking, regardless of legal or protective status. This term includes species designated as any of the above terms, but also includes species that may be considered biologically rare; are restricted in distribution; are declining throughout their range; have a critical, vulnerable stage in their life cycle that warrants monitoring; are on the periphery of their range and are threatened with extirpation in California; are associated with special status habitats; or are considered by other State or federal agencies or private organizations to be sensitive or declining.

The California Rare Plant Rank (CRPR), formerly known as CNPS List, is a ranking system by the Rare Plant Status Review group (which consists of over 300 botanical experts from the government, academia, non-governmental organizations, and the private sector) and is managed by the CNPS and the CDFW (CNPS 2015). A CRPR summarizes information on the distribution, rarity, and endangerment of California's vascular plants. Plants with a CRPR of 1A are presumed extinct because they have not been seen in the wild for many years. Plants with a CRPR of 1B are Rare, Threatened, or Endangered throughout their range. Plants with a CRPR of 2A are presumed extirpated from California, but are more common elsewhere. Plants with a CRPR of 2B are considered Rare, Threatened, or Endangered in California, but are more common elsewhere. Plants with a CRPR of 3 require more information before they can be assigned to another rank or rejected; this is a "review" list. Plants with a CRPR of 4 are of limited distribution or are infrequent throughout a broader area in California; this is a "watch" list. The Threat Rank is an extension that is added to the CRPR to designate the plant's endangerment level. An extension of .1 is assigned to plants that are considered to be "seriously threatened" in California (i.e., over 80 percent of the occurrences are threatened or have a high degree and immediacy of threat). Extension .2 indicates the plant is "fairly threatened" in California (i.e., between 20 and 80 percent of the occurrences are threatened or have a moderate degree and immediacy of threat). Extension .3 is assigned to plants that are considered "not very threatened" in California (i.e., less than 20 percent of occurrences are threatened or have a low degree and immediacy of threat or no current threats are known). The absence of a threat code extension indicates that this information is lacking for the plant(s) in question.

### ***Special Status Vegetation Types***

In addition to providing an inventory of special status plant and wildlife species, the CNDDDB also provides an inventory of vegetation types that are considered special status by State and federal resource agencies, academic institutions, and various conservation groups (such as the CNPS). In addition, the County of Los Angeles Oak Tree Ordinance protects all oak trees in Los Angeles County that are 8 inches or more in diameter measured at 4.5 feet above natural grade. At the community level, oak woodlands are protected via Section 21083.4 of the *California Public Resources Code* (PRC), which was enacted by Senate Bill (SB) 1334 in 2004. Finally, all wetland and riparian vegetation types are also considered special status by (1) the CDFW in its capacity as a natural resource trustee for purposes of CEQA review and (2) the federal CWA, Section 404, which protects "waters of the U.S.," including those jurisdictional wetlands that are defined by the presence of hydrophytic vegetation, hydric soils, and wetland hydrology. The CDFW considers the vegetation types listed below as being a high priority for preservation.

Special status vegetation types existing on the Project site and on a portion of the off-site impact areas (see Table 5.7-3, Vegetation Type Acreages) include the following: Wright's buckwheat scrub (12.2 acres); mixed oak woodland (1,370.8 acres); alluvial scrub (5.6 acres); cottonwood woodland (0.1 acre); riparian herb (53.3 acres); rush riparian grassland (48.9 acres); southern arroyo willow riparian (8.6 acres); southern cottonwood willow woodland (4.0 acres); southern willow scrub (13.1 acres); unvegetated wash (25.7 acres); valley oak riparian woodland (12.1 acres); willow riparian forest (15.1 acres); willow riparian woodland (8.3 acres); alkali meadow (3.7 acres); Baltic rush (21.5 acres); coastal and valley freshwater marsh (2.5 acres); seeps and ephemeral ponds (8.0 acres); and native perennial grasslands and wildflower fields that are coincident and mixed with annual grasslands and other vegetation types (see Table 5.7-3 for individual acreages). Undifferentiated grasslands and wildflower fields cover 9,324.3 acres on the site and in mapped off-site areas, a portion of which includes the native perennial grassland and wildflower field special status vegetation type. Additionally, some of these special status vegetation types occur in mixed communities on site, as noted in the "Mixed Chaparral or Scrub and Grassland Vegetation Types" portion of Table 5.7-3. Special status vegetation types on the Project site are illustrated in Exhibit 5.7-1, Grouped Vegetation Types, and in greater detail in Exhibit 5.7-17, Detailed Vegetation Map.

### ***Special Status Plants***

Many special status plant species are known to occur in the Project region. The 12 quadrangles listed earlier were used to compile a list of potential special interest species that might occur on the Project site from the database of the CNDDDB and the CNPS Inventory of Rare and Endangered Plants. These plants and their potential to occur on the Project site are listed in Table 5.7-5. Exhibit 5.7-7a, Special Status Plant Species Observations, depicts the locations of the eight special status plant species that were identified on the site. Descriptions of all species follow the table.

Several additional special status plant species were considered, but were excluded from further review (and therefore not listed in Table 5.7-5) due to their lack of any potential to occur in the Project region (defined as the western Antelope Valley and associated watersheds). These include the California jewel-flower (*Caulanthus californicus*; State- and federally listed Endangered, CRPR List 1B.1), striped adobe-lily (*Fritillaria striata*, State-listed Threatened, CRPR List 1B.1), San Joaquin woollythreads (*Monolopia congdonii*; federally listed Endangered, CRPR 1B.2), and San Joaquin adobe sunburst (*Pseudobahia peirsonii*; State-listed Endangered, federally listed Threatened, CRPR List 1B.1). Two species—New York Mountains cryptantha (*Cryptantha tumulosa*) and San Gabriel ragwort (*Senecio astephanus*)—were identified during the CNPS Inventory search as being within the 12 quadrangle vicinity of the Project. However, no further documentation was found (such as CNDDDB, herbarium collections, or any other reporting databases) to support these species as being in the vicinity. Furthermore these locations would be significantly disjunct from the otherwise known distribution of these species. Therefore, these two species were excluded from further review.

**TABLE 5.7-5  
SPECIAL STATUS PLANT SPECIES**

Species	Status			Preferred Habitat and Site Suitability/Potential to Occur	Observations*
	USFWS	CDFW	CRPR		
<i>Acanthoscyphus</i> [ <i>Oxytheca</i> ] <i>parishii</i> var. <i>parishii</i> Parish's oxytheca	-	-	4.2	Dry, granitic sites in yellow pine forests and chaparral. Some potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Androsace elongata</i> ssp. <i>acuta</i> California androsace	-	-	4.2	Dry, grassy places in coastal sage scrub, chaparral, and oak woodlands. In 2008, 5 total occurrences (381 plants) were identified on the site. In 2015, 320 total occurrences (over 29,000 estimated plants) were identified on the site. Most were located on ridgetops and north-facing slopes.	Observed
<i>Astragalus hornii</i> var. <i>hornii</i> Horn's milk-vetch	-	-	1B.1	Salty flats/lake shores and alkali sink habitats. Some marginally suitable habitat exists on the site. Low potential to occur.	Not Observed
<i>Atriplex coronata</i> var. <i>coronata</i> crownscale	-	-	4.2	Alkaline, often clay soils in chenopod scrub, grassland, and around vernal pools. In 2015, 8 occurrences with over 16,000 estimated plants were identified on the site.	Observed
<i>Boechera lincolnensis</i> [ <i>Arabis pulchra</i> var. <i>munciensis</i> ] Lincoln rockcress	-	-	2B.3	Carbonate soils, in chenopod scrub and Mojavean desert scrub. Project is not in the range of this species. Not expected to occur.	Not Observed
<i>California</i> [ <i>Erodium</i> ] <i>macrophyllum</i> round-leaved filaree	-	-	1B.2	Open sites in grasslands and scrub, especially with friable clay loam soils. In 2004, 39 occurrences were identified on the site. Most were located along the low hills and slopes south of SR-138, typically associated with limestone-derived friable clay loam soils. Some large occurrences covered several acres and supported several thousand plants. In 2008, several occurrences, each with several thousand plants, were observed on the site. In 2015, 117 occurrences, totaling nearly	Observed

SPECIAL STATUS PLANT SPECIES**

Species	Status			Preferred Habitat and Site Suitability/Potential to Occur	Observations*
	USFWS	CDFW	CRPR		
				25,000 plants, were observed at the site.	
<i>Calochortus clavatus</i> var. <i>gracilis</i> slender mariposa lily	-	-	1B.2	Chaparral and coastal scrub in shaded foothill canyons, and on grassy slopes. Suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Calochortus fimbriatus</i> [ <i>Calochortus weedii</i> var. <i>vestus</i> ] late-flowered mariposa lily	-	-	1B.2	Dry slopes in chaparral and woodlands. Some potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Calochortus palmeri</i> var. <i>palmeri</i> Palmer's mariposa lily	-	-	1B.2	Meadows and vernal moist sites in yellow-pine forests and chaparral. Potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Calystegia peirsonii</i> Peirson's morning-glory	-	-	4.2	Dry slopes in chaparral, scrub, woodlands, forests, and grasslands. Potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Castilleja gleasoni</i> Mt Gleason paintbrush	-	-	1B.2	Cliffs, rocky slopes in open yellow-pine forest, chaparral, and pinyon and juniper woodland. Potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Caulanthus lemmonii</i> Lemmon's jewel flower	-	-	1B.2	Dry slopes in grasslands, chaparral, and woodlands. Potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Chorizanthe spinosa</i> Mojave spineflower	-	-	4.2	Dry sandy and gravelly places in desert scrub. In 2004, 19 densely populated occurrences were identified in grasslands along the alluvial slopes near the central/southern edge of the Project site, south of SR-138. In 2006, approximately 47,575 individuals were observed on the site. In 2008, approximately 6,000 individuals were observed on the site. In 2015, approximately 10,000	Observed

				individuals were estimated on the site.	
<i>Clinopodium mimuloides</i> monkey flower savory	-	-	4.2	Moist places, streambanks, in chaparral and woodland. Some marginally suitable habitat on site. Potential to occur.	Not Observed
<i>Delphinium inopinum</i> unexpected larkspur	-	-	4.3	Rocky upper montane coniferous forest. No suitable habitat exists on the site. Not expected to occur.	Not Observed
<i>Delphinium parryi</i> ssp. <i>purpureum</i> Mt Pinos larkspur	-	-	4.3	Chaparral, Mojavean desert scrub, pinyon-juniper woodland. Suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Delphinium umbraculorum</i> umbrella larkspur	-	-	1B.3	Chaparral and cismontane woodland. Suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Eriogonum callistum</i> Tehachapi buckwheat	-	-	1B.1	Openings in chaparral on rocky, limestone substrates. Suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Eriogonum kennedyi</i> var. <i>austromontanum</i> southern mountain buckwheat	FT	-	1B.2	Dry, stony slopes in yellow pine forests. No suitable habitat exists on the site. Not expected to occur.	Not Observed
<i>Eriophyllum lanatum</i> var. <i>hallii</i> Fort Tejon woolly sunflower	-	-	1B.1	Dry sites with metamorphic soils, especially north-facing slopes near oak woodlands. Some potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Eschscholzia lemmonii</i> ssp. <i>kernensis</i> Tejon poppy	-	-	1B.1	Open grasslands with heavy clay soils. Some marginally suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Frasera</i> [ <i>Swertia</i> ] <i>neglecta</i> pine green-gentian	-	-	4.3	Dry slopes in montane coniferous forests and pinyon/juniper woodlands. Some potentially suitable habitat exists on the site. Potential to occur.	Not Observed

**TABLE 5.7-5

	USFWS	CDFW	CRPR		
<i>Githopsis tenella</i> delicate bluecup	-	-	1B.3	Moist places in oak woodlands. Some potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Hulsea vestita</i> ssp. <i>gabrielensis</i> San Gabriel Mountains sunflower	-	-	4.3	Montane coniferous forests. No suitable habitat exists on the site. Not expected to occur.	Not Observed
<i>Leptosiphon</i> [ <i>Linanthus</i> ] <i>serrulatus</i> Madera leptosiphon	-	-	1B.2	Open areas in woodlands and chaparral. Suitable habitat exists on the site, but species has not been observed in Project region (or even more than 60 miles to the north) since the 1930s. Low potential to occur.	Not Observed
<i>Lilium humboldtii</i> ssp. <i>ocellatum</i> ocellate Humboldt lily	-	-	4.2	Gravelly soils of gullies and canyons in chaparral and oak woodlands. Suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Microseris sylvatica</i> sylvan scorzonella	-	-	4.2	Grasslands and open woodlands, especially upper ridges and ephemeral drainages. In 2004, numerous (500+) occurrences were identified on the Project site. In 2008 and 2015, this species was found to be common on ridgetops and dirt roads, with a total population estimate likely exceeding 100,000 on the site.	Observed
<i>Mimulus pictus</i> calico monkeyflower	-	-	1B.2	Around granite outcrops in bare, sunny, shrubby areas. Some marginally suitable habitat exists on the site. Low potential to occur.	Not Observed
<i>Monardella linoides</i> ssp. <i>oblonga</i> flax-like monardella	-	-	1B.3	Desert scrub, pinyon-juniper woodlands, open conifer forests, and subalpine areas. Some marginally suitable habitat exists on the site. Low potential to occur.	Not Observed

**TABLE 5.7-5  
SPECIAL STATUS PLANT SPECIES**

	USFWS	CDFW	CRPR		
<i>Navarretia fossalis</i> spreading navarretia	FT	-	1B.1	Vernal pools, alkali grasslands, alkali playas, and alkali sinks. Some potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Navarretia peninsularis</i> Baja navarretia	-	-	1B.2	Wet areas in open forests and openings in chaparral. Some potentially suitable habitat exists on the site. Potential to occur.	Not Observed
<i>Navarretia setiloba</i> Piute Mountains navarretia	-	-	1B.1	Depressions in clay or gravelly loam in woodlands and grasslands. In 2004, 3 occurrences were identified with approximately 20,100 total plants. Occurrences were all located in the hills (associated with clay soils) in the far western region and found in areas that had been recently disturbed by feral pigs.	Observed
<i>Nemacladus secundiflorus</i> var. <i>robbinsii</i> Robbins' nemacladus	-	-	1B.2	Dry, gravelly slopes in openings of chaparral and grassland. Suitable habitat exists on site. Potential to occur.	Not Observed
<i>Opuntia basilaris</i> var. <i>treleasei</i> Bakersfield cactus	FE	SE	1B.1	Alluvial benches and fans in arid plains. No suitable habitat is present on the site. Not expected to occur.	Not Observed
<i>Perideridia pringlei</i> adobe yampah	-	-	4.3	Grassy slopes, serpentine outcrops, and openings in oak woodlands. In 2004, 1 occurrence with 16 plants was identified on an open, north-facing slope in the western portion of the Project site, associated with sandy to gravelly loam soils. In 2006, 3 occurrences were identified, including approximately 15 individuals. In 2008, approximately 108 individuals were observed on the site. In 2015, nearly 100 occurrences were recorded on site, with an estimate of over 3,000 total plants.	Observed

### Parish's Oxytheca

Parish's oxytheca (*Acanthoscyphus* [*Oxytheca*] *parishii* var. *parishii*) is a CRPR 4.2 species. This annual herb occurs on dry granitic slopes and flats, mostly in yellow pine forest habitat, between approximately 4,000 and 8,300 feet above mean sea level (msl); it typically blooms between June and September (Munz 1974). It is also found in chaparral and sandy or gravelly lower montane coniferous forest, and is known from Los Angeles, San Bernardino, and Ventura Counties (CNPS 2015). In the Project vicinity, it occurs about 15 miles southwest of the site, near the Little Mutau Trail, just west of the McDonald Cabin in Ventura County (CCH 2016). Although potentially suitable habitat for this species exists on the site, Parish's oxytheca was not observed during focused surveys.

### California Androsace

California androsace (*Androsace elongata* spp. *acuta*) has a CRPR of 4.2. It typically blooms between March and June (CNPS 2015). This annual herb occurs in dry grassy places between sea level and approximately 4,000 feet above msl in coastal sage scrub, chaparral, and oak woodland habitats (Munz 1974). This species occurs in Alameda, Contra Costa, Colusa, Fresno, Glenn, Kern, Los Angeles, Merced, Riverside, San Bernardino, San Benito, Santa Clara, San Diego, Siskiyou, San Joaquin, San Luis Obispo, San Mateo, Stanislaus, and Tehama Counties, as well as in Oregon and Baja California, Mexico (CNPS 2015). In 2008, although 15 occurrences were found in the region, only 5 occurrences with 381 total plants were found in the survey area. All other occurrences were found in proposed mitigation areas to the southeast and northwest of the site. All occurrences of this species on the site were highly localized and directly associated with hot, exposed, mostly south-facing slopes (NRC 2008a). In 2015, California androsace was found scattered throughout the site on hilltops and on upper north-facing slopes, with the highest abundances on the lower hills in the northeastern section of the Project site. Over 29,000 individuals in 320 locations were estimated during field surveys; however, due to poor general detectability of this small plant, surveys likely underestimated both the extent and population numbers in the survey area.

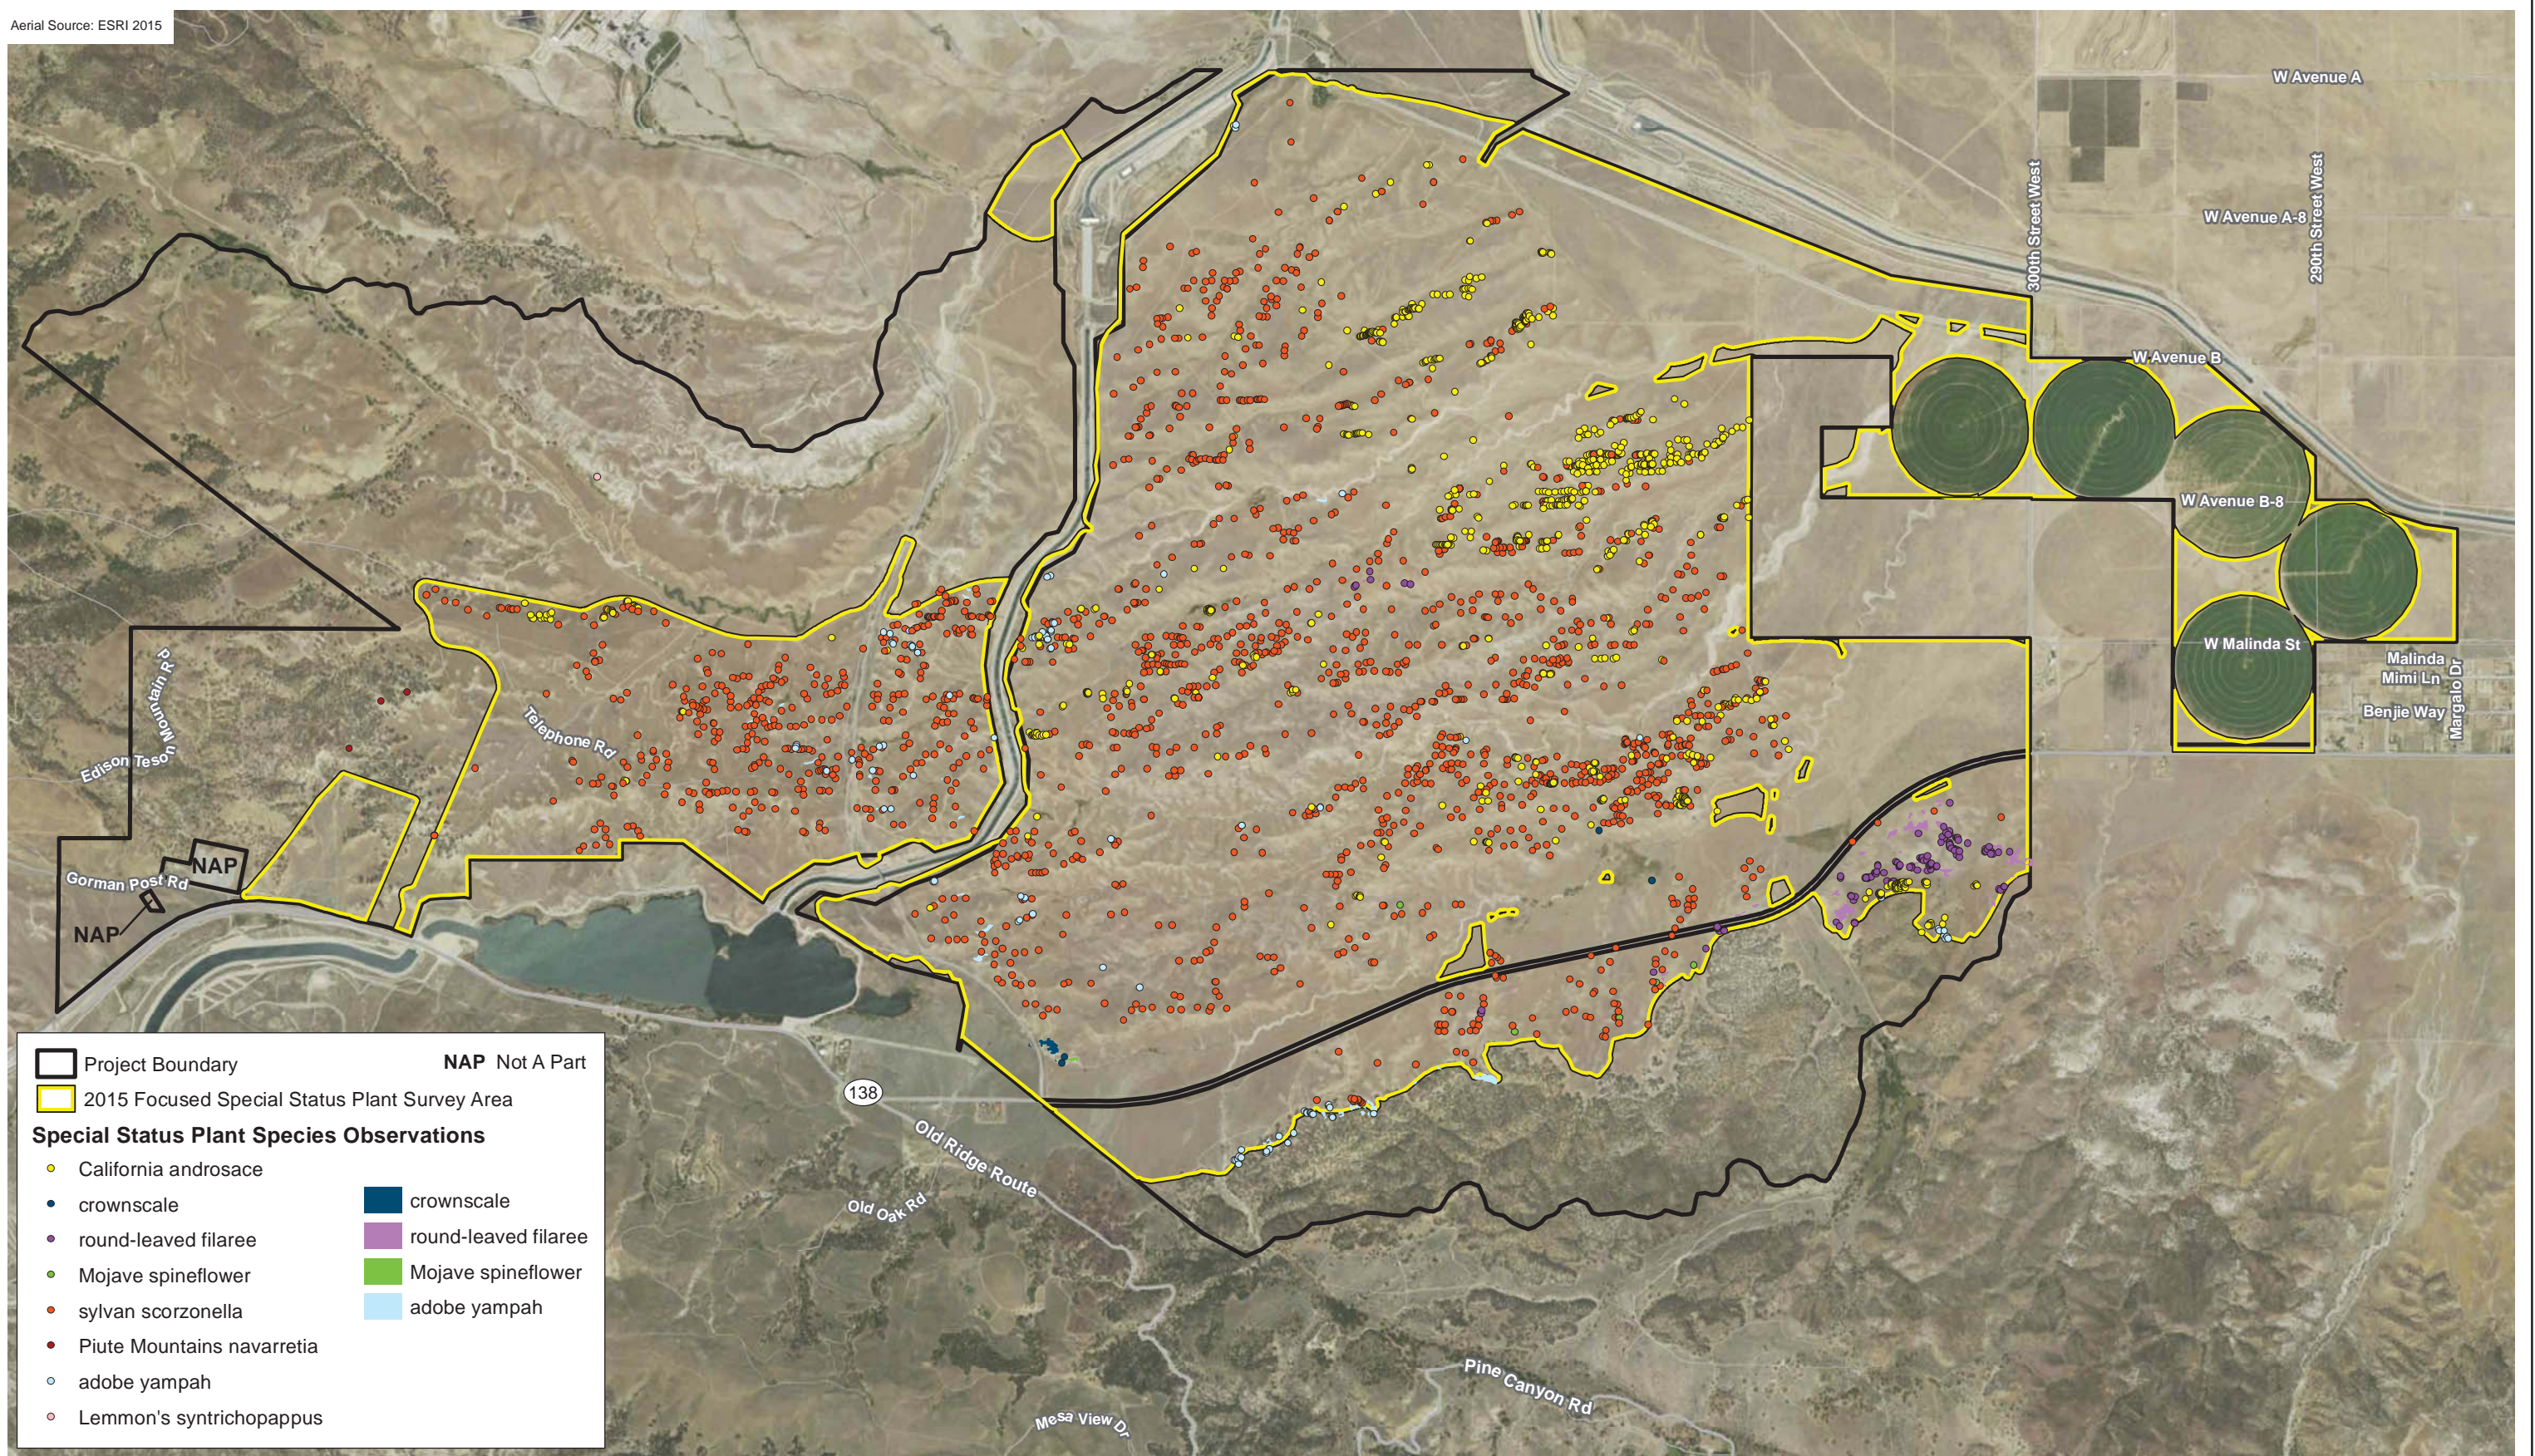

### Horn's Milk-Vetch

Horn's milk-vetch (*Astragalus hornii* var. *hornii*) is a CRPR List 1B.1 species. It typically blooms between May and October (CNPS 2015). This annual herb prefers salty flats and lake shores (Jepson Herbarium 2015); it occurs in alkali sink habitats at elevations of about 2,500 to 3,700 feet above msl in the western Mojave Desert, at lower elevations in the San Joaquin Valley, and formerly in the San Bernardino Valley (Munz 1974). This species occurs in Inyo, Kern, San Bernardino, and Tulare Counties (CNPS 2015). In the Project vicinity, according to a historical record from 1863, it occurred about ten miles northwest of the Project site, near Fort Tejon (CDFW 2015a). Although some suitable habitat for this species exists on the site, Horn's milk-vetch was not observed during focused surveys.

### Crownscale

Crownscale (*Atriplex coronata* var. *coronata*) has a CRPR of 4.2. It typically blooms between March and October. This annual herb is generally found in alkaline, often clay, soil in chenopod scrub, grasslands, and around vernal pools usually between sea level and approximately 2,000 feet above msl (CNPS 2015). Historically it has been known only from

### Special Status Plant Species Observations

Centennial Project

the Sacramento Valley, San Joaquin Valley, and the Inner South Coast Ranges (Jepson Herbarium 2015). The closest known location outside the Project boundary is approximately 30 miles to the north, near the town of Arvin (CCH 2016). On the Project site, 2015 surveys identified 8 populations with more than 16,000 estimated total plants within the same drainage feature. The largest populations were found on alkali scalds and dry pools near the intersection of SR-138 and National Cement Plant Road. Populations on the Project site are not entirely consistent with published descriptions of the species, with most individuals expressing spherical, densely tubercled fruit bracts, along with flattened compressed fruit bracts. This results in a mixed key characteristic between the more common crownscale, and the federally listed Endangered San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*), which is known only from a limited distribution in Riverside County over 100 miles to the southeast. Based on expert opinion and its closer proximity to known distribution of the more common crownscale, it was decided that individuals on the Project site be considered as an unusual form of the more common crownscale (Sanders 2015).

### Lincoln Rockcress

Lincoln rockcress (*Boechea lincolnensis* [*Arabis pulchra* var. *munciensis*]) is a CRPR 2B.3 species. It typically blooms between March and May (CNPS 2015). This perennial herb is generally found on rocky slopes and gravelly soil in sagebrush and shrublands at elevations of about 4,590 to 6,560 feet above msl (Jepson Herbarium 2015). It occurs in the White and Inyo Mountains, the mountains of the Mojave Desert, and into Nevada and Utah (Jepson Herbarium 2015). There is one CNDDDB record of this species approximately nine miles east of the Project at Ripley Desert Woodland State Park (CDFW 2015a). However, this occurrence is based solely on a March 2005 CalPhotos picture of Lincoln rockcress which was originally misidentified as *Boechea lincolnensis*. The Project site is outside the known range of this species and it is therefore is unlikely to occur on the site.

### Slender Mariposa Lily

Slender mariposa lily (*Calochortus clavatus* var. *gracilis*) is a CRPR 1B.2 species. This bulbiferous herb typically blooms between March and June and usually occurs in chaparral and coastal scrub in shaded foothill canyons, but is also found on grassy slopes in other habitats (CNPS 2015; Jepson Herbarium 2015). This species occurs in Los Angeles and Ventura Counties (CNPS 2015). Slender mariposa lily is known to hybridize with club-haired mariposa lily (*Calochortus clavatus* ssp. *clavatus*), which is a more common subspecies. Slender mariposa lily occurs approximately 2.5 miles south of the Project site along Liebre Gulch road on the Angeles National Forest (CDFW 2015a). Although suitable habitat for this species exists on the site, slender mariposa lily was not observed during focused surveys. Rainfall patterns during the 2015 season resulted in diminutive plants and a very short blooming period for all mariposa lily species observed on site, and many individuals were only observed in vegetative or fruiting conditions. The majority of the observed plants were assumed to be butterfly mariposa lily (*Calochortus venustus*), but slender mariposa lily cannot be ruled out.

### Round-Leaved Filaree

Round-leaved filaree (*California [Erodium] macrophyllum*) has a CRPR of 1B.2. It typically blooms between March and May (Munz 1974). This low-growing forb is found in open sites in grassland and shrubland at elevations between sea level and approximately 3,940 feet above msl. It occurs throughout California to northern Mexico (Jepson Herbarium 2015). The 2004 special status plant survey report indicated that 46 occurrences were observed, but only 39 of these occurrences are located on the Project site (each ranging in size from 20 individuals to several thousand plants); the other occurrences are located in proposed open space just north of the Project site. All 2004 occurrences of this species on the site were directly associated with friable clay loam soils, as evidenced by the presence of limestone fragments in the soils and, in some cases, nearby limestone outcrops (Vollmar 2004). In 2008, several occurrences, each with several thousand plants, were observed on the site (NRC 2008a). In 2015, 117 occurrences were identified, with an estimated total population of about 25,000 plants. Populations were strongly associated with distinctive areas of friable clay loam soils, which also supported associated patches of common monolopia (*Monolopia lanceolata*) and Great Valley phacelia (*Phacelia ciliata*). Identified populations largely overlap those found in previous surveys, so the higher number of occurrences is likely due to mapping these occurrences at a finer scale. Germination rates of this species appeared to be high in 2015, which resulted in large population numbers; however, spring rainfall patterns caused a high percentage of individuals to die before producing viable fruit, which could affect population numbers in subsequent seasons.

### Late-Flowered Mariposa Lily

Late-flowered mariposa lily (*Calochortus fimbriatus [Calochortus weedii var. vestus]*) is a CRPR 1B.2 species. It typically blooms between July and August (Munz 1974). This bulbiferous perennial herb occurs on dry slopes in chaparral at elevations between sea level and approximately 2,500 feet above msl (Munz 1974). It is found in dry, open coastal woodlands and chaparral (Jepson Herbarium 2015). This species occurs in Kern, Los Angeles, Monterey, Santa Barbara, San Luis Obispo, and Ventura Counties (CNPS 2015). It has been reported approximately ten miles from the Project site (CNPS 2015). However, no further documentation was found (such as CNDDB, herbarium collections, or any other reporting databases) to support these species as being in the vicinity. Although potentially suitable habitat exists on the site, the Project site is likely out of range for the species. Late-flowered mariposa lily was not observed during focused surveys.

### Palmer's Mariposa Lily

Palmer's mariposa lily (*Calochortus palmeri var. palmeri*) is a CRPR 1B.2 species. It typically blooms between May and July (Munz 1974). This bulbiferous perennial herb occurs in meadows and other vernal moist places at elevations between approximately 3,500 and 6,500 feet above msl in the San Bernardino and Tehachapi Mountains (Munz 1974). It is associated with yellow-pine forests and chaparral (Jepson Herbarium 2015). This species occurs in Kern, Los Angeles, Riverside, Santa Barbara, San Bernardino, San Luis Obispo, and Ventura Counties (CNPS 2015). A population of approximately 2,000 plants has been reported less than one mile north of the Project site, east of the National Cement Plant, along

the margins of a wet meadow (CDFW 2015a). Although potentially suitable habitat for this species exists on the site, Palmer's mariposa lily was not observed during focused surveys.

#### Peirson's Morning-Glory

Peirson's morning-glory (*Calystegia peirsonii*) is a CRPR 4.2 species. This perennial herb occurs on dry slopes between approximately 3,000 and 4,500 feet above msl and typically blooms between May and June (Munz 1974). It is found in chaparral, scrub, woodland, forest, and native grassland habitats, and is known from Los Angeles County (CNPS 2015). In the Liebre Mountain region, this species is considered widespread and locally common in grassland and open situations in scrub and woodland (Boyd 1999). In the Project vicinity, it occurs more than ten miles southeast of the Project site on the Fish Canyon Truck Trail at Castaic Creek (CDFW 2015a) and also about eight miles southeast of the site, near the confluence of Pine Canyon and Bear Canyon (CCH 2016). Historical records exist from 1896 and 1935 from the vicinity of Neenach, which is less than three miles east of the Project site (CCH 2016). Although potentially suitable habitat for this species exists on the site, Peirson's morning-glory was not observed during focused surveys.

#### Mt. Gleason Paintbrush

Mt. Gleason paintbrush (*Castilleja gleasoni*) is a CPRP 1B.2 species. It typically blooms between May and September (CNPS 2015). This perennial herb occurs on cliffs and rocky slopes in open yellow pine forest, chaparral, and pinyon and juniper woodland between approximately 3,600 and 7,200 feet above msl (Jepson Herbarium 2015; CNPS 2015). This species is known only from Los Angeles County (CNPS 2015). In the Project vicinity, it occurs on the western end of Liebre Mountain, less than three miles south of the Project site (CDFW 2015a). Although suitable habitat for this species occurs on the site, the Project site is slightly under the elevation range of the species, and Mt. Gleason paintbrush was not observed during focused surveys.

#### Lemmon's Jewel Flower

Lemmon's jewel flower (*Caulanthus lemmonii*) is a CRPR 1B.2 species. It typically blooms between March and May (CNPS 2015). This annual herb occurs on dry slopes between sea level and about 5,000 feet above msl in valley grassland, chaparral, and foothill woodland habitats (Munz 1974). In Southern California, this species occurs in Kern, Santa Barbara, San Luis Obispo, and Ventura Counties (CNPS 2015). It occurs approximately 19 miles northwest of the Project site, in the vicinity of Wheeler Ridge (CDFW 2015a). Although potentially suitable habitat for this species exists on the site, Lemmon's jewel flower was not observed during focused surveys. A closely related species, Coulter's jewel flower (*Caulanthus coulteri*) was found to be common in the mixed chaparral community on the western end of the Project site. Some individuals in these populations were found to have spreading to erect fruits, which is a key characteristic of Lemmon's jewel flower, but were otherwise consistent with Coulter's jewel flower. It is possible there has been some hybridization between these and Lemmon's jewel flower, or alternatively this is simply an uncommon, undescribed characteristic of Coulter's jewel flower.

### Mojave Spineflower

Mojave spineflower (*Chorizanthe spinosa*) has a CRPR of 4.2. It typically blooms between March and July (CNPS 2015). This annual forb is found in desert scrub between sea level and 4,270 feet above msl (Jepson Herbarium 2015). It is prostrate and loosely branched and prefers dry sandy and gravelly places (Munz 1974). It occurs in Kern, Los Angeles, and San Bernardino Counties (CNPS 2015). Prior to focused surveys for the Project, this species was not known to occur in the vicinity of the Project site (Munz 1974). The closest reported occurrence outside the site is in the Antelope Valley along SR-138 at the intersection of 140<sup>th</sup> Street West (CCH 2016). In 2004, 19 densely populated occurrences were observed (Vollmar 2004). In 2006, approximately 47,575 individuals were observed on the site (NRC 2006b). In 2008, approximately 6,000 individuals were observed on the site (NRC 2008a). In 2015, approximately 10,000 individuals were observed on the site.

### Monkey Flower Savory

Monkey flower savory (*Clinopodium mimuloides*) is a CRPR 4.2 species. It typically blooms between June and October. This perennial herb occurs at elevations between approximately 1,000 and 5,900 feet above msl, and prefers moist sites and streambanks in chaparral and coastal coniferous forests (CNPS 2015). This species occurs in Los Angeles, Monterey, Santa Barbara, San Luis Obispo, and Ventura Counties. The closest known occurrence of this species is approximately nine miles south of the Project in Middle Fish Canyon (CCH 2016). Although marginally suitable habitat exists on the site, monkey flower savory was not observed during focused surveys.

### Unexpected Larkspur

Unexpected larkspur (*Delphinium inopinum*) is a CRPR 4.3 species. It typically blooms between May and July. This perennial herb occurs at elevations between approximately 6,200 and 9,200 feet above msl, and prefers rocky sites in upper montane coniferous forests. This species occurs in Fresno, Inyo, Kern, Tulare, and Ventura Counties (CNPS 2015). The closest recorded occurrence of this species is from an undated collection approximately 14 miles west of the Project, near Cuddy Valley (CCH 2016). The Project is well below the known elevation range of this species and there is no suitable habitat on the site. Unexpected larkspur was not observed during surveys, and is not expected to occur.

### Mt. Pinos Larkspur

Mt. Pinos larkspur (*Delphinium parryi* ssp. *purpureum*) is a CRPR 4.3 species. It typically blooms between May and June. This perennial herb occurs at elevations between approximately 3,300 and 8,500 feet above msl, and is generally found in chaparral, Mojavean desert scrub, and pinyon-juniper woodland. This species occurs in Kern, Santa Barbara, and Ventura Counties (CNPS 2015). The closest known record of this species is less than one mile south of the Project site along Pine Canyon Road (CCH 2016). Suitable habitat exists on the Project site; however no individuals of Mt. Pinos larkspur were identified during focused surveys.

### Umbrella Larkspur

Umbrella larkspur (*Delphinium umbraculorum*) is a CRPR 1B.3 species. It typically blooms between April and June. This perennial herb occurs at elevations between approximately 1,300 and 5,250 feet above msl, and typically grows in chaparral and cismontane woodland. This species occurs in Kern, Monterey, Santa Barbara, San Luis Obispo, and Ventura Counties (CNPS 2015). The closest recorded occurrence of this species is approximately six miles northeast of the Project near I-5 and Lebec Road in Rising Canyon (CDFW 2015a). Suitable habitat for this species exists on the Project site; however, no individuals of umbrella larkspur were identified during focused surveys.

### Tehachapi Buckwheat

Tehachapi buckwheat (*Eriogonum callistum*) is a CRPR 1B.1 species. It typically blooms between May and July. This perennial herb occurs at elevations between approximately 4,600 and 4,900 feet above msl; it prefers openings in chaparral on rocky, limestone substrates. This species has only recently been described, and is known from fewer than five occurrences in Kern County (CNPS 2015). The closest known occurrence of this species is approximately 1.5 miles northwest of the Project boundary (CDFW 2015a). Although suitable habitat for this species occurs on the site, Tehachapi buckwheat was not observed during focused surveys.

### Southern Mountain Buckwheat

Southern mountain buckwheat (*Eriogonum kennedyi* var. *austromontanum*) is a federally listed Threatened and a CRPR 1B.2 species. It typically blooms between June and September (CNPS 2015). This perennial herb occurs on dry, stony slopes at elevations between approximately 6,300 and 6,500 feet above msl, in yellow pine forest habitats (Munz 1974). This species occurs in San Bernardino and Ventura Counties (CNPS 2015). In the Project vicinity, this species has been collected several times in Lockwood Valley, more than ten miles west of the Project site (CCH 2016). Suitable elevation and habitat for this species does not exist on the site; southern mountain buckwheat was not observed during focused surveys.

### Fort Tejon Woolly Sunflower

Fort Tejon woolly sunflower (*Eriophyllum lanatum* var. *hallii*) is a CRPR 1B.1 species. It typically blooms between May and July (CNPS 2015). This herbaceous perennial grows in dry sites at elevations between approximately 3,940 and 4,600 feet above msl (Munz 1974; Jepson Herbarium 2015). It occurs in both Kern and Santa Barbara Counties, and the nearest occurrence is approximately three miles north of the Project site (CDFW 2015a). This species is associated with soils derived from metamorphic rock and is also known from 17 sites located a few miles north of the Project site; these sites were located mainly on steep, north-facing hillsides within or adjacent to dense or moderately open oak woodlands (BonTerra Psomas 2015b). Although potentially suitable habitat for this species exists on the site, Fort Tejon woolly sunflower was not observed during focused surveys.

### Tejon Poppy

Tejon poppy (*Eschscholzia lemmonii* ssp. *kernensis*) is a CRPR 1B.1 species. It typically blooms between March and May (CNPS 2015). This annual grows in open grasslands at elevations between approximately 650 and 3,280 feet above msl (Jepson Herbarium 2015). It only occurs in Kern County (CNPS 2015). This species is generally found on the northern side of the Tehachapi Mountains, and is associated with heavy clay soils (Vollmar Consulting 2004). It is reported from the canyon west of Fort Tejon State Historic Park; however, when this purported location was revisited, Tejon poppy was not found, and a similar species, the foothill poppy (*Eschscholzia caespitosa*), was found. It is possible that this foothill poppy was misidentified in this location as Tejon poppy (Vollmar Consulting 2004). Although potentially suitable habitat for this species exists on the site, Tejon poppy was not observed during focused surveys.

### Pine Green-Gentian

Pine green-gentian (*Frasera* [*Swertia*] *neglecta*) is a CRPR 4.3 species. This perennial herb occurs on dry slopes between approximately 4,500 and 8,000 feet above msl, largely in yellow pine forest habitat, and typically blooms between May and July (Munz 1974). It is found in dry, open woodlands (Jepson Herbarium 2015). More specifically, it prefers montane coniferous forest and pinyon/juniper woodland habitats, and is known from Kern, Los Angeles, Santa Barbara, San Bernardino, and Ventura Counties (CNPS 2015). In the Project vicinity, it is known from approximately six miles to the north along Blue Ridge (CCH 2016). It is also known from multiple collections southwest of the site in the Mount Pinos region of Ventura County, including about 14 miles away on Alamo Mountain, 16 miles away along Seymour Creek, and 18 miles away in Lockwood Valley (CCH 2016). Although potentially suitable habitat for this species exists on the site, pine green-gentian was not observed during focused surveys.

### Delicate Bluecup

Delicate bluecup (*Githopsis tenella*) is a CRPR List 1B.3 species. It typically blooms between May and June (CNPS 2015). This annual grows in moist places in oak woodlands at elevations between 3,600 and 6,230 feet above msl (Jepson Herbarium 2015). It occurs in Kern and Tulare Counties (CNPS 2015). It occurs approximately eight miles from the Project site, on Purdie Ridge, south of Purdie Canyon, in the Tehachapi Mountains (CDFW 2015a). The Purdie Ridge location supports an isolated stand of white fir (*Abies concolor*) within a grove of canyon live oak (*Quercus chrysolepis*). Although potentially suitable habitat for this species exists on the site, delicate bluecup was not observed during focused surveys.

### San Gabriel Mountains Sunflower

San Gabriel Mountains sunflower (*Hulsea vestita* ssp. *gabrielensis*) is a CRPR 4.3 species. This perennial herb occurs in montane coniferous forest habitat between approximately 4,900 and 8,200 feet above msl (Jepson Herbarium 2015). It typically blooms between May and July, and is known from Los Angeles, San Bernardino, and Ventura Counties (CNPS 2015). In the Project vicinity, it occurs about 10 miles west of the site at the summit of Frazier Mountain, and about 13 miles southwest of the site, west of Sewart Mountain Peak in Ventura

County (CCH 2016). Suitable elevation and habitat for this species does not exist on the site, and San Gabriel Mountains sunflower was not observed during focused surveys.

#### Madera Leptosiphon

Madera leptosiphon (*Leptosiphon [Linanthus] serrulatus*) is a CRPR 1B.2 species. This annual herb occurs in open areas in woodland and chaparral habitats (Jepson Herbarium 2015). It is found between approximately 1,000 and 4,250 feet above msl, and typically blooms between April and May. It is known from Fresno, Kern, Madera, Mariposa, and Tulare Counties (CNPS 2015). In the Project vicinity, according to a historical record from 1935, it was collected in the general vicinity of the Tehachapi Mountains, among scattered oaks (CDFW 2015a). Other than this collection, the closest known occurrences (also historical records from the 1930s) are more than 60 miles north of the Project site, in the Sequoia National Forest area, near the Kern/Tulare County boundary (CDFW 2015a; CCH 2016). Although potentially suitable habitat for this species exists on the site, Madera leptosiphon has not been observed in the Project region (or even more than 60 miles to the north) since the 1930s, so it has very low potential to occur on the site, and it was not observed during focused surveys.

#### Ocellated Humboldt Lily

Ocellated Humboldt lily (*Lilium humboldtii* ssp. *ocellatum*) is a CRPR 4.2 species. Ocellated Humboldt lily is a bulbiferous herb endemic to California that typically blooms between March and August (CNPS 2015). It occurs at elevations below about 3,000 feet above msl, in gravelly soil in gullies and canyons, usually in chaparral and oak woodland habitats (Munz 1974). This species is known from Los Angeles, Orange, Riverside, Santa Barbara, San Bernardino, San Diego, and Ventura Counties, and Anacapa Island, Santa Cruz Island, and Santa Rosa Island (CNPS 2015). In the Liebre Mountain region, this species is considered widespread but generally rather scattered on shaded benches along streams (Boyd 1999). In the Project vicinity, it occurs about 12 miles southeast of the site in Warm Springs Canyon, west of Lake Hughes Road (CCH 2016). Although suitable habitat for this species exists on the site, ocellated Humboldt lily was not observed during focused surveys.

#### Sylvan Scorzonella

Sylvan scorzonella (*Microseris sylvatica*) has a CRPR of 4.2. It typically blooms between March and May (Munz 1974). This herb is found in grasslands and open woodlands between sea level and approximately 5,600 feet above msl. It occurs in the North Coast Ranges, Sacramento Valley, Sierra Nevada Foothills, Tehachapi Mountains, eastern San Francisco Bay, South Coast Ranges, western Transverse Ranges, and Mojave Desert (Jepson Herbarium 2015). In Los Angeles County, it was reported along SR-138 in the western portion of the Antelope Valley (CCH 2016). Numerous occurrences of sylvan scorzonella were observed on the Project site during 2004 focused surveys. It was most commonly found on thin, well-drained gravelly or coarse sandy loam and clay loam soils on the upper north sides of ridges and hills and on slopes and flats immediately bordering ephemeral drainages. Nearly all occurrences were located within native perennial grasslands, and a few were in areas bordered by oak woodlands (Vollmar 2004). In 2008, this species was found to be common on ridgetops and dirt roads, with a total population estimate on the site likely exceeding

100,000 plants (NRC 2008a). In 2015, focused surveys estimated that the population exceeded 100,000 plants.

#### Calico Monkeyflower

Calico monkeyflower (*Mimulus pictus*) is a CRPR 1B.2 species. It typically blooms between March and May (CNPS 2015). This annual herb grows in bare, sunny, shrubby areas around granite outcrops between about 300 and 4,700 feet above msl (Jepson Herbarium 2015; CNPS 2015). It occurs in Kern and Tulare Counties and occurs approximately 5.5 miles north of the Project site along Geghus Ridge, near Bear Trap Canyon (CNPS 2015; CDFW 2015a). Although some marginally suitable habitat for this species exists on the site, calico monkeyflower was not observed during focused surveys.

#### Flax-Like Monardella

Flax-like monardella (*Monardella linoides* ssp. *oblonga*) is a CRPR 1B.3 species. It typically blooms between June and August (Munz 1974). This perennial herb grows on gravelly dry slopes and flats in chaparral, conifer woodland, and forests at elevations between approximately 4,900 and 8,500 feet above msl (Jepson Herbarium 2015). It occurs in Los Angeles, Ventura, Tulare, and Kern Counties and occurs approximately 13 miles from the Project site, near Chuchupate Campground, which is located close to Frazier Mountain (CNPS 2015; CDFW 2015a). This location is situated on a rocky, north-facing slope with thin soils and is surrounded by chaparral (Vollmar Consulting 2004). Although some marginally suitable habitat for this species exists on the site, flax-like monardella was not observed during focused surveys.

#### Spreading Navarretia

Spreading navarretia (*Navarretia fossalis*) is a federally Threatened and CRPR 1B.1 species. It typically blooms between April and June (CNPS 2015; Jepson Herbarium 2015). This annual herb occurs at elevations between approximately 100 and 4,265 feet above msl in Los Angeles, Orange, San Diego, and Riverside Counties, as well as in Baja California, Mexico (USFWS 2010b; CNPS 2015). It prefers areas characterized by mounds, swales, and depressions within a matrix of upland habitat that result in intermittently flowing surface and subsurface water in swales, drainages, ephemeral vernal pools, and seasonally flooded alkali vernal plains (USFWS 2010b). It has been reported approximately 13 miles southeast from the Project boundary, in a seasonal depression situated between the toe slope of a small ridge and a disturbed field (former agricultural field) (CCH 2016). Although potentially suitable habitat for this species occurs on the site, spreading navarretia was not observed during focused surveys.

#### Baja Navarretia

Baja navarretia (*Navarretia peninsularis*) is a CRPR 1B.2 species. It typically blooms between June and August (CNPS 2015). This annual herb occurs at elevations between approximately 4,900 and 7,500 feet above msl in Kern, Los Angeles, Santa Barbara, San Bernardino, San Diego, and Ventura Counties, as well as in Baja California, Mexico (CNPS 2015). It prefers wet areas in open forests and openings in chaparral and lower montane coniferous forests (CNPS 2015; Jepson Herbarium 2015). It has been reported less than 1,000 feet from the Project

boundary on a disturbed slope in oak-pine woodland near German Peak, on the west end of the Project (CDFW 2015a). Although potentially suitable habitat for this species occurs on the site, Baja navarretia was not observed during focused surveys

#### Piute Mountains Navarretia

Piute Mountains navarretia (*Navarretia setiloba*) is a CRPR 1B.1 species. It typically blooms between April and July (CDFW 2015a). This annual grows in depressions in clay or gravelly loam at elevations between approximately 1,640 and 6,890 feet above msl (Jepson Herbarium 2015). Before surveys for this site, it was reported only in Kern and Tulare Counties (CNPS 2015). This species is a rare local endemic, restricted to woodland and valley and foothill grassland, in the far southern Sierra Nevada Mountains and in the Tehachapi Mountains (Vollmar Consulting 2004). In the Project vicinity, 39 occurrences were identified a few miles north of the Project site during surveys for a project located approximately 5 miles northwest. They were located in annual grasslands and open oak woodlands (Vollmar Consulting 2004). Piute Mountains navarretia was observed within the 2004 focused survey study area; the three occurrences included approximately 20,100 total plants. These occurrences represent the only known occurrences for this species in Los Angeles County and are the southernmost known occurrences (Vollmar Consulting 2004). Surveys in 2015 verified these occurrences still exist on the Project site; however focused surveys found no occurrences within the proposed impact area.

#### Robbins' Nemacladus

Robbins' nemacladus (*Nemacladus secundiflorus* var. *robbinsii*) is a CRPR 1B.2. It typically blooms between April and June (CNPS 2015). This species grows on dry gravelly slopes in openings of chaparral and grassland at elevations between 1,150 and 5,600 feet above msl (CNPS 2015; Jepson Herbarium 2015). It occurs in Los Angeles, Santa Barbara, San Benito, San Luis Obispo, and Ventura Counties (CNPS 2015). This species was recorded occurring in oak-juniper woodland approximately five miles to the west of the Project site in Hungry Valley, near Gorman (CDFW 2015a). Although suitable habitat is present on the site, Robbins' nemacladus was not observed during focused surveys.

#### Bakersfield Cactus

Bakersfield cactus (*Opuntia basilaris* var. *treleasei*) is a federally and State-listed Endangered species and a CRPR 1B.1 species. It typically blooms between April and May. This species grows in arid plains at elevations between approximately 390 and 4,750 feet above msl. It occurs only in Kern and Los Angeles Counties (CNPS 2015). This species is endemic to the alluvial benches and fans along the southern and southeastern edges of the San Joaquin Valley (Vollmar Consulting 2004). This species has been reported at the base of the Tehachapi Mountains just west of I-5, approximately 20 miles northwest of the Project site, and at Comanche Point, which is more than 20 miles north of the Project site (Vollmar Consulting 2004). In 2013, this species was reported just east of the I-5, south of Gorman Post Road, and just north of the Quail Lake Road exit (CCH 2016). This population occurs approximately 1 mile west of the Project site. Although suitable habitat exists on the site, Bakersfield cactus was not observed during focused surveys.

### Adobe Yampah

Adobe yampah (*Perideridia pringlei*) has a CRPR of 4.3. It typically blooms between April and July (CNPS 2015). This perennial herb is found on grassy slopes and serpentine outcrops at elevations between approximately 980 and 5,910 feet above msl (Jepson Herbarium 2015). It occurs in Los Angeles, Kern, Monterey, Santa Barbara, Tulare, Ventura, and San Luis Obispo Counties (CNPS 2015). Ten occurrences were identified a few miles north of the Project site within openings in oak woodlands and associated annual grasslands. Adobe yampah was observed in the north-central portion of the Project site during 2004 focused surveys. One occurrence with 16 individuals was found in native perennial grasslands on a dry, moderately steep slope with bare soil and low total vegetation cover (Vollmar 2004). In 2006, it was observed at three locations east of the Aqueduct, including approximately 15 individuals (NRC 2006b). In 2008, scattered populations were found east of the Aqueduct, including approximately 108 individuals (NRC 2008a). In 2015, adobe yampah was observed along drainage cut banks and also on north slopes of the larger hills in the southern and western halves of the Project site. Nearly 100 occurrences were recorded on site, with an estimate of over 3,000 total plants. This is assumed to be significantly underestimated, as 2015 spring rainfall patterns caused many populations to die without flowering, therefore becoming undetectable during the focused blooming period surveys.

### San Bernardino Aster

San Bernardino aster (*Symphyotrichum defoliatum* [*Aster bernardinus*]) is a CRPR 1B.2 species. It typically blooms between July and November (Munz 1974). This rhizomatous herb prefers damp meadows, and is generally found from between sea level and 6,700 feet above msl (CNPS 2015). This species occurs in Imperial, Kern, Los Angeles, Orange, Riverside, San Bernardino, San Diego, and possibly San Luis Obispo Counties. It is associated with meadows and seeps; marshes and swamps; cismontane woodland; coastal scrub; lower montane coniferous forest; and vernal mesic grasslands near ditches, streams, and springs (CNPS 2015). According to a historical record from 1939, this species was observed in Kern County in the vicinity of Lebec, about five miles northwest of the Project site (CDFW 2015a). Although suitable habitat for this species exists on the site, San Bernardino aster was not observed during focused surveys.

### Greata's Aster

Greata's aster (*Symphyotrichum* [*Aster*] *greatae*) is a CRPR 1B.3 species. It typically blooms between June and October (CNPS 2015). This perennial herb occurs in moist or dry places in canyons at elevations between approximately 1,000 and 6,600 feet above msl, and is associated with chaparral and oak woodlands (CNPS 2015; Munz 1974). It occurs in Los Angeles, San Bernardino, and Ventura Counties, although historically was only known from the southern slopes of the San Gabriel Mountains (CNPS 2015; Jepson Herbarium 2015). In the region, it has been found near springs in the understory of oak woodlands (Boyd 1999). It occurs approximately nine miles from the Project site, on Liebre Mountain and in Fish Canyon just north of the Cienega Campground (CDFW 2015a). Although potentially suitable habitat for this species exists on the site, Greata's aster was not observed during focused surveys.

### Lemmon's Syntrichopappus

Lemmon's syntrichopappus (*Syntrichopappus lemmonii*) is a CRPR 4.3 species. It typically blooms between April and June (CNPS 2015). This annual species is found in open, sandy to gravelly areas at elevations between approximately 2,950 and 4,920 feet above msl (Jepson Herbarium 2015). It is associated with chaparral habitats and Joshua tree woodlands, and ranges from the southwestern border of the Mojave Desert to adjoining slopes of the San Gabriel and San Bernardino Mountains (Munz 1974). It occurs in Kern, Los Angeles, Monterey, Riverside, San Bernardino, and Ventura Counties (CNPS 2015). No records were found in the Project vicinity prior to focused surveys in the Project site (Vollmar Consulting 2004). Lemmon's syntrichopappus was observed during 2004 focused surveys (outside the 2015 survey area). The occurrence, with approximately 30 individuals, was located in a sparsely vegetated area composed of non-native annual grasses, native perennial bunchgrasses, and native forbs, with prominent areas of bare soil and exposed sandstone bedrock (Vollmar Consulting 2004). Lemmon's syntrichopappus was not observed during the 2015 focused surveys.

### Silvery False Lupine

Silvery false lupine (*Thermopsis macrophylla* var. *argentata*), considered a synonym of *Thermopsis californica* var. *argentata*, is a CRPR 4.3 species. This rhizomatous perennial herb typically blooms between April and October. It grows in lower montane coniferous forest, cismontane woodland, and pinyon/juniper woodland at elevations between approximately 2,200 and 5,200 feet above msl. It occurs in Kern, Siskiyou, Shasta, Modoc, Lassen, Los Angeles, Santa Barbara, and Ventura Counties (CNPS 2015). This species is associated with slopes, especially areas below limestone outcrops or limestone-derived soils (Vollmar Consulting 2004). This species was found in numerous locations on alluvial slopes below a limestone formation a few miles north of the Project site (Vollmar Consulting 2004). Scattered locations have also been reported in the vicinity of the National Cement Plant, which is located immediately north of the Project site (Vollmar Consulting 2004). Although potentially suitable habitat for this species does occur on the site, silvery false lupine was not observed during focused surveys.

### **Oak Trees**

#### Tucker's Oak (*Quercus john-tuckeri*)

A previous botanical survey report prepared for the Project included a review of the species Tucker's oak also known as shrub live oak (*Quercus turbinella*), which is a CNPS List 4 species (Vollmar Consulting 2004). However, communication with a representative of the CNPS indicated that the two taxa are in fact distinct, and that only individuals that match the morphology for *Quercus turbinella* as described by E.L. Greene in 1889 are considered special status by the CNPS (Ward 2005). The range of *Quercus turbinella* in California is thought to be limited to the New York Mountains in the southeastern portion of the California Mojave Desert (CNPS 2015). Given the known range of *Quercus turbinella*, the oaks on the Project site are likely *Quercus john-tuckeri*; however, additional taxonomic studies of the oaks in the Project site would be required to confirm this. The oak tree study conducted in 2001 did not differentiate *Quercus john-tuckeri* from other scrub oak species observed on the Project site (Tree Life Concern 2003).

Tucker oak was reported on slopes in the southeastern and southwestern portions of the Project site (Vollmar Consulting 2004). These sites are located in two general regions: (1) scattered in the hills in the southwestern region of the Project site in open, mixed oak woodland and chaparral habitat and (2) in oak woodland and chaparral habitat along the southeastern edge in the hills south of SR-138. Although Tucker oak should not be considered a CNPS List 4 special status plant species, all individuals of the genus *Quercus* are considered under the County of Los Angeles Oak Tree Ordinance, described in the following section.

### Regulated Oak Trees

As stated previously, Sections 22.56.2050–22.56.2260 of the County of Los Angeles Oak Tree Ordinance protects “regulated oaks” in unincorporated areas of Los Angeles County that are 25 inches or more in circumference (8 inches in diameter) as measured 4.5 feet above mean natural grade; in the case of oaks with more than 1 trunk, the ordinance protects those trees with a combined circumference of any 2 trunks of at least 38 inches (12 inches in diameter) as measured 4.5 feet above mean natural grade (LACDRP 1988). A “heritage oak”, as defined by the CLAOTO, is (1) any oak tree that measures 36 inches or more in diameter, as measured 4.5 feet above the natural grade or (2) any oak less than 36 inches in diameter having a significant historical or cultural importance to the community. The CLAOTO requires that all potential impacts to regulated oak trees regulated by the ordinance be preceded by an application to the County that includes a detailed Oak Tree Report. Mitigation for impacts to regulated oak trees is usually required as a condition to receive a County oak tree permit.

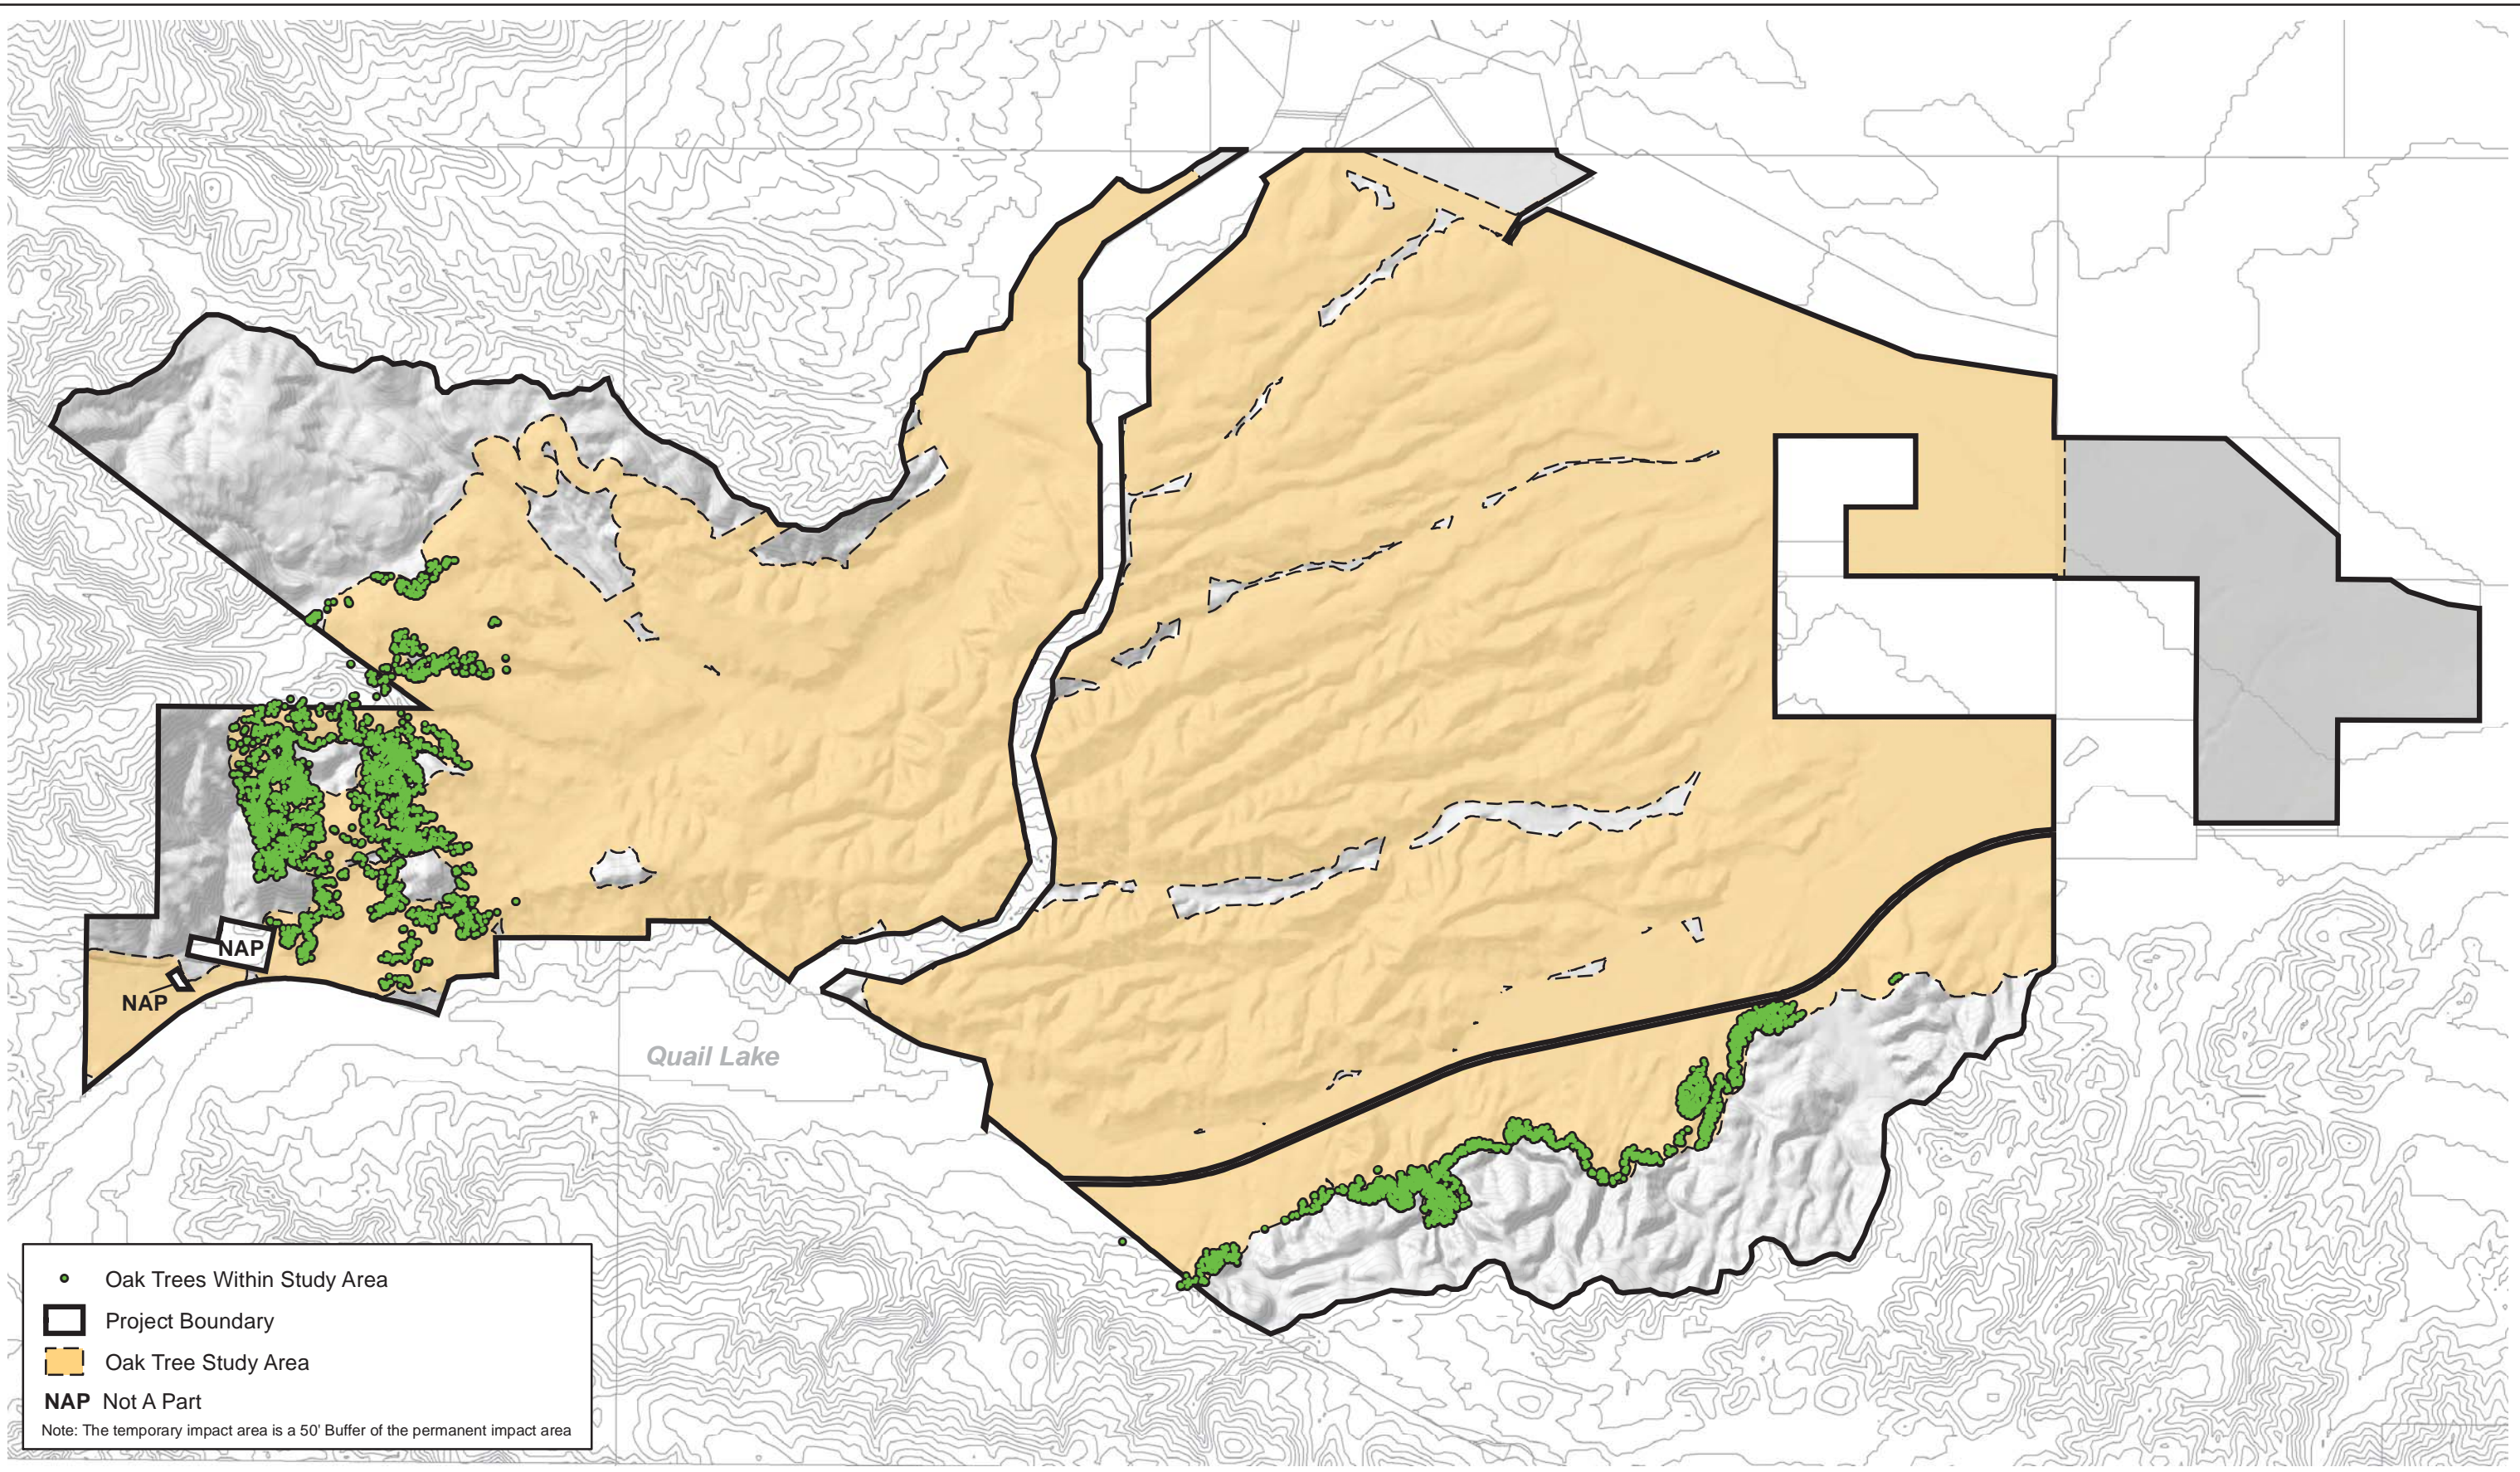

Oak tree surveys were conducted of the on-site oak woodlands occurring inside, and within 200 feet outside, both the original and revised proposed grading limits. The surveys identified 7,149 oaks potentially regulated by the CLAOTO. Blue oak, scrub oak, interior live oak, canyon live oak, valley oak, and hybrids were recorded during the survey (see Exhibit 5.7-8, Oak Trees within Study Area). Of the 7,149 oaks surveyed, 127 are “heritage oaks” as defined by the CLAOTO.

Because the CLAOTO mandates that oak surveys focus on oak trees likely to be either directly or indirectly impacted by proposed development, the survey did not include the vast majority of the oaks that would be preserved in open space areas. Specifically, an extensive oak woodland area is present south of SR-138 and within Significant Ecological Area No. 17. A blue and valley oak-dominated area lies in the western portion of the Project site north of SR-138.

To roughly determine the approximate number of preserved oaks (of all sizes) that will occur on the Project site following development, a limited census was conducted using a standard plant population sampling method. Within the proposed open space areas, oak tree densities were generally lower on the northern side of SR-138 than on the southern side of SR-138 due in part to the different composition of species in these two areas. The results of the oak census are summarized in Table 5.7-6, Estimated Number of Oaks on the Project site.

### Oak Trees Within Study Area

Centennial Project

**TABLE 5.7-6  
ESTIMATED NUMBER OF OAKS ON THE PROJECT SITE**

<b>Location</b>	<b>Density</b>	<b>Area</b>	<b>Number of Oaks (regulated and non-regulated)</b>
South of SR-138	169.5 oaks per acre	841 acres	142,550 oaks
North of SR-138	85.6 oaks per acre	450 acres	38,520 oaks
<b>Total</b>		<b>1,291 acres*</b>	<b>181,070 oaks</b>
SR: State Route			
* 10.4% of the Project's on-site and off-site components			
<i>Note: These estimates are not used for the impact assessment. They are meant only to provide a rough approximation number for discussion and therefore have not been statistically tested for margin of error.</i>			
Sources: BonTerra Consulting 2009a; Tree Life Concern 2003, 2008; Impact Sciences 2003.			

Using this same method, an estimate of oak tree populations in various size classes was also calculated. Either the diameter of the trunk (at breast height or above any basal swelling) or the largest diameter trunk (if multi-trunked) was estimated for all the oaks both north and south of SR-138. The majority of the trees (70.4 percent) have trunk diameters smaller than 12 inches. The estimated number of oaks in each size class is provided in Table 5.7-7, Estimated Number of Oaks by Size Class on the Project Site.

**TABLE 5.7-7  
ESTIMATED NUMBER OF OAKS BY SIZE CLASS  
ON THE PROJECT SITE**

<b>Size Category (Largest Trunk)</b>	<b>Percent of Oaks in Size Category (Rounded to nearest percent)</b>	<b>Number of Oaks in Size Category (Rounded to nearest unit)</b>
0-5 inches	34	61,563
5-12 inches	36	65,186
12-24 inches	25	45,267
24-36 inches	4	7,243
Greater than 36 inches in diameter	1	1,811
<i>Note: These estimates are not used for the impact assessment. They are meant only to provide a rough approximation number for discussion and therefore have not been statistically tested for margin of error.</i>		
Source: Tree Life Concern 2003.		

Of the 1,370.8 acres of mixed oak woodland existing on the site, 1,364.6 acres would be unimpacted by the Project (500.8 acres north of SR-138 and 870.0 acres south of SR-138). Additionally, of the 1,370.8 acres of mixed oak woodland existing on the site, 1,291.8 acres (473.2 north of SR-138 and 818.6 acres south of SR-138) would be preserved in the on-site preservation areas (unimpacted areas within SEA 17). As mentioned above, oak tree surveys that were performed in support of the impact analysis for the Project only considered trees within the proposed grading footprint at that time, including a 200-foot buffer area (this oak tree survey area includes potential habitat within the current proposed grading footprint). Therefore, in order to estimate the number of oaks under the jurisdiction of CLAOTO that

would be preserved by the Project, twenty 1-acre sample areas were randomly chosen in the mixed oak woodlands located in the survey area of the previous tree studies (10 sample areas were located north of SR-138 and 10 were located south of SR-138). The average tree density for areas north and south of SR-138 was calculated and extrapolated to determine the number of oaks within the adjacent on-site preservation areas (unimpacted areas within SEA 17). Only oaks that are regulated by CLAOTO were considered for this analysis.

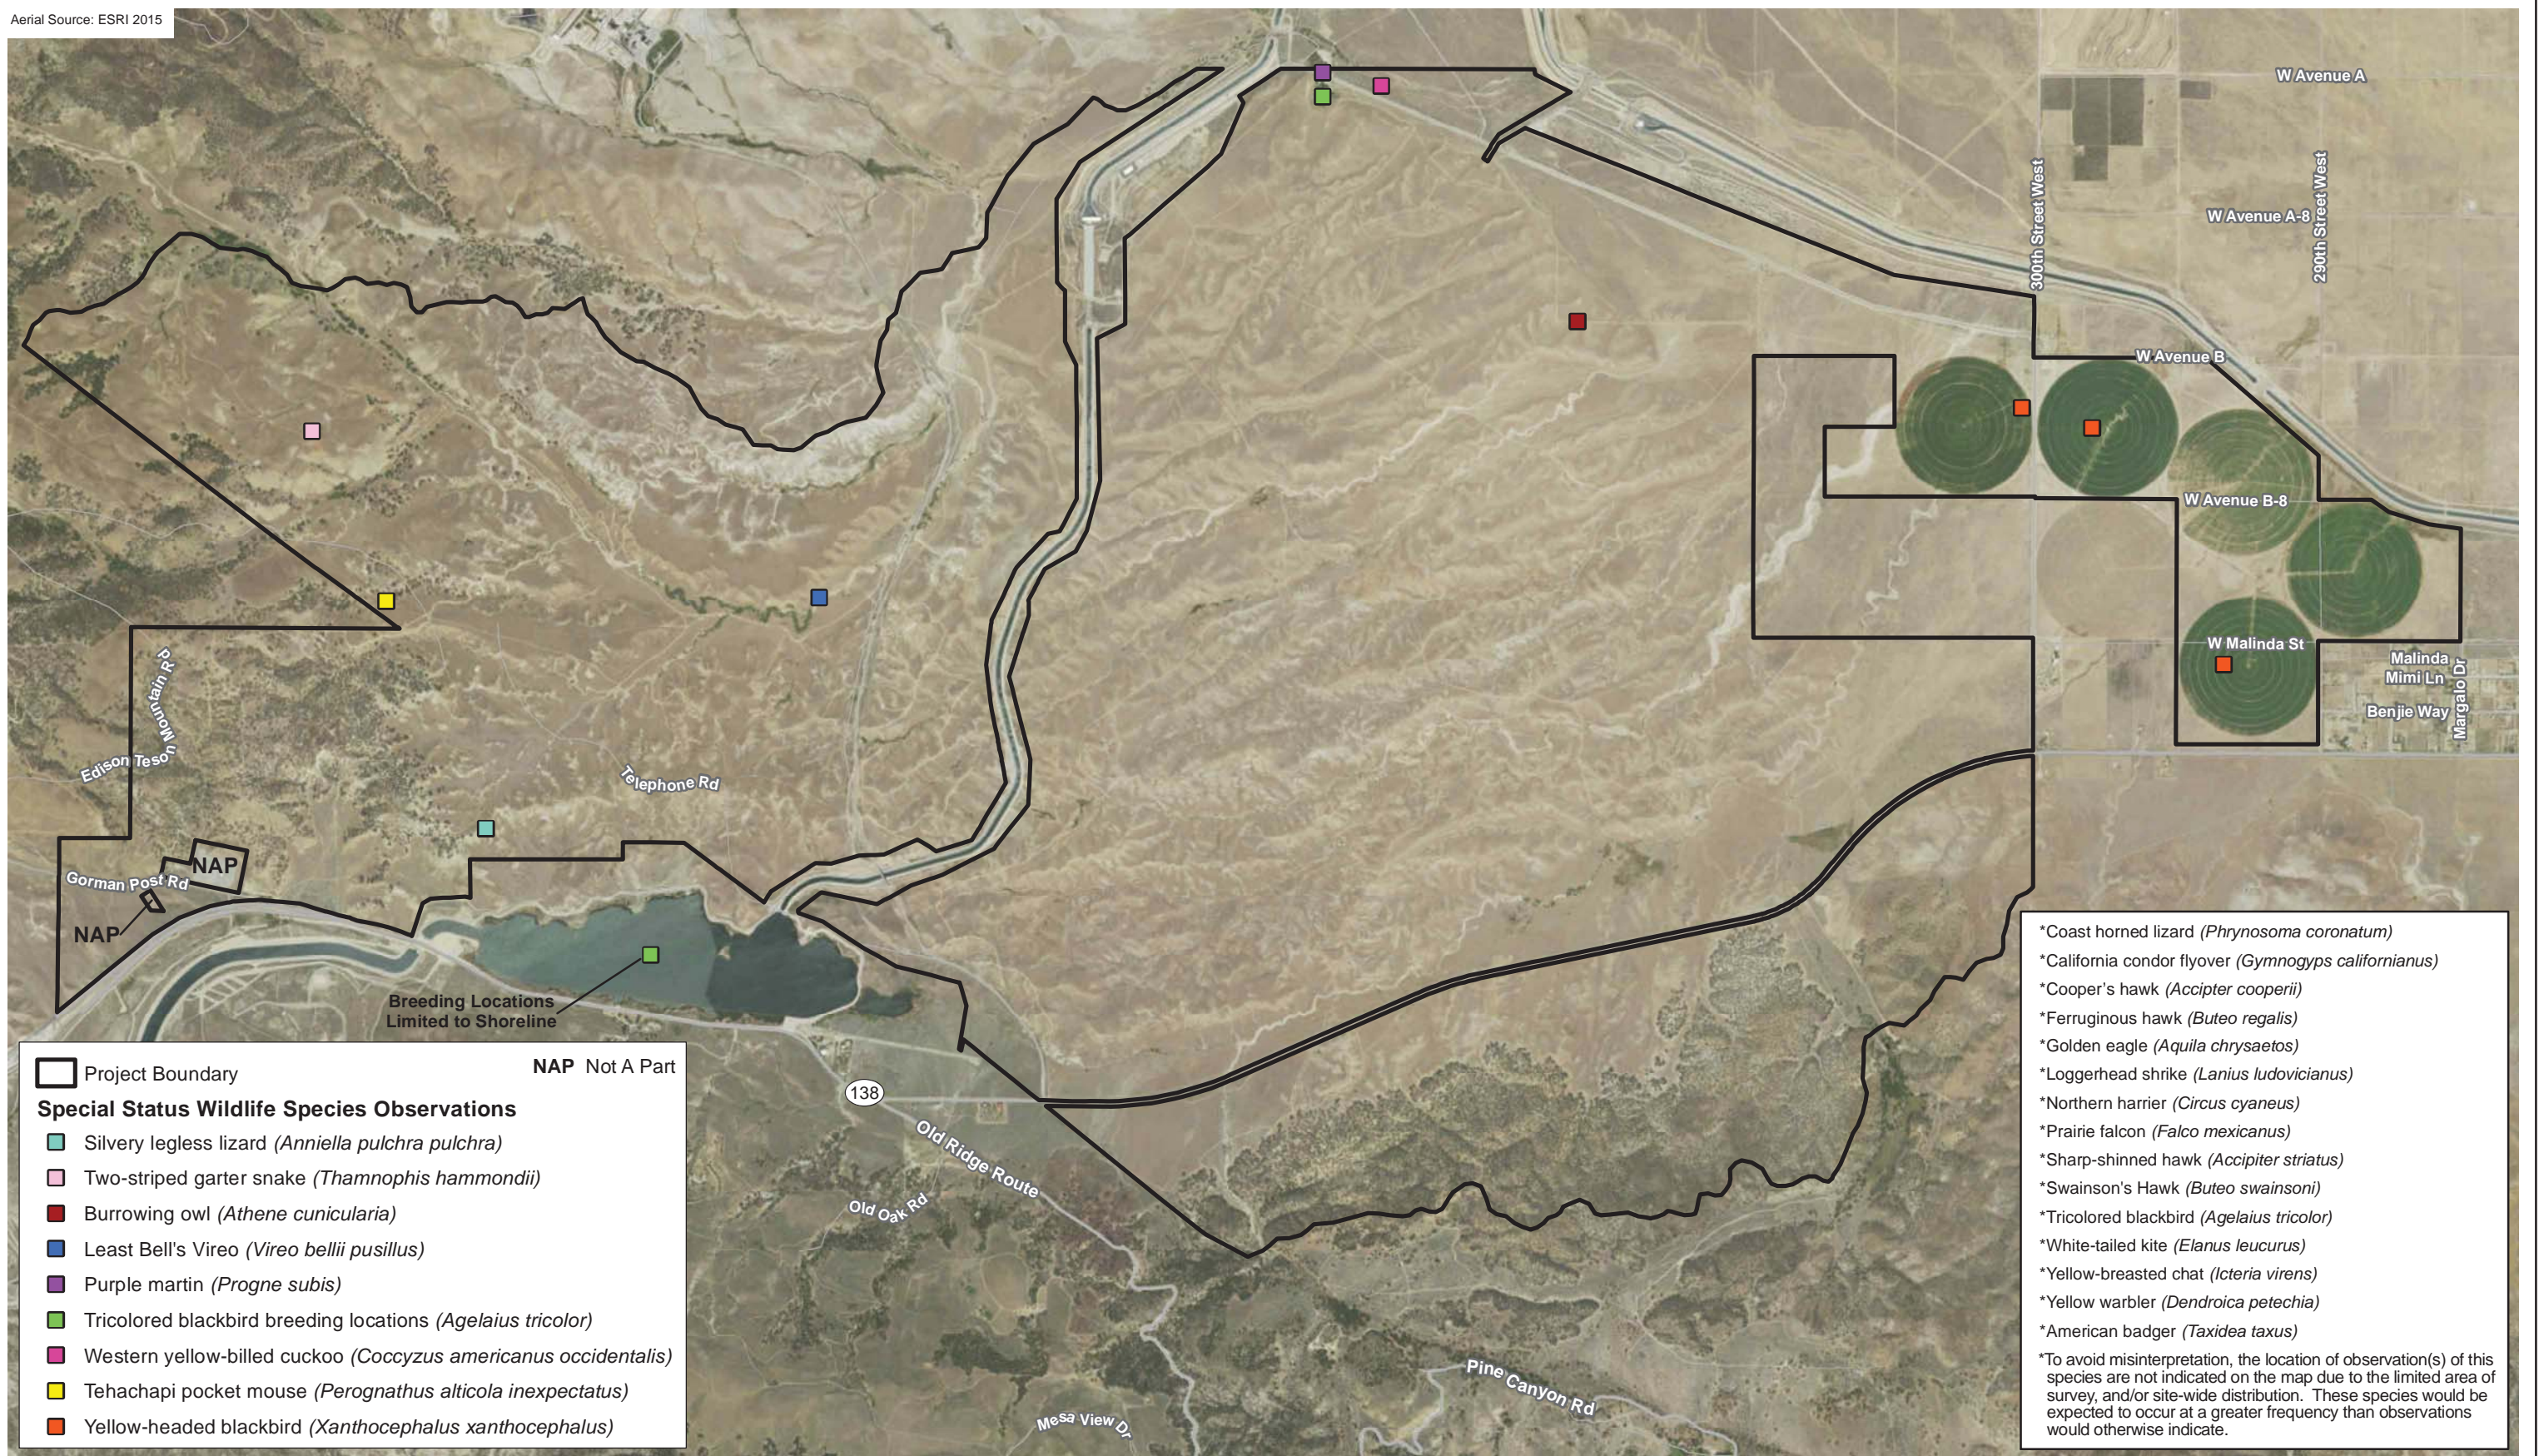

In areas north of SR-138, the average density of oaks under the jurisdiction of CLAOTO was 20.9 trees per acre. By extrapolating this density into adjacent on-site preservation areas, it is estimated that approximately 9,890 regulated oaks would be preserved. In areas south of SR-138, the average density of regulated oaks was 27.4 trees per acre, meaning that approximately 22,430 regulated oaks would be preserved. Therefore, according to this method, it is estimated that approximately 32,319 oaks under the jurisdiction of CLAOTO would be preserved on the site (outside the proposed impact boundary and within SEA 17). Overall it is estimated that about 33,861 regulated oaks are present on the site.

## Special Status Wildlife

A total of 42 special status wildlife species that are known to occur or potentially occur in the Project region (defined as the western Antelope Valley and its associated watersheds) are listed in the table below. Thirty-three of these species have at least some potential to occur, albeit low in many cases, or were observed by Biologists working with Impact Sciences during the course of various field surveys conducted on the Project site. Of these potentially occurring species, 10 are State- and/or federally listed as Endangered, Threatened, or Candidate Species: conservancy fairy shrimp (*Branchinecta conservatio*), vernal pool fairy shrimp (*Branchinecta lynchi*), Tehachapi slender salamander, arroyo toad (*Anaxyrus californicus*), Swainson's hawk, western yellow-billed cuckoo, southwestern willow flycatcher, California condor, bald eagle, and least Bell's vireo. The Project site is not located within any USFWS-designated or proposed Critical Habitat for any of these species. The remaining species are considered to be "of concern" by the CDFW. Table 5.7-8, Special Status Wildlife Species, lists the special status wildlife; the suitability of the habitat on or adjacent to the site; and their potential to occur on the Project site. Following the table are descriptions of special status wildlife species that may be potentially impacted by the Project. Exhibit 5.7-7b, Special Status Wildlife Species Observations, depicts the locations of the special status wildlife species that were observed on the site.

Other species formally considered to be "of concern" by the CDFW but that were recently down-graded to "Watch List" (i.e., as a result of studies suggesting the species numbers and/or distribution are more extensive than previously thought) were considered but not addressed further due to their status. An additional set of species was reviewed due to occurrence records on USGS 7.5-minute quadrangle maps of adjacent regions. The species that did not have records in the Project region and are not expected to occur anywhere in the Project region were excluded from further analysis. Lastly, those species that are tracked by the CDFW through the CNDDDB but have no State-listed special status were excluded from additional analysis.

- Silvery legless lizard (*Anniella pulchra pulchra*)
- Two-striped garter snake (*Thamnophis hammondi*)
- Burrowing owl (*Athene cunicularia*)
- Least Bell's Vireo (*Vireo bellii pusillus*)
- Purple martin (*Progne subis*)
- Tricolored blackbird breeding locations (*Agelaius tricolor*)
- Western yellow-billed cuckoo (*Coccyzus americanus occidentalis*)
- Tehachapi pocket mouse (*Perognathus alticola inexpectatus*)
- Yellow-headed blackbird (*Xanthocephalus xanthocephalus*)

- \*Coast horned lizard (*Phrynosoma coronatum*)
  - \*California condor flyover (*Gymnogyps californianus*)
  - \*Cooper's hawk (*Accipiter cooperii*)
  - \*Ferruginous hawk (*Buteo regalis*)
  - \*Golden eagle (*Aquila chrysaetos*)
  - \*Loggerhead shrike (*Lanius ludovicianus*)
  - \*Northern harrier (*Circus cyaneus*)
  - \*Prairie falcon (*Falco mexicanus*)
  - \*Sharp-shinned hawk (*Accipiter striatus*)
  - \*Swainson's Hawk (*Buteo swainsoni*)
  - \*Tricolored blackbird (*Agelaius tricolor*)
  - \*White-tailed kite (*Elanus leucurus*)
  - \*Yellow-breasted chat (*Icteria virens*)
  - \*Yellow warbler (*Dendroica petechia*)
  - \*American badger (*Taxidea taxus*)
- \*To avoid misinterpretation, the location of observation(s) of this species are not indicated on the map due to the limited area of survey, and/or site-wide distribution. These species would be expected to occur at a greater frequency than observations would otherwise indicate.

### Special Status Wildlife Species Observations

### Exhibit 5.7-7b

Centennial Project

The Los Angeles Audubon maintains a list of Sensitive Bird Species that they consider to be at risk of decline or extirpation in Los Angeles County (Allen et. al 2009). Although not considered special status for the purposes of State CEQA guidelines, these species were analyzed for potential to occur on the Project site and are included in Table 5.7-9, Other L.A. Audubon Sensitive Bird Species, presented further below. Species already included in Table 5.7-8 are not included in Table 5.7-9 to avoid duplication of information.

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<b>Invertebrates</b>					
<i>Branchinecta conservatio</i> conservancy fairy shrimp	FE	-	Highly turbid water of ephemeral or temporary pools of fresh water (vernal pools) that form in the cool, wet months of the year; dependent upon seasonal fluctuations in their habitat, such as absence or presence of water during specific times of the year.	Although potentially suitable habitat is present, this species was not identified during wet and dry season protocol surveys in 2004-2005.	Not observed
<i>Branchinecta lynchi</i> vernal pool fairy shrimp	FT	-	Inhabits small vernal pools with cool water (10°C) of moderate alkalinity and conductivity that are less than 1-m deep; occurs primarily in vernal pools and seasonal wetlands that fill with water during fall and winter rains and dry up in spring and summer.	Not known to occur on the Project site; although potentially suitable habitat is present, this species was not identified during wet and dry season protocol surveys of 2 ponds in 2004-2005.	Not observed
<b>Amphibians</b>					
<i>Anaxyrus californicus</i> arroyo toad	FE	SSC	Washes/streams, sandy banks, willows, cottonwoods, or sycamores; riparian habitats of semiarid areas, small cobbly streambeds.	Potentially suitable habitat is present in large drainages; not detected during protocol surveys in 2006; may occur.	Not observed
<i>Batrachoseps stebbinsi</i> Tehachapi slender salamander	-	ST	North-facing slopes in valley-foothill hardwood conifer and valley-foothill riparian habitats.	Some potentially suitable habitat in oak woodland areas of the site and within high elevation <i>Hesperoyucca whipplei</i> ; not detected during focused surveys in 2006; may occur.	Not observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<i>Ensatina eschscholtzii croceator</i> yellow-blotched ensatina (salamander)	-	SSC	Coniferous habitats, montane hardwood habitats, and mixed chaparral.	Potentially suitable habitat present in the heavily wooded drainages in the westernmost portion of the site; may occur.	Not observed
<i>Rana aurora draytonii</i> California red-legged frog	FT	SSC	Humid forests, woodlands, grasslands and streamsides, especially where cattails and other plants provide good cover.	Not detected during focused protocol surveys conducted in 2001; not detected during protocol surveys in 2006; marginally suitable habitat present on the site.	Not observed
<i>Spea hammondi</i> western spadefoot	-	SSC	Relatively open areas in lowland grasslands, chaparral, and pine-oak woodlands, sandy or gravelly soil in alluvial fans, washes, and floodplains.	Potentially suitable habitat is present; not detected during 2005 focused surveys west of the Aqueduct; may occur east of the Aqueduct.	Not observed
<b>Reptiles</b>					
<i>Anniella pulchra pulchra</i> silvery legless lizard	-	SSC	Coastal dune, valley-foothill, chaparral, and coastal scrub habitats.	1 silvery legless lizard was observed in the far western portion of the site. Potentially suitable habitat is present in many areas on the site.	Observed
<i>Emys marmorata pallida</i> western pond turtle	-	SSC	Ponds, marshes, rivers, streams, irrigation ditches.	Western pond turtles have been observed at Quail Lake; limited potentially suitable habitat is present on the Project site.	Not observed
<i>Gambelia sila</i> blunt-nosed leopard lizard	FE	SE FP	Vegetative ground cover of 50% or less, dominated by a relatively short grass component. Vegetation types utilized include grassland, saltbush scrub, and valley sink scrub.	Blunt-nosed leopard lizard has a range that stops north of the Tehachapi Range; not expected to occur on the site.	Not observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<i>Phrynosoma blainvillii</i> coast horned lizard	-	SSC	Valley-foothill hardwood, conifer, and riparian habitats, pine-cypress, juniper and annual grassland habitats from sea level to 6,000 feet above msl and open country, especially sandy areas, washes, floodplains, and windblown deposits.	Horned lizards were observed in several drainages, primarily in the eastern portion of the site; potentially suitable habitat is present in many areas.	Observed
<i>Thamnophis hammondi</i> two-striped garter snake	-	SSC	Riparian and freshwater marshes with perennial water.	1 individual was observed in the northwestern portion of the site; potentially suitable habitat is also present in other permanent water sources on the site, including cattle ponds and along Oso Creek.	Observed
<b>Birds</b>					
<i>Agelaius tricolor</i> tricolored blackbird (nesting colony)	-	SCE, SSC	Freshwater marshes and riparian scrub.	This species was observed foraging and nesting. A large nesting colony along the north-central edge of the Project site was observed during surveys in 2006 and 2008. This species was <b>not</b> observed nesting on the site in 2015, although it was observed nesting in Quail Lake and foraging on site.	Observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<i>Ammodramus savannarum</i> grasshopper sparrow (nesting)	-	SSC	Grassland habitats including a variety of tall- and mixed-grass habitats such as native prairies, hayfields, pastures, and grassy fallow fields.	Grassland habitats provide potentially suitable habitat, but the Project site is outside the historic and current known range; not expected to occur.	Not observed
<i>Aquila chrysaetos</i> golden eagle (nesting and non-breeding/ wintering)	-	FP, WL	Mountains, deserts, and open country; prefer to forage over grasslands, deserts, savannahs and early successional stages of forest and shrub habitats.	Observed foraging in the northwestern and northeastern portions of the site; limited potential nesting but extensive foraging habitat is present on the site.	Observed
<i>Asio otus</i> long-eared owl (nesting)	-	SSC	Breeding habitat includes thickly wooded areas with nearby open spaces for hunting. Winters in dense conifer groves or brushy thickets.	Limited potentially suitable habitat in the western portion of the Project site.	Not Observed
<i>Athene cunicularia</i> burrowing owl (burrow sites and some wintering sites)	-	SSC	Dry grasslands, desert habitats, open pinyon-juniper, and ponderosa pine woodlands between sea level and 5,300 feet above msl; berms, ditches, and grasslands adjacent to rivers, agricultural, and scrub areas.	1 pair observed in the eastern portion of the site in 2001 and 1 pair just off the site in 2006; potentially suitable foraging and nesting habitat exists throughout the site; although not detected on site since 2001, this species is expected to occur in low numbers.	Observed
<i>Aythya americana</i> redhead (nesting)	-	SSC	Marshes, lakes, reservoirs, river pools, and bays.	Potentially suitable habitat at adjacent Quail Lake; not expected to occur for breeding on the Project site.	Not Observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<i>Buteo swainsoni</i> Swainson's hawk (nesting)	-	ST	Plains, ranges, open hills, sparse trees.	Observed on an adjacent site during 2004 spring migration; a group of 5 non-breeding birds was present in summer 2008; potentially suitable breeding habitat is present on the site; this species is not known to breed in the Project region, although in recent years nesting has been observed to the east of the Project region.	Observed
<i>Charadrius montanus</i> mountain plover (wintering)	-	SSC	Open grasslands and agricultural fields of larger valleys and basins of the region	The eastern portions of the Project site dominated by grasslands and agricultural fields on relatively gentle terrain provide potentially suitable wintering habitat. This species was not observed during focused surveys.	Not observed
<i>Circus cyaneus</i> northern harrier (nesting)	-	SSC	Coastal salt marshes, freshwater marshes, grasslands, and agricultural fields; occasionally forages over open desert and brushlands.	This species was observed foraging during field investigations; potentially suitable foraging and nesting habitat is present on the site.	Observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<i>Coccyzus americanus occidentalis</i> western yellow-billed cuckoo (nesting)	FT	SE	Riverine woodlands, thickets, and farms.	One individual was reported during June 2003 surveys and is considered to be a migrant; the limited amount of suitable nesting habitat probably would not support breeding for this species.	Observed
<i>Elanus leucurus</i> white-tailed kite (nesting)	-	FP	Grasslands with scattered trees, near marshes, along highways.	Observed on the site; potentially suitable breeding and foraging habitat is present on the site; local breeder in small numbers in Antelope Valley.	Observed
<i>Empidonax traillii extimus</i> southwestern willow flycatcher (nesting)	FE	SE	Wet meadow and montane riparian habitats, river valleys and large mountain meadows.	Although migrant willow flycatchers (unknown subspecies) have been observed on the site, no breeding southwestern willow flycatchers were present in 2006 and 2008; the site provides potentially suitable nesting habitat for this species.	Not Observed
<i>Gymnogyps californianus</i> California condor	FE	SE	Montane and foothill regions; vast expanses of open savannah, grasslands, and chaparral with cliffs, large trees, and snags.	No suitable breeding habitat; potential foraging habitat is present, but lack of thermals appears to prohibit use of the site. Although there are many flyover records from the site (and 1 landing) and from the surrounding areas, this species is expected to occur only as a relatively rare flyover compared with core	Observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
				habitat in the adjacent mountains to the north and west.	
<i>Haliaeetus leucocephalus</i> bald eagle (nesting and non-breeding/ wintering)	(De-listed 2007)	SE, FP	Lakes, reservoirs, rivers, offshore islands, and some rangelands and coastal wetlands in Southern California.	Not observed on the site, but observed foraging adjacent to the site at Quail Lake; marginal nesting habitat is present on the site; may occur.	Not observed
<i>Icteria virens</i> yellow-breasted chat (nesting)	-	SSC	Riparian woodlands with a thick understory.	Singing males present during May 2006 and 2008 but none remained to breed; potentially suitable nesting habitat on the site.	Observed
<i>Lanius ludovicianus</i> loggerhead shrike (nesting)	-	SSC	Open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches.	Observed foraging on the site in 2006, 2008, and 2015; present throughout site; nesting habitat is present in the Oso Canyon drainage and also the woodland habitats at western edge of site.	Observed
<i>Piranga rubra</i> summer tanager (nesting)	-	SSC	Mature, desert riparian habitat dominated by cottonwoods and willows, especially older, dense stands.	Cottonwood woodlands on the site provide potentially suitable breeding habitat, although this species is rare this far west; may occur.	Not observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<i>Polioptila californica californica</i> coastal California gnatcatcher	FT	SSC	Prefers open sage scrub with California sagebrush as a dominant or co-dominant species. More abundant near sage scrub-grassland interface than where sage scrub grades into chaparral. Dense sage scrub is occupied less frequently than more open sites. Mostly absent from coastal areas dominated by black sage, white sage, or lemonade berry.	No suitable habitat exists on the site; not expected to occur.	Not observed
<i>Progne subis</i> purple martin (nesting)	-	SSC	In Southern California, now only a rare and local breeder on the coast and in interior mountain ranges, with few breeding localities. Absent from higher desert regions except as a rare migrant. Often nests in tall, old trees near a body of water. Also nests occasionally in residential areas. Frequents old-growth, multi-layered, open forest and woodland with snags.	Observed in oak woodlands on the site; potentially suitable breeding and foraging habitat exists and it may nest on the site.	Observed
<i>Setophaga petechia</i> yellow warbler (nesting)	-	SSC	Sparse to dense woodland and forest habitats with or without heavy brush understory.	Common migrant of riparian habitats during 2006 and 2008 surveys, but none remained to breed; may potentially nest in the more dense riparian areas of Oso Creek and other drainages on the site.	Observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<i>Strix occidentalis occidentalis</i> California spotted owl	-	SSC	Oak and oak-conifer habitats.	Oak woodlands in the western portion of the site provide potentially suitable breeding and foraging habitat; may occur on site.	Not observed
<i>Vireo bellii pusillus</i> least Bell's vireo (nesting)	FE	SE	Perennial and intermittent streams with low, dense riparian scrub and riparian woodland habitats generally between sea level and 2,000 feet above msl (about 4,000 feet above msl on eastern side of the Sierra Nevada).	Cottonwood and willow woodlands on the site provide potentially suitable breeding habitat; 1 singing male was present on June 22, 2006, but not thereafter and presumed to be an unmated wandering male; none were present during 2008 surveys.	Observed
<i>Xanthocephalus xanthocephalus</i> yellow-headed blackbird (nesting)	-	SSC	Freshwater marshes and riparian scrub	Agricultural fields on the Project site provide suitable foraging habitat. This species was observed foraging on the site in the agricultural fields in 2015. Not observed nesting on the site.	Observed
<b>Mammals</b>					
<i>Ammospermophilus nelsoni</i> Nelson's antelope squirrel	-	ST	Primarily valley saltbush scrub; often lives sympatrically with giant kangaroo rat.	Current and historical geographic range do not include the Project site and are separated by a mountain range; not expected to occur.	Not observed
<i>Antrozous pallidus</i> pallid bat	-	SSC	Roosts in cliffs, crevices, mine tunnels, caves, house attics, and other man-made structures.	Potentially suitable roosting habitat present in oak woodlands; likely forages throughout the site; expected to occur.	Not observed

**TABLE 5.7-8  
SPECIAL STATUS WILDLIFE SPECIES**

Species	Status <sup>a</sup>		Preferred Habitat	Habitat Suitability and Potential to Occur	Occurrence <sup>b</sup>
	USFWS	CDFW			
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	-	SSC	Caves, mine tunnels, and buildings.	No potentially suitable hibernation or maternity roosting features observed on the Project site; potential to forage throughout the site; low potential to occur.	Not observed
<i>Dipodomys nitratoides nitratoides</i> Tipton kangaroo rat	FE	SE	Primarily valley sink scrub.	Current and historical geographic range do not include the Project site and are separated by a mountain range; not expected to occur.	Not observed
<i>Eumops perotis</i> western mastiff bat	-	SSC	In arid and semi-arid lowlands; roosts in cliffs and rock crevices.	No potentially suitable roosting habitat; may occur to forage, but not expected to roost.	Not observed
<i>Onychomys torridus ramona</i> southern grasshopper mouse	-	SSC	Grasslands, desert areas, especially scrub with friable soils.	Potentially suitable habitat present in grasslands and scrub habitat; may occur.	Not observed
<i>Perognathus alticolus inexpectatus</i> Tehachapi pocket mouse	-	SSC	Arid annual grassland, desert shrub, fallow grain fields, Russian thistle; burrows for cover and nesting; aestivates and hibernates; forages on open ground and under shrubs.	1 individual was observed during small mammal trapping surveys; potentially suitable habitat present in the western part of the site.	Observed
<i>Taxidea taxus</i> American badger	-	SSC	Prefers drier open stages of most shrub, forest, and herbaceous habitats with friable soils. Badgers are generally associated with treeless regions, prairies, park lands, and cold desert areas but are unlikely in cultivated lands.	Individual badgers were observed in both the eastern and western portions of the site and a number of badger dens were observed throughout the site during various field surveys.	Observed

**TABLE 5.7-9  
OTHER L.A. AUDUBON SENSITIVE BIRD SPECIES**

Species	Status	Preferred Habitat	Potential to Occur on the Project site; Results of Surveys	Occurrence
	L.A. Audubon			
<i>Anser albifrons</i> greater white-fronted goose	CSBS	Tundra wetlands for breeding; winters in agricultural fields, marshes, bays, and lakes.	The Project site does not provide suitable breeding habitat, but does provide marginal wintering habitat; not expected to occur as species has strong site fidelity for known wintering locations supporting large flocks.	Not observed
<i>Asio flammeus</i> short-eared owl	CSBS	Large, open areas with low vegetation, including prairie and coastal grasslands, meadows, shrub steppe, savanna, tundra, marshes, dunes, and agricultural areas; nests most commonly on tundra, inland and coastal prairies, extensive marshes, farmland.	The Project site provides a very limited amount of potentially suitable marsh habitat that is not substantial enough for breeding; may occur for wintering in the scrub, grassland, and agricultural areas of the Project site.	Not observed
<i>Botaurus lentiginosus</i> American bittern	CSBS	Wetlands of a variety sizes and kinds; freshwater marshes with tall vegetation for breeding; near the coast they occasionally use brackish marshes; managed wetlands important for wintering, may also forage in dry grasslands and other terrestrial habitats in winter.	The Project site provides a very limited amount of potentially suitable marsh habitat that is not substantial enough to support breeding or wintering birds; not expected to occur other than as a rare migrant.	Migrant observed
<i>Buteo regalis</i> ferruginous hawk	CSBS	Open-country; grasslands, sagebrush, saltbush-greasewood shrublands, and edges of pinyon-juniper forests at low to moderate elevations for breeding; breeding habitat includes features such as cliffs, outcrops, and tree groves for nesting; grasslands or deserts with abundant rabbits or pocket gophers for wintering.	The Project site is outside known breeding range for this species, but does provide suitable foraging habitat for wintering birds; it is expected to occur in small numbers on and in the vicinity of the Project site during winter.	Observed

**TABLE 5.7-9  
OTHER L.A. AUDUBON SENSITIVE BIRD SPECIES**

Species	Status	Preferred Habitat	Potential to Occur on the Project site; Results of Surveys	Occurrence
	L.A. Audubon			
<i>Cathartes aura</i> Turkey Vulture	CSBS (breeding)	Open areas including mixed farmland, forest, and rangeland; nest on ground, hollow logs and trees, caves, cliff ledges, and rocky cavities; roost in trees, on rocks, and other high secluded spots.	Suitable foraging and roosting habitats are present throughout most of the Project site, but only the more remote western portions of the site provide potentially suitable nesting sites; expected to occur year-round for foraging.	Observed
<i>Cardellina pusilla</i> Wilson's warbler	CSBS (ML breeding)	Thickets of riparian habitats, lakes, bogs, and overgrown clear-cuts of montane and boreal zone for breeding; winters in tropical evergreen and deciduous forest, cloud forest, pine-oak forest, and forest edge habitat; also found in mangrove undergrowth, secondary growth, thorn-scrub, dry washes, riparian gallery forest, mixed forests, brushy fields, and plantations.	The riparian habitats on the Project site are considered to be too sparse to suitable breeding habitat for this species, so it is expected to occur only as a migrant.	Migrants Observed
<i>Catharus ustulatus</i> Swainson's thrush	CSBS (breeding)	Coniferous forests for breeding, except in coastal California where they are found primarily in deciduous streamside woodlands, alder or willow thickets, and occasionally in coastal scrub; sea level up to about 8,500 feet in elevation; winter habitat includes primary and old second-growth tropical forest and forest-pasture edges.	The riparian habitats on the Project site are considered to be too sparse to suitable breeding habitat for this species, so it is expected to occur only as a migrant.	Migrants observed

**TABLE 5.7-9  
OTHER L.A. AUDUBON SENSITIVE BIRD SPECIES**

Species	Status	Preferred Habitat	Potential to Occur on the Project site; Results of Surveys	Occurrence
	L.A. Audubon			
<i>Chen caerulescens</i> snow goose	CSBS	Colonial breeder on Canadian and Northern Alaskan tundra in the vicinity of the coast; winter in regions on both American coasts as well as in some inland areas, frequenting open habitats like marshes, grasslands, marine inlets, freshwater ponds, and agricultural fields.	The Project site does not provide suitable breeding habitat, but does provide marginal wintering habitat; not expected to occur as species has strong site fidelity for known wintering locations supporting large flocks.	Migrant observed
<i>Chordeiles acutipennis</i> lesser nighthawk	CSBS (coastal slope)	Large open areas with relatively level topography and naturally open land; nest on vernal pool soils in large.	The Project site provides potentially suitable breeding and foraging habitat; this species may occur for foraging and breeding.	Not observed
<i>Cistothorus palustris</i> marsh wren	CSBS (interior breeding)	Marshes (cattail, bulrush, or brackish); breeds in many fresh and brackish marsh situations, usually with a large area of cattails, bulrushes, or cordgrass; winters in a wider variety of large and small marshes, including salt marshes and brushy edges of ponds or irrigation ditches.	The Project site provides a limited amount of potentially suitable marsh habitat for breeding and wintering; may occur for breeding and wintering.	Not observed
<i>Empidonax wrightii</i> gray flycatcher	CSBS (breeding)	Sagebrush, and pinyon and juniper; open and rather arid habitats for breeding, especially sagebrush plains with a few taller trees or shrubs, also scrubby woods of juniper and pinyon pine; winters in mesquite groves and in streamside willows and other trees, in lowlands.	Project site is outside known breeding range; not expected to occur other than as rare migrant.	Migrant observed
<i>Eremophila alpestris actia</i> California horned lark	CSBS (coastal slope)	Open areas dominated by sparse low herbaceous vegetation or widely scattered low shrubs; nests in hollow on ground often next to grass tuft or clod of earth or manure.	The Project site is outside the breeding range for this subspecies that occurs primarily on the coastal slope of Los Angeles County; the Mojave horned lark ( <i>E. a. ammophila</i> ) does nest on the Project site.	Not observed

**TABLE 5.7-9  
OTHER L.A. AUDUBON SENSITIVE BIRD SPECIES**

Species	Status	Preferred Habitat	Potential to Occur on the Project site; Results of Surveys	Occurrence
	L.A. Audubon			
<i>Falco mexicanus</i> prairie falcon	CSBS (breeding)	Bluffs and cliffs in open country for nesting; the majority spend the winter in the Great Plains and Great Basin, In winter, often found in farmland and around lakes and reservoirs, and may regularly winter in some western cities; avoids forested country, and usually scarce on the immediate coast.	The Project site does not provide suitable nesting sites for this species, but this species is expected to occur during the breeding and winter seasons for foraging.	Observed
<i>Geococcyx californianus</i> greater roadrunner	CSBS	Semi-open, scrubby habitat including areas dominated by creosote, mesquite, chaparral, and tamarisk, as well as grasslands, riparian woodlands and canyons.	The Project site provides suitable breeding and foraging habitat and it is expected to occur.	Observed
<i>Hydroprogne caspia</i> caspiian tern	CSBS (breeding)	Breeds in wide variety of habitats along water, such as salt marshes, barrier islands, dredge spoil islands, freshwater lake islands, and river islands; during migration and winter found along coastlines, large rivers and lakes; roosts on islands and isolated spits.	The Project site does not provide suitable habitat for this species; this species is an infrequent visitor to Quail Lake and may, as a result, be seen from or over the project site.	Observed
<i>Icterus parisorum</i> Scott's oriole	CSBS (breeding)	Dry woods and scrub in desert mountains, yuccas, Joshua-trees, pinyons; breeds in semi-arid zones of Southwest in oak zones of lower canyons, open woods of juniper and pinyon pine, stands of Joshua-trees, grassland with many yuccas, palm oases; avoids true desert.	The Project site does not provide suitable breeding habitat, so it is not expected to occur.	Not observed

**TABLE 5.7-9  
OTHER L.A. AUDUBON SENSITIVE BIRD SPECIES**

Species	Status	Preferred Habitat	Potential to Occur on the Project site; Results of Surveys	Occurrence
	L.A. Audubon			
<i>Megaceryle alcyon</i> belted kingfisher	CSBS (breeding)	Need access to bodies of water (streams, rivers, ponds, lakes, estuaries, and calm marine waters) for feeding; vertical earthen banks for nesting.	The Project site does not provide suitable foraging habitat, and is not expected to provide any potentially suitable nesting sites near Quail Lake; may occur on Project site as fly-over, but not expected to occur for nesting.	Not observed
<i>Melospiza lincolni</i> Lincoln's sparrow	CSBS (breeding)	Bogs, wet meadows, and riparian thickets for breeding, mostly in northern and montane areas; winters in brushy areas, thickets, hedgerows, understory of open woodlands, forest edges, clearings, and scrubby areas.	The Project site does not provide suitable breeding habitat; expected to occur as migrant and winter visitor.	Observed
<i>Numenius americanus</i> long-billed curlew	CSBS (wintering)	Sparse, short grasses, including shortgrass and mixed-grass prairies as well as agricultural fields for breeding; winters at coastal and interior Mexico, in wetlands, tidal estuaries, mudflats, flooded fields, and occasionally beaches.	The Project site provides suitable foraging habitat and potentially suitable breeding habitat, although south of known breeding locations in California; may occur in winter, but has been observed in migration and summer.	Observed
<i>Picoides villosus</i> Hairy woodpecker	CSBS (lowland)	Mature woodlands with medium to large trees, and coniferous forests, deciduous forests, or mixtures, and generally up to about 6,500 feet elevation.	The Project site provides suitable habitat for this species; it is expected to occur in the woodlands on western portions of the Project site; may occur in the riparian woodlands elsewhere on the Project site.	Not observed
<i>Plegadis chihi</i> white-faced Ibis	CSBS (breeding)	Fresh and saltwater marshes containing many rushes and sedges for nesting; also found around ponds, rivers and in flooded pastures and agricultural fields; movement patterns shift depending on rain.	The Project site does not provide suitable breeding habitat, but does provide suitable foraging habitat; observed during migration and may occur during winter.	Observed

**TABLE 5.7-9  
OTHER L.A. AUDUBON SENSITIVE BIRD SPECIES**

Species	Status	Preferred Habitat	Potential to Occur on the Project site; Results of Surveys	Occurrence
	L.A. Audubon			
<i>Podiceps nigricollis</i> eared grebe	CSBS (breeding)	Breeds in shallow lakes and ponds; migration and in winter prefers salt water.	The Project site does not provide suitable habitat for this species; Quail Lake provides suitable habitat for this species; may occur on Project site but only as fly-over.	Observed
<i>Poocetes gramineus</i> vesper sparrow	CSBS	Found in various open habitats with grass, including prairie, sagebrush steppe, meadows, pastures, and roadsides.	The Project site is outside the breeding range for this species, but does provide suitable wintering habitat; this species is expected to occur in migration and winter.	Observed
<i>Porzana carolina</i> sora	CSBS (breeding)	Breeds in shallow wetlands with lots of emergent vegetation.	The Project site provides a very limited amount of potentially suitable marsh habitat for breeding and wintering; may occur during migration and winter but not expected to breed as marsh habitat not substantial enough.	Not observed
<i>Rallus limicola</i> Virginia rail	CSBS	Freshwater marshes in dense emergent vegetation; occasionally inhabits salt marshes.	The Project site provides a very limited amount of potentially suitable marsh habitat for breeding and wintering; may occur during migration and winter but not expected to breed as marsh habitat not substantial enough.	Not observed
<i>Sialia currucoides</i> mountain bluebird	CSBS (wintering)	Open areas with a mix of short grasses, shrubs, and trees, at elevations of up to 12,500 feet above sea level for breeding; winter at lower elevations—in meadows, hedgerows, prairies, and flat grasslands with few scattered trees and bushes, pinyon-juniper and oak-juniper woodlands, and	The Project site provides suitable wintering habitat; small numbers observed wintering on the Project site during surveys.	Observed

**TABLE 5.7-9  
OTHER L.A. AUDUBON SENSITIVE BIRD SPECIES**

Species	Status	Preferred Habitat	Potential to Occur on the Project site; Results of Surveys	Occurrence
	L.A. Audubon			
		agricultural areas; they avoid the most arid desert habitats.		
<i>Sturnella neglecta</i> western meadowlark	CSBS	Open grasslands, prairies, meadows, and some agricultural fields; avoid wooded edges and areas with heavy shrubs; in winter they forage for seeds on nearly bare ground.	The Project site provides suitable habitat; moderate numbers observed year-round on the Project site during surveys.	Observed
<i>Thalasseus elegans</i> elegant tern	CSBS (breeding)	Coastal waters, occasionally ocean far from land; breeds on low, flat, sandy islands.	The Project site is outside the known range of this species; not expected to occur.	Not observed
<i>Thalasseus maximus</i> royal tern	CSBS (breeding)	Coasts, sandy beaches, salt bays; favors warm coastal waters, especially those that are shallow and somewhat protected, as in bays, lagoons, estuaries; usually nests on low-lying sandy islands.	The Project site is outside the known range of this species; not expected to occur.	Not observed
<i>Toxostoma lecontei</i> Le Conte's thrasher	CSBS	Desert flats with sparse growth of saltbush; also on creosote bush flats in some areas; mainly where there are a few slightly larger mesquites or cholla cactus.	The Project site is outside the known range of this species; not expected to occur	Not observed
ML=Mountain and lowland

CSBS County Sensitive Bird Species				

## ***Invertebrates***

### **Conservancy Fairy Shrimp**

The conservancy fairy shrimp is a federally listed Endangered Species. It was listed on September 19, 1994. The species is currently known from several disjunct populations: the Vina Plains in Tehama County; south of Chico in Butte County; the Jepson Prairie Preserve and surrounding area in Solano County; the Sacramento National Wildlife Refuge in Glenn County; Mapes Ranch west of Modesto; San Luis National Wildlife Refuge and the Haystack Mountain/Yosemite Lake area in Merced County; and two locations on the Los Padres National Forest in Ventura County (USFWS 1994b). Critical Habitat was designated for this species on February 10, 2006. A total of 161,786 acres in Butte, Colusa, Mariposa, Merced,

Solano, Stanislaus, Tehama, and Ventura Counties were determined to be critical habitat for this species. Three other vernal pool crustacean species had Critical Habitat designated within the same document: longhorn fairy shrimp (*Branchinecta longiantenna*), vernal pool fairy shrimp, and vernal pool tadpole shrimp (*Lepidurus packardii*). Although there are no records of this species within the vicinity of the site, survey data are limited. A habitat assessment conducted by Glenn Lukos Associates indicated that suitable conditions for this species may occur on the Project site (GLA 2005b). This species was not observed during protocol dry and wet season surveys of two seasonal ponds in 2004–2005 (GLA 2005a). The conservancy fairy shrimp is not expected to occur on the Project site due to negative results of focused surveys.

### Vernal Pool Fairy Shrimp

The vernal pool fairy shrimp is a federally listed Threatened Species. It occupies a variety of different vernal pool habitats from small, clear, sandstone rock pools to large, turbid, alkaline, grassland valley pools. The vernal pool fairy shrimp requires water temperatures of 10 degrees Celsius (°C, 50 degrees Fahrenheit [°F]) or less for cysts to hatch, and time to sexual maturity ranges from an absolute minimum of 18 days at 20°C (68°F) to a more typical 41 days at 15°C (59°F). Longevity ranges from about 70 days to a maximum of 139 days (Eriksen and Belk 1999). Although the species has been collected from large vernal pools, including 1 exceeding 25 acres, it tends to occur in smaller pools. It is most frequently found in pools measuring less than 0.05 acre (Impact Sciences 2003). These are most commonly found in grass- or mud-bottomed swales, or basalt flow depression pools in unplowed grasslands (USFWS 1994b). This species has been recorded from elevations as high as 5,600 feet above msl. The vernal pool fairy shrimp is known from three locations in Los Angeles County: one near Via Princessa, one at Cruzan Mesa, and the third at nearby Plum Canyon in the Santa Clarita area (Impact Sciences 2011; GLA 2005b).

A total of 597,821 acres in Jackson County, Oregon and Alameda, Amador, Butte, Contra Costa, Fresno, Kings, Madera, Mariposa, Merced, Monterey, Napa, Placer, Sacramento, San Benito, San Joaquin, San Luis Obispo, Santa Barbara, Shasta, Solano, Stanislaus, Tehama, Tulare, Ventura, and Yuba Counties, California were determined to be Critical Habitat for this species. A habitat assessment conducted by Glenn Lukos Associates indicated that suitable conditions for this species may occur on the Project site (GLA 2005b); however, it was not observed during protocol dry and wet season surveys of two seasonal ponds in 2004–2005 (GLA 2005a). Based on the absence of this species from the two ponds during protocol surveys, the lack of reported occurrences in the site vicinity, and the location of the Project site outside the Critical Habitat designation for this species, the vernal pool fairy shrimp is not expected to occur on the Project site.

## ***Amphibians and Reptiles***

### Arroyo Toad

The arroyo toad is a federally listed Endangered Species and a California Species of Special Concern. This species historically occurred from San Luis Obispo to San Diego Counties along most major rivers. Most of the remaining populations occur in the national forests. The nearest recorded observation location is Piru Creek in the Los Padres National Forest (CDFW

2015a). The arroyo toad is generally found in semi-arid regions near washes or intermittent streams (Zeiner et al. 1988); however, this species has highly specialized habitat requirements, such as breeding pools within approximately 300 feet of juvenile and adult habitats, consisting of stream banks comprised of stable, sandy terraces (Jennings and Hayes 1994).

On February 9, 2011, the USFWS published the current Final Rule designating 98,366 acres of land as critical habitat for the arroyo toad in Santa Barbara, Ventura, Los Angeles, San Bernardino, Riverside, Orange, and San Diego Counties (USFWS 2011b). The study area is not located in areas designated as critical habitat for the arroyo toad. Although potentially suitable habitat is present in some drainages on the Project site, the site is located outside the species' known current range, and it has not been observed during other biological surveys and site visits. The Project site is not within the 2001, 2005, or 2011 designated Critical Habitat areas determined by the USFWS; the closest Critical Habitat is from the 2011 designation and is located about four miles southwest of the site. Surveys for this species were completed by BonTerra Consulting in spring/summer 2006 and results were negative. The arroyo toad is not expected to occur on the Project site.

#### Tehachapi Slender Salamander

The Tehachapi slender salamander is a State-listed Threatened Species. It occurs in scattered populations through the Tehachapi Mountains to Fort Tejon in Kern County, California (Stebbins 2003). This species is associated with north-facing slopes; it is found within and under rock talus and rotting logs; and it is located in moist, decomposing, our Lord's candle leafbases (Hansen and Wake 2005; Sweet 2011). The Tehachapi slender salamander occurs in moist canyons comprised of canyon live oak, blue oak, interior live oak, western sycamore (*Platanus racemosa*), Fremont cottonwood, California buckeye (*Aesculus californica*), foothill pine (*Pinus sabiniana*) woodlands, and juniper woodland (Hansen and Wake 2005; Sweet 2011). Individuals are usually observed between elevations of 2,000 and 4,600 feet above msl (Stebbins 2003). In the vicinity (within ten miles) of the site, this species has been reported from Bear Trap Canyon and Fort Tejon State Park (CDFW 2015a). The range of distribution for this species overlaps with only one other slender salamander species: the black-bellied slender salamander. The black-bellied slender salamander and Tehachapi slender salamander can be easily distinguished from each other. Although Tehachapi slender salamander was not observed on the site, potentially suitable habitat is present in the north-facing oak woodlands in the western portion of the site and in the southern portion of the site south of SR-138. Focused surveys for this species were completed by BonTerra Consulting in spring/summer 2006 and results were negative for all salamanders. The Tehachapi slender salamander may occur on the Project site.

On April 22, 2009, the USFWS published a 90-day finding concluding that the petition to list the salamander contained substantial scientific or commercial information to indicate that listing the Tehachapi slender salamander may be warranted (USFWS 2009). On October 11, 2011, the petition to list the Tehachapi slender salamander was denied by the USFWS. It was determined that the threats to the species did not warrant federal protective status and that, despite the species limited range and population, it was not threatened throughout the entirety of its occurrences (USFWS 2011a).

### Yellow-Blotched Ensatina (Salamander)

The yellow-blotched ensatina, a subspecies of ensatina (*Ensatina eschscholtzii*), is a California Species of Special Concern. This subspecies occurs in the Tehachapi Mountains, on Mount Pinos, in the vicinity of Fort Tejon, and in the Frazier-Alamo Mountain area. This species is found under rotting logs, bark, and rocks. In the south, this species is found in forests and well-shaded canyons, oak woodlands, grasslands, and chaparral (Stebbins 2003). In the vicinity of the site, yellow-blotched ensatina has been reported from Fort Tejon State Park (near Lake Castaic) and Tejon Peak (CDFW 2015a). Wooded drainages in the western portion of the Project site could possibly support the yellow-blotched ensatina. Surveys for this species were completed by BonTerra Consulting in spring/summer 2006 and results were negative. However, this species may occur in unsurveyed areas on the Project site where there is suitable habitat.

### California Red-Legged Frog

The California red-legged frog (*Rana aurora draytonii*) is a federally listed Threatened Species and a California Species of Special Concern. This frog has been extirpated from approximately 70 percent of its historic range and now primarily occurs only in wetlands and streams in Central California (USFWS 2006a). Until 2004, the red-legged frog (*Rana aurora*) was considered to comprise two subspecies, the California red-legged frog (*Rana aurora draytonii*) and the northern red-legged frog (*Rana aurora aurora*) until genetic studies (Shaffer et al. 2004) determined that the two taxa are actually two separate species, *R. aurora*, and *R. draytonii*. The ranges of these two species overlap in Mendocino County. However, the regulatory agencies (CDFW and USFWS) continue to recognize the older taxonomy of one species of red-legged frog as having two subspecies: the California red-legged frog and the northern red-legged frog. Only the California red-legged frog (*Rana aurora draytonii* or *R. draytonii*) occurs in the Project region. This frog prefers areas with deep ponds in slow-moving streams where emergent vegetation is found on the bank edges (Jennings and Hayes 1994). Adults feed primarily on aquatic and terrestrial invertebrates.

On March 17, 2010, the USFWS published the current Final Rule designating 1,636,609 acres of land as Critical Habitat for the California red-legged frog in 27 California counties, including Los Angeles County. The Project site is not located in the final Critical Habitat designations for this species. This species was not observed during focused protocol surveys in 2001, and the stream conditions on the site indicate that this species is not expected to occur (Impact Sciences 2001a). Focused surveys for this species were completed by BonTerra in spring/summer 2006 and results were negative. The Project site is not located within areas designated as Critical Habitat in either 2001, 2006, or 2010 (USFWS 2010a); the closest Critical Habitat is from the 2010 designation, and is located approximately 16 miles south of the Project site.

### Western Spadefoot

The western spadefoot is a California Species of Special Concern. This species occurs in the Central Valley, in its bordering foothills, and in the Pacific Coast Ranges from Monterey Bay south to Baja California, Mexico (Stebbins 2003). From the Santa Clara River Valley in Los Angeles and Ventura Counties southward, an estimated 80 percent of habitat for this species

has been lost. This species inhabits grassland, coastal sage scrub, and other habitats with open sandy, gravelly soils. The western spadefoot is primarily a species of the lowlands, frequenting washes, floodplains of rivers, alluvial fans, and alkali flats (Stebbins 2003). The western spadefoot breeds in quiet streams, vernal pools, and temporary ponds. This species is rarely seen outside the breeding season. The Project site provides conditions potentially suitable for this species at cattle ponds, ephemeral ponds, and other areas where there are water ponds during the wet season; however, the Project site is located just outside the known geographical range for this species (Zeiner et al. 1988). The western spadefoot was not observed during focused surveys in 2005 (only a portion of the Project site was surveyed). This species may occur in other unsurveyed areas on the Project site where there is potentially suitable habitat.

#### Silvery Legless Lizard

The silvery legless lizard (*Anniella pulchra pulchra*) is a California Species of Special Concern. It occurs in the Coast, Transverse, and Peninsular Ranges from Contra Costa County south to Baja California, Mexico (Stebbins 2003). It is nearly endemic to the state of California (Jennings and Hayes 1994). Though currently viewed as subspecies of silvery legless lizard by the CDFW, the silvery legless lizard's taxonomic classification is under review due to the present amount of genetic similarity between the silvery legless lizard and black legless lizard (*Anniella pulchra nigra*) populations. This report conforms to the regulatory agency, CDFW, and thus places the silvery legless lizard and black legless lizard as subspecies of silvery legless lizard. The distribution ranges of the silvery legless lizard and black legless lizard do not overlap in the Project region, and the Project site is within the silvery legless lizard's known geographical range (Zeiner et al. 1988).

The silvery legless lizard is a small, secretive lizard that spends most of its life beneath the soil, under stones, logs, debris, or in leaf litter. This species requires areas with loose, sandy soil, moisture, warmth, and plant cover. It occurs in chaparral, pine-oak woodland, beach, and riparian vegetation types at elevations ranging from sea level to about 5,100 feet above msl (Stebbins 2003). The strict habitat requirements for this species (such as substrates with high sand and moisture content) and its limited range make this species extremely vulnerable to disturbance. It is threatened by development, grazing, off-road vehicle activity, sand mining, beach erosion, excessive recreational use of coastal dunes, and the introduction of exotic plants (Jennings and Hayes 1994). The Project site provides suitable habitat for this species; one silvery legless lizard was observed, although no focused surveys for this species were conducted.

#### Western Pond Turtle

The western pond turtle (*Actinemys marmorata pallida*) is a California Species of Special Concern. This subspecies occurs from approximately the San Francisco Bay area south to northern Baja California, Mexico. The western pond turtle is thought to be in decline in 75 to 80 percent of its range (Stebbins 2003). The western pond turtle occurs primarily in freshwater rivers, streams, lakes, ponds, vernal pools, and seasonal wetlands, requiring water depths in excess of six feet and basking sites such as logs, banks, or other suitable areas above water level. Nesting occurs during spring or early summer (generally between April and August). Nest sites can be located along sandy banks adjacent to large, slow-moving

streams, but females may travel up to approximately 300 feet in search of suitable nesting sites and have been known to nest in open grasslands on south-facing slopes (Morey 2000; Lovich n.d.). Other long-distance movements (e.g., overwintering) may be in response to drying bodies of water or other local factors (Morey 2000). In cold regions where hibernation is more common, it usually occurs in mud beneath water, though this has been documented in upland areas as well. The life history of western pond turtles living in perennial water bodies, such as at Quail Lake, may be almost exclusively aquatic, only leaving the water to nest (Zargoza et al. 2015).

In addition to losses of habitat, this species is also threatened by grazing, non-native species, and disease (Jennings and Hayes 1994). There are reported occurrences of this species in the vicinity of the Project site in the Lebec and Frazier Mountain USGS topographic quadrangles (CDFW 2015a); however, specific location information is suppressed by the CDFW to protect this species from collectors. This species has been observed adjacent to the Project site at Quail Lake. The Project site has limited availability of similar suitable habitat (Impact Sciences 2004b). General surveys conducted during 2006 and 2008 found habitat insufficient to support pond turtle except for the ranch pond located near the north-central edge of the Project site (also where the tricolored blackbird colony was observed). Although no live trapping for the pond turtle was conducted during the 2006 and 2008 surveys, this species is not expected to occur due to poor water quality. Other wetland areas on the site were inadequate for turtle occupation. Upland areas just north (within 300 feet) of Quail Lake may contain potentially suitable nesting habitat, partially overlapping the Project site. This species was not detected during surveys.

#### Blunt-Nosed Leopard Lizard

The blunt-nosed leopard lizard (*Gambelia sila*) is a federally listed Endangered, State-listed Endangered, and a California Fully Protected species. No Critical Habitat has been designated for this species. Endemic to California, this species inhabits the San Joaquin Valley and nearby valleys and foothills, from extreme northwest Santa Barbara County and western Kern County north to southern Merced County. Elevation requirements extend from 100 to 2,400 feet above msl. It is no longer present throughout most of its former range as the habitat has been significantly altered by farming, urban development, overgrazing, oil wells, mining, reservoirs, and off-road vehicle use. At one time, it hybridized with long-nosed leopard lizard (*Gambelia wislizenii*) in the upper Cuyama drainage in Ventura County (near Santa Barbara County), but much of the habitat in this region has now been degraded. This species uses mammal dens and burrows for cover and shelter. The number of available burrows will determine the size of this lizard's population in an area (Stebbins 2003). Blunt-nosed leopard lizard inhabits relatively open wash habitat, floodplain, and grasslands (Warrick et al. 1998) with sparse open vegetation comprised of bunch grass, alkali bush, sagebrush, creosote bush, or other scattered low plants (Germano et al. 2001). It avoids dense grass and brush, which interfere with running (Stebbins 2003). The blunt-nosed leopard lizard has a current range that stops north of the Tehachapi Range. It has not been observed and is not expected to occur on the site.

### Coast Horned Lizard

The coast horned lizard is a California Species of Special Concern. It occurs throughout much of California, west of the desert and Cascade-Sierra highlands south to Baja California, Mexico (Stebbins 2003); however, many of the populations in lowland areas have been reduced or eliminated due to urbanization and agricultural expansion (Stebbins 2003). It is a small, spiny, somewhat rounded lizard that occurs in scrubland, grassland, coniferous forest, and broadleaf woodland vegetation types; it prefers open areas for basking and loose, friable soil for burrowing. Three factors have contributed to its decline: loss of habitat, overcollecting, and the introduction of exotic ants. In some places, especially adjacent to urban areas, the introduced ants have displaced the native species upon which the lizard feeds (Fisher et al. 2002; Suarez and Case 2002; Suarez et al. 2000). In addition to loss of habitat, this species is also threatened by fires, off-road vehicles, grazing and pets, especially domestic cats (Jennings and Hayes 1994). In the vicinity of the site, this species has been reported from Hungry Valley, Tejon Peak, Tehachapi Mountains, and two miles east of Gorman along SR-138 (CDFW 2015a). This species was observed in several drainages scattered across the Project site in 2003 (Impact Sciences) and in washes and upland scrub habitat during various surveys on the Project site in 2015.

### Two-Striped Garter Snake

The two-striped garter snake is a California Species of Special Concern. It occurs from Monterey County, south to Rio Rosario in Baja California, Mexico at elevations between sea level and approximately 8,000 feet above msl (Stebbins 2003). It is considered locally rare in southwestern California. The two-striped garter snake is highly aquatic and occurs primarily in or near perennial or intermittent freshwater streams with rocky beds in riparian habitats bordered by oak woodlands, willows (*Salix* spp.), or other dense vegetation (Jennings and Hayes 1994; Stebbins 2003). The two-striped garter snake feeds on small fishes, frogs, tadpoles, and earthworms. It is estimated that development and other human impacts have reduced the historic range of this species in California by 40 percent (Stebbins 2003). A two-striped garter snake was observed in Oso Canyon (Impact Sciences 2003). Due to the suitable aquatic habitat and the known reported occurrence, it is determined that this species is expected to occur on the Project site.

## **Birds**

### Tricolored Blackbird

The tricolored blackbird is a California Species of Special Concern and a California Candidate for listing as an Endangered Species. These colonially nesting birds prefer to breed in marsh vegetation of bulrushes (*Schoenoplectus* spp.) and cattails (*Typha* sp.) and have also been recorded nesting in willows (*Salix* spp.), blackberries (*Rubus* spp.), and mustard (*Brassica* spp.) (Beedy et al. 1991). During winter months, they are often found foraging in wet pastures, grasslands, agricultural fields, and seasonal wetlands. Tricolored blackbirds are nomadic, wandering during the nonbreeding season and occupying colony sites intermittently (Unitt 1984). There are reported occurrences of this species in the vicinity of the site along the southern edge of Quail Lake (north of SR-138) and on the shores of Holiday Lake approximately five miles east of the Project site (CDFW 2015a). The Project site provides suitable foraging and small amounts of suitable nesting habitat, which consists of

areas of dense reeds (*Typha* spp.) and nettles (*Urtica dioica*). The tricolored blackbird was observed nesting in large numbers along the north-central edge of the Project site and was also observed in Oso Creek (BonTerra Consulting 2008; Impact Sciences 2004a). Most recently, focused surveys for tricolored blackbird were conducted in 2015 and they were observed nesting off site along the northern shore of Quail Lake and at Holiday Lake, and these birds were observed foraging on the Project site (BonTerra Psomas 2015d).

Tricolored blackbird breeding was detected at Quail Lake and approximately 3.4 miles east at Holiday Lake. No evidence of tricolored blackbird breeding was detected on the Project site. However, tricolored blackbirds from the Quail Lake and potentially the Holiday Lake breeding locations were detected foraging on the Project site. The breeding birds at Quail Lake were observed foraging on caterpillars and grasshoppers in the grasslands and rabbitbrush scrub on the Project site, while the breeding birds potentially from Holiday Lake were observed foraging on unknown insects in the agriculture fields in the easternmost portion of the Project site. The assumption that birds from Holiday Lake may have been feeding at the agricultural fields on the Project site was made based on flight direction, while the birds from Quail Lake were directly observed foraging on the Project site. Flocks of what appeared to be unpaired males were also observed foraging throughout the Project site during these surveys. Areas where these flocks were detected with high frequency included the Oso Canyon portion of the Project site; the rabbitbrush scrub along the length of the East Branch of the California Aqueduct (east-west alignment); in the northern section of the Project site immediately east of the Aqueduct; and the agricultural fields. Details on breeding colonies and population counts are provided below.

Five distinct breeding colony locations were detected in the bulrush vegetation on the shores of Quail Lake. The breeding colony with the closest proximity to the Project site was Location 1 at 50 feet (west), while the farthest proximity was Location 5 at approximately 2,030 feet (southwest). All other locations fall between those proximities. Breeding tricolored blackbirds along the northern shore of Quail Lake were detected foraging on the Project site, while birds from Location 5 were observed foraging south of SR-138, off site.

Population counts for breeding tricolored blackbirds at the Quail Lake locations numbered as high as 1,000 adults on March 31, 2015. By June 11, 2015, this number had dropped to approximately 200 birds; a mix of adult males, females, and juvenile birds were observed. Adults were still observed feeding nestlings and fledglings at this time. No feeding of nestlings was detected during the June 26, 2015, survey and it was determined that all birds had fledged. The Holiday Lake colony had an estimated population count of approximately 3,500 adult birds. Breeding was detected there from March 31, 2015 to June 26, 2015.

On February 26, 2016, the CDFW issued a Public Notice that announced the tricolored blackbird as a Candidate Threatened or Endangered species under the CESA (CDFW 2016). The CDFW has initiated a status review of the tricolored blackbird and will review data and comments on the petitioned action (listing of the species). The CDFW has 12 months to review the petition; evaluate the available information; and report whether or not the petition action is warranted. A 30-day public comment period will be allowed prior to taking any action on the CDFW recommendation. According to the Notice, as a Candidate

Threatened or Endangered species, the tricolored blackbird receives the same legal protection afforded to an Endangered or Threatened species.

### Grasshopper Sparrow

The grasshopper sparrow (*Ammodramus savannarum*) is a California Species of Special Concern. This sparrow is an uncommon and very local summer resident along the coastal slope of Southern California (Garrett and Dunn 1981). This is an inconspicuous bird of grasslands with an insect-like song; it is declining throughout North America due to loss of habitat and inhibition of fire. In the southwestern part of its breeding range, this sparrow prefers more lush areas with some shrub cover in arid grasslands (Vickery 1996). Reports of this species at Gorman Ranch, including a recent CNDDDB report of 1 adult observed in grasslands 0.8 mile northeast of the I-5/SR-138 interchange, are believable since this species is migratory and can appear in places previously unknown (CDFW 2015a). Potentially suitable habitat for this species is present in the grassland vegetation types of the Project site. It has not been observed during the surveys and, since the Project site is outside the historic and current known breeding range for the species, it is not expected to occur to breed, though it may migrate through the site.

### Golden Eagle

The golden eagle is a California Fully Protected Species, a California Species of Special Concern Watch List Species, and is also protected by the Federal Bald Eagle Act. Habitat for this species generally consists of grasslands, deserts, savannas, and early successional stages of forest and shrub habitats. Broad expanses of open country are required for foraging, while nesting is primarily restricted to rugged mountainous areas with large trees or cliffs (Johnsgard 1990). The golden eagle is an uncommon resident throughout Southern California, except in the Colorado Desert and Colorado River, where it is a casual winter visitor (Garrett and Dunn 1981). This species is threatened by habitat destruction, shooting, and human disturbance at nest sites (Remsen 1978). This species has been reported from the Tehachapi Mountains two miles west-northwest of Quail Lake (CDFW 2015a). Potentially suitable foraging habitat is present for this species throughout the Project site; however, only limited nesting opportunities are present in woodland areas of the site. The golden eagle was observed on multiple occasions soaring over the site (BonTerra Consulting 2008; Impact Sciences 2004a; BonTerra Psomas 2013). Golden eagle is expected to occur on-site for foraging, and may occur on site for nesting.

### Long-Eared Owl

The long-eared owl is a California Species of Special Concern. The breeding range of this species in California includes Central and coastal Southern California (AOU 1998). This species occupies coniferous, deciduous and evergreen forests, orchards, wooded parks, farm woodlots, river woods, and desert oases. Wooded areas with dense vegetation are needed for roosting and nesting, while open grasslands or shrublands are needed for hunting (Marks et al. 1994; AOU 1998). Population declines in Southern California are attributed to loss of riparian and grassland habitats to development (Marti and Marks 1989; Bloom 1994). This species has not been detected on site; however there are records for this species in the Project region (eBird 2016). The western portion of the Project site provides a limited

amount of potentially suitable wintering and breeding habitat for this species; therefore, the long-eared owl has a low potential to occur.

### Burrowing Owl

The burrowing owl is a California Species of Special Concern. Although the burrowing owl was proposed as a State Candidate for listing, it was determined that the species did not warrant listing. This species is considered a Species of Local Concern, however, because it is much less common in Southern California than in the Central Valley. In Southern California, burrowing owls breed and forage in grasslands and prefer flat to low rolling hills in treeless terrain; this species has declined in many other areas due to habitat modification, poisoning of its prey items, shooting, and human disturbance (Remsen 1978). In the vicinity, this species has been reported approximately eight miles east of the Project site in the Antelope Valley (CDFW 2015a). Potentially suitable conditions for foraging and nesting for this species are present throughout most of the Project site. One pair of burrowing owls was observed on the site in 2001 (Impact Sciences 2004a); one individual was observed just off the site to the north during surveys in 2006 (BonTerra Consulting 2008). Due to the lack of incidental observations of burrowing owls by biologists conducting other surveys on the site over multiple years, burrowing owls are expected to occur in very low numbers.

### Redhead

The redhead (*Aythya americana*) is a California Species of Special Concern. The redhead is a duck that breeds in open water areas from central Alaska, British Columbia, central Canada, and the midwestern United States south to southern California, Arizona, New Mexico, and north-central Texas; also sporadically in the northeastern United States, southeastern Canada, and interior Mexico (Shuford and Gardali 2008). Since the mid-1940s breeding populations in California have been greatly reduced, with the largest breeding populations occurring in northeastern California. Breeding redheads have been documented in Southern California in Bishop, Inyo County, Antelope Valley, and eastern Kern County. Redheads continue to breed in small numbers at the Salton Sea. Redheads have been observed at Quail Lake and Holiday Lake (approximately 3.4 miles east of the project site) during migration (eBird 2016). The Project site is within the current breeding range for the redhead (Shuford and Gardali 2008). The Project site does not contain suitable breeding habitat for the redhead, not expected to occur for breeding but may occur as an occasional visitor.

### Swainson's Hawk

The Swainson's hawk is a State-listed Threatened species. The Swainson's hawk is a Neotropical migrant that breeds in grassland and savannah habitats in western North America east to the Great Plains and from southwest Alaska and southern Canada south to northern Mexico. This is a gregarious species that is often observed in migrating flocks, sometimes numbering in the thousands (England et al. 1997). Although the total population has been conservatively estimated at 40,000 to 55,000 breeding pairs, the Swainson's hawk has experienced serious local declines in parts of its breeding range such as in Oregon and California (del Hoyo et al. 1994). In California, the Swainson's hawk is considered to be a locally common to rare breeder with the majority of breeding territories located in the Central Valley and Great Basin regions. Most breeding pairs are located in the middle of the

Central Valley between Sacramento and Modesto, and in the northern San Joaquin Valley (Woodbridge 2004).

Swainson's hawks are now absent from most of their historic range in the central and southern parts California (Woodbridge 2004). Bloom (1980) estimated the California breeding population to be 375 pairs and found this to represent a 91 percent decline from historical population estimates. More recent surveys have shown an increase with estimates as high as 1,000 pairs (Woodbridge 2004). Unpublished data from Pete Bloom and Woodridge (2004) indicates that there has been recent recolonization of historic habitats in the Antelope Valley and population increases in the Owens Valley. In addition, recent surveys in 2008, 2009, and 2010 in the western Antelope Valley, east of the Project region, have found nesting Swainson's hawks at new sites (CEC and CDFG 2010). This species is threatened by loss of habitat, habitat deterioration at the South American wintering grounds, human disturbance at nest sites, shooting, and possibly pesticides (Remsen 1978). Potentially suitable foraging and nesting habitat for this species occurs on the site, and this species nests in high desert areas such as the Antelope Valley. Swainson's hawk was observed on the Project site as a spring migrant (Impact Sciences 2004a) and as a non-breeding summer visitor. A Swainson's hawk group of five individuals, which was observed during the 2008 breeding season (July 2008), was considered to be summering outside their known breeding range (BonTerra Consulting 2008). Focused surveys for Swainson's hawk were conducted on the Project site in 2013. No breeding Swainson's hawks were detected during the focused surveys; however, migrating Swainson's hawks were detected then and were detected incidentally during tricolored blackbird surveys (BonTerra Psomas 2013, 2015d). Swainson's hawk is expected to occur on site for foraging, but is not expected to occur on site for nesting.

### Mountain Plover

Mountain plover (*Charadrius montanus*) is a California Species of Special Concern. This species breeds from southern Alberta and southwestern Saskatchewan, Canada south through Montana and Wyoming to southeastern New Mexico and western Texas (AOU 1998). Most of these birds spend the winter in the Central and Imperial valleys of California (Knopf 1996). Its winter range in California was previously described as interior valleys and plains at low elevations from the Sacramento Valley and eastern parts of the San Francisco Bay region south to the coastal counties of Southern California and the Imperial Valley (Grinnell and Miller 1986). The largest numbers of mountain plovers currently winter in the Imperial Valley and in the Central Valley from Colusa County south to Kern County. Relatively small populations also occur in the Panoche Valley and Carrizo Plains west of the San Joaquin Valley (or southern Central Valley), in the Colorado River Valley near Blythe, and the western Antelope Valley (Shuford and Gardali 2008). For both breeding and wintering, mountain plovers are strongly associated with short-grass prairie habitats or other similar habitats that are flat and generally lack vegetation (Knopf 1996). They also occur on more natural, non-cultivated sites, such as alkali sink scrub, valley sink scrub, alkali playa, and annual grasslands (USFWS 1999). Grazed or burned agricultural fields also provide suitable habitat for this species, as well as Bermuda grass fields (Knopf 1996). Flocks of this plover have been detected on about 75 percent of the National Audubon Society's (NAS) Christmas Bird Counts conducted annually at Lancaster since 1990 (NAS 2017). The Project site contains

grasslands and agricultural fields on relatively gentle terrain that provide potentially suitable wintering habitat; however, due to a lack of detections during focused surveys or otherwise, the mountain plover is not expected to occur on site.

#### Northern Harrier

The northern harrier is a California Species of Special Concern. It is a regular winter migrant in marshes and fields throughout Southern California, but is very scarce as a local breeder (Garrett and Dunn 1981). This species nests in protected marshes or open grassy meadows. Northern harriers can be expected at any month of the year and can be seen foraging in grassland, scrub, and riparian vegetation types. While once a relatively common species during fall, winter, and spring in undeveloped areas of Los Angeles County, the northern harrier population is now greatly reduced and localized in distribution. This species is threatened by loss of suitable breeding habitat (Grinnell and Miller 1986). Potential foraging and nesting conditions for this species are present on the site. In addition, the northern harrier was observed on the site near Oso Canyon (Impact Sciences 2003) and observed during the summer season (BonTerra Consulting 2008; BonTerra Psomas 2013). Northern harrier is expected to occur on site for foraging, and may occur on site for nesting.

#### Western Yellow-Billed Cuckoo

The western yellow-billed cuckoo is a federally Threatened and a California Endangered species. There is currently no designated Critical Habitat for this species. California's population of western yellow-billed cuckoo was once estimated to be over 15,000 pairs, but in less than 100 years, it has declined to less than 30 pairs with most cuckoos concentrated at 3 locations: the Sacramento River, the South Fork of the Kern River, and the lower Colorado River (Hughes 1999). Cuckoos appear to have been extirpated from other locations such as at the Santa Ana River in the Prado Basin where small numbers (three to seven) were reported annually prior to 1995 (Pike et al. 2004). Breeding western yellow-billed cuckoos require relatively large (i.e., greater than 20 hectares or 50 acres) contiguous patches of multilayered riparian habitats (Daw 2014). They require broad areas of old-growth riparian vegetation dominated by willows and Fremont's cottonwoods (*Populus fremontii*) with dense understories. Mature riparian woodlands with cottonwoods (*Populus* sp.) and willows exist on the Project site in just a few scattered small patches. These are not considered substantial enough to support breeding cuckoos. A Western yellow-billed cuckoo was reported during surveys in June 2003 in the north-central portion of the site (Impact Sciences 2004a). This observation was considered most likely a rare migrating individual. Follow-up visits in the following weeks to the location where the bird was observed were negative for the cuckoo (Babcock 2005). Avian surveys conducted in 2006 by BonTerra Consulting did not detect this species on the Project site, and it has not been observed on the Project site to date. Western yellow-billed cuckoo may occur onsite as a rare migrant, but it is not expected to occur on site for nesting.

#### White-Tailed Kite

The white-tailed kite is a California Fully Protected Species. This species is an uncommon to common resident in coastal Southern California, and a rare visitor on the western edge of the deserts (Garrett and Dunn 1981). This raptor has been slowly increasing in interior

regions in recent years and small numbers breed locally in the Antelope Valley. Kites nest primarily in oaks, willows and western sycamores (*Platanus racemosa*), and forage in grassland and scrub vegetation types. White-tailed kites show strong site fidelity to nest groves and trees. Conditions suitable for foraging and nesting are present throughout the site. The Project site provides potentially suitable nesting habitat and there is potential for this species to breed on the site. It has been observed flying over the grasslands in the western portion of the Project site. White-tailed kite is expected to occur on site for foraging, and it may occur on site for nesting.

#### Southwestern Willow Flycatcher

The southwestern willow flycatcher is a federally and State-listed Endangered Species. This subspecies was once considered a common breeder in coastal Southern California; however, it has declined drastically due to losses of breeding habitat and nest parasitism by the brown-headed cowbird (*Molothrus ater*). This species occurs in riparian habitats along rivers, streams, or other wetlands where a dense growth of willows, baccharis (*Baccharis* sp.), arrowweed (*Pluchea* sp.), tamarisk (*Tamarix* sp.), or other riparian plants are present, often with a scattered overstory of cottonwood (USFWS 1995). Critical Habitat for this species was originally designated on July 22, 1997, and was updated on October 19, 2005. In 2007, the USFWS announced that it would review the 2005 designation; then, in November 2007, the USFWS declared that it would maintain the 2005 designation. The USFWS designated final Critical Habitat in Arizona, California, Nevada, New Mexico, and Utah. Counties containing Critical Habitat in California include Kern, Santa Barbara, San Bernardino, and San Diego. Of the 48,896 USFWS-designated acres of Critical Habitat for the southwestern willow flycatcher, 17,212 acres are located in California (USFWS 2013). Limited suitable habitat for this species is present in the riparian vegetation types on the site. The Project site is not located within the final 2013 USFWS-designated Critical Habitat. Focused surveys were completed and, although transient willow flycatchers (unknown subspecies) were detected, no breeding southwestern willow flycatchers were detected (Impact Sciences 2003; BonTerra Consulting 2008). The southwestern willow flycatcher may occur on site during migration, but it is not expected to occur for nesting due to extreme rarity of the subspecies in the region.

#### California Condor

The California condor is a federally and State-listed Endangered Species. It has broad habitat and climatic tolerances. Suitable habitat for the condor includes adequate food supply, open areas to locate food, and reliable air movements to allow for extending soaring (Bloom 2009). Foraging habitat consists of vast expanses of open savannah and grassland, including potreros (cattle ranches or pastures) within chaparral with cliffs, large trees, and snags that are often separated by far distances from the nesting sites. Roosting habitat is located near important foraging grounds, often near a previously discovered carcass. Nesting habitat ranges from chaparral to forested montane regions, including redwood forests. The California condor nests in caves, crevices, and large ledges on high sandstone cliffs. Expending very little energy, these scavengers soar on thermal updrafts and wind currents until they spot potential food sources. Breeding birds typically forage within 50 to 70 kilometers (31 to 43.5 miles) of their nesting areas, with core foraging areas ranging from 2,500 to 2,800 square kilometers (970 to 1,100 square miles) (Bloom 2009).

In the early 1980s, the total population for this species was estimated at fewer than 20 individuals. By the end of 1986, all but two condors had been taken into captivity. On April 19, 1987, the last wild condor was captured and taken to the San Diego Wild Animal Park (Bloom 2009). Decline of this species has been attributed to many factors, including reduction or modification of foraging habitat, decrease in available food, disturbance around nest sites, shooting, poisoning, pesticide residues, and general senescence (growing old; aging) of the species (Garrett and Dunn 1981). A captive breeding program was initiated and birds have since been reintroduced into the wild at the Sespe Reserve, at Big Sur, and in the Grand Canyon. Currently, there are over 400 condors in the world population (both captive and wild), 128 of whom are in California (CDFW 2015a). Due to the combination of captive breeding and limited wild nest reproduction, the condor population is steadily increasing (Bloom 2009). In more recent years, the greatest cause of death is believed to be lead poisoning from eating carcasses with lead shot in them. Efforts to reduce lead poisoning in the region have been led by Tejon Ranch by voluntarily placing a ban on lead shot ammunition on Tejon Ranch lands. Most recently, the State of California has followed suit by enacting into law the Ridley-Tree Condor Preservation Act, which bans lead shot ammunition within the range of the California condor (Bloom 2009).

Nesting California condors, prior to the use of radio telemetry in the wild, were not known to travel more than 50–75 kilometers (31–43.5 miles) from an active nest. As opportunistic scavengers, California condors may travel tremendous distances in search of food (Bloom 2009); in some instances they can travel up to 225 kilometers (about 140 miles; Meretsky and Snyder 1992). As a resident, non-migratory species, the California condor has the largest home range of any terrestrial bird in North America studied to date. The Centennial Project site is about 30 kilometers (18.5 miles) from current active nest sites known since 2000, and approximately 10 kilometers (6 miles) from the closest known historical nesting site (Bloom 2009). Current satellite and radio-telemetry location data have shown that California condors occasionally travel in the perimeter of the Project site, but rarely occur actually on the Project site. There is one recorded instance of a bird landing on the site (Bloom 2009).

Condors apparently avoid valley floors for foraging; they rarely fly over valley floor habitat and almost never land there (Bloom 2009). By example, from 1982 to 1987, no condors with transmitters were known to cross the Central Valley. Instead, all birds followed the foothills and mountains surrounding the valley floor to move from the Sierra Nevada foothills to the Coast Ranges and back. Observations of flying condors prior to 1987 indicate that, on the few instances that they were known to have flown over valley floor habitat (including the Centennial Project site), the birds were usually flying high over the landscape, probably at an altitude of over 1,000 feet. During these flights, the condors rarely, if ever, landed and their movements appeared transitory. To date, four GPS location points out of many thousands were in the vicinity of the Centennial Project site. Numbers of GPS locations of released birds are increasing in the region as the number of condors in the wild increases (Bloom 2009).

Observations and data from telemetered birds (by radio and satellite) indicate that the Project site is not used for diurnal or nocturnal roosts, but may rarely be used for foraging or flyovers. It contains no features suitable for nesting, no cliffs or large trees of the height

and stature typical of condor nests. As the condor population increases, the Project site may receive flyovers by California condors; however, based upon known condor movements, flyovers would likely be rare events. Possibly as a result of limited big-game hunting or reduced wind currents and thermals, the Centennial Project site appears not to have the essential elements needed to attract condors (Snyder and Snyder 2000; Bloom 2009). Unreliable seasonal winds and/or thermals may be the reason for the area's limited use by past and present condors.

In the Project region, condors have been reported from the Sespe Reserve, Tejon Ranch, and Redrock Mountain (CDFW 2015a); On the Project site, a few hundred records,<sup>4</sup> representing high flying birds, exist including one landing (CDFW 2015a; Bloom 2009). Relative to the plethora of observation data that have been gathered for this species over the past 20 years, occurrence on the Project site is extremely rare. The thousands of other records for this species in the region are almost entirely located more than ten miles from the site. A study of all available California condor data gathered by the USFWS in recent years shows a preference for several high elevation areas in the region and an obvious avoidance of the low-lying western Antelope Valley, including the Project site (Bloom 2009). The California condor is not expected to occur on site for nesting or foraging.

On September 24, 1976, the USFWS designated Critical Habitat for the condor consisting of 9 areas that encompass approximately 600,000 acres (USFWS 1976). These areas occur in the following counties: Tulare, San Luis Obispo, Ventura, Kern, Santa Barbara, and Los Angeles. The Sespe-Piru, Matilija, Sisquoc-San Rafael, and Hi Mountain-Beartrap condor areas were considered critical for nesting and related year-long activity and the Mt. Pinos and Blue Ridge condor areas were considered critical for roosting. Tejon Ranch, Kern County rangelands, and Tulare County rangelands were considered important for feeding and related activities. Tejon Ranch and the Bitter Creek Wildlife Refuge were considered to be important because they contained the only significant feeding habitat remaining in close proximity to the Sespe-Piru condor nesting area (USFWS 1976). The Project site is not located within designated Critical Habitat for this species.

### Bald Eagle

The bald eagle was a federally listed Endangered species until 2007 when USFWS removed the bald eagle from the federal Endangered species list (USFWS 2007b). It does remain a California State-listed Endangered and California Fully Protected species; and it is also protected by the Federal Bald Eagle Protection Act of 1940 and the Migratory Bird Treaty Act of 1918 (U.S. Congress 1994, 2005). Several recovery plans from 1982 to 1990 were used to help the bald eagle populations recover. California is located within the Pacific Recovery Plan approved in 1986. Currently, there is no Critical Habitat designated for this species. Bald eagles usually nest in trees near water, but are known to nest on cliffs and are rarely on the ground. Fish are the major component of its diet, but waterfowl, gulls, and carrion are also eaten. The species may also use prairies if adequate food is available. Bald eagles frequent estuaries, large lakes, reservoirs, major rivers, and some seacoast habitats. Conditions marginally suitable for nesting and foraging are present on the Project site. The bald eagle

---

<sup>4</sup> It is important to note that hundreds of records does not equate to hundreds of condors. Rather, multiple data points for one bird would be recorded as it flew over the site.

has not been observed on the site, but has been observed adjacent to the site at Quail Lake (Impact Sciences 2004a). Due to the proximity of potentially suitable foraging habitat just off the site at Quail Lake and along the California Aqueduct, the bald eagle may occasionally occur and may potentially nest in trees on the site. Success of any potential future breeding at Quail Lake would be dependent on the quality of the foraging opportunities provided by available aquatic habitats regardless, to some degree, of adjacent upland habitats. This species would be expected to opportunistically scavenge on available carrion (i.e., dead prey including mammals), as it does elsewhere, but this behavior is more common in the non-breeding season. The bald eagle may occur for foraging and nesting.

#### Yellow-Breasted Chat

The yellow-breasted chat (*Icteria virens*) is a California Species of Special Concern. This species occurs as an uncommon and local summer resident in Southern California along the coast and in the deserts (Garrett and Dunn 1981). This large warbler was once a fairly common summer resident in riparian woodlands throughout California, but is now much reduced in numbers, especially in Southern California (Remsen 1978). For nesting, this species requires dense, brushy tangles near water and riparian woodlands supporting a thick understory. Singing males that were present in the Oso Canyon drainage during May 2006 and in 2008 did not remain to breed. The Project site provides potentially suitable habitat, and the yellow-breasted chat may occur during migration and for nesting on the site.

#### Loggerhead Shrike

The loggerhead shrike (*Lanius ludovicianus*) is a California Species of Special Concern. This species is now a fairly uncommon resident of lowlands and foothills in Southern California. Shrikes inhabit grasslands and other dry, open habitats. They can often be found perched on fences and posts from which prey items (e.g., large insects, small mammals, and lizards) can be seen. This species is threatened by habitat loss and pesticides (Ehrlich et al. 1988). The loggerhead shrike was observed on the site to the east and west of the California Aqueduct near the central portion of the site; it was also observed during summer season 2006 and 2008 surveys, and was seen incidentally during 2015 site visits (BonTerra Consulting 2008; Impact Sciences 2004a). The loggerhead shrike is expected to occur on site for foraging and nesting.

#### Summer Tanager

The summer tanager (*Piranga rubra*) is a California Species of Special Concern. This tanager is an uncommon summer resident along the Colorado River and locally elsewhere in the desert riparian habitats of Southern California (Garrett and Dunn 1981). It is primarily a rare migrant and winter visitor to the Southern California coast (Garrett and Dunn 1981; Lehman 1994). Breeding habitat for the summer tanager in the west consists of low elevation riparian woodlands dominated by willows and cottonwoods (Robinson 1996). In particular, older dense stands of willows and cottonwoods along rivers and streams provide suitable nesting habitat (Zeiner et al. 1990b). Riparian vegetation types on the Project site provide potentially suitable conditions for the summer tanager and it may occur, although the site is at the western edge of this species' breeding range.

### Coastal California Gnatcatcher

The coastal California gnatcatcher (*Polioptila californica californica*) is a federally listed Threatened species and a California Species of Special Concern. This species occurs in most of Baja California, Mexico's arid regions, but is extremely localized in the United States where it predominantly occurs in coastal regions of highly urbanized Los Angeles, Orange, Riverside, and San Diego Counties (Atwood 1992). In California, this species is an obligate resident of several distinct subassociations of the coastal sage scrub vegetation type. Brood parasitism by brown-headed cowbirds and loss of habitat to urban development have been cited as causes of the coastal California gnatcatcher population decline (Unitt 1984; Atwood 1990). On December 19, 2007, the USFWS published a final rule revising critical habitat for the coastal California gnatcatcher. The revised critical habitat designates 197,303 acres of land in Ventura, Los Angeles, Orange, Riverside, San Bernardino, and San Diego Counties, California (USFWS 2007a). The Project site is within the revised Critical Habitat for this species.

This species has been observed south of Lebec near the I-5/SR-138 interchange (CDFW 2015a); however, this was a highly unusual location for a sighting. There is no potentially suitable sage scrub habitat for this species on the Project site. Furthermore, the Project site is generally considered to be well north of the gnatcatcher's current range. Therefore, coastal California gnatcatcher is not expected to occur on the Project site.

### Purple Martin

The purple martin is a California Species of Special Concern. This large swallow is a rare and local summer resident in the region (Garrett and Dunn 1981). It breeds in woodlands of the foothill regions, often found in open or semi-open country near water. The purple martin was observed in the oak woodlands and grasslands on the Project site and may occur for nesting on the site (Impact Sciences 2004a).

### Yellow Warbler

The yellow warbler is a California Species of Special Concern. Most yellow warblers in Southern California are migrants, occurring in coastal areas south to western Baja California, Mexico (Dunn and Garrett 1997). Yellow warblers breed locally in riparian woodlands, but during migration they can forage in a variety of different habitat types. This species is threatened by loss of habitat and nest parasitism by brown-headed cowbirds (Remsen 1978). It was a common migrant during 2006 surveys for riparian habitats along the Oso drainage and its tributaries, but none remained to breed (BonTerra Consulting 2008). Yellow warbler is expected to occur on site during migration, and it may occur on site for nesting.

### California Spotted Owl

The California spotted owl (*Strix occidentalis occidentalis*) is a subspecies of the spotted owl (*Strix occidentalis*) and is a California Species of Special Concern. It is a non-migratory bird and is one of three subspecies of spotted owl. This medium-sized owl ranges from 16 to 19 inches in length with a wingspan of 42 to 45 inches. California spotted owls do not build their own nests; instead they rely on naturally occurring nest sites or nests built by other animals (Gutierrez et al. 1995). Historically, the California spotted owl has ranged

throughout most of California and has been known to occur from Monterey to San Diego Counties. A year-long resident of California, this nocturnal species is usually observed between elevations of 2,500 feet to 6,000 feet above msl, but has been observed from 1,000 feet to 7,700 feet above msl (Grinnell and Miller 1986). This uncommon bird is found in dense forested or woodland areas, adjacent to cliffs or steep-sided wooded canyons that generally consist of oak/bigcone Douglas-fir forest, redwood/California laurel forest, mixed conifer forest, and riparian/hardwood areas on the western side of the Sierra Nevada Mountains from Shasta County south to the Tehachapi Mountains; it is also found in all major mountains of Southern California with isolated observations on the eastern side of the Sierra Nevada Mountains and the central Coast Ranges as far north as Monterey County (USFWS 2006b; Grinnell and Miller 1986). A search of the CNDDDB showed no historic records for the California spotted owl. However, within the vicinity (i.e., ten miles) of the site, this species has been reported from Tejon Ranch north of the Project site (CDFW 2015a). Focused surveys for the spotted owl were conducted on the site in 2006, and results were negative (BonTerra Consulting 2006a). Due to survey results, limited potentially suitable habitat, and nearby range limits, this species is not expected to occur on the Project site. There is currently no CDFW-designated Critical Habitat for the California spotted owl.

#### Least Bell's Vireo

The least Bell's vireo is a federally and State-listed Endangered Species. The vireo is now a rare and local summer resident of Southern California's lowland riparian woodlands. While destruction of lowland riparian habitats has played a major role in driving this species to its present situation, brood parasitism by brown-headed cowbirds is the most important factor in its decline (Garrett and Dunn 1981). Local cowbird-control programs have been effective in maintaining some populations (Small 1994), and the species has begun to recover. The least Bell's vireo breeds primarily in riparian habitats dominated by willows with dense understory vegetation (USFWS 1986). Sharon Goldwasser found that a dense shrub layer two to ten feet above ground is the most important habitat characteristic for this species (Olson and Gray 1989). On February 2, 1994, the USFWS designated Critical Habitat for the least Bell's vireo at ten different locations. The designated Critical Habitat includes approximately 38,000 acres in Santa Barbara, Ventura, Los Angeles, San Bernardino, Riverside, and San Diego Counties, California. These areas account for nearly 49 percent of the least Bell's vireo population in the United States (USFWS 1994a). Conditions potentially suitable for this species are present in riparian vegetation on the site. The Project site is not located in the Critical Habitat designated for this species by the USFWS (USFWS 1994a). Focused surveys were completed in 2006 and 2008, and the only observation of the species consisted of a single male least Bell's vireo singing on June 22, 2006, in the Oso drainage portion of the Project site; it did not remain and was presumed to be a wandering unmated male (BonTerra Consulting 2008). The least Bell's vireo is expected to occur only as an occasional migrant and is not expected to occur for nesting based on negative results from multiple years of focused surveys.

#### Yellow-Headed Blackbird

Yellow-headed blackbird (*Xanthocephalus xanthocephalus*) is a California Species of Special Concern. Depending on availability of food resources, these blackbirds are either territorial or form loose colonies. Male yellow-headed blackbirds are typically polygynous, generally

mating with two to six females (Twedt and Crawford 1995). These blackbirds typically nest in marshes with tall emergent vegetation such as tules (*Scirpus* spp.) and cattails adjacent to open water (Shuford and Gardali 2008). A common summer resident at the Salton Sea and in the Colorado River Valley, this species is an uncommon to fairly common migrant that remains to breed irregularly at just a few locations elsewhere in Southern California (Garrett and Dunn 1981). This species breeds in the Antelope Valley, including the Lancaster area (Jaramillo 2008). The Project site does not provide suitable breeding habitat for the yellow-headed blackbird (although they have been documented breeding immediately off site at Quail Lake), but does provide suitable foraging habitat and this species has been observed foraging in the agricultural fields on the east of the Project site.

## ***Mammals***

### **Nelson's Antelope Squirrel**

The Nelson's antelope squirrel (*Ammospermophilus nelsoni*) is a California Threatened species. The current and historical geographic distribution includes portions of Kern, Kings, Merced, San Luis Obispo, Santa Barbara, and Tulare Counties (CDFW BDB 2014). This species resides primarily in the western San Joaquin Valley from 200 to 1,200 feet above msl. Suitable habitat for Nelson's antelope squirrel is frequently found in areas with sandy loam soils, widely spaced alkali scrub vegetation, and dry washes. This species prefers broken terrain with small gullies and washes with slopes that are 20 degrees or less (Harris and Stearns 1991). Loss of suitable habitat for this species is a result of cultivation, overgrazing, and rodenticides (CDFW BDB 2014). These squirrels dig burrows or use existing kangaroo rat burrows. They also use cover provided by rocks and other topographic features (CDFW BDB 2014). Both the historical and recent distributions of the Nelson's antelope squirrel do not include the Project site (CDFW 2015a). The Nelson's antelope squirrel has not been observed on the Project site; therefore, it is not expected to occur.

### **Pallid Bat**

The pallid bat (*Antrozous pallidus*) is a California Species of Special Concern. This species occurs throughout California except for the high Sierra Nevada from Shasta to Kern Counties and the northwestern portion of the state. The Project site is within this species' known geographical range. It most commonly occurs in mixed oak and grassland habitats. This large bat roosts in rock crevices and in cavities of trees, especially oaks. The pallid bat is very sensitive to disturbance at its roosting sites (Zeiner et al. 1990a). Neither the historical nor recent distributions of pallid bat include the Project site (CDFW 2015a). Potentially suitable foraging and roosting conditions are present on the site. Due to its presence in the region and potentially suitable habitat, the pallid bat is expected to occur on the site.

### **Townsend's Big-Eared Bat**

The Townsend's big-eared bat (*Corynorhinus townsendii*) is a Candidate for listing as a California Threatened species, and a California Species of Special Concern. Townsend's big-eared bat is considered an uncommon, year-round resident throughout the state (Zeiner et al. 1990a). In California, the species is found throughout most of the state, from the inland deserts to the coastal redwood forests, in oak woodlands of the inner Coast Ranges and Sierra Nevada foothills, and lower to mid-elevation mixed coniferous-deciduous forests.

Distribution is patchy and strongly correlated with the availability of caves and cave-like roosting habitat, with population centers occurring in areas dominated by exposed, cavity-forming rocks and/or historic mining districts. Townsend's big-eared bat prefers open surfaces of caves or cave-like structures (e.g., subsurface hard rock mines) and large undisturbed spaces in buildings, bridges, and water diversion tunnels. Specific roosts may be used only one time of year or may serve different functions throughout the year (such as for maternity roosts, hibernation, or during the breeding season). Maternity colonies may use multiple sites for different stages (pregnancy, birthing, and rearing). Males remain solitary during the maternity season. Townsend's big-eared bat appears to have fairly restrictive roost requirements with temperature appearing to be critical. Townsend's big-eared bat is highly sensitive to human disturbance; however, in some instances it can become habituated to reoccurring and predictable human activity (CDFW 2013). The Project site is within this species' known geographical range (Zeiner et al. 1990a). The Project site contains suitable foraging habitat; however, no suitable maternity or hibernation roost locations are known to be present on or in the immediate vicinity of the site. Therefore, the Townsend's big-eared bat has low potential to occur on the site for foraging.

### Tipton Kangaroo Rat

The Tipton kangaroo rat (*Dipodomys nitratooides nitratooides*) is a federal and California Endangered Species. It is one of three subspecies of the San Joaquin kangaroo rat (*Dipodomys nitratooides*). The historical geographic range of Tipton kangaroo rat had a southern extent to the northern foothills of the Tehachapi Mountains (Williams 1985). By 1986, the distribution had been reduced to 3.7 percent of its historical acreage as a result of cultivation and urbanization (Williams 1986). The 1986 range was primarily located in northwestern Kern and southwestern Tulare Counties. The current acreage of occupied habitat is unknown, but it probably does not differ much from the 1985 estimate (USFWS 1998). Tipton kangaroo rat habitat is limited to arid-land communities occupying the valley floor of the Tulare Basin on level or nearly level terrain. It occupies alluvial fan and floodplain soils ranging from fine sands to clay-sized particles with high salinity. Much of the currently occupied habitat has one or more species of sparsely scattered woody shrubs and a ground cover of mostly introduced and native annual grasses and forbs. Woody shrubs commonly associated with Tipton kangaroo rats are: spiny and common saltbushes, arrowscale (*Atriplex phyllostegia*), quailbush (*Atriplex lentiformis*), iodine bush (*Allenrolfea occidentalis*), goldenbush (*Ericameria* spp.), and honey mesquite (*Prosopis glandulosa* var. *torreyana*) (Williams 1985). Tipton kangaroo rats live in ground burrows probably dug by the occupant or a predecessor of the same species (Germano and Rhodehamel 1995). Neither historical nor recent distributions of the Tipton kangaroo rat include the Project site (CDFW 2015a). The Tipton kangaroo rat has not been observed on the Project site. It is not expected to occur due to the large distance from the site to its current known range.

### Western Mastiff Bat

The western mastiff bat (*Eumops perotis*), the largest bat in the United States, is a California Species of Special Concern. The subspecies that occurs in Southern California is the California mastiff bat (*E. p. californicus*). The western mastiff bat is a very wide-ranging and high-flying insectivore that typically forages in open areas with high cliffs. This species roosts in small colonies in crevices on cliff faces with a vertical drop of at least ten feet below the roost to

achieve flight speeds when emerging (Brylski et al. 1998). It occurs in the southeastern San Joaquin Valley and Pacific Coast Ranges from Monterey County southward through Southern California, and from the coast eastward to the Colorado Desert. The Project site is within this species' known geographical range. The western mastiff bat is found in many open, semi-arid to arid habitats including conifer and deciduous woodlands, coastal scrub, grasslands, palm oases, chaparral, desert scrub, and urban areas (Zeiner et al. 1990a). Threats to this species include loss of habitat due to development, drainage of marshes, and conversion of land to agriculture (Williams 1986). Although not observed, this species may forage on the Project site. Due to the lack of suitable roosting habitat, it is not expected to roost on site.

#### Southern Grasshopper Mouse

The southern grasshopper mouse (*Onychomys torridus ramona*) is a California Species of Special Concern. It is a territorial, predatory rodent of grassland and sparse scrub vegetation types and prefers sandy soils. It has been found to occur in Los Angeles County south to northwestern Baja California, Mexico (McCarty 1975). Threats to this species include the loss of habitat due to development. This species was not observed during small mammal trapping in 2001 and 2003. Although not observed in the region since 2003, the southern grasshopper mouse may occur on the site in potentially suitable areas.

#### Tehachapi Pocket Mouse

The Tehachapi pocket mouse is a California Species of Special Concern. This species occurs in arid annual grassland and desert shrub vegetation types in the region. This species has been reported in the vicinity of the Project site two miles east of Gorman and two miles west of Quail Lake (CDFW 2015a). This species was not observed during small mammal trapping in 2001 and 2003 (Impact Sciences 2001d, 2003), but conditions potentially suitable for this species are present throughout the grasslands on the Project site. Focused surveys for this species were completed in 2006, and one individual was detected on the Project site as shown in Exhibit 5.7-7b, Special Status Wildlife Species Observations (Ecological Sciences 2006).

#### American Badger

The American badger is a California Species of Special Concern. This species occupies a wide variety of habitats and ranges throughout the state except for the coastal redwood forests of the extreme northwest. In Southern California, this species is most commonly associated with grasslands and other relatively open habitats with friable, uncultivated soils. In the vicinity of the Project site, this species has been reported from Quail Lake, Liebre Gulch, and Pastoria Creek (CDFW 2015a). The American badger has been observed on the site in several areas east and west of the West Branch of the California Aqueduct, and is expected to occur across most of the site (Crawford 2003).

#### San Joaquin Kit Fox

The San Joaquin kit fox (*Vulpes macrotis mutica*) is a federally Endangered and California Threatened species. The historic range of the San Joaquin kit fox included most of the San Joaquin Valley from southern Kern County north to Tracy in San Joaquin County (on the west side) and near La Grange in Stanislaus County (on the east side) (Grinnell et al. 1937). More

than 50 percent of the suitable kit fox habitat has been lost as a result of habitat conversion from valley and foothill grassland, arid shrub, and oak savanna to irrigated agriculture, urban development, and oil fields. Habitat loss and degradation by agricultural, industrial, and urban development within and among kit fox populations are negatively affecting kit fox movement and population connectivity, leading to isolated and unconnected kit fox populations. The San Joaquin kit fox prefers open habitats including grasslands and open scrubland. In the southernmost portion of the range, the kit fox is commonly associated with valley sink scrub, valley saltbush scrub, upper Sonoran subshrub scrub, and annual grassland. Kit foxes also inhabit grazed grasslands, petroleum fields, urban areas, and survive adjacent to tilled or fallow fields. Kit foxes use some types of agricultural land where uncultivated land is maintained, allowing for denning sites and a suitable prey base. Kit foxes also den on small parcels of native habitat surrounded by intensively maintained agricultural lands and adjacent to dryland farms. They prefer loose-textured soils for denning, but are found in virtually every soil type (USFWS 1998). The diet of kit foxes varies geographically, seasonally, and annually, based on variation in abundance of potential prey, and abundance of a prey base significantly influences reproductive success in kit foxes (USFWS 1998; Egoscue 1975). Kit foxes in the southern portion of their range feed on a variety of prey including small mammals, ground-nesting birds, and insects (USFWS 1998; ECCCHC 2007). The southernmost edge of the San Joaquin kit fox is north of Los Angeles County in Kern County. Therefore, this species is not expected to occur on the site.

### ***Other Regionally Limited Wildlife***

In addition to the species listed above, which have a special status designated by the CDFW and/or the USFWS, one additional species warrants consideration as a result of its limited population size in the region: the pronghorn antelope.

#### Pronghorn Antelope

Although resource agencies have not assigned the pronghorn antelope with any special status designation due to the abundance of the species throughout most of its range, numbers in California have been in decline (Morton et al. 2008) and pronghorn are uncommon in the Project region. Donald McLean describes that pronghorn were extirpated from the Project region by 1940 as a result of over-hunting (Ferrel and Leach 1950). In 1985 and 1987 the CDFG re-introduced a group of pronghorn into the region (Autenrieth et al. 2006; Koch and Yoakum 2002). The re-introduced pronghorn population in the Antelope Valley consisted originally of 93 individuals translocated from an existing, wild population in the northeastern portion of California extending into Oregon (Autenrieth et al. 2006). This translocated population originally increased in number until about 2000 (Geivet 2009); however, the known population size in the Antelope Valley around 2006 was considered to be approximately 70 individuals (Autenrieth et al. 2006). Reasons for this decline are as yet unknown. Currently, in the larger regional area, pronghorn occur not only in Antelope Valley but also in nearby Carrizo Plain and in the Central Valley.

While pronghorn are capable of long-range movements, it is unknown whether there is genetic exchange between subherds. Topography, vegetation community composition, developments, range conditions, and fencing are likely reducing the ability of regional pronghorn populations to intermix. Pronghorn do not typically jump over fences, although

they are known to go under or around fences wherever they come across them (Wilson and Ruff 1999). A habitat suitability assessment for pronghorn was recently completed for the Carrizo Plain/Shandon area. However, a similar analysis has not been initiated for the area between the Carrizo Plain and the Antelope Valley.

This 90-pound to 130-pound horned mammal uses flat or rolling, expansive grass-, shrub-, and range-lands from sea level to 11,000 feet above msl. High-quality forage is considered to include succulent and nutritious grasses, forbs, and shrubs (Wilson and Ruff 1999). They prefer to consume the new, green growth on plants, and they are capable of consuming plants that are considered toxic or lethal to livestock (Autenrieth et al. 2006; Wilson and Ruff 1999). However, the CDFG found the re-introduced population to be heavily dependent on less typical scrub species for forage such as rabbitbrush (Mohr 2008). Adult pronghorn rely primarily on speed and ability to detect moving predators at long distances rather than vegetative cover for protection (CDFW BDB 2014; Wilson and Ruff 1999). However, low shrubs in otherwise open habitat are a very important feature for concealing young fawns. In the vicinity of the Project site, this species has been reported in the Fish Creek Area, Northrup Area, and upper Oso Canyon (Geivet 2009). The pronghorn is occasionally observed on the Project site in suitable habitat areas. Pronghorn have reportedly been seen on rare occasions in random locations in the region, but have been commonly observed and are known to primarily occupy the western portion of the site (upper Oso Canyon in particular) and other locations along the foothills continuing to the northeast.

## **Drainages and Wetlands**

The waters and wetlands on the Project site were identified as primarily riverine with an intermittent streambed, or as palustrine (non-tidal marsh without flowing water), forested, or emergent (one stream section was classified as scrub shrub). The small pond near the northern boundary of the site, just southeast of the fork in the Aqueduct, is classified as palustrine with an unconsolidated bottom.

The dominant water sources for the site are runoff from the mountains to the west and north, surface water runoff, and groundwater discharge. Oso Canyon, the prominent drainage in the northern portion of the site west of the Aqueduct, often has a significant flow from snowmelt and subsequent groundwater discharges.

The Project site contains a number of riverine and palustrine systems and riverine, slope, flat, and depression wetland types (these are known as Hydrogeomorphic [HGM] classes). Several distinct watersheds are present on the site with the directional flows of their drainages oriented to the northeast. These drainages flow into the previously mentioned large alluvial fan composed of deep sand to the east. All of the water infiltrates into the substrate; the distance that flows remain on the surface before infiltrating into the sand depends on the amount of rainfall.

Short drainages (less than 0.1 mile) on the western side of the Aqueduct flow into or toward Quail Lake. No surface waters from the Project site enter the lined portions of the California Aqueduct. Culverts under the Aqueduct facilitate eastward-flowing drainage courses.

Several small areas of impounded water or depressions are present on the site and are generally associated with springs or flats.

The descriptions below provide more detail about the various drainage features in the Project site.

### ***Oso Creek***

Oso Creek begins in the higher elevations to the north and west of the Project site and drains from west to east. The creek has a number of tributaries that feed into the main drainage. Segments of this creek have perennial flowing water; however, portions of the drainage course appear to be subsurface, particularly during the dry summer months. Oso Creek eventually infiltrates into the alluvial fan to the east, which (in normal years) is approximately 200 feet west of 300<sup>th</sup> Street West, just north of the Project site and the California Aqueduct. Oso Creek is a seasonally high-energy stream with eroded, generally vertical banks that clearly define the ordinary high water mark along most of its reach. On the Project site mainly west of the West Branch of the Aqueduct, arroyo willow trees, with occasional other willow species and, periodically, mule fat (*Baccharis salicifolia*) occur in areas not subject to scouring by high-water flows. Exposed flow lines are dominated by water speedwell (*Veronica* sp.), a perennial emergent aquatic plant. In areas of lesser flow energy, stinging nettles (*Urtica* sp.) form a vegetation zone along the upper banks.

Eight larger tributaries to Oso Creek are present on the site, several of which maintain flows well into the summer. The recent erosional channels are actively eroding along steeper slopes and are occurring at such a pace that riparian vegetation is unable to become established. Consequently, the grassland vegetation in these areas, which does not stabilize deeper sediments, is being lost at a relatively rapid rate.

Non-eroded channels associated with Oso Creek support a variety of plants. Non-hydrophytic grasses and forbs occur in parts of channels that dry out or that have deeper subsurface flows. Herbaceous wetland vegetation is generally dominated by rushes (*Juncus* sp.), dock, sedge, spike rush, monkeyflower (*Mimulus* sp.), and giant wild-rye. Scattered riparian plants, dominated by willows and mule fat, also occur in and adjacent to the streambeds.

Most of the tributaries begin on the southern side of Oso Creek and on north-facing, sloped wetlands vegetated by rushes, spikerush, and monkeyflower. Several of the headwater tributaries begin at springs (identified on the USGS topographic quadrangle maps). Most of these springs have been dammed to provide a source of water for livestock. Slope wetlands have sandy loam soils that may remain saturated or moist near surfaces into the late spring in years with average rainfall (Impact Sciences 2003).

### ***Watersheds East of the National Cement Plant Access Road***

The main watershed in the eastern portion of the Project site is located just north of SR-138 and east of the National Cement Plant Road. Its upper source is near the National Cement Plant Road and flows toward the east, ending in the sandy alluvial fan where it infiltrates into subterranean flows or aquifers. This watershed has a number of tributaries. Tributaries

entering from the north begin at seeps and springs on hillsides, while those from the south emerge from hills south of SR-138 and flow northward through culverts under the highway. The major creek from the south is Tentrock Canyon Creek, which crosses north under SR-138 and joins the watershed near its eastern terminus.

Several segments of these drainages are dominated by willows, while a few localized sites along the channels are dominated by large cottonwoods. Most of the channel reaches are dominated by emergent vegetation, specifically watercress (*Nasturtium officinale*) and water speedwell. Adjacent to the channels, several areas of the wet flats and depressions are associated with Chino loam soils. These areas are dominated by Baltic rush, sedge, spike rush, wild-rye (*Elymus* [*Leymus*] sp.), and dock. The wettest depressions, primarily where berms have been created to provide water for cattle, support California bulrush (*Schoenoplectus* [*Scirpus*] *californicus*) and broad-leaved cattail (*Typha latifolia*). In most of the dry areas of this watershed, grasslands are present, with varying cover of native perennial grasses, forbs, and non-native annual grasses.

To the north of this watershed are ten additional “blue-line” streams (as indicated on the USGS topographic quadrangle maps). Seven of these drainages have natural channels (bed and banks), while the other three are broad swales between ridges. These drainages have ephemeral or intermittent flows from west to east. Most of these drainages begin east of the Aqueduct; however, two begin to the west, flowing through culverts under the Aqueduct. These drainages vary from shallow and narrow, to wide and deep (when flowing), but all end on the site, and infiltrate into the sandy alluvial fan to the east. Several springs are present on slopes adjacent to the drainages, and several drainages have eroded deeply enough to possibly reach groundwater. In both cases, these areas remain wet long into the summer. The drainage systems beyond the first ridge north of SR-138 are less diverse botanically than the watershed along SR-138, with increasing non-native vegetation to the north. In contrast to the drainage along SR-138, these drainages lack willow riparian and rush vegetation.

### ***Ponds and Impoundments***

Surveys conducted on the Project site have identified ten seasonal pools/depressional features in the Project site (GLA 2005a, 2005b, 2005c, 2006a, 2006b; see Appendix 5.7-B). Most, if not all, these sites were created to provide water for livestock and some have been disturbed by livestock grazing. These features are described in a fairy shrimp habitat assessment, most as roadside depressions that receive local watershed runoff and direct rainfall; the report contains detailed information on existing conditions, dimensions, ponding depth, and common vegetation for each feature (GLA 2005b).

The ponding depth of the identified depressional features varies from a few inches to over two feet. Ponding is associated with runoff, direct rainfall, slope discharge from shallow subsurface groundwater, and overbank connection to adjacent creeks during high flows. Although some depressional features are unvegetated, others support vegetation, including black mustard, bromes, small-flowered melic grass (*Melica imperfecta*), willow-herb (*Epilobium pygmaeum*), toad rush, common knotweed (*Polygonum arenastrum*), everlasting (*Gnaphalium* sp.), Mexican rush (*Juncus mexicanus*), black willow, spike rush (*Eleocharis acicularis*), perennial spike rush (*Eleocharis macrostachya*), alkali plagiobothrys (*Plagiobothrys leptocladus*), and woolly-heads (*Psilocarphus tenellus* var. *tenellus*).

### ***Small Drainages***

A number of short, isolated drainages originating at seeps occur on steep slopes on the Project site, primarily west of the Aqueduct. Most of the smaller drainages either evaporate or infiltrate within a short distance of the source. Because of the erosive character of the soils, channels are often incised. In a few cases, one or several riparian trees or shrubs may be present along the channel.

### ***Ecological Functions Associated with Drainages and Wetlands in the Project Area***

#### Potential Wildlife Habitat

A functional assessment of the drainages and other aquatic features on the Project site was completed by Glenn Lukos Associates (GLA 2006b, 2009a) using a combined assessment approach and subsequently refined by BonTerra Psomas (BonTerra Psomas 2015a) using the California Rapid Assessment Method (CRAM). The results of these assessments indicate that the wetlands on the site provide potentially suitable habitat for a variety of invertebrate and vertebrate species. The riparian, palustrine, and small lacustrine systems also provide potential wildlife habitat for several species. For the wetland functional assessment, the functional capacity of jurisdictional resources was determined using a Functional Capacity Index, which is a ratio of the functional capacity of a wetland under an existing condition, and the functional capacity of a wetland under attainable conditions. The Functional Capacity Index provides a measure of a wetland's ability to perform a function relative to similar wetlands in the region, as evaluated in the field based on multiple metrics (indicators of wetland function). Functional capacity units, therefore, provide a measure of a wetland's ability to perform a function and are calculated by multiplying a Functional Capacity Index by the area of wetland it represents.

The wetland vegetation includes monkeyflowers, which provide nectar resources for adult hawkmoths (feeding on nectar) and other pollinators. The hawkmoths (white-lined sphynx moth [*Hyles lineata*] and tobacco hornworm sphinx [*Manduca sexta*]) are abundant during the summer, and were observed visiting flowers for nectar. Dragonfly and damselfly species (e.g. common green darner [*Anax junius*] and damselfly [*Enallagma* sp.]) are abundant around open water. Several pools appear to be densely populated by microcrustaceans (Impact Sciences 2003).

The drainages, ponds, and pools provide potentially suitable habitat for a number of frog and toad species. In turn, a number of snakes and lizards have been observed adjacent to open water feeding on the frogs, toads, and their tadpoles. The sand deposition downstream has created potential habitat for coast horned lizards (which were observed) along the lower reaches of dry sandy streambeds, and continuing into the alluvial fans. Waterbirds (mallard [*Anas platyrhynchos*], bufflehead [*Bucephala albeola*], black-necked stilt [*Himantopus mexicanus*], Wilson's phalarope [*Phalaropus tricolor*], and lesser yellowlegs [*Tringa flavipes*]) and a variety of swallow species [e.g. violet-green swallow [*Tachycineta thalassina*], northern rough-winged swallow [*Stelgidopteryx serripennis*], cliff swallow [*Petrochelidon pyrrhonota*], and barn swallow [*Hirundo rustica*]) have been observed on or using open water on the site. Bullock's orioles have been frequently observed among the mature valley oaks adjacent to Oso Creek. Livestock and other mammals also utilize the ponds as water

sources. Large and small mammal tracks were observed along the sandy banks and within both wet and dry washes of many of the drainages on the site. Coyotes, including two pups, were observed using the Baltic rushes in moist to seasonally dry drainage channels at den sites (Impact Sciences 2003).

The opportunity for plant diversity in the riverine, palustrine, and small lacustrine environments appears to be limited, likely due to water stress during dry periods and scouring flows during the rainy season. All wetland and drainage communities on the site exhibit generally low species diversity, except for Oso Creek in the northwestern portion of the site and the drainage north of SR-138 and east of the National Cement Plant Road. Limiting factors for diversity may be livestock grazing and the presence of invasive, non-native plants.

### ***Stream Shoreline Stabilization/Sediment Retention, Storm Water Attenuation, and Groundwater Recharge***

Stream shoreline stabilization is occurring where sufficient vegetation is present along the drainages to control stream bank erosion. Most of the sparsely vegetated stream banks are eroding and contribute to the quantity of sediment moving downstream. The translocation of sediments is evident in the size of the alluvial fans and by direct observation of sediment movement, even during periods with low stream flows. Storm water attenuation is limited in the systems because the on-site sandy soils do not retain significant water and stream gradients encourage water to move through the site rapidly. The wetlands associated with the loam soils retain some of the peak runoff and release the water into the drainages at a slower rate than do the adjacent sandy soils (see Table 5.7-1, Soil Types and their Hydrological Characteristics, for permeability and runoff rates of each soil type).

Groundwater recharge has a high degree of opportunity to occur and a high degree of effectiveness since all the water flowing through the site infiltrates in the alluvial fans at the downstream ends of each in the watershed. All of the water from the drainages assist in recharging groundwater, as discussed in greater detail in Section 5.2, Hydrology and Flood, which apparently moves in a subterranean manner toward the east, where a large quantity is extracted for agricultural irrigation.

## **Jurisdictional Resources**

Wetlands and permanent and intermittent drainages, creeks, and streams are generally subject to the jurisdiction of the U.S. Army Corps of Engineers (USACE) under Section 404 of the Federal Clean Water Act (CWA) (U.S. Congress 2008). By USACE definition, all aquatic or riverine habitats between the ordinary high water mark (OHWM) of rivers, creeks, and streams, are considered “waters of the U.S.” and may fall under USACE jurisdiction. If adjacent wetlands occur, the jurisdictional limits extend beyond the ordinary high water mark to the outer edge of the wetlands. The USACE defines wetlands as “those areas that are inundated or saturated by surface or groundwater at a frequency or duration to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions” (Environmental Laboratory 1987). The presence and extent of wetland areas are normally determined by examination of the vegetation, soils, and

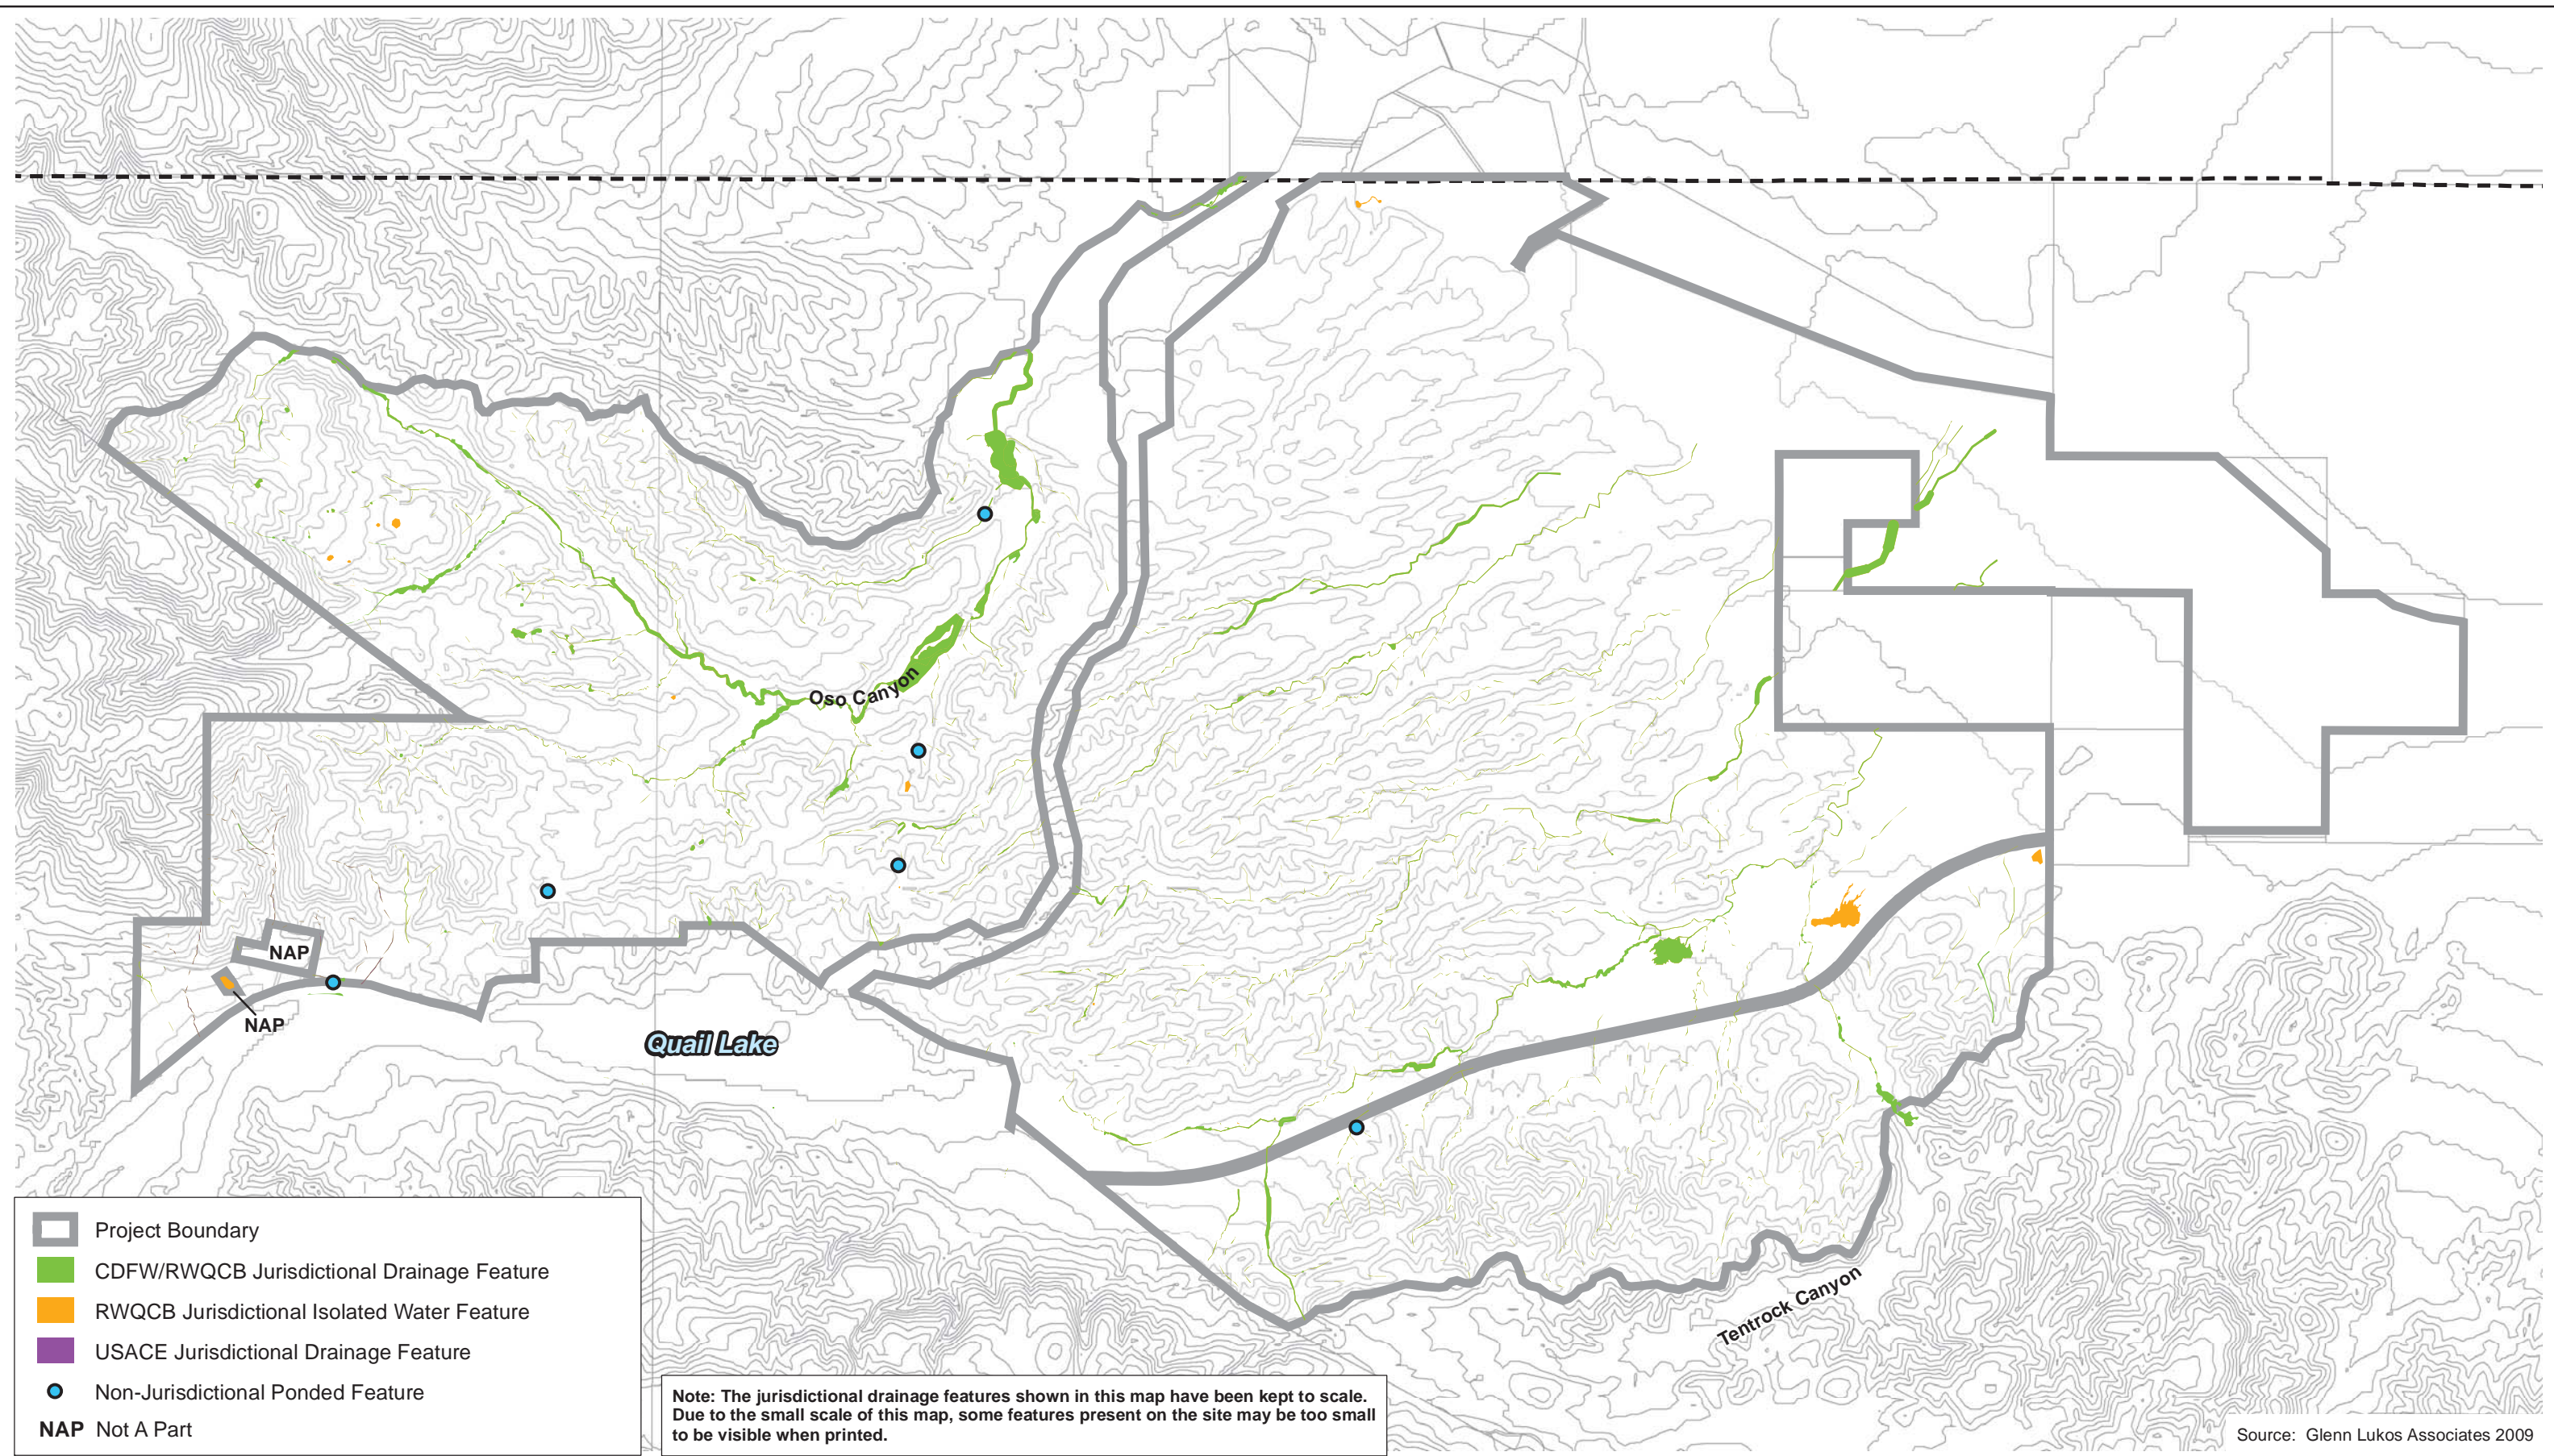

hydrology of a site. The USACE definition of wetlands requires that all three wetland identification parameters be met.

Streambeds in the Project site are also subject to CDFW regulation under Sections 1600 et seq. of the *California Fish and Game Code*. A stream is defined under these regulations as a body of water that flows at least periodically or intermittently through a bed or channel having banks and that support fish or other aquatic life. This definition includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation. The CDFW jurisdiction typically extends to the edge of the riparian vegetation canopy. In addition, groundwater, surface water, and wetlands fall under RWQCB jurisdiction.

Table 5.7-10, Jurisdictional Wetlands and Waters Summary, provides the acreages associated with aquatic resources on the site. This table summarizes the results of a delineation of features under the jurisdiction of the CDFW, the Regional Water Quality Control Board (RWQCB), and/or the USACE. The results summarized below are based on field surveys conducted by Glenn Lukos Associates in 2006 and 2009 (GLA 2005c, 2006b, 2009b) and refined by field surveys conducted by BonTerra Psomas in July 2015 (BonTerra Psomas 2015a). Exhibit 5.7-9, Jurisdictional Drainage Features, depicts the location and extent of jurisdictional features on the Project site. Water runoff from the Project site generally originates in the western portion of the site and flows east toward the Antelope Valley. The drainages historically infiltrated into the groundwater on the site; however, six short on-site drainages and three short off-site drain toward Quail Lake. These drainages were determined to be Non-Relatively Permanent Waters without a Significant Nexus to a Traditional Navigable Water, and therefore not under the jurisdiction of the USACE. Since Quail Lake is connected to the California Aqueduct, these drainages have a tenuous connection to the aqueduct. Much of the water that flows on the surface in drainages on the site eventually infiltrates into the alluvial sandy soils before exiting the site, while the remainder infiltrates the soils soon after exiting the site (Impact Sciences 2002b). A functional assessment of the jurisdictional features on the site was conducted by Glenn Lukos Associates (GLA 2006b, 2009a) and subsequently refined by BonTerra Psomas (2015a). The delineation of jurisdictional drainage features is subject to change at the discretion of permitting agencies as part of the permitting process. Changes in the determination of jurisdiction, if any, would be expected to be relatively minor. The jurisdictional delineation verification provided by the USACE indicates general consensus in the determination at that time.

### ***U.S. Army Corps of Engineers Jurisdiction***

Several surveys were conducted to delineate the jurisdictional waters and streambeds in accordance with the USACE regulatory definition of “waters of the U.S.”. The definition of a wetland, as summarized above, is included in the 1987 USACE manual and streambed criteria from the *California Fish and Game Code* (Impact Sciences 2002b; GLA 2005c, 2006b, 2006c, 2009b). The results of the original jurisdictional delineations for the Project site have been verified by the USACE (Impact Sciences 2002b; USACE 2002). Three on-site drainages that flow toward Gorman Creek have been determined to be jurisdictional under the CWA due to hydrologic connection with navigable waters. The remaining drainages and associated wetlands on the site infiltrate into the alluvial sandy plain to the east of the site and do not connect to navigable waters. Therefore, these features have been determined to be non-jurisdictional under current USACE regulations. The estimated total USACE jurisdictional “waters of the U.S.” on the Project site is 1.7 acres (BonTerra Psomas 2015a).

As described in Section 5.7.2, the USACE and USEPA issued a Final Clean Water Rule whose implementation has since been blocked by a federal court. If the USACE interprets “waters of the U.S.” as defined in the Final Clean Water Rule when the Project enters a regulatory permit processing phase, no changes to the amount of “waters of U.S.” on the Project site are expected. Though there are waters that exist within 4,000 feet of the OHWM of a covered tributary (thereby subject to a case-specific significant nexus determination), these waters flow to the east and do not have a significant nexus with a downstream Traditional Navigable Water (TNW) (i.e., they do not provide chemical, physical, or biological functions to downstream waters).

### ***California Department of Fish and Wildlife Jurisdiction***

All the drainages, adjacent wetlands, and riparian areas on the Project site are under the jurisdiction of the CDFW pursuant to Sections 1600–1616 of the *California Fish and Game Code*. CDFW jurisdiction extends to the top of the bank, at a minimum, and to the outer edge

of the canopy of riparian vegetation, if a canopy is present. Many of the stream banks exhibit nearly vertical slopes. The total CDFW jurisdictional “streambeds and riparian vegetation” on the Project site is 165.5 acres (BonTerra Psomas 2015a).

### ***Regional Water Quality Control Board Jurisdiction***

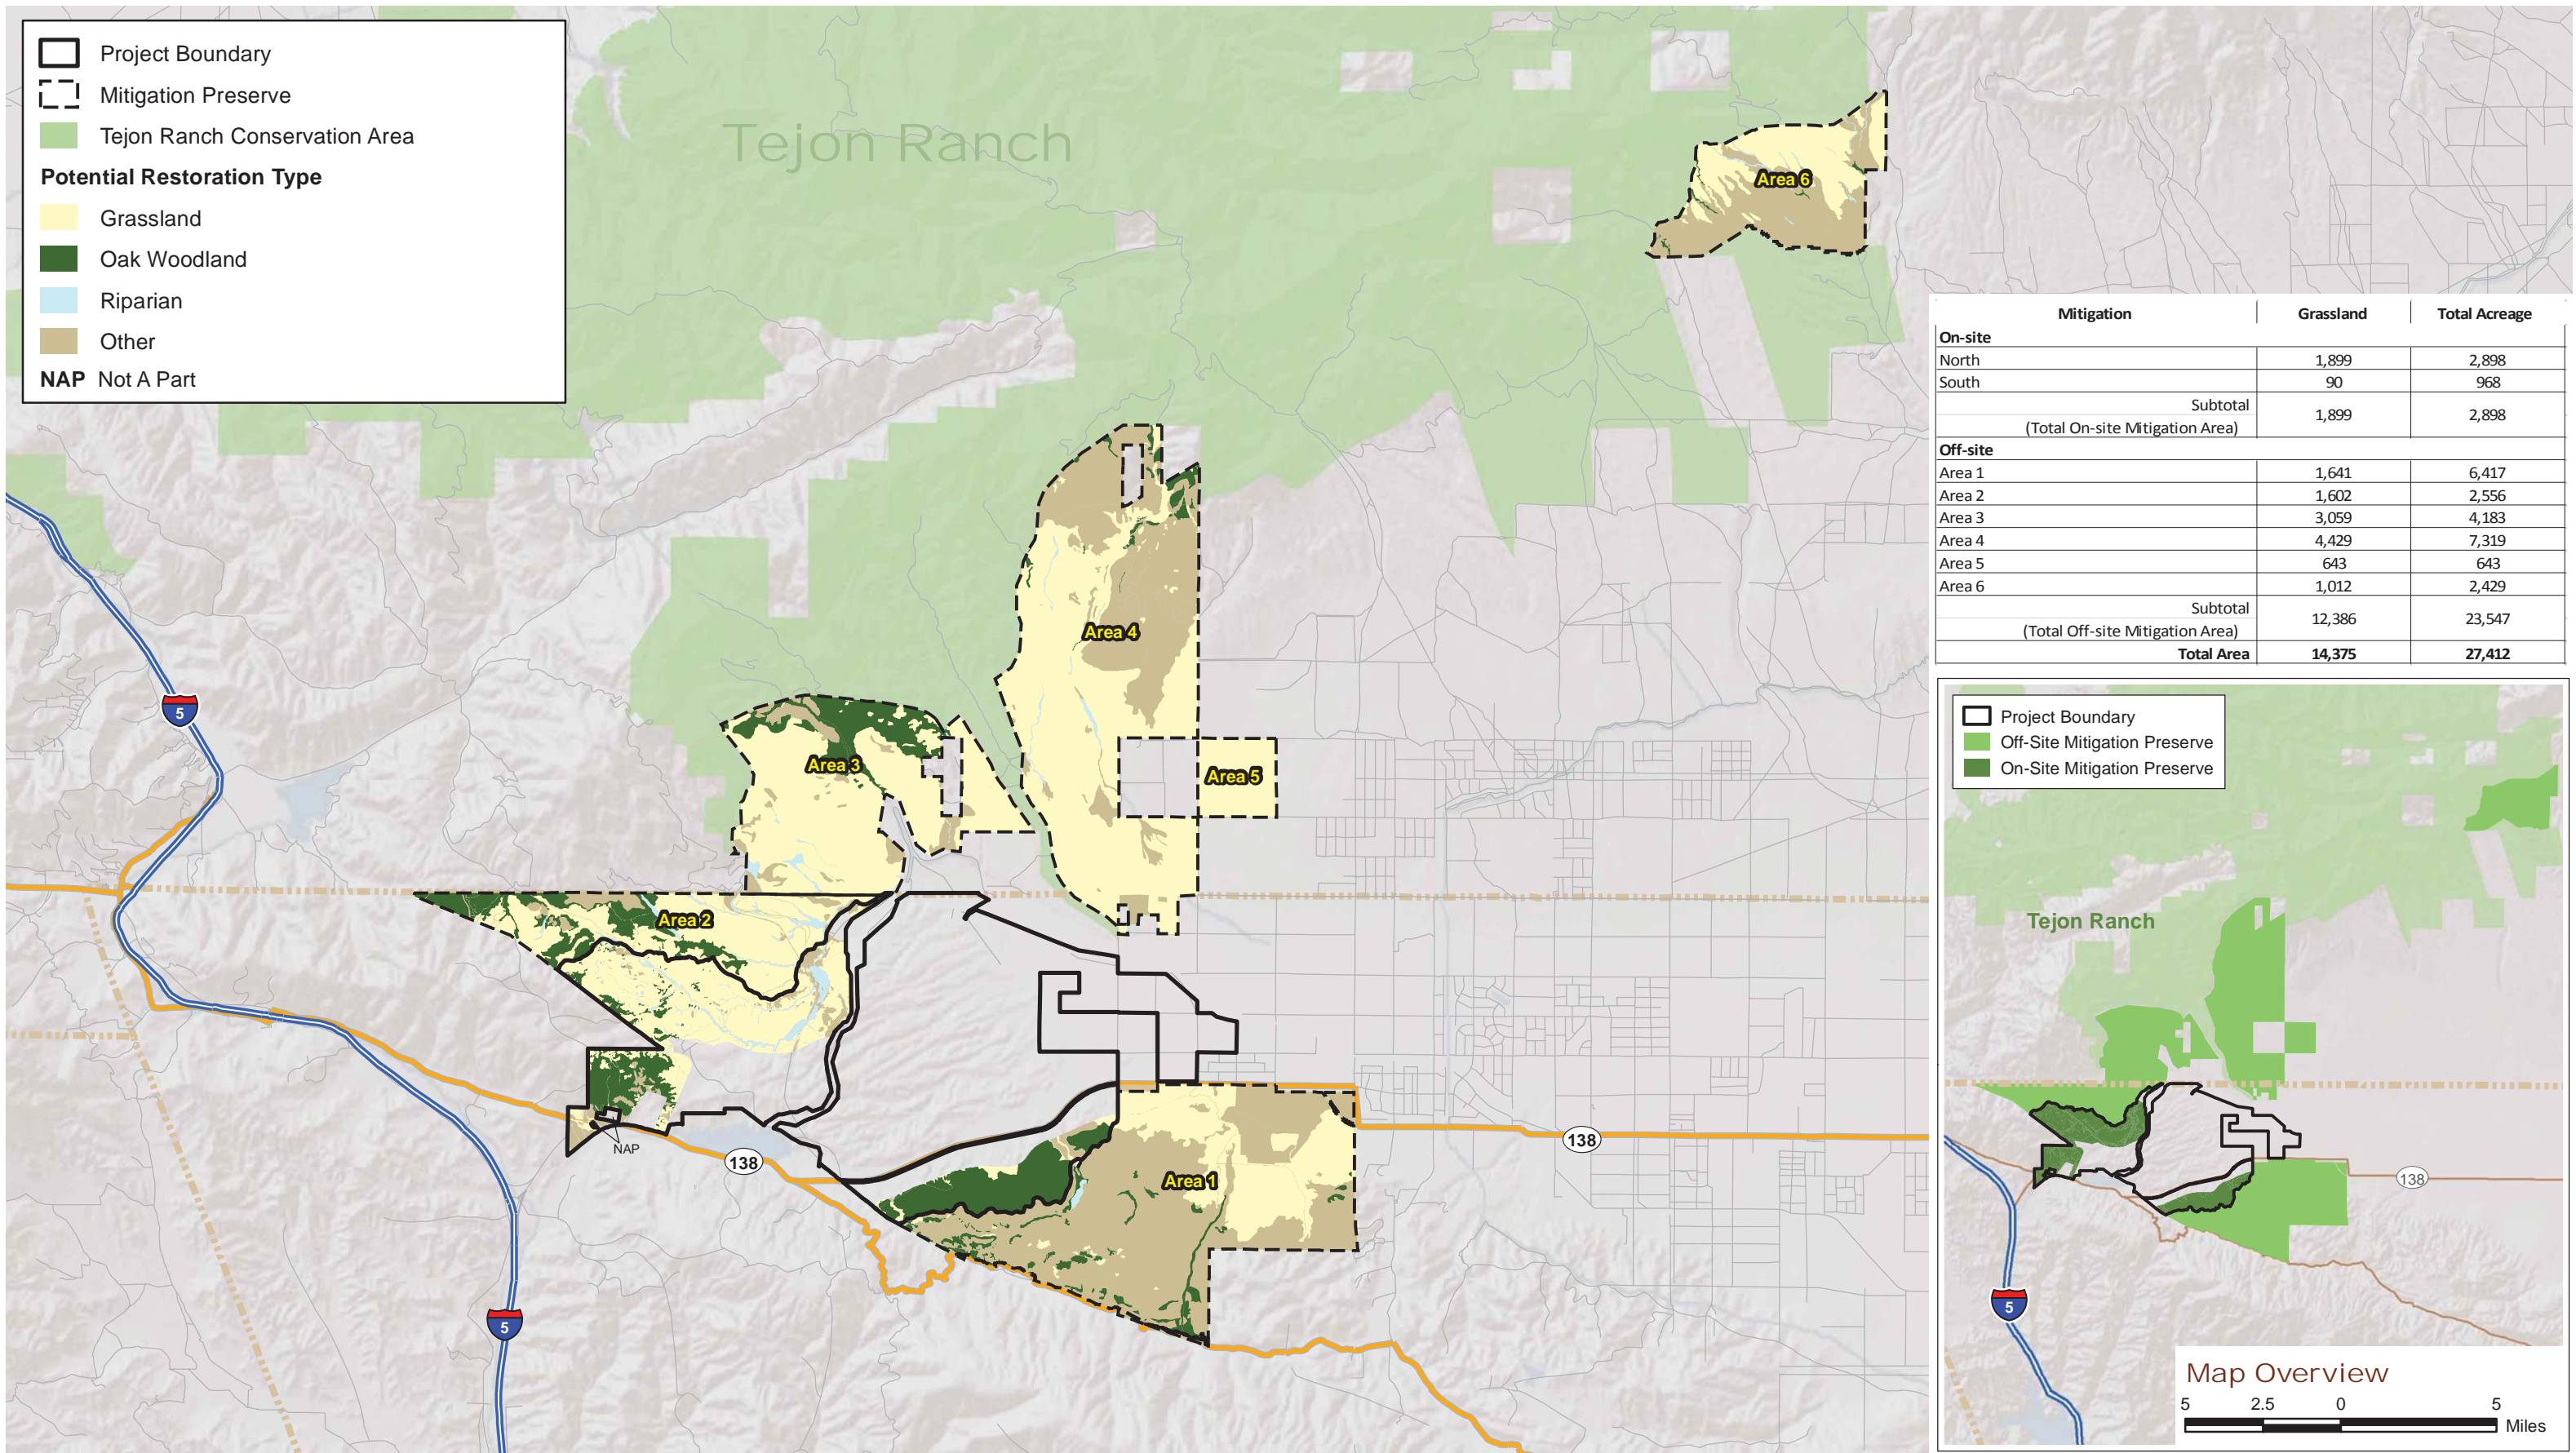

All the groundwater, surface water, and wetlands on the Project site are under the jurisdiction of the two RWQCBs that govern the site (i.e., Lahontan and Los Angeles), pursuant to the Porter-Cologne Water Quality Control Act (*California Water Code*, Section 13000 et seq.) (SWRCB 2009). The extent of their jurisdiction tracks that of the CDFW with regard to the drainages on the Project site, but does not include some CDFW-regulated riparian vegetation. The RWQCB jurisdiction does extend, however, to isolated wetlands and discharges to groundwater that the CDFW does not cover. The surface waters on the Project site that are under the RWQCBs’ jurisdiction total 149.2 acres (BonTerra Psomas 2015a).

## **5.7.4 PROJECT DESIGN FEATURES**

**PDF 7-1** The dedication schedule for the Mitigation Preserve program is designed to accommodate full Project implementation, which would occur over an approximate 20-year timeframe. The Mitigation Preserve program distinguishes two components: (1) preservation via open space dedication and (2) enhancement and management of certain resources (such as oak woodlands and riparian habitats) to maintain biological resource values. The overall concept is to retain biological resources in a manner that is feasible and maximizes the potential for success.

The Project’s Mitigation Preserve program is designed to maintain regional biological resource functions and values. In this way, the biological impacts of developing the Project are being mitigated to levels that are less than significant under CEQA at a Project-specific level.

The Mitigation Preserve program includes preservation of grasslands as well as preservation, enhancement, restoration, and creation of other special status resources. The level of mitigation necessary will correspond to the quality of the affected habitats and to the quality of habitats that are currently present in the specified mitigation areas. Each individual resource mitigation plan will describe the areas for proposed mitigation for that particular resource which occur both within Significant Ecological Area (SEA) 17; within the Project boundary; and within off-site mitigation areas. These areas combine to form an extensive regional mitigation preserve system of 27,408 acres (see Exhibit 5.7-10, Mitigation Preserve). Detailed floral sampling was conducted within grasslands on the Project site including impact areas, as well as within the Mitigation Preserve (NRC 2006a, 2007a, 2007b, 2007c, 2008b). Generally, studies consisted of quadrat sampling (338 total quadrats) and analysis of data generated results on regional species composition, between-site species composition, and plant community-based analysis. within grasslands on the Project site within the impact area and mitigation areas (NRC 2008b) and

Mitigation Preserve

Centennial Project

Exhibit 5.7-10

2016 site reconnaissance surveys over a period of four days, within mitigation areas. Both the detailed floral sampling and the site reconnaissance surveys indicate the presence of similar vegetation and habitat types, species composition, and special status species presence throughout the Preserve in varying degrees similar to the range of impacted areas.

The proposed 27,408-acre preserve system contains all major habitat types affected by the Project, as well as particular individual biological resource values which are described in each of the corresponding mitigation plans. In addition, the overall value of the preserve system is enhanced by configuration of the preserved areas within large and contiguous biological core areas (see Exhibit 5.7-10). The biological value of the proposed preserve system is further enhanced by its continuity with other open space areas. Most of the core is immediately bordered by additional existing and proposed preserved lands, which increases the conservation value of the dedication areas. When a preserve is comprised of many small areas within a larger unpreserved area, there are greater edge effects, even when the overall acreage may seem substantial. Edge effects include indirect effects from adjacent land uses such as noise from roadway traffic or night lighting from development. The lands proposed for preservation, especially those occurring off site, have been chosen with the intent to minimize such edge effects so that the biological resources within them are not jeopardized by the Project or potential future development in the region. In addition, the adjacent open space lands include Los Angeles County SEAs and National Forest Lands that would similarly benefit from the preservation of adjacent lands.

An additional factor in the high value of the proposed preservation lands is buffering of the regional landscape linkage through the region. The open space areas in the northwestern and southeastern portions of the site and the off-site preservation lands in these areas provide a layer of protection for the potential wildlife linkage to the immediate northwest, which may be an essential part of sustaining healthy populations of a wide variety of wildlife species in the surrounding mountainous regions. Additionally, several smaller local linkages between open space on site and preservation areas off site and in contiguous lands have been preserved.

Based on the large size of the Mitigation Preserve, the connectivity of this area to other regionally important open space areas, and the similarity to resources removed by development of the Project, the proposed mitigation preserve system provides a core for biological mitigation planning. The resources preserved in the reserve area, when supplemented by individual programs for special-status resources, would mitigate all significant impacts to biological resources on the Project site.

Each of the resource mitigation plans, required per mitigation measures below, will be incorporated into an overall Mitigation Monitoring and

Reporting Program (MMRP). This document will describe the procedures for mitigation implementation, success criteria, and reporting requirements.

**PDF 7-2**

Mitigation for impacts to vegetation types, such as native grasslands, would require preservation with minimal management. Other resources, such as jurisdictional riparian habitats and wetlands, would require more intensive creation, restoration, and/or enhancement efforts to mitigate for Project impacts. The acreages of the primary resources identified in the mitigation areas are listed in Table 5.7-11, Primary Biological Resources within the On-Site and Off-Site Preserve System, below.

Mitigation lands for impacts to biological resources would consist of approximately 3,861 acres of unimpacted/SEA lands on the site and 23,547 acres within additional off-site areas, including areas on Tejon Ranch, referred to as Areas 1 through 6. These mitigation lands comprise six areas which would provide sufficient land and biological resources to implement mitigation strategies to fully mitigate for Project impacts. Two of these areas, Areas 3 and 4, are the subject of conservation easements that expressly allow for such mitigation use of these lands. The dominant biological resources within these mitigation lands (such as the vegetation types and jurisdictional drainages) are depicted on Exhibit 5.7-10. The acreages of the dominant biological resources identified within the mitigation areas are listed in Table 5.7-11 below.

It should be noted that the similarity of the biological resources contained within the impact areas and mitigation areas is relative. The greater the level of detail available for a particular resource, the greater potential for variability between sites. Although intensive studies may reflect differences between the impacted grasslands and preserved grasslands, this is to be expected. The understanding of the general similarity and the long-term preservation goals for regional native species biodiversity should dictate the appropriateness of preservation lands. Grassland and wildflower studies of mitigation areas also indicate an acceptable degree of similarity in vegetation species composition at varying degrees consistent with Project impact areas (NRC 2008b). For a detailed analysis and representative photographs of mitigation lands see Appendix 5.7-D.

Area 1 consists of 6,417 acres located adjacent to and immediately east of the southeastern corner of the Project site. These lands are located within Significant Ecological Area (SEA) No. 17 and support many resources including a relatively undisturbed north-to-south running riparian corridor that provides connectivity to the wildlands to the south of the site. This drainage is likely to function as an important wildlife movement corridor for wildlife moving between the higher elevations of Liebre Mountain in the Angeles National Forest and grassland and scrubland resources in the lower foothills.

Area 2 consists of 2,556 acres located adjacent and contiguous to the northwestern portions of the Project site. These lands are also located within SEA No. 17. This area has experienced minimal disturbance and contains a complement of resources similar to the Project site, but it generally has a higher quality. This area contains extensive grasslands, oak woodlands, and riparian corridors. The woodlands and riparian zones include degraded and disturbed areas that are suitable for restoration and enhancement. Additionally, this mitigation area contains several substantial drainages, including upper Oso Canyon. Preservation of these features would retain wildlife movement values, allowing wildlife to continue to use these pathways to move between the on-site mitigation preserve and the Tehachapi Mountains.

Area 3 consists of 4,183 acres; this mitigation area is located in Kern County, immediately north of the Project site. It consists almost entirely of grassland habitat on the alluvial fans of several major drainages that flow into the Antelope Valley from the Tehachapi Mountains. Oak and sycamore woodlands are found in these canyons. The California Aqueduct also runs through this parcel. A portion of the Pacific Crest Trail alignment parallels the northeastern boundary of Area 3.

Area 4 consists of 7,319 acres; this mitigation area is also located in Kern County on the northern slope of the Antelope Valley, northeast of both Area 3 and the Project site. This site contains similar biological resources as described for Area 3 above. A portion of the Pacific Crest Trail alignment parallels the southwestern boundary of Area 4.

Area 5 consists of 643 acres and is a square-shaped parcel located in Kern County on the northern slope of the Antelope Valley, immediately east of Area 4 and northeast of the Project site. It consists entirely of undifferentiated grasslands along the alluvial fans of several major drainages in the foothills of the Tehachapi Mountains. The lower flatter areas are divided into a number of grazing areas, and it is intensively grazed.

Area 6 consists of 2,429 acres and is located in Kern County on the northern slope of the Antelope Valley, farthest to the northeast of the Centennial Project site. Approximately half of Area 6 is dominated by undifferentiated grasslands. The area represents a transitional zone between the grasslands and forb-dominated habitats found in Areas 3, 4, and 5 to the more desert habitats consisting of Joshua tree woodland and various scrub lands. It has several major drainages that flow from the Tehachapi Mountains that provide for riparian habitat and, at higher elevations, oak woodlands.

The combined off-site mitigation preserve area amounts to 23,547 acres of mitigation lands. In total, the mitigation preserve system available for mitigation covers 27,408 acres and includes both on- and off-site mitigation areas.

- PDF 7-3** The primary features retained in the mitigation preserve are the western portion of Oso Canyon and the mountainous areas along the western and southern edges of the site. The western portion of Oso Creek and several large tributaries, which are considered high wildlife use areas, would be preserved as open space. At least three ephemeral ponds would also be preserved in the open space area; which may provide habitat for amphibians, invertebrates, and migratory birds. In addition, existing drainages have been incorporated into the Project's design as greenways and open space areas to buffer the riparian corridors from indirect impacts.
- PDF 7-4** The removal of oaks on the site has been minimized: of the estimated 181,070 oaks of all sizes on the site, and of the estimated 33,861 oaks under the jurisdiction of the County of Los Angeles Tree Ordinance (CLAOTO) on the site, only 91 regulated oaks [blue oak (*Quercus douglasii*) and hybrid oak species<sup>5</sup>] occur within the disturbance area. Of those, 49 (blue oak) are within the grading footprint and would presumably be directly impacted by the Project, while 42 occur within the temporary disturbance area and would potentially be unimpacted/preserved, or 99.99 percent of regulated oaks would be preserved. The majority of the mixed oak woodland located in the western portion of the site and nearly the entire mixed oak woodland area located in the southern portion of the site would be preserved as natural open space.
- PDF 7-5** Regulated oaks within the Project's temporary disturbance area shall be avoided to the maximum extent feasible. Construction activities will employ methods, such as temporary orange mesh fencing, to surround the regulated oak trees at the dripline in order to avoid impacts to regulated oak trees in these areas, when feasible.
- PDF 7-6** If a golf course is developed on the site, it will be built and managed in accordance with the Audubon Cooperative Sanctuary Program for Golf Courses (or equivalent), which is a cooperative effort between the United States Golf Association and Audubon International that is designed to promote ecologically sound land management and to conserve natural resources.
- PDF 7-7** As an additional Project feature, the Project Applicant will explore locating a wildlife-friendly crossing across the Aqueduct with the California Department of Water Resources. The ideal location for such a crossing would be adjacent to Quail Lake or adjacent to the new bridge proposed across the Aqueduct. Final design of any such crossing shall be reviewed and approved by Los Angeles County.

---

<sup>5</sup> Hybrid oak species are probably (*Quercus x alvordiana*) and (*Quercus x macdonaldi*) but hybridization within hybrids can even result in triple hybrids making positive identification of these species very difficult (Tree of Life 2008).

**PDF 7-8** To minimize the introduction and spread of invasive plants on the site, the *Centennial Specific Plan* contains a list of invasive plant species that will be prohibited from being planted on the site.

PDF 11-4 from Section 5.11, Air Resources, is also applicable to the analysis in this section.

## 5.7.5 THRESHOLD CRITERIA

### California Environmental Quality Act Criteria

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would have a significant impact related to biological resources if it would:

**Threshold 7-1** Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

**Threshold 7-2** Have a substantial adverse effect on any sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS.

**Threshold 7-3** Have a substantial adverse effect on federally or state protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, and drainages) or waters of the United States, as defined by §404 of the federal Clean Water Act or California Fish and Game code §1600 et seq. through direct removal, filling, hydrological interruption, or other means.

**Threshold 7-4** Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

**Threshold 7-5** Convert oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10 percent canopy cover with oaks at least 5 inches in diameter measured at 4.5 feet above mean natural grade) or otherwise contain oak or other unique native trees (junipers, Joshuas, southern California black walnut, etc.).

**Threshold 7-6** Conflict with any local policies or ordinances protecting biological resources, including Wildflower Reserve Areas (L.A. County Code, Title 12, Ch. 12.36), the Los Angeles County Oak Tree Ordinance (L.A. County Code, Title 22, Ch. 22.56, Part 16), the Significant Ecological Areas (SEAs) (L.A. County Code, Title 22, §22.56.215),

and Sensitive Environmental Resource Areas (SERAs) (L.A. County Code, Title 22, Ch. 22.44, Part 6).

**Threshold 7-7** Conflict with the provisions of an adopted state, regional, or local habitat conservation plan.

An evaluation of whether an impact on biological resources would result in a “substantial adverse effect” must consider both the resource itself and how that resource fits into a regional context. For the Project, the regional setting includes the western portion of the Antelope Valley, including the slopes of the surrounding mountains that face the Valley. Impact analysis is based on the Project’s impact relative to the amount of the resource within the Project region.

For purposes of the impact analysis, “substantial adverse effect” is defined as the loss or harm of a magnitude which, based on current scientific data and knowledge, would (1) substantially diminish population numbers of a species or distribution of a habitat type within the region or (2) eliminate the functions and values of a biological resource in the region.

### **5.7.6 ENVIRONMENTAL IMPACTS**

The determination of direct impacts in this analysis is based on changes to the existing biological resources on the Project site (as previously described in Section 5.7.3, Environmental Setting) that would occur from Project implementation, which includes all on-site and off-site earth disturbing/grading activities (including staging, trenching, and equipment storage). Impacts on biological resources associated with the Project were evaluated with respect to common vegetation types and common plant and wildlife species and, in greater detail, special status biological resources.

Indirect impacts on biological resources as a result of Project implementation may include the following: (1) increased lighting and glare effects on wildlife species in the remaining and adjacent open space areas; (2) potential increase in use of pesticides, herbicides, and in release of pollutants into adjacent drainages, creeks, and wetlands as a result of landscaping maintenance, irrigation, and storm water runoff; (3) increase in non-native plant species that are adapted to more urban environments and can out-compete native species for available resources, thus reducing the distribution and population of native species; (4) increases in human activity and domestic animal presence that can disturb natural habitat areas by trampling and extirpating native vegetation and displacing wildlife populations; and (5) erosion and dust resulting from construction and grading activities.

**Threshold 7-1**      **Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS?**

## **On-Site Impacts**

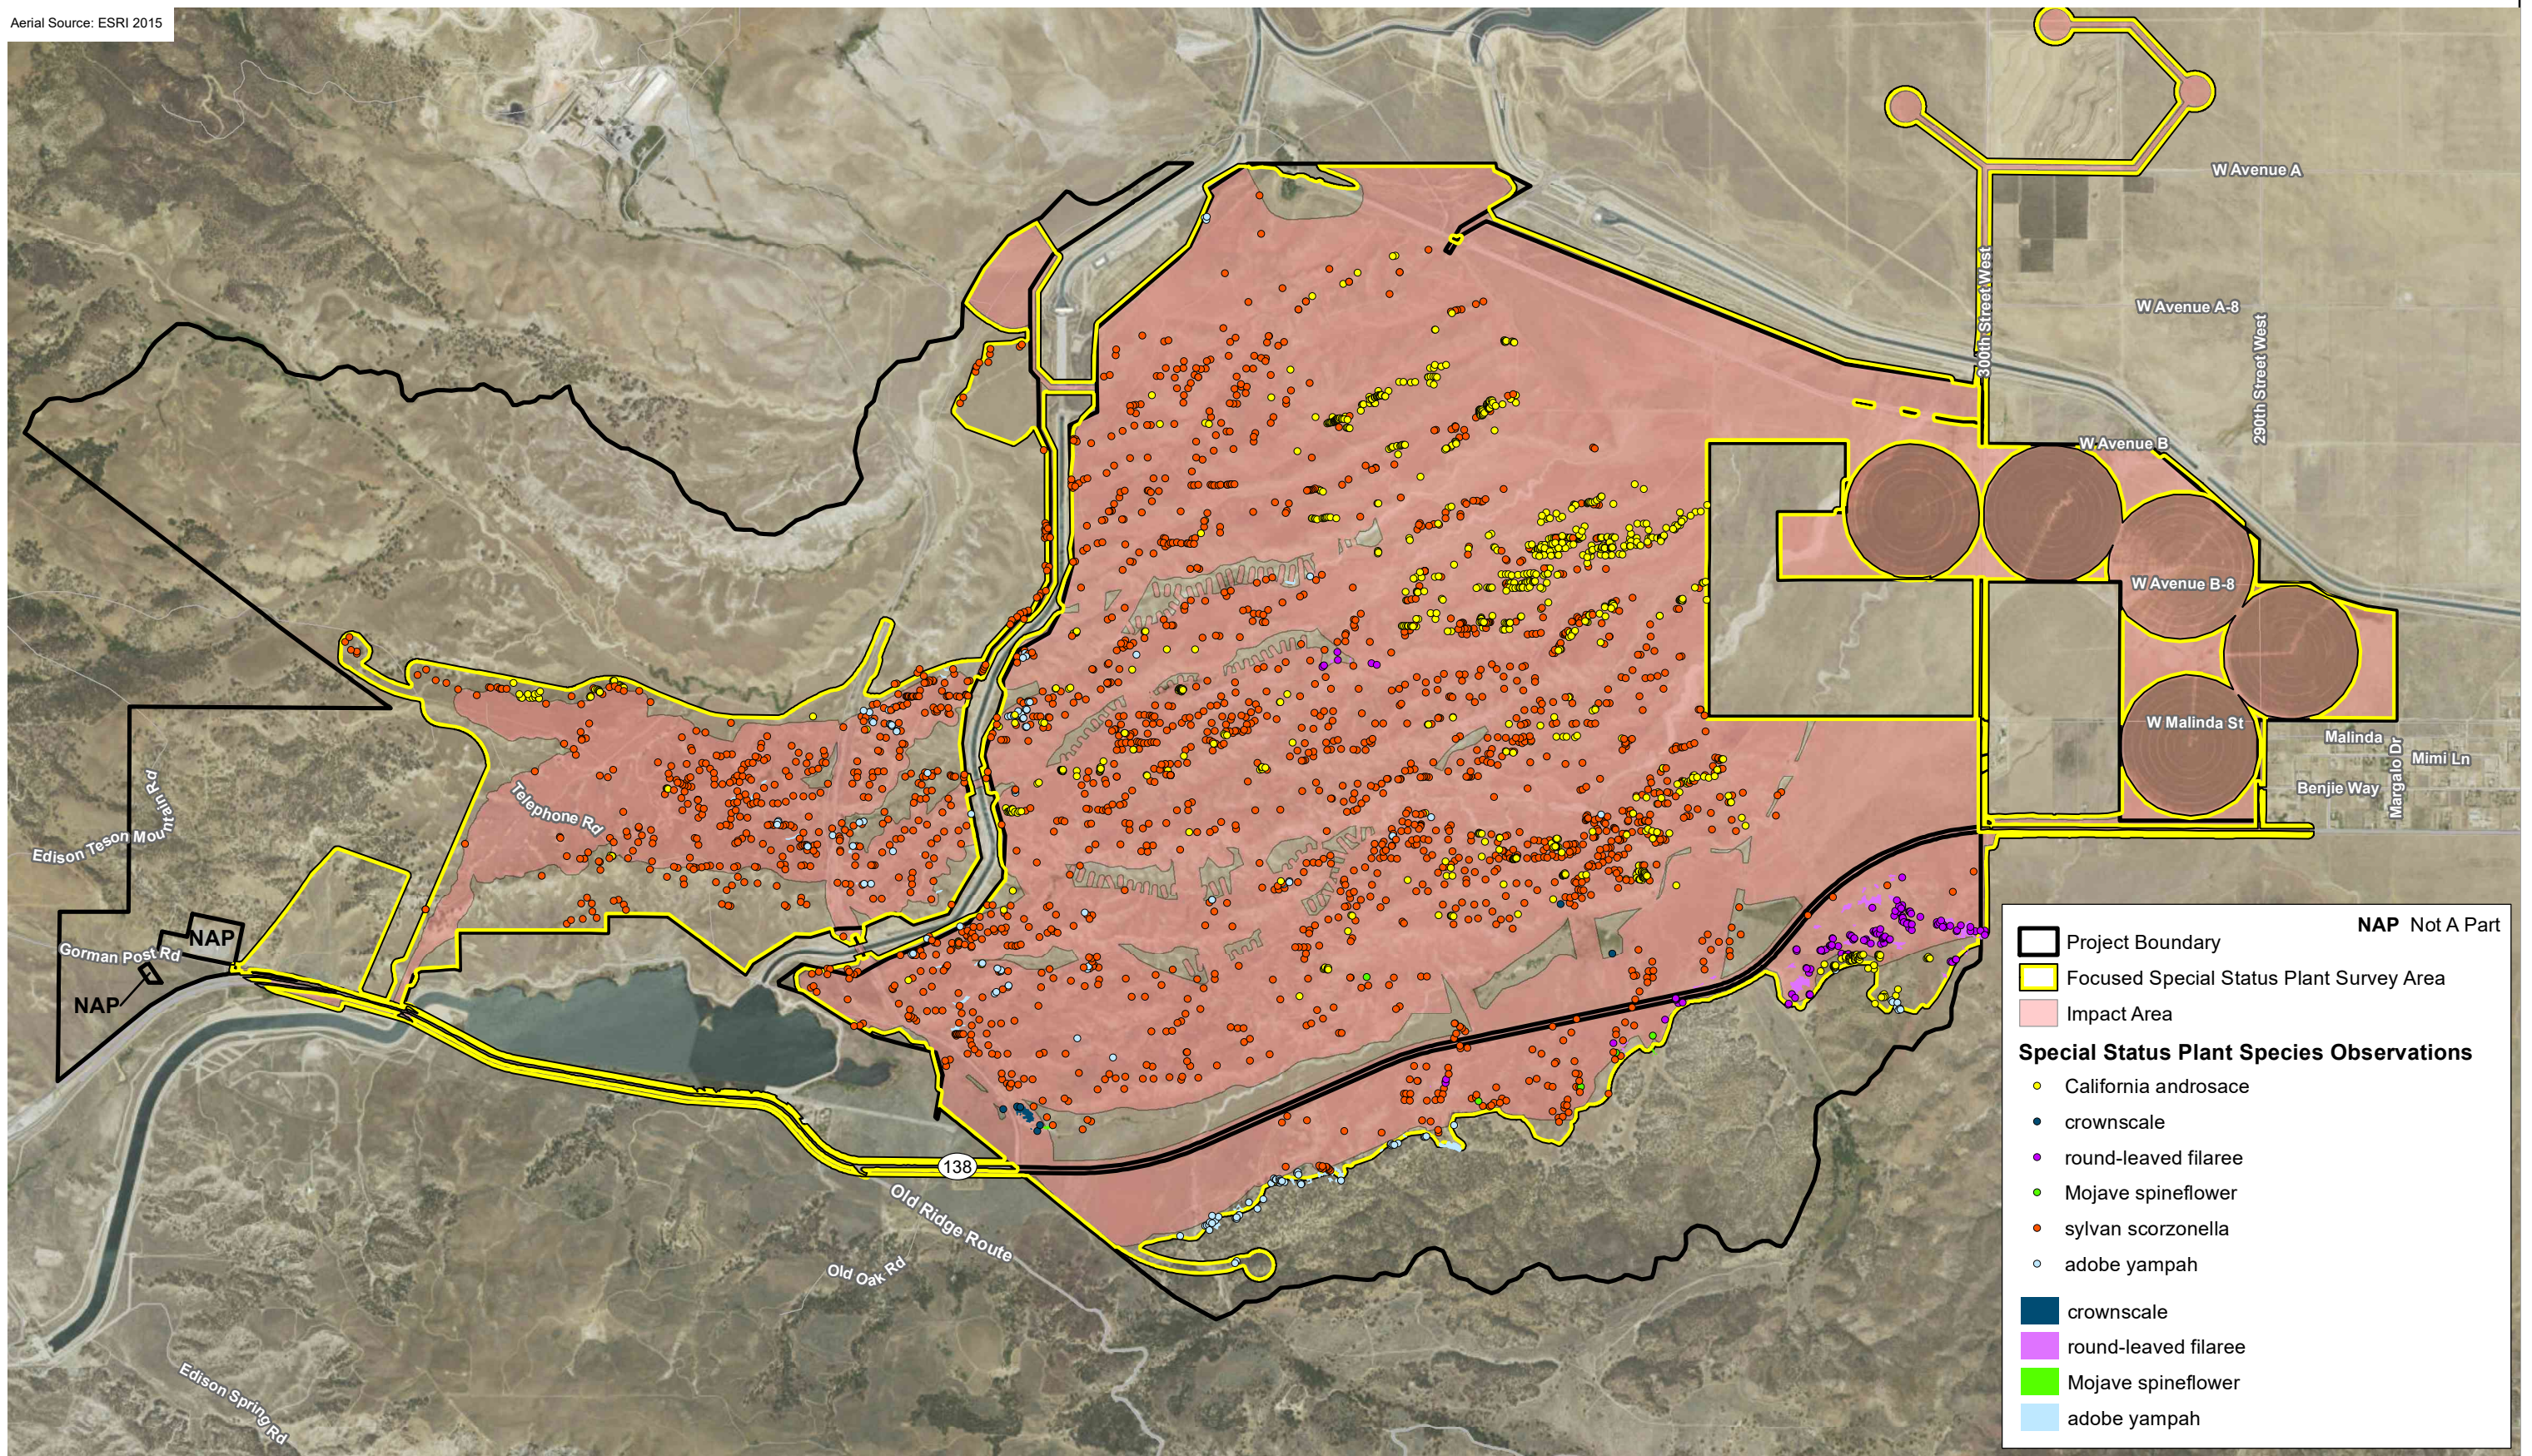

### ***Special Status Plant Species***

Most of the special status plants listed as having a potential to occur on the Project site in Table 5.7-5, Special Status Plant Species would not be impacted by the Project because of negative results of multiple focused botanical surveys and/or they are not expected to occur on the site due to lack of suitable habitat. However, six of the eight special status plant species found on the site, including California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah would be impacted by Project implementation, as shown in Exhibit 5.7-11a, Special Status Plant Species Observation with Impact Boundary. The two remaining special status plant species observed on the site, Piute Mountains navarretia and Lemmon's syntrichopappus, were found in locations that lie outside the proposed development footprint and would therefore not be directly impacted; indirect impacts are not expected due to their distance from proposed development and their occurrence within proposed open space.

California androsace is a CRPR 4.2 species. In 2008, 5 occurrences with 381 total plants were found on the Project site. In 2015, over 29,000 individuals on 320 locations were estimated during focused surveys, with the highest abundances on the lower hills in the northeastern section of the Project site. The on-site population is the largest known population of the species in the County. Project implementation would result in impacts to approximately 28,345 individuals (up to 97 percent of the on-site population) detected during focused surveys. On Liebre Mountain, this species has been described as "occasional in grassland and openings in scrub at the northern base of the range" (Boyd 1999). As discussed, the County of Los Angeles Department of Regional Planning typically does not require mitigation for impacts to CRPR 4.2 species. However, due to the lack of botanical knowledge in the region for this species, the level of impact is difficult to ascertain and impacts are considered potentially significant. Implementation of MM 7-1, proposed to mitigate for impacts to special status plants, would reduce the level of impact by promoting the distribution of this species in the Project region through the propagation of new populations in the Mitigation Preserve. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

Crownscale has a CRPR of 4.2. Historically it has been known only from the Sacramento Valley, San Joaquin Valley, and the Inner South Coast Ranges (Jepson Herbarium 2015). The closest known location outside the Project boundary is approximately 30 miles to the north, near the town of Arvin (CCH 2016). On the Project site, 2015 surveys identified 8 populations with more than 16,000 estimated total individual plants. The largest populations were found on alkali scalds and dry pools near the intersection of SR-138 and National Cement Plant Road. Approximately 16,690 individuals (the entire on-site population) would be impacted by the Project. CRPR 4.2 species are considered naturally limited in distribution and have

### Special Status Plant Species Observations with Impact Boundary

Exhibit 5.7-11a

Centennial Project

**Legend**

- Project Boundary
- Impact Area
- Special Status Wildlife Species Observations**
- Silvery legless lizard (*Anniella pulchra pulchra*)
- Two-striped garter snake (*Thamnophis hammondi*)
- Burrowing owl (*Athene cunicularia*)
- Least Bell's Vireo (*Vireo bellii pusillus*)
- Purple martin (*Progne subis*)
- Tricolored blackbird breeding locations (*Agelaius tricolor*)
- Western yellow-billed cuckoo (*Coccyzus americanus occidentalis*)
- Tehachapi pocket mouse (*Perognathus alticola inexpectatus*)
- Yellow-headed blackbird (*Xanthocephalus xanthocephalus*)

**NAP Not A Part**

- \*Coast horned lizard (*Phrynosoma coronatum*)
  - \*California condor flyover (*Gymnogyps californianus*)
  - \*Cooper's hawk (*Accipiter cooperii*)
  - \*Ferruginous hawk (*Buteo regalis*)
  - \*Golden eagle (*Aquila chrysaetos*)
  - \*Loggerhead shrike (*Lanius ludovicianus*)
  - \*Northern harrier (*Circus cyaneus*)
  - \*Prairie falcon (*Falco mexicanus*)
  - \*Sharp-shinned hawk (*Accipiter striatus*)
  - \*Swainson's Hawk (*Buteo swainsoni*)
  - \*Tricolored blackbird (*Agelaius tricolor*)
  - \*White-tailed kite (*Elanus leucurus*)
  - \*Yellow-breasted chat (*Icteria virens*)
  - \*Yellow warbler (*Dendroica petechia*)
  - \*American badger (*Taxidea taxus*)
- \*To avoid misinterpretation, the location of observation(s) of this species are not indicated on the map due to the limited area of survey, and/or site-wide distribution. These species would be expected to occur at a greater frequency than observations would otherwise indicate.

**Special Status Wildlife Species Observations with Impact Boundary**

**Exhibit 5.7-11b**

been placed on a “watch list”. These species are considered relatively common within their ranges, although it is important to note the location of their occurrences to assist in identifying a decline in population should one occur. Although the CNPS considers CRPR 4.2 species to be special status, impacts to these species often do not meet the significance criteria under CEQA to require mitigation. Because this population is far removed from other known populations of the taxon, its identity is uncertain, and it is the only known population of its taxon in the County, the County of Los Angeles Department of Regional Planning considers the loss of the on-site population to be a significant impact, and therefore mitigation is proposed to reduce impacts to the regional population. Implementation of MM 7-1, to mitigate for impacts to special status plants, would reduce the level of impact by promoting the distribution of this species in the Project region through the propagation of new populations in the Mitigation Preserve. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

Round-leaved filaree is a CRPR 1B.2 species. Although the CNPS considers it to be Rare, Threatened, or Endangered in California and elsewhere, it has no State or Federal listing status. Other than the recent on-site observation, this species was known to occur in the region based on a 1962 collection on Tejon Ranch, from the northern side of Oso Canyon; the population size of this occurrence was not reported (CDFG 2015a). In 2004, 39 occurrences of round-leaved filaree, each ranging in size from 20 to several thousand individual plants, were identified on the Project site. In 2015, over 29,000 individuals on 320 locations scattered throughout the site on hilltops and on upper north-facing slopes were detected in the survey area. The on-site population is the largest documented population of the species in the County. Approximately 22,900 individuals (80 percent of the on-site population) would be impacted by the Project. The remaining occurrences would be retained in open space. Due to the large number of plants that would be lost, impacts to the round-leaved filaree are considered significant. Implementation of MM 7-1 would reduce adverse impacts to a less than significant level by preserving existing populations within the Mitigation Preserve and promoting the distribution of this species within the Project region through the propagation of new populations. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

Mojave spineflower is a CRPR 4.2 species, but it has no State or federal listing status. Nineteen densely populated occurrences were identified on the Project site in 2004; they were located along alluvial slopes in the southeastern portion of the Project site. In 2015, approximately 10,000 individuals were observed in the survey area. Project implementation would result in impacts to approximately 5,100 individuals. This annual plant varies in population size from year to year; during 2006 surveys approximately 47,575 individuals were found on the site, but during 2008 only 6,000 were observed. On Liebre Mountain, this species is considered scarce, and was documented by a historical collection from near Elizabeth Lake, which is located almost 20 miles southeast of the Project site (Boyd 1999). As discussed above, the County of Los Angeles Department of Regional Planning typically does not require mitigation for impacts to CRPR 4.2 species. However, due to the lack of botanical knowledge in the region for this species, the level of impact is difficult to ascertain and therefore the impact is considered potentially significant and mitigation is proposed to reduce impacts to the regional population. Implementation of MM 7-1, to mitigate for impacts to special status plants, would reduce the level of impact by preserving existing

populations within the Mitigation Preserve and promoting the distribution of this species in the Project region through the propagation of new or expanded populations in the Mitigation Preserve. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

Sylvan scorzonella is a CRPR 4.2 species. Numerous occurrences (roughly approximated at 500), were identified on the Project site in 2004 and, in 2008 the number of individuals observed across the site likely exceeded 100,000 plants. This species was observed in scattered patches in grasslands predominately east of the Aqueduct. It was most commonly found on the upper north sides of ridges and hills, and on slopes and flats immediately bordering ephemeral drainages. Nearly all occurrences were located within grasslands; a few were in areas bordered by oak woodland (Vollmar Consulting 2004). In 2015, estimated population counts exceeded 100,000 and, as in previous years, it was observed predominately in grasslands, but was also noted to occur in scrub habitat. Project implementation would remove most occurrences of this species on the site. As discussed above, the County of Los Angeles Department of Regional Planning typically does not require mitigation for impacts to CRPR 4.2 species. However, due to the lack of botanical knowledge in the region for this species, the level of impact is difficult to ascertain and therefore the impact is considered potentially significant. Implementation of MM 7-1, proposed to mitigate for impacts to special status plants, would reduce the level of impact by preserving existing populations within the Mitigation Preserve and promoting the distribution of this species in the Project region through the propagation of new or expanded populations in the Mitigation Preserve. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

Piute Mountains navarretia is a CRPR 1B.1 species. It was observed on the Project site in 2004 at 3 locations, with approximately 20,100 total plants. Occurrences on the site were all located in the hills in the far western region of the Project site, associated with clay soils in areas that had been recently disturbed by feral pigs. These occurrences represent the only known occurrences for this species in Los Angeles County and the southernmost known occurrences. However, this population is outside the Project impact area; as such, impacts to this species are not expected to occur and no mitigation for this species would be required.

Adobe yampah is a CRPR 4.3 species. In 2004, one occurrence of this species with approximately 16 individuals was identified on the Project site. It was found in native grassland habitat on a dry, moderately steep slope with bare soil and low total vegetation cover south of SR-138 (Vollmar Consulting 2004). In 2006, three occurrences were identified including approximately 15 individuals. In 2008, approximately 108 individuals were observed. In 2015, approximately 100 occurrences were recorded in the survey area, with an estimate of 3,100 individuals. Project implementation would result in impacts to approximately 1,490 individuals. On Liebre Mountain, this species has been described as “generally infrequent and scattered in open chaparral and grassland on the higher ridges, but locally common in clay-rich openings on the north face of Sawmill Mountain” (Boyd 1999); Sawmill Mountain is located about ten miles southeast of the Project site. Like CNPS 4.2 species, although CRPR 4.3 species are considered special status species, impacts on CRPR 4.3 species often do not meet the significance criteria under CEQA to require mitigation. However, due to the lack of botanical knowledge in the region for this species, the

level of impact is difficult to ascertain and therefore the impact is considered potentially significant. Implementation of MM 7-1, proposed to mitigate for impacts to special status plants, would reduce the level of impact by preserving existing populations within the Mitigation Preserve and promoting the distribution of this species in the Project region through the propagation of new or expanded populations in the Mitigation Preserve. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

Lemmon's syntrichopappus has a CRPR of 4.3. This annual herb in the Sunflower family is endemic to California. It occurs in Kern, Los Angeles, Monterey, Riverside, San Bernardino, and Ventura Counties (CNPS 2015). No records were found in the Project region prior to focused surveys in the Project site. In 2004, 1 occurrence with 30 plants was identified on an open, moderately steep northwest-facing slope in the north-central portion of the site west of the Aqueduct. This species was not observed in the survey area in 2015. The population detected in 2004 is outside the Project impact area; as such, impacts to this species are not expected to occur and no mitigation for this species would be required.

### ***Special Status Wildlife Species***

A total of 44 special status wildlife species are known to occur in the Project region. Forty of these species have some potential to occur on the Project site, including 17 federally or State-listed species: conservancy fairy shrimp, vernal pool fairy shrimp, arroyo toad, Tehachapi slender salamander, California red-legged frog, blunt-nosed leopard lizard, tricolored blackbird, Swainson's hawk, western yellow-billed cuckoo, southwestern willow flycatcher, California condor, bald eagle, least Bell's vireo, Nelson's antelope squirrel, Townsend's big-eared bat, Tipton kangaroo rat, and San Joaquin kit fox (see Table 5.7-8, Special Status Wildlife Species). Five of these species, the blunt-nosed leopard lizard, golden eagle, white-tailed kit, California condor, and bald eagle are also a State Fully Protected species. Currently, the tricolored blackbird and Townsend's big-eared bat are Candidate State-listed species, require a CESA take permit, and receive the same legal protection afforded to an Endangered or Threatened species. All these species, including the non-listed special status species, are discussed further below based on habitat requirements.

### **Invertebrates**

The conservancy fairy shrimp and vernal pool fairy shrimp were not observed during multiple surveys performed for invertebrates between March 2001 and January 2007 including wet- and dry-season protocol surveys for fairy shrimp conducted in 2004–2005 and 2006–2007 (see Table 5.7-2); therefore, these two listed species are considered to be absent from the Project site. As a result, Project implementation would not impact these species and no mitigation would be required.

### **Amphibians and Reptiles**

The arroyo toad and California red-legged frog were not observed during multiple surveys performed for amphibians between March 2000 and June 2006 including protocol surveys conducted in 2006 for the arroyo toad and 2001 and 2006 for the red-legged frog (see Table 5.7-2); therefore, these listed species are considered to be absent from the Project site.

As a result, Project implementation would not impact these species and no mitigation would be required.

The Tehachapi slender salamander was not observed during multiple surveys performed for amphibians between March 2000 and June 2006 including focused surveys conducted in 2006 (see Table 5.7-2). Potentially suitable habitat for this species includes the north-facing slopes of oak woodland and in a more recent discovery, within the decaying leaves of our Lord's candle plants located in higher elevation woodland (including Joshua tree woodland) where snow melt is retained within the dead plant material (Sweet 2011). Methods for the 2006 focused survey included searching traditional habitats (north-facing oak woodlands) on the Project site. Although yucca scrub does occur within the Project's impact footprint (Exhibit 5.7-12), this habitat is not potentially suitable for Tehachapi slender salamander due to lack of sufficient snowfall (either direct or runoff). The 2006 protocol survey conducted within the Project's impact footprint was negative for this species. The species may occur well outside the Project's impact footprint in the western portion of the Project site and the southern portion of the Project site south of SR-138. As a result, Project implementation would not impact this listed species and no mitigation would be required.

The yellow-blotched ensatina was not observed during multiple surveys performed for amphibians between March 2000 and June 2006 including focused surveys for salamanders in 2006 (see Table 5.7-2). The Project site provides potentially suitable habitat for this salamander, but these habitat areas are mostly located outside the Project's impact footprint. The 2006 surveys conducted within the Project's impact footprint were negative for this species (and all salamander species). The yellow-blotched ensatina may occur outside the Project's impact footprint in the western portion of the Project site and the southern portion of the Project site south of SR-138. As a result, Project implementation would not impact this species and no mitigation would be required.

The western spadefoot was not observed during multiple surveys performed for amphibians between March 2000 and June 2006 including focused surveys for this species in 2004 and 2005 (see Table 5.7-2). Since the Project site is outside the known range of the western spadefoot, the focused surveys were conducted only in those areas supporting high quality habitat for the species. The results of these surveys were negative, and western spadefoot is not expected to occur on the Project site. As a result, Project implementation would not impact this species and no mitigation would be required.

The blunt-nosed leopard lizard was not observed during multiple surveys performed for reptiles between March 2000 and June 2006 (see Table 5.7-2). The Project site provides potentially suitable habitat for the blunt-nosed leopard lizard; however, it has not been observed during the surveys and the Project site is outside the known range for this species. The expected Gambelia species for the Project site is the long-nosed leopard lizard (*G. wislizenii*) (not a special status species), which has not been observed on the Project site to date. As a result, Project implementation would not impact this listed species and no mitigation would be required.

The western pond turtle was not observed during multiple surveys performed for reptiles between March 2000 and June 2006, including focused surveys conducted for this species in

2001 (see Table 5.7-2). Although, not documented officially in CNDDDB records, the western pond turtle has been observed incidentally off-site at Quail Lake, so it is possible that individuals may occur on the Project site for nesting. One two-striped garter snake was observed outside the Project's impact footprint in the northwestern portion of the Project site. Based on an absence of official records, if Quail Lake in fact does support a population of western pond turtle, the population is expected to be small. The two-stripe garter snake is a highly aquatic species that depends on a perennial water source. Project impacts would result in the loss of a small amount of potentially suitable western pond turtle nesting habitat available to a population that may persist at Quail Lake. For both these species, the amount of potentially suitable habitat on the Project site is very limited and would only amount to a couple of acres at most. Project impacts to this limited potentially suitable habitat for both species is not expected to have a substantial impact on regional populations. Therefore, the loss of limited and isolated cattle pond features and the grassland/scrub habitat immediately adjacent to Quail Lake that would occur with Project implementation would be considered adverse, but less than significant for the western pond turtle and two-striped garter snake. The loss of individuals for these two species, however, may be considered significant under Section 15380 of the State CEQA Guidelines. Implementation of MM 7-2 through MM 7-4 requiring avoidance of impacts outside disturbance limits, pre-construction surveys, and biological monitoring (including relocation of individuals from the Project's impact footprint) would reduce the impact to less than significant.

The silvery legless lizard and coast horned lizard were both observed during multiple surveys performed for reptiles between March 2000 and June 2006 (see Table 5.7-2). One legless lizard was observed at the far western edge of the Project site. Horned lizards were observed in several site drainages, primarily in the eastern portions of the Project site. Suitable and potentially suitable habitat for these two species generally may occur within grassland, scrub, riparian, and oak woodland habitat types. The legless lizard requires a high soil moisture content, while the coast horned lizard can tolerate dryer habitats. Areas on the Project site with high soil moisture content are limited and the legless lizard is expected to occur mainly in the oak woodland and riparian habitats where the soil moisture content is higher due to factors such as plant cover and leaf litter. The coast horned lizard has been detected mainly in the dry, sandy, washes within the grassland and scrub habitats in the eastern portion of the project site. Based on these vegetation types and the habitat requirements of these species, potentially suitable habitat on the Project site is expected to be scattered patchy in distribution, amounting to no more than 10% of the total area. Of the roughly 7,000 acres impacted by the Project, it is estimated that no more than 700 acres of potentially suitable habitat occurs for both species, though is likely much less for the legless lizard. These two species are expected to be relatively abundant in the region; therefore, the loss of roughly 700 acres associated with Project implementation would be considered adverse, but less than significant for the silvery legless lizard and coast horned lizard and no mitigation is required. Even though impacts would be less than significant, implementation of MM 7-2 through MM 7-4 requiring avoidance of impacts outside disturbance limits, pre-construction surveys, and biological monitoring (including relocation of individuals from the Project's impact footprint) if detected would further help these species.

## Birds

Of the eight listed bird species with potential to occur on the Project site, the western yellow-billed cuckoo, southwestern willow flycatcher, and least Bell's vireo occupy similar riparian habitats. Multiple bird surveys performed between March 2000 and July 2015 including protocol surveys for the flycatcher and vireo conducted in 2006 and 2008 (see Table 5.7-2) have not detected any breeding activities for these three species. One yellow-billed cuckoo was observed in the north-central part of the Project site in June 2003, but follow-up avian surveys in 2006 were negative for the species and the sighting was considered to represent a rare migrant rather than a breeding bird (BonTerra Consulting 2006b). Although the southwestern willow flycatcher was not present during the 2006 and 2008 protocol surveys, migrant willow flycatchers were observed. These migrants represent more northerly breeders of different subspecies that are relatively common in the region during May and June when southwestern willow flycatchers are breeding. A territorial willow flycatcher detected in southern California late June would be identified as a southwestern willow flycatcher, as the northern subspecies would have migrated out of the area by that time. Except for a singing least Bell's vireo on June 22, 2006, the 2006 and 2008 protocol surveys were negative for documenting breeding activity. Migrant landbirds or songbirds (i.e., passerines) can use a wide range of habitats and are typically present for short periods of time (generally one to three days in spring). Based on the results of these surveys, the Project site is not considered to be occupied by the western yellow-billed cuckoo, southwestern willow flycatcher, or least Bell's vireo. Therefore, Project implementation is not expected to impact these three listed species and no mitigation would be required. Since all three of these listed species are migratory, however, and may occur as breeders in the future, MM 7-5 is included to conduct pre-construction protocol surveys for the western yellow-billed cuckoo, southwestern willow flycatcher, and least Bell's vireo to confirm absence prior to disturbance.

The bird surveys performed between March 2000 and July 2015 (see Table 5.7-2) have shown that both the California condor and bald eagle are rarely seen on the Project site. Quail Lake provides suitable foraging habitat for the bald eagle where it has occasionally been observed. Trees in the surrounding area provide potentially suitable nests sites for the bald eagle, but nesting at this location has not yet been documented. All California condors are wing-tagged and fitted with radio transmitters. These birds have been documented flying high over the area (with one reported landing), but foraging and breeding activities are conducted elsewhere and not on or in the vicinity of the Project site (Bloom 2009; BonTerra Psomas 2015d). Therefore, Project implementation is not expected to result in any impacts on these two species and no mitigation is required. MM 7-6 is included to further ensure that the proposed Project does not result in future impacts on the California condor.

Migrant Swainson's hawks have been observed on the Project site during focused protocol surveys performed between March 2000 and July 2013 (see Table 5.7-2), as well as incidentally during 2015 tricolored blackbird surveys during and 2015-2016 plant surveys. Breeding Swainson's hawks have not been detected during protocol surveys. Most migrant sightings on the Project site have been in spring (March—May) and consist of fly-overs, but also include observations of foraging individuals that often concentrate in the alfalfa fields at the east end of the Project site. The sightings also include a small group of non-breeders

summering on the Project site in July 2008. This group consisted of five immatures foraging for grasshoppers in the Oso Canyon grasslands just west of Cement Plant Road. Project implementation would result in the loss of habitats used by migrating Swainson's hawks, occasional non-breeding birds in summer, and potentially suitable nesting habitats in the eastern portions (i.e., alfalfa fields and surrounding trees) of the Project site. The primary threat to this species is the loss of breeding habitats; therefore, these impacts are considered adverse but less than significant and no mitigation is required. As with other migratory birds, however, this species may occur as a breeder in the future and MM 7-2 is included to conduct pre-construction protocol surveys for the Swainson's hawk to confirm absence prior to disturbance.

The Project site is outside the known range and does not provide suitable habitat for the coastal California gnatcatcher. Therefore, Project implementation is not expected to impact this listed species and no mitigation would be required.

The tricolored blackbird is currently a Candidate State-listed species that receives the same legal protection afforded to an endangered or threatened species. Its status was only recently elevated, so protocol surveys were conducted for the first time in 2015 (BonTerra Psomas 2015c). The results of this focused survey documented relatively heavy use of the Project site for foraging purposes by tricolored blackbirds nesting off site at Quail Lake, and to a much lesser degree, Holiday Lake. In an effort to determine the Project's potential effect on tricolored blackbird nesting colony foraging lands of the region, an assessment of each of four known colonies was conducted (BonTerra Psomas 2015c). Breeding colonies are known to forage as far as five miles away from the nesting location. Therefore, the suitability of foraging was assessed for all lands within a five-mile radius of each colonies nesting location. Based on vegetation types, potentially suitable foraging habitat occurs on nearly 100,000 acres in the Project region. The Project would result in the loss of approximately 8 percent of this nesting colony foraging habitat. Although this loss is considerable, the effect on individual colonies may be more informative in determining overall effects on the regional nesting population.

Due to the shifting of tricolored blackbird nesting locations from year to year, a subset of two or three of the available nesting locations may represent the entire regional breeding population. A substantial reduction of foraging lands surrounding this subset of nesting locations could result in considerable reduction of nesting success. A review of the Quail Lake and the on-site colony subset identified a potential post-Project reduction of approximately 20 percent of potentially suitable foraging habitat at each location. In a given year, if these two areas were used for nesting, the reduced availability of suitable foraging land could result in substantial reduction in nesting success.

The indirect impacts described above may be considered potentially significant pursuant to CEQA; and mitigation may be required to reduce the impact to a less than significant level. Potentially suitable areas for enhancement and preservation include the pond area along the northern boundary and Oso Canyon, as well as any other created water bodies as part of the Project Drainage Plan, where feasible. Tricolored blackbirds were observed foraging heavily within the Mitigation Preserve in Oso Canyon and, with some hydrology and habitat enhancement in this area, it may be suitable to support a breeding colony in the future. An

additional colony of nesting tricolored blackbird birds was incidentally detected in 2016 within Mitigation Areas north of the Project site. Enhancement factors shall include the creation of cattail/bulrush marsh habitat or other substrate known to support breeding tricolored blackbirds, persistent nearby standing water during the breeding season, and sufficient available adjacent foraging habitat with an appropriate food source.

To avoid all direct impacts and minimize indirect impacts to the nesting colonies on the Project site, MM 7-7 is included. This MM states that the Project shall incorporate avoidance and additional open space buffer features for the identified nesting areas such as at the northern edge of the Project site and at Quail Lake. Permanent impacts will be restricted to a minimum distance of 400 feet from the nesting area. The nesting area will be delineated by a qualified Ornithologist based on all available data (a minimum of three years of site-specific data shall be used). Temporary impacts (i.e., construction noise) within 400 feet shall be restricted to the non-breeding season. The breeding season for this species shall be considered April 1 through July 1. In addition to MM 7-7, the Project design incorporates a buffer of greater than 1,000 feet along the northern shore of Quail Lake to minimize impacts to adjacent foraging grounds. At the east end of the Lake, east of the mouth of the aqueduct, where a small section of shoreline is close to the project impact footprint, land uses include a regional park within a low density development zone so that lands immediately beyond the required 400 foot buffer (if nesting is identified) remain permeable and retain some potential for foraging for this species.

Of the 13 non-listed special status bird species with potential to occur on the Project site (see Table 5.7-8), focused surveys have been conducted for the mountain plover and California spotted owl (BonTerra Consulting 2010, 2006a). The results of these surveys were negative; therefore, Project implementation would not be expected to impact the mountain plover or California spotted owl and no mitigation would be required.

Only single pairs or individual burrowing owls have been observed on or in the vicinity of the Project site during multiple bird surveys performed between March 2000 and July 2015 (see Table 5.7-2). Focused burrowing owl surveys have also been conducted (NRC 2006c; Impact Sciences 2003). The Project site does not support a population of this species that would be considered regionally important; therefore, the loss of potentially suitable habitat for this species would be considered adverse, but less than significant. The loss of individual burrowing owls, however, may be considered significant under Section 15380 of the State CEQA Guidelines. Implementation of MM 7-2 for biological monitoring during construction is recommended to relocate individuals from the Project's impact footprint.

The golden eagle, northern harrier, and white-tailed kite have been observed foraging on the Project site, but nesting has not yet been documented on the Project site. Project implementation would result in the loss of approximately 6,416 acres of foraging habitat for these raptors that would be considered adverse, but less than significant. The potential exists for all three raptors to nest on the Project site. As golden eagle and white-tailed kite are California Fully Protected species, "take" would not be allowed. In addition, the nests of all three species would be protected by the Migratory Bird Treaty Act (MBTA). Therefore, MM 7-8 is included to protect nesting birds during construction.

The Project site's wooded areas in the western portions provided limited potentially suitable breeding habitat (and wintering) for the long-eared owl. The long-eared owl has not been detected on the Project site but may occur. The Project site does not support a population of this species that would be considered regionally important; therefore, the loss of limited potentially suitable habitat for this species would be considered adverse, but less than significant. The nests of this species would be protected by the MBTA. Therefore, MM 7-8 is included for protection of nesting birds during construction.

The yellow warbler and yellow-breasted chat were observed during the surveys, but no nesting was documented for the Project site. The riparian habitats dominated by willows and cottonwoods, especially those in Oso Canyon, provide potentially suitable nesting habitat for these two species as well as the summer tanager, which was not observed during the surveys. The purple martin may also nest in these areas, but is more likely to occur on the upslope oak woodlands in western portions of the Project site. Project implementation would result in the loss of approximately 35 acres potentially suitable nesting habitat for these four species that would be considered adverse, but less than significant. The nests of all four species would be protected by the MBTA. Therefore, MM 7-8 is included for protection of nesting birds during construction.

The Project site's grasslands provide potentially suitable habitat for the grasshopper sparrow; however, this species has not been observed during multiple bird surveys performed between March 2000 and July 2015 (see Table 5.7-2) and the Project site is outside the known range for the species. Therefore, Project implementation is not expected to impact this species and no mitigation would be required.

Small numbers of loggerhead shrikes have been observed year-round on the Project site. Although nesting has not yet been documented, this species is expected to breed on the Project site. Relative to numbers of this species elsewhere in the Antelope Valley, the Project site does not support a population that would be considered regionally important; therefore, the loss of approximately 460 acres of suitable habitat for this species would be considered adverse, but less than significant. The nests of this species would be protected by the MBTA; therefore, MM 7-8 is included for protection of nesting birds during construction.

During the focused surveys for tricolored blackbird (BonTerra Psomas 2015c), large numbers of yellow-headed blackbirds were observed foraging with other blackbird species in the eastern portions of the Project site. This species may nest in the cattail beds of Quail Lake, but is not expected to nest on the Project site. Project implementation would result in the loss of suitable foraging habitat for this species that would be considered adverse, but less than significant and no mitigation is required.

### Mammals

The Project site is outside the known range and does not provide suitable habitat for the Nelson's antelope squirrel or Tipton kangaroo rat. The Project site may provide potentially suitable habitat for the San Joaquin kit fox, but it is also outside the known range for this species. If present, the multiple biological surveys conducted on the Project site since 2001 (see Table 5.7-2) would have detected this species. Therefore, Project implementation is not expected to impact these three listed species and no mitigation would be required.

Disturbance and loss of large colony roost sites during the maternity and hibernation seasons are considered primary factors that may negatively impact the Townsend's big-eared bat in California (CDFW 2014). There are no known maternity or significant roosting sites for the Townsend's big-eared bat on or in the vicinity of the Project site. The oak woodlands in western portions of the Project site may provide temporary roost sites for individual Townsend's big-eared bats. Potential foraging habitat is expected to be limited to edge habitats along streams and areas adjacent to and within the oak woodlands in western portions of the Project site outside the Project's impact footprint; therefore, Project implementation is not expected to impact the Townsend's big-eared bat and no mitigation is required. The loss of individual Townsend's big-eared bats, however, may be considered significant under Section 15380 of the State CEQA Guidelines. Implementation of MM 7-9 for pre-construction bat surveys, MM 7-3 for biological monitoring during construction, and MM 7-4 for clear demarcation of disturbance limits are recommended to avoid taking of solitary roosting individuals that may be present within the Project's impact footprint.

The Project site provides potentially suitable foraging habitat for both the pallid and western mastiff bats, but limited roosting opportunities for pallid bats and no roosting opportunities for western mastiff bats. Project implementation would result in the loss of roughly 7,000 acres of potentially suitable foraging habitat for these 2 bat species. This loss is small relative to the amount of foraging habitat available to these two species elsewhere in the region; therefore, the loss of potential foraging habitat for the pallid bat and western mastiff bat is considered to be adverse but less than significant and no mitigation is required. The loss of individual pallid bats, however, may be considered significant under Section 15380 of the State CEQA Guidelines. Implementation of MM 7-3 for biological monitoring during construction, MM 7-4 for clear demarcation of disturbance limits, and MM 7-9 for pre-construction bat surveys are recommended to avoid taking of roosting individuals that may be present within the Project's impact footprint.

The Tehachapi pocket mouse has been reported in the vicinity of the Project site at points across the Tehachapi foothills within grassland and desert shrub. One individual of this species was also detected on the Project site during focused surveys. It is expected to occur, albeit in very low numbers, within arid annual grassland and desert shrub vegetation types on the site. The only area where this species was detected is outside the Project's disturbance limits. However, there is reasonable opportunity for this species to occur in very low numbers within impact areas of potentially suitable habitat. Based on current known distribution, this species is likely to occupy much of the Tehachapi foothill south facing slope stretching from the project site to the northeast for some distance. Although small mammal trapping surveys in the region are fairly limited, CNDDDB records from recent years (2000 and up) provide evidence of this projected distribution. The loss of potentially suitable habitat for this species would be considered adverse, however, substantial adverse effects on the regional population are not expected to occur due to the relative abundance of mostly contiguous habitat across the southern slope of the Tehachapi Mountains. The loss of potentially suitable habitat is therefore considered less than significant. The loss of individuals, however, may be considered significant under Section 15380 of the State CEQA Guidelines. Implementation of MM 7-3 for biological monitoring during construction is recommended to relocate individuals from the Project's impact footprint if detected.

The Southern grasshopper mouse has not been detected on site during focused mammal surveys, but the Project site is within the known historical range. Although not observed in the region since 2003, the southern grasshopper mouse may potentially occur on the site in potentially suitable areas such as low, open, and semi-open scrub habitats including mixed chaparral, riparian scrub, and annual grasslands with scattered shrubs. Due to a lack of detection during focused mammal surveys on the Project site, it is unlikely that the Project site supports a population of this species that would be considered regionally important; therefore, the loss of approximately 460 acres of potentially suitable habitat for this species would be considered adverse, but less than significant. The loss of individuals, however, may be considered significant under Section 15380 of the State CEQA Guidelines. Implementation of MM 7-3 for biological monitoring during construction is recommended to relocate individuals from the Project's impact footprint if detected.

The American badger was observed at several locations on the Project site east and west of the California Aqueduct. Suitable habitat is found throughout the Project site. American badgers have large home ranges and wander widely. As a result, Project implementation is not expected to impact more than a few territories, at most, of this species. Compared to the amount of suitable habitat available in the region, the loss of roughly 7,000 acres of suitable habitat associated with Project implementation would be considered adverse but less than significant for the American badger and no mitigation is required. The loss of individual American badgers, however, may be considered significant under Section 15380 of the State CEQA Guidelines. Implementation of MM 7-2 for pre-construction surveys and MM 7-3 for biological monitoring during construction are included to relocate individuals from the Project's impact footprint.

Although not classified as a special status species (CDFW 2017b), the relatively small population of reintroduced pronghorn antelope on the Project site is considered of interest due to limited numbers and historical presence in the. Additionally, the CDFW issues permits allowing the occasional hunting of pronghorn in this population. Project implementation would reduce the amount of available foraging habitat for this population. However, impacts on a reintroduced population of a non-special status species that may result from Project implementation would be considered adverse but less than significant under applicable CEQA significance thresholds. As part of the Ranchwide Management Plan (TRC 2013), which is an implementation tool of the Ranchwide Agreement, the Project Applicant will work with the Tejon Ranch Conservancy to identify and implement potential enhancement measures that are also supported by CDFW. Potential measures could focus on enhancing pronghorn fawn survivorship with GPS-tracking devices and other measures to evaluate and minimize losses from coyote predation; completing further evaluation of modeling tools at a site-specific level (such as those used on the Carrizo Plain), and incorporating volunteer involvement with supportive activities such as fencing retrofits.

### ***Nesting Birds***

Construction activities could result in the direct loss of active bird nests or the abandonment of active nests by adult birds in a variety of habitats across the site. In particular, raptor species are prone to nest abandonment. Bird nests with eggs or young are protected under the MBTA and the *California Fish and Game Code*. Specific provisions of the statute include

the establishment of a federal prohibition, unless permitted, to “pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird, included in the terms of the Convention for the protection of migratory birds or any part, nest, or egg of any such bird” (16 USC 703).

Bird species protected under the provisions of the MBTA are identified by the List of Migratory Birds (50 *Code of Federal Regulations* [CFR] 10.13, as updated by the 1983 American Ornithologists’ Union [AOU] Checklist and USFWS-published supplements through 2014). Impacts to nesting birds, including raptors, resulting from Project development are considered significant. Implementation of MM 7-8 would reduce adverse impacts to a less than significant level by minimizing disturbance to nesting birds during construction through seasonal avoidance in some areas and pre-construction surveys and avoidance of designated active nesting areas.

### **Off-Site Impacts**

The potential for impacts to special status plant and wildlife species and nesting birds with implementation of the off-site Project components, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, are discussed below.

#### ***Special Status Plant Species***

The off-site Project areas contain potentially suitable habitat for some of the special status plant species shown in Table 5.7-5, Special Status Plant Species. Focused surveys for these areas were conducted in 2016. During focused surveys, approximately 1 adobe yampah, 64 round-leaved filaree, and 1,590 sylvan scorzonella plants were observed. Impacts to these rare plant populations would be considered potentially significant. Implementation of MM 7-1, proposed to mitigate for impacts to special status plants, would reduce the level of impact by preserving existing populations within the Mitigation Preserve and promoting the distribution of this species in the Project region through the propagation of new or expanded populations in the Mitigation Preserve. The expansion of the local population of this species is expected to increase its potential to be sustained in perpetuity.

#### ***Special Status Wildlife Species***

The off-site Project areas contain potentially suitable habitat for the special status wildlife species as shown in Table 5.7-8, Special Status Wildlife Species. Impacts in these areas are considered to be the same as the Project except at a smaller scale due to the much smaller area of impact. Mitigation described in MM 7-2, MM 7-3, MM 7-4, MM 7-5, MM 7-6, MM 7-7, MM 7-8, and MM 7-9 would reduce adverse impacts to a less than significant level; these mitigation measures minimize disturbance during construction through clear demarcation of disturbance limits, pre-construction surveys, monitoring during construction to ensure no mortality, relocation of individuals prior to grading, focused surveys for certain species prior to Project implementation, and seasonal avoidance of certain areas. These measures also mitigate for losses to tricolored blackbird foraging habitat.

### ***Nesting Birds***

Impacts associated with development of off-site Project features may result in the disturbance of nesting birds. Due to their protected status, impacts to nesting birds resulting from off-site development are considered significant. Implementation of MM 7-8 would reduce adverse impacts to a less than significant level by minimizing disturbance to nesting birds during construction through seasonal avoidance in some areas and pre-construction surveys and avoidance of designated active nesting areas.

***Impact Summary:*** Impacts to special status plants, special status wildlife, and nesting birds that would result from implementation of the Project would be reduced to a level considered less than significant through implementation of MMs 7-1, 7-2, 7-3, 7-4, 7-5, 7-6, -7, and 7-9.

**Threshold 7-2**      **Would the Project have a substantial adverse effect on any sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by the CDFW or USFWS?**

### **On-Site and Off-Site Impacts**

Table 5.7-11, Impacts to Vegetation Types, below details the impacts to vegetation types in the Project's on-site and off-site study areas, which are discussed separately below. Table 5.7-12, Primary Biological Resources within the Impact Areas and the On-Site and Off-Site Mitigation Preserve System, summarizes the on- and off-site impacts to the primary, group vegetation types and the associated acres to be preserved. The Mitigation Preserve refers to the on-site unimpacted lands that are within SEA 17 and the off-site open space preserve areas.

### ***Native Perennial Grasslands and Wildflower Fields***

Native perennial grasslands and wildflower fields are considered special status vegetation types (CDFG 2010) and are classified within the grass- and herb-dominated vegetation type group. Project construction would result in the loss of native perennial grasslands and wildflower fields as quantified in Table 5.7-11 (see also Exhibit 5.7-12, Vegetation Type Impacts). Note that the distribution and quantity of wildflower fields is not specifically delineated, although this community occurs in a patchy distribution throughout the grassland vegetation types on the Project site. In a preliminary study of Centennial grasslands, conducted in a high rain fall year (2003), the investigators characterized large areas of the site as an “herbaceous community” based on the wildflower blooms observed (Impact Sciences 2003).

The grass- and herb-dominated vegetation type group includes grassland areas that are considered to be a mix of native perennial grassland and California annual grassland (with associated wildflower fields). Areas of increased native cover tend to include the upper slopes and ridge tops of existing hills and ridges. Most of these grassland areas would be directly impacted by implementation of the Project. Subsequent studies indicate that the grassland includes areas where the percent cover of native grass species increases relative to non-native grasses and other species. The wildflower field component of these areas is also considered a special status vegetation type (CDFG 2010).

Grasslands on the site are dominated by non-native plants including two introduced annual grasses, foxtail chess (*Bromus madritensis*), and cheat grass (*B. tectorum*); and two introduced annual forbs, red-stemmed filaree (*Erodium cicutarium*), and broad leaf filaree (*E. botrys*). Although the percent cover on the site is dominated by these non-native plants, the species richness (number of species per unit area) on the site is overwhelmingly dominated by native species. Approximately 80 percent of the species occurring within the grasslands are native forbs, grasses, and perennials. Native species accounted for

Centennial Project

Exhibit 5.7-12

approximately eight percent of the total cover with native grasses alone providing approximately five percent cover in the 2006 and 2007 study years.

Native grasslands are believed to have once covered nearly a fifth of the state and have been reduced to approximately 0.1 percent of their former area (Barry 1972). Given its dramatic decline, the native grassland vegetation type is considered special status in California (CDFG 2010). Although no detailed accounts of the composition of California's pre-settlement grasslands exist, Heady (1977) and others believe that before the arrival of the earliest explorers, perennial bunchgrasses formed a rather stable climax community on well-drained upland sites and that a wide array of annual herbaceous plants (or forbs) dominated intermediate and early successional circumstances there and elsewhere. Today, native grasslands survive on shallow soils, in ruderal areas, on serpentine-based and other anomalous soils, and in other situations like those on the Project site.

Although intensive grazing can be associated with loss of native perennial grasses, less intensive grazing may inhibit non-native establishment. Most areas in California that support extensive remnant stands of native grassland plants have been grazed continuously over at least the past century, and evidence indicates that livestock grazing at intermediate stocking levels discourages and slows the invasion of weedy non-native species in these grassland areas. This evidence may explain the persistence of native grasslands on the Project site despite a history of moderate cattle grazing over most of the site. Some studies have indicated that grasslands where cattle grazing has ceased have shown an increase in the percentage of native taxa (Murphy and Ehrlich 1989); however, longer-term assessments are not available. Differences in native grass and forb response from location to location are likely due to environmental factors specific to each site, making direct comparison very difficult.

While native grasslands have declined in California, native grasslands in the Project region may be more prevalent than they are in more developed or disturbed portions of Southern California. Open space is abundant within the remainder of the Tejon Ranch property, in the nearby National Forests, and along the foothills of the Tehachapi Mountains to the northeast of the site. Within the mountainous areas, grasslands are limited to relatively small patches. Recent large-scale studies of the vegetation types in the Mojave Desert region, including the Project site, found over 59,500 acres of grassland, including 22,000 acres of native grasslands. Based on a review of aerial photos, review of California Gap Analysis Project (GAP) regional vegetation maps, and field observation from a distance, the foothills of the Tehachapi Mountains (continuing north and northeast from the site) and the valley floor (continuing east) appear to be predominantly covered by grassland vegetation not unlike the Project site. The surrounding grasslands, including approximately 30,000 acres along the southern Tehachapi slope, have a similar species composition.

Although the abundance of native perennial grasses on the Project site has been reduced over the past century, the persistence of moderate but sustainable levels of these grasses over thousands of contiguous acres is highly impressive when compared to the rest of California. From either a statewide or regional perspective, the quality and extent of native perennial grasslands on the site is excellent. Most of the remaining stands in the Southern California area are generally small (less than 100 acres) and isolated in widely scattered

areas. GAP vegetation maps indicate that grasslands are relatively abundant in the Project region and in the closely associated surrounding regions. As shown in Table 5.7-11, Impacts to Vegetation Types, the Project would impact 6,415 acres of the Native Perennial Grassland/California Annual Grassland vegetation type on site. Due to the loss of approximately 11 percent of the grasslands in general in the Mojave Desert region, the loss of thousands of acres of grassland at least potentially containing a native perennial component (a special status vegetation type) is significant. Loss of wildflower fields, considered to be a subset vegetation type within the grasslands, is similarly considered a significant impact due to their rarity and status as a special status vegetation type (CDFG 2010; Holland 1986). Implementation of MM 7-10 would reduce these impacts to less than significant levels through preservation of 14,375 acres of on-site and off-site grasslands. The proposed preservation reflects greater than a 2:1 ratio of preservation acreage to impact acreage. This ratio has been applied to all impacted grasslands (undifferentiated) although typically is only applied to native grasslands. Due to the intent and objective of preserving a mixed community similar to that which is impacted by the project, areas selected for preservation are similarly mixed. Furthermore, studies indicate a high degree of similarity between impacted grasslands and preserved grasslands assuring a sustained community throughout the region.

The grassland mitigation is based on site-specific characteristics including, for example, the existence of native grasslands in the 27,408-acre on-site (unimpacted/SEA lands) and off-site preserve areas. The availability of native grassland in the vicinity of the Project site is unique and allows for the implementation of the preferred preservation mitigation approach (existing native grasslands to be preserved), which generally results in better quality habitat with higher potential for long-term stability, rather than the implementation of creation mitigation (new native grasslands are created as mitigation), which has a higher degree of uncertainty.

Other factors considered in determining the grassland mitigation ratio include the size, scale, and biological diversity of the contiguous preserve. The preserve is designed to maximize the potential for success by creating a contiguous large open space with minimum potential for edge effects from regional development. This program is described in the Mitigation Measures section below. Specifically, the Project proposes to preserve 14,375 acres of grasslands within the 27,404 -acre on-site (unimpacted/SEA lands) and off-site mitigation preserve, which is part of a larger 240,000-acre conservation area (including dedication and acquisition areas). Regardless of the status of the acquisition areas in the future, the grassland mitigation area will remain contiguous with the larger dedicated open space areas. The contiguity of the preserve with the larger Tejon Ranch open space dedication areas ensures that the preserved grasslands are not “islands” surrounded by development but rather part of a larger, contiguous natural landscape that will be preserved in perpetuity.

### ***Other Special Status Vegetation Types***

In addition to grasslands and wildflower fields, several special status vegetation types on the Project site would be directly impacted by Project implementation, as quantified in Table 5.7-11 and detailed below (see Exhibit 5.7-12, Vegetation Type Impacts). Due to the status of these special status vegetation types as high priority and the additional protection

of oak woodlands afforded by the *California Public Resources Code* and County ordinance, the loss resulting from Project implementation is considered significant. Implementation of MM 7-11 would reduce these impacts to less than significant levels. This measure outlines a plan to preserve, enhance, and restore these community types within the mitigation preserve on and off the site (when it is not feasible on site). The details included in this plan are described in depth in the “Mitigation Measures” section below.

#### Broad Leafed Upland Tree-Dominated Vegetation Types

Within the broad leafed upland tree-dominated vegetation type group, Project implementation would create impacts to mixed oak woodland, a special status vegetation type. All oak woodlands found on the site are subject to Senate Bill (SB) 1334 (*California Public Resources Code* [PRC] Section 21083.4), which “provides funding for the conservation and protection of California’s oak woodlands”. This bill mandates that oak woodlands be regulated by mitigation measures that are defined in the bill itself. Additionally, the loss of individual oak trees would be subject to the CLAOTO, as further described below under Threshold 7-5, and therefore would require an Oak Tree Permit with associated conditions before the Project can be implemented.

#### Riparian and Bottomland Vegetation Types

Within the riparian and bottomland vegetation type group, impacts would occur to the following special status vegetation types with Project implementation: alluvial scrub, riparian herb, rush riparian grassland, southern arroyo willow riparian, southern willow scrub, unvegetated wash, willow riparian forest, and willow riparian woodland. Project impacts, such as reduced access to the unnamed drainage that runs north of SR-138, will also reduce foraging habitat available to common or non-special status species such as the mountain lion and black bear.

#### Bog and Marsh Vegetation Types

Within the bog and marsh vegetation type group, alkali meadow, Baltic rush, Coastal and valley freshwater marsh, and seeps and ephemeral ponds are all special status vegetation types and would be impacted by Project implementation.

#### Grass- and Herb-Dominated Vegetation Types

Within the grass- and herb-dominated vegetation types group, the native perennial grassland/California Annual Grassland vegetation type would be impacted by Project implementation.

#### Mixed Chaparral or Scrub and Grassland Vegetation Types

Within the mixed chaparral or scrub and grassland vegetation type group, special status vegetation types would be impacted by Project implementation. These include goldenbush scrub/native perennial grassland/California annual grassland; rabbitbrush scrub/native perennial grassland/California annual grassland; bush lupine scrub/native perennial grassland/ California annual grassland, California buckwheat scrub/native perennial grassland/ California annual grassland, wand buckwheat scrub/native perennial grassland/

California annual grassland, and Wright’s buckwheat scrub/native perennial grassland/  
California annual grassland and yucca scrub/native perennial grassland/California annual  
grassland.

**Impact Summary:** Impacts to all special status vegetation types, including native  
perennial grasslands and wildflower fields, would be reduced to less  
than significant levels with implementation of MM 7-10 and 7-11.

**Threshold 7-3:** **Would the project have a substantial adverse effect on federally or  
state protected wetlands (including, but not limited to, marshes,  
vernal pools, coastal wetlands, and drainages) or water of the  
United States, as defined by Section 404 of the Clean Water Act or  
California Fish & Game Code Section 1600 et. seq. through direct  
removal, filling, hydrological interruption, or other means?**

**On-Site Impacts**

A determination of direct impacts resulting from Project implementation to USACE, CDFW,  
and RWQCB jurisdictional drainage features was conducted by overlaying development and  
grading plans on the jurisdictional delineation map (Impact Sciences 2002b, 2003; GLA  
2009b; BonTerra Psomas 2015a). Table 5.7-13, Impacts to Jurisdictional Wetlands and  
Waters, below provides a summary of these direct impacts.

**TABLE 5.7-13  
IMPACTS TO JURISDICTIONAL WETLANDS AND WATERS**

Agency with Jurisdiction		On Site (acres)		Off Site (acres)	No Impacts (acres)	Total Project (acres)

### Jurisdictional Drainage Feature Impacts

Centennial Project

of the U.S.” because there is no significant nexus to a Traditional Navigable Water. The USACE issued an Approved Jurisdictional Determination (AJD) on December 1, 2009, confirming that 1.745 acres of “waters of the U.S.” occur on the Project site and another 0.009 acre occurs off site along the southern edge of Quail Lake. As described in the AJD, impacts to “waters of the U.S.” are as follows:

- **On-Site Permanent Impacts:** 0.04 acre (all non-wetland waters)
- **Off-Site Permanent Impacts:** 0.01 acre (all non-wetland waters)

Impacts to CDFW-regulated streambeds and riparian areas total 57.0 acres (48.7 acres of on-site permanent impacts; 8.0 acres of on-site temporary impacts; and 0.3 acre of off-site permanent impacts) (BonTerra Psomas 2015a). These impacts are further broken down as follows:

- **On-Site Permanent Impacts:** 48.7 acres (13.1 acres of riparian habitat and 35.6 acres of unvegetated streambeds)
- **On-Site Temporary Impacts:** 8.0 acres (3.7 acres of riparian habitat and 4.3 acres of unvegetated streambeds)
- **Off-Site Permanent Impacts:** 0.3 acre (0.03 acre of riparian habitat and 0.3 acre of unvegetated streambeds)

Impacts to RWQCB-regulated waters total 55.8 acres (47.6 acres of on-site permanent impacts; 7.9 acres of on-site temporary impacts; and 0.3 acre of off-site permanent impacts) (BonTerra Psomas 2015a). These impacts are further broken down as follows:

- **On-Site Permanent Impacts:** 47.6 acres (36.6 acres of non-wetland waters and 11.0 acres of wetlands)
- **On-Site Temporary Impacts:** 7.9 acres (4.2 acres of non-wetland waters and 3.7 acres of wetlands)
- **Off-Site Permanent Impacts:** 0.3 acre (all non-wetland waters)

Additionally, the following vegetation types are associated with the drainages on the site and fall under the jurisdiction of the CDFW: riparian herb; rush riparian grassland; southern arroyo willow riparian; southern cottonwood willow woodland; southern willow scrub; unvegetated wash; valley oak riparian woodland; willow riparian forest; willow riparian woodland; alkali meadow; Baltic rush; and coastal and valley freshwater marsh.

Impacts to the drainages, wetlands, and riparian vegetation on the Project site are considered significant due to their protected status. A less than significant impact would be achieved through implementation of MM 7-12, which includes preservation, enhancement, and creation of jurisdictional wetland and water features to maintain the overall pre-Project functional values in the Mitigation Preserve. This MM would result in a “no net loss” of functional values of jurisdictional resources, as determined by a functional assessment of existing and proposed restoration activities. Additionally, in accordance with PDF 7-6, if a

golf course is developed in an area with jurisdictional features on the site, it would be built in accordance with the Audubon Cooperative Sanctuary Program for Golf Courses, a cooperative effort between the United States Golf Association and Audubon International designed to promote ecologically sound land management and conservation of natural resources.

***Impact Summary:*** Project implementation will result in impacts to the jurisdictional drainages, wetlands, and riparian vegetation in the Project site. Implementation of PDF 7-6, and MM 7-12 would reduce these impacts to less than significant levels by managing biological resources in any golf courses; by replacing all lost functional values; by obtaining appropriate regulatory agency permits and/or agreements; and by complying with the mitigation measures stipulated in those permits/agreements.

**Threshold 7-4:** **Would the project interfere substantially with the movement of any native or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

## **On-Site Impacts**

### ***Direct Impacts***

Wildlife movement corridors are identified at two spatial scales: regional and local (or home range level). At the regional level, landscape linkages, typically kilometers or more in breadth, connect large, otherwise disjunct open space areas (such as parklands, forests, preserves, and wilderness). At the local or home range level, movement corridors of substantially lesser breadth typically occur as linear habitat features (e.g., drainages and ridgetops) facilitating movement of individual animals across their home ranges or territories. For short-ranging species (e.g., insects, rodents, and reptiles), these corridors may connect subpopulations and promote some genetic diversity. The impact of Project implementation at each of these scales is addressed below.

### **Regional Movement**

From an impact assessment perspective, the statement “interfere substantially with the movement of any native resident or migratory fish or wildlife species”, from the Significance Threshold, refers to blockages, barriers, or other substantial impediments to animal dispersal between large, regional open space areas. Subsequent barriers have consequences to wildlife persistence where they reduce genetic diversity, limit range extensions, inhibit colonization of new areas, and interfere with maintenance of ecological processes and functions. As stated in the wildlife movement discussion, camera and tracking studies to show regional wildlife linkages were conducted off site (with the nearest location approximately one mile to the west of the Project site). Such studies were not warranted and not conducted on the Project site because they would not have contributed to the regional wildlife linkage analysis. The area of the site that provides the greatest cover and is nearest to the regional wildlife corridor, located on the western edge of the Project site, is largely

included in permanent open space and is not grassland. However, linkages still remain important among populations for maintaining genetic diversity that promotes long-term species viability, even for those species that have individuals spending their lives in a restricted amount of habitat.

Although large areas of open space occur in and adjacent to the vicinity of the Project site, the California Aqueduct and I-5 substantially limit the site's ability to contribute to regional wildlife movement. In particular, as shown in Exhibit 5.7-6, Regional Wildlife Movement, the Aqueduct presents a barrier to the regional movement of wildlife to and from the site in the east-west and north-south directions. The Aqueduct's West Branch extends north to south through the center of the Project site to Quail Lake and is a barrier to east-west movement across the site. The East Branch runs close to the northern boundary of the site and is a barrier to north-south movement in that area. Underpasses and culverts located on I-5, north of its intersection with SR-138, do facilitate east-west movement of some species across this freeway (Pioneer Environmental Services 2004). Wildlife access to these would not be hindered by the Project.

As previously stated, possible impacts on wildlife corridors from development must be evaluated with respect to blockages or barriers to movement in a regional context (i.e., the animal's ability to move between existing large, regional open space areas) (Beier 2003). Project development is not expected to interfere with a majority of regional wildlife movement (1) based on the findings of independent studies that the Project site is largely outside the regional wildlife movement corridor; (2) since the site's feasibility to be utilized as part of a regional wildlife corridor between the Tehachapi Mountains (to the north) and the Angeles National Forest (to the south and west) is limited by the Aqueduct and I-5; and (3) because the majority of the site is open grassland and does not support the forest and shrub cover that many larger, wide-ranging species tend to use during movement episodes. The most likely north-south passage across or in the vicinity of the Project site (on the western edge of the site and adjacent areas) would be retained as open space.

Although the Project includes a new road along its western edge (Cement Plant Road), the road's use would be limited to infrequent daytime truck traffic to and from the Cement Plant, functioning the same as the existing Cement Plant Road to the east. Nighttime use will be prohibited except for emergency. This new Cement Plant Road would connect to SR-138 via a Gorman Post Road extension, and a new intersection in this area will be avoided.

Similar findings resulted from a review of representative species likely to occur on site and within similar vegetation and terrain conditions around the Antelope Valley (i.e. foothill grass/scrublands). While these conditions are expansive on the southern slopes of the Tehachapi Mountains, they are comparatively much more limited on the north side of the Liebre Mountains on the south side of the western Antelope Valley. Although the south side of the western Antelope Valley has incurred more human disturbance than the north side, the limited of foothill grass/scrubland is more of a result of topography. The north side of the Liebre Mountains drop in elevation quickly and die into the valley floor creating minimal low elevation foothills. Analysis of species preferred habitats and known current distribution in the Project region indicate that most are expected to utilize a variety of grass and scrub vegetation types which occur scattered throughout the region. As a result, there is no

indication that development of the site would restrict genetic exchange of species occurring in foothills on the north and south sides of the Antelope Valley.

Development of the Project site will result in some losses of areas that may be used for foraging and/or breeding for these species. Pathways to or from foraging or breeding grounds on the Project site, such as along ridge-lines or canyon bottoms, may become “dead ends” to through dispersal. However, these sorts of impacts are not expected to destabilize the regional population dynamics of these species, especially given the substantial amount of similar terrain in the northwestern Antelope Valley area. Multi-generational gene flow among wildlife populations in the region is expected to be sustained in the open spaces on and off the site that will remain following Project implementation. The direct impacts of Project development, therefore, are considered less than significant.

### Local Movement

The open space areas proposed for development on the Project site provide breeding and foraging habitat for a variety of invertebrates, amphibians, reptiles, birds (including raptors and passerines), mammals, and connective breeding areas for plants. Accordingly, open spaces on the Project site also facilitate the local movement of wildlife and dispersal and gene flow between populations of small organisms (particularly insects, amphibians, reptiles, small mammals). Following Project implementation, select local populations of certain wildlife species could become isolated from one another (such as those in the internal open space patches east of the Aqueduct and in the southwestern portion of the site) and genetic exchange between local populations might be reduced. In addition, although the four identified potential wildlife crossings of the West Branch would remain intact, the feasibility of their use as such would become further reduced with Project buildout. This reduction would result from increased barriers to access as well substantial increases in truck traffic at the SR-138 crossing due to the realignment of Cement Plant Road to intersect with SR-138 immediately adjacent to the potential local wildlife crossing point at the SR-138 (Location 4 on Exhibit 5.7-6). However, new dispersal impediments would only affect portions of populations of small organisms that are not considered to be of conservation concern, and these impediments are not expected to substantially affect the likelihood of the regional population persistence of those species. Impacts on local wildlife dispersal are considered to be less than significant. Although impacts on local wildlife movement are considered less than significant and no mitigation is required, MM 7-14 is proposed to reduce impacts on local wildlife movement and to provide for habitat connectivity in the Quail Lake area.

### ***Indirect Impacts***

Dispersal events by some species, such as mountain lion, may be rare, but are nonetheless important in facilitating ecological interactions and for retaining genetic diversity among regional populations. The Project’s indirect impacts may accumulate in the long term and may affect dispersal events by individuals of some species, resulting in reduced genetic diversity. Genetic diversity is important to organisms by allowing for greater potential to adapt to changing environmental conditions. Indirect impacts include, but are not limited to nighttime light and glare, non-native plant species, exotic and pest wildlife, pathogens and pests associated with landscaping, increased human presence, and noise, as described below.

### Nighttime Light and Glare

Development of the Project would substantially increase the number of nighttime light and glare sources on the site. Currently, these levels are low to non-existent; however, open spaces at higher elevations near the Project site's southern boundaries serve as a natural barrier to effects from increased lighting in landscaped areas south of the Project boundaries by reducing the amount of light that reaches open space areas. Impacts could result from light entering other open space portions of the Project site or adjacent open space off the site. Nighttime illumination is known to impact many species of animals in natural areas by disturbing movement, resting, and foraging behavior. It can potentially alter breeding cycles and nesting behavior; hence, where such light is near remaining open space areas, it could adversely impact the behavior of wildlife species that occur in these areas by disrupting wildlife movement or breeding and foraging on the Project site and adjacent open space areas.

Implementation of MM 13-2 and 13-6 from Section 5.13, Visual Resources, which requires the Project Applicant to develop a Lighting Plan to reduce potential impacts to biological resources caused by light and glare, would reduce the level of the impact. The Lighting Plan, also referred to as the Dark Sky Plan, shall be consistent with County lighting standards and shall provide guidelines for outdoor lighting that will be used throughout the Project site. Final lighting orientation and design shall be approved by the County of Los Angeles Department of Building and Safety. This measure will reduce the impact of light and glare to a level considered less than significant.

### Non-Native Plant Species

After Project completion, certain non-native plant species that are more adapted to urban environments are likely to increase in population and may locally displace native species because of their ability to more effectively compete for resources. Certain non-native plant species are adapted to a wide variety of growing conditions and may out-compete native plant populations for available nutrients, prime growing locations, and other resources. Because some non-native plants reproduce so quickly, they can replace many native plant populations. This eventually results in lower species diversity; loss of areas suitable for breeding and/or nesting by common and special status wildlife species; changes to the riparian ecosystem; and overall reductions in habitat values. Such impacts may result in reduced viability of wildlife movement corridors in adjacent open space areas. In order to reduce these impacts, PDF 7-8 and MM 7-15 shall be implemented. These measures include the development of a Landscaping Plan (subject to County review) and will identify both a plant palette composed of non-invasive species and a list of invasive plant species prohibited from being planted on the Project site. In addition, the measures require pressurized rinsing of vehicles entering open space preservation areas. These efforts are expected to minimize invasive species impacts of the Project and reduce the level of the impact to less than significant.

### Exotic and Pest Wildlife

Urban development also tends to attract wildlife species that are better adapted to urban settings; these include house sparrows (*Passer domesticus*), European starlings (*Sturnus vulgaris*), rock pigeons (*Columba livia*), brown-headed cowbirds, American crows (*Corvus brachyrhynchos*), ravens (*Corvus corax*), striped skunks, Virginia opossum (*Didelphis virginiana*), red foxes (*Vulpes vulpes*), raccoons, and Norway rats (*Rattus norvegicus*). Most native species are less adapted to urban development; their populations tend to decrease or be eliminated entirely in the vicinity of residential or recreational developments. In addition, local increases in meso-predators (e.g., skunk, opossum, fox) can adversely impact native rodent and bird populations. Developed areas also attract non-native Argentine ants, which respond to high soil moisture in horticultural circumstances. These ants have the potential to impact native ant populations, which serve as pollinators and seed dispersers for many native plant species. Additionally, the reduction of native ant populations due to the introduction of Argentine ants could adversely affect various wildlife species such as the coast horned lizard (a species of special concern), which depends on native ants as a food source and which does not eat the exotic Argentine ants. Such impacts may result in reduced viability of wildlife movement corridors in adjacent open space areas. Implementation of MM 7-16 through MM 7-18 would reduce these impacts. These measures require installation of waste and recycling receptacles that discourage foraging by wildlife species; inspection of all landscaping materials to ensure that they are free of Argentine ants prior to planting; and distribution of educational pamphlets to future Project residents regarding the importance of not feeding wildlife. Additionally, in order to mitigate for potential oak (*Quercus* spp.) pests being brought in on firewood, the Homeowners Association rules shall ban the use of wood burning devices. No wood burning fireplaces or stoves shall be installed, and wood burning is banned from outdoor fire pits and outdoor freestanding fireplaces (see MM 11-3 from Section 5.11, Air Quality). Implementation of these measures and Homeowners Association rules would reduce the impact to a level considered less than significant.

### Pathogens and Pests Associated with Landscaping

Landscaping and restoration efforts can introduce pathogens and pests into an ecosystem. Common pathogens that cause plant diseases (e.g., root and crown diseases) include microorganisms such as bacteria, fungi, and viruses. Pathogens are spread in numerous ways, such as splashing water, wind, insects, irrigation runoff, contaminated seeds, infected transplanted material, infected soil and debris on boots and shoes, and contaminated tools and equipment. Additionally, invertebrate pests such as non-native ants (as discussed above), nematodes, scales, aphids, whiteflies, and mites can be introduced on the foliage of plant material, or in infested soil. Pathogens and pests can spread into, and cause die-off, of ornamental areas, native habitat, and restored areas if conditions favorable to the pathogen or pest persist, and to a greater degree if host plants are stressed or damaged. Pathogens and pest infestations could potentially impact native habitat and/or restored habitat, and native and/or restored special status plant species on or adjacent to the Project site. Such impacts could potentially lead to habitat degradation or reduced numbers of special status plant species. These impacts would be considered potentially significant. Implementation of MM 7-17 requiring inspections of all landscaping material for Argentine ant infestations and MM 7-19 requiring various nursery and field protocols to reduce the potential for the

introduction of pathogens and pests into the Project site and for spreading outside the Project site would reduce these impacts to less than significant.

#### Increased Human Presence

To date, human activities have been largely limited on the Project site. An added resident human population would likely cause increased disturbances and degradation of conserved areas within and adjacent to developed areas. Additionally, there would be increased use of Quail Lake. Increased recreational and other human activities along proposed trails and in open space areas would likely result in increased noise disturbances to wildlife (especially within the breeding season of birds) which can, in turn, result in nest abandonment and cessation of local breeding activity. In addition, human habitation increases the harassment and/or capture of slower moving species, such as some reptiles and amphibians; increases the displacement of wildlife species; increases amounts of refuse and pollutants in the area; and causes soil compaction and trampling of ground-dwelling plants and wildlife.

Increased use of open space and natural areas by Centennial residents would also result in a corresponding increase in domestic animals. Dogs can disturb nesting or roosting sites and disrupt the normal foraging activities of wildlife in adjacent habitat areas. Such activity over a long time period results in long-term effects on the behavior of both common and special status wildlife and would likely result in their extirpation from the area. Feral cats and house cats cause substantial damage to the species composition of natural areas, including populations of special status species, through predation. Over time, the effects of these indirect impacts would reach further into open space, reducing habitat quality, and may result in reduced wildlife movement through the area.

Implementation of MM 7-18 is expected to reduce these impacts. This mitigation measure involves implementation (by the Project Applicant) of a public awareness program (prior to the first occupancy permit and ongoing throughout development) in an effort to restrict public access to the riparian and open space areas to designated trails and to prevent unleashed domestic animals from entering these areas. This program will also include signs that identify the boundaries of ecologically sensitive areas; the use of temporary fencing around sensitive areas; and the promotion of public education and awareness of such areas. In addition, only passive recreational activities shall be permitted in designated natural open space areas. All dogs shall be required to be leashed while in the designated natural open space areas. As required by the Los Angeles County Code (Section 10.20.350), all residents of unincorporated areas in Los Angeles County must have their dogs and cats neutered or spayed; dogs must have an identification microchip implanted; and evidence of this shall be shown to Management prior to entry into the Project. Implementation of these measures would reduce the impact to a level considered less than significant.

#### Noise

Noise levels on the Project site will increase substantially above present levels during Project construction. During construction, temporary noise impacts could disrupt the foraging, nesting, roosting, and denning activities for a variety of wildlife species such as birds and medium to large mammals. These impacts are considered adverse and significant because the Project will impact a large landscape area. Nesting raptors will potentially incur

temporary impacts from construction noise if present in the Project vicinity and could be temporarily displaced. The effects of increased noise levels have been well documented for many types of animals and can be responsible for reduced bird nesting success. Although no specific noise thresholds have been established for wildlife on the Project site, substantial noise-level increases can be expected relative to the amount of construction.

Noise will likely also increase after construction; therefore, open spaces and wildlife remaining within and immediately surrounding the Project site would likely be subject to increased disturbance. Wildlife stressed by noise may be displaced and may alter wildlife movement patterns. In an effort to minimize operational noise impacts, the Conceptual Land Use Plan (see Exhibit 4-1) has been designed to maximize the distance between areas of high noise and preserved open space. Higher density housing and higher volume traffic roadways are near the center of developed areas, while the lower density housing and lower traffic roadways occur at the edge of the Project near open space areas. In addition, industrial and business park land uses are located adjacent to the roadway with the highest noise level (SR-138). As a result, potential wildlife impacts due to potential Project related noise are reduced to a level considered less than significant.

#### Indirect Impacts Conclusion

Project implementation may have substantial indirect impacts on wildlife movement adjacent to the site. Although some wildlife movement in adjacent areas may be disrupted, areas further north and northwest in the Tehachapi Mountains would not likely be impacted. Information presented in the Wildlife Movement discussion clearly identifies the foothills and highlands of the Tehachapi Mountains as the regional linkage zone, and the core area of this linkage zone is several miles to the northwest of the Project site. As a result, the Project's indirect impacts are not expected to reach the primary regional linkage area, and regional connectivity is expected to be minimally impacted. The Project would not cause any regional populations of plants or animals in adjacent regions to become isolated. The Project's indirect impacts on wildlife movement are therefore considered to be less than significant. Please note that the evaluation of cumulative impacts on wildlife movement is provided in Section 7.0, Cumulative Impacts, of this document and results in a separate conclusion.

### **Off-Site Impacts**

Development of off-site Project features is expected to result in isolated and mostly temporary impacts with very few permanent impacts. Due to the small scale of those features with aboveground components (e.g., wells, bridges, and utility lines), both individually and collectively, and the widely spaced geographic distribution of these features, impacts on wildlife movement due to the presence of these features, alone, are expected to be temporary and minor. Impacts of off-site Project features are not expected to affect movement of regional or local populations and are not expected to be substantially adverse.

***Impact Summary:*** Project implementation would result in potentially significant impacts on wildlife movement. These impacts are addressed in PDF 7-7 and PDF 7-8, and are further minimized with implementation of MMs 7-13 through 7-19, which incorporate planning and construction methods to

reduce potential indirect impacts such as developing a Lighting Plan and Landscaping Plan and to create public awareness concerning multiple urban interface issues. With implementation of the identified SCs and MMs, impacts to wildlife movement would be less than significant.

**Threshold 7-5** **Would the project convert oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10% canopy cover with oaks at least 5 inch in diameter measured at 4.5 feet above mean natural grade) or otherwise contain oak or other unique native trees (junipers, Joshuas, southern California black walnut, etc.)?**

**Threshold 7-6** **Would the project conflict with any local policies or ordinances protecting biological resources, including Wildflower Reserve Areas (L.A. County Code, Title 12, Ch. 12.36), the Los Angeles County Oak Tree Ordinance (L.A. County Code, Title 22, Ch. 22.56, Part 16), the Significant Ecological Areas (SEAs) (L.A. County Code, Title 22, Section 22.56.215), and Sensitive Environmental Resource Areas (SERAs) (L.A. County Code, Title 22, Ch. 22.44, Part 6)?**

The analysis of oak tree impacts, as well as related mitigation measures and PDFs, are generally consistent with the OWCMP, because they consider the ecological function of the woodland habitat and examine functions at several spatial levels.

## On-Site Impacts

### *Oak Trees*

The County of Los Angeles Oak Tree Ordinance (CLAOTO) protects oak trees in unincorporated areas of Los Angeles County that are 25 inches or more in circumference (8 inches in diameter) as measured 4.5 feet above mean natural grade; in the case of oaks with more than 1 trunk, the ordinance protects those trees with a combined circumference of any 2 trunks of at least 38 inches (12 inches in diameter), as measured 4.5 feet above mean natural grade (LACDRP 1988). A "Heritage Oak", as defined by CLAOTO, is any oak tree that: (1) measures 36 inches or more in diameter, as measured 4.5 feet above the natural grade or (2) any oak less than 36 inches in diameter having a significant historical or cultural importance to the community. CLAOTO requires that all potential impacts to oak trees be preceded by an application to the County that includes a detailed Oak Tree Report, and that requires mitigation for impacts to oak trees (which may include the replacement of oak trees at a ratio of at least two to one [2:1]; this ratio may be greater if required as a condition in the County-issued Oak Tree Permit) (LACDRP 1988).

The Project site contains an estimated 181,070 oak trees of all sizes; of these, an estimated 33,861 oaks under the jurisdiction of CLAOTO are present on the site; an estimated 91 regulated oaks would be directly impacted by the Project (see Exhibit 5.7-14, Oak Tree Impacts) (Tree Life Concern 2008, 2003; BonTerra Consulting 2009a). Of the oaks to be

**Oak Tree Impacts**

Centennial Project

D:\Projects\3C\EN\Centennial\MXD\EIR\Ex\_Oak\_Tree\_Impacts\_20150915.mxd

impacted, 7 qualify as “heritage” oaks. As shown in Exhibit 5.7-14, oak impacts are generally limited to two areas. The first area is located north of SR-138, directly west of Quail Lake, and occurs in Mixed Oak Woodland. The second area occurs south of the SR-138 and in the western portion of the Project site, also in Mixed Oak Woodland. As listed in Table 5.7-6 of the Special Status Biological Resources Section, areas north and south of the SR-138 have different oak tree densities with areas north of SR-138 being less dense than areas south of SR-138. Species impacted north of the SR-138 include blue and valley oaks and in the south blue oak and hybrid oaks. Any oak tree removals would be subject to a mitigation plan, which would be reviewed subject to County approval. These oak tree impacts are considered significant; therefore, implementation of PDF 7-4, 7-5, and MM 7-11, MM 7-20, and MM 7-21 are recommended in order to reduce adverse impacts to a less than significant level by reducing impacts and by creating, enhancing, and/or restoring oak habitats. For potential restoration areas refer to Exhibit 5.7-16, Oak Tree/Oak Woodland Restoration/Creation Areas, presented in MM 7-11 further below.

### ***Significant Ecological Areas***<sup>6</sup>

The San Andreas Significant Ecological Area (No. 17) incorporates two former SEAs in the Project region; those resources, which were previously within SEAs 58 and 59 continue as designated resources within SEA 17. The SEA would remain intact, and the Project would not result in any fragmentation of this area (see Exhibit 5.7-15, Significant Ecological Areas). Approximately 3,865 acres of on-site lands are located within the boundaries of SEA 17 and would be preserved as potential on-site mitigation lands. As such, MM 7-22 is included to ensure that fuel modification zones are contained within the current Project impact boundary and would not intrude into the adjacent SEA 17.

## **Off-Site Impacts**

### ***Oak Trees***

No oak trees would be impacted as a result of development of the off-site Project features; therefore no additional oak tree impacts are expected to occur.

### ***Significant Ecological Areas***

None of the proposed off-site Project features, including intersections with SR-138, utility connections, water wells, or the California Aqueduct crossings, would impact the designated SEA boundaries; therefore no SEA impacts would occur.

***Impact Summary:*** Impacts on oak tree resources as a result of Project implementation are considered significant. Implementation of PDF 7-5, 7-5, MM 7-11, MM 7-20, and MM 7-21 would reduce adverse impacts to oak trees to a less than significant level by performing additional oak surveys and by creating, enhancing, and/or restoring oak habitats.

---

<sup>6</sup> There is a proposed change to the SEA boundaries within the Draft Los Angeles General Plan Update, which is discussed in Section 5.8.2, Land Use, Entitlements, and Planning; Relevant Plans and Policies, and Regulations.

Centennial Project

---

**Threshold 7-7**      **Would the project conflict with the provisions of an adopted state, regional, or local habitat conservation plan?****On-Site Impacts**

As discussed previously, the Tejon Ranch Company has received a permit pursuant to Section 10(a)(1)(B) of FESA (16 USC Sections 1531–1544) for incidental take of the Covered Species and to meet the requirements for this permit, has developed a multiple species habitat conservation plan (MSHCP). This MSHCP was approved in April 2013.

The TU MSHCP's Covered Lands propose to encompass 141,886 acres of the 270,365-acre Ranch. The TU MSHCP focuses on the California condor and other species of the montane upland communities. The communities on the Centennial Project site, which is primarily in a valley area, do not fit into the same criteria for coverage. Regardless, many of the same species occur in the foothills and lowland areas, including on the Centennial site. These species will mutually benefit from the MSHCP and the Centennial Mitigation Preserve Program.

There are no other approved or proposed habitat conservation plans near the site or that cover the Project site. There would, therefore, be no conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

**Off-Site Impacts**

There are no other approved or proposed habitat conservation plans near the site or that cover the Project site. There would, therefore, be no conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

***Impact Summary:*** There would be no impact due to habitat conservation plans (HCPs) or natural community conservation plans (NCCPs) as there are no active HCPs or NCCPs for the Project site. The Project site is outside the TU MSHCP boundaries, therefore impacts are not expected to occur.

**5.7.7 MITIGATION MEASURES**

**MM 7-1**      Prior to issuance of grading permits in areas of the Project site that may disturb California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, or adobe yampah populations, focused surveys of mitigation lands shall have been completed to confirm compliance with the 2:1 mitigation ratio for the California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah. Surveys will be conducted in accordance with current California Native Plant Society (CNPS) protocol and will occur during the appropriate time of year. The Survey Report shall be submitted to the County and the California Department of Fish and Wildlife (CDFW) for their review. In addition to rare

plant species populations that have previously been found in the Mitigation Preserve, newly detected populations will be preserved and managed for long-term preservation. These populations will provide baseline information for management efforts described below and will provide information to help determine habitat suitability in areas where propagation of rare plants may be considered.

The Project Applicant shall prepare and implement a Special Status Plant Species Restoration Plan covering the California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah that shall specify the following: (1) procedures for the collection and temporary storage of seed (all available seed from every impacted occurrence shall be collected); (2) planting procedures, including soil preparation and irrigation; (3) a schedule and action plan to maintain and monitor enhanced, restored, and/or created populations; (4) methods to control plant densities (of competing plants) to promote the establishment of California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah; and (5) a list of County-approved success criteria (e.g., germination rates, growth, plant cover) to compare to the density of existing populations. The Project Applicant shall develop the Special Status Plant Species Restoration Plan and the County shall approve it prior to any vegetation clearing or grading on the site. Adoption of this plan shall be used as the performance standard. An overview of the plan objectives is provided in the Biological Resource Mitigation Program to be submitted and approved by the County prior to issuance of grading permits.

Prior to the commencement of vegetation clearing and/or grading activities, the Project Applicant shall contract a qualified firm to harvest California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah seeds from the impacted populations on the Project site. The seeds shall be collected in the manner and time described in the Special Status Plant Species Restoration Plan. The harvested seed shall be used for the enhancement, restoration, or creation of these species' populations to be preserved in open space areas on the Project site. Additionally, prior to implementation of the Plan, a focused survey for the special status species impacted (listed above) shall occur in the preserve areas to document existing populations.

The previously documented populations of California androsace, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah occurring in the designated on-site mitigation areas (north of State Route [SR] 138 and south of SR-138), and Mitigation Areas 1, 2, 3 shall be preserved in perpetuity. These existing areas shall be enhanced, expanded, or restored or new areas shall be created in suitable habitat in order to compensate at a 2:1 ratio for the thousands of individual special status plants that will be lost due to the Project.

Those portions of the crownscale and Mojave spineflower populations that are located within and along the western edge of the open space polygon located approximately 500 feet east of Cement Plant Road and approximately 650 feet north of the SR-138 shall be protected. No temporary or permanent disturbance (including fuel modification) shall occur in the identified occurrence points or polygons; these occurrence points or polygons shall be flagged by a qualified Biologist prior to the start of Project activities in the area. In addition, the post-construction hydrology that supports these protected populations shall be consistent with the pre-Project hydrologic condition. The supporting area consists of the adjacent slope, which drains to the protected plant populations and consists of approximately 300 feet to the north and north northwest.

Planting of California androsace, crownscale, round-leaved filaree, Mojave spineflower, sylvan scorzonella, and adobe yampah shall be performed in accordance with the specifications in the Special Status Plant Species Restoration Plan, which will also indicate the target densities for each of these species so that the new populations will support at least as many individuals of each species as were impacted.

**MM 7-2**

A pre-construction/grading survey of all areas proposed for construction/grading activities that contain potentially suitable habitat for silvery legless lizard, coast horned lizard, two-striped garter snake, and American badger shall be conducted by a qualified Biologist. Surveys will consist of 1 pass-through by a qualified Wildlife Biologist walking 50-meter belt transects across areas to be impacted while visually searching for the species listed above. Surveys will be conducted no more than three days prior to the disturbance of the surveyed area. If any of these species or other wildlife species that can be easily moved are observed within the construction/grading zone, the Biologist (who must have a valid California Scientific Collecting Permit) shall relocate them to a suitable area outside the construction zone. Suitable areas would include appropriate habitats within the proposed open space areas in the northwestern portion of the Project site and would be identified in a Wildlife Relocation Plan (described below) prior to surveys but before construction begins.

Areas adjacent to Quail Lake and on the Project site potentially supporting western pond turtle breeding habitat shall not be disturbed during the breeding season for the turtles (April through August). No Project activities shall occur within 300 feet from the edge of Quail Lake, due to potential for nesting in those areas.

Pre-construction burrowing owl and Swainson's hawk surveys shall be conducted in all potentially suitable habitat areas prior to initial site preparation. Methods employed shall be consistent with standard and appropriate protocols for both species within the appropriate season of the year prior to construction. Burrowing owl pre-construction surveys shall be

conducted prior to the start of construction/ground-breaking activities. Surveys will be conducted following the California Department of Fish and Wildlife's (CDFW's) 2012 burrowing owl survey protocol. These surveys shall be conducted weekly beginning 30 days prior to the start of construction with the final survey occurring 1 day prior to construction.

If pre-construction surveys locate an active Swainson's hawk nest on the Project site, then no construction activities will occur within ½ mile of the nest between March 1 and September 15. Furthermore, a Swainson's hawk Monitoring and Mitigation Plan shall be prepared within 90 days after locating an active Swainson's hawk nest in consultation with the County and the CDFW.

The Wildlife Relocation Plan shall describe: (1) all areas potentially suitable for receiving relocated animals and (2) methods that shall be used in the relocation process. Methods shall include appropriate species-specific handling techniques and appropriate hygienic methods to prevent the spread of pathogens. The Plan shall also identify thresholds for the number of individuals of each species that shall be allowed to be placed in any particular area. The Wildlife Relocation Plan shall be prepared by the Project Applicant/Developer and submitted to the CDFW prior to Project implementation. County and CDFW approval of the Plan shall indicate that the performance standards have been met. Although, implementation of the mitigation plan may have some impact on wildlife, it is expected to be negligible relative to the project as a whole and expected to have a net positive effect as required.

**MM 7-3**

For all grading and construction activities, the Project Applicant/Developer shall retain a qualified Biologist (with selection reviewed by the County) to ensure that incidental construction impacts on special status wildlife species are avoided or minimized. The Biologist shall relocate silvery legless lizard, coast horned lizard, two-striped garter snake, American badger, and any other special status wildlife species that can be moved which would otherwise be destroyed or adversely affected by construction and/or site-preparation activities. Responsibilities of the Construction Biological Monitor shall include:

- a. Attendance at the pre-construction meeting to ensure that timing and location of construction activities do not conflict with other mitigation requirements (e.g., seasonal surveys for nesting birds). The meeting shall be conducted with the Contractor and other key construction personnel to describe the importance of restricting work to designated areas.
- b. Discussion with the Contractor of procedures to minimize harm/harassment of wildlife that may be encountered during construction.
- c. Review/designation of the construction area with the Contractor in accordance with the Final Grading Plan. Haul roads, access roads, and

on-site staging and storage areas shall be sited in grading areas to minimize degradation of habitat adjacent to these areas. If activities outside these limits are necessary, they shall be evaluated by the Biologist to ensure no special status species or habitats will be affected.

- d. A field review that is conducted to stake designated construction limits (to be set by the Surveyor). Any construction activity areas immediately adjacent to riparian areas or other special status resources (such as large trees or bird nests) may be flagged or temporarily fenced by the Monitor at his/her discretion.
- e. Periodic visits to the site during construction to coordinate and monitor compliance with the above provisions.
- f. Submittal of a brief report to the County and CDFW discussing any conflicts or errors resulting in impacts to special status resources within 48 hours of the incident. At the conclusion of construction of each planning area, submittal of a Final Report discussing the results of the activities and any recommendations for improving the process. Submission of this report shall be the performance standard.

In addition, a Biological Monitor will be on site during all initial vegetation removal and will employ salvage methods to minimize direct impacts to common wildlife species. Where feasible, the biological monitor will attempt to ensure wildlife are out of potential direct impact. If a wildlife species is in harm's way and has not moved on its own, the Biologist will attempt to scare them away from the area. If wildlife does not move, and where feasible, the wildlife species will be relocated to suitable habitat.

**MM 7-4** All open space preservation areas adjacent to active construction sites shall be denoted with fencing installed and maintained during construction to ensure that construction activities remain within the development footprint. Construction area temporary signage shall not have holes (or holes shall be covered or filled within the top four inches) to prevent raptor talon entanglement. Construction fencing and signage will be overseen by the Project Biologist.

**MM 7-5** Within the year prior to, and within the appropriate season, focused surveys for the following special status species shall be repeated: arroyo toad, Tehachapi slender salamander, California red-legged frog (concurrent with two-striped garter snake and western pond turtle focused surveys), western spadefoot, mountain plover, southwestern willow flycatcher, and least Bell's vireo. Surveys shall be conducted in accordance with the approved CDFW or U.S. Fish and Wildlife Species (USFWS) protocol for that species.

**MM 7-6** The Project Applicant/Developer shall retain a qualified Biologist with knowledge of California condors to monitor construction activities in the Project area. The resumes of the proposed Biologist(s) will be provided to the CDFW for concurrence. This Biologist(s) will be referred to as the "Authorized

Biologist” hereinafter. During clearing and grubbing of construction areas, the Authorized Biologist shall be present at all times. During mass grading, construction sites shall be monitored on a daily basis, and the Authorized Biologist will have the authority to stop all activities until appropriate corrective measures have been completed. If condors are observed landing in the Project area, the Applicant shall avoid further construction within 500 feet of the sighting until the animals have left the area, or as otherwise authorized by CDFW and USFWS. All condor sightings in the Project area will be reported to CDFW and USFWS within 24 hours of the sighting.

To further protect California condors potentially foraging in the Project area over the long term from negative interactions with humans and/or artificial structures, the Project Applicant/Developer shall remove dead cattle that are found or reported within 1,000 feet of the boundary of a residential or commercial development. Dead cattle shall be relocated to a predetermined location. The locations where carcasses shall be placed shall be a minimum of 1,000 feet from a development area boundary. Appropriate locations for transfer of carcasses include open grasslands and oak/grassland areas where condors can readily detect carcasses and easily land and take off without encountering physical obstacles such as powerlines and other utility structures. The proposed locations would be selected and approved by the CDFW and USFWS. Pursuant to this measure, a telephone number for reporting dead cattle shall be provided and actively maintained. Any cattle carcasses transferred to the relocation areas shall be reported to the USFWS Condor Group.

All surfaces on new antennae and phone/utility towers shall be designed and operated with anti-perching devices in conformance with Avian Power Line Interaction Committee standards to deter California condors and other raptors from perching. During construction, the area shall be kept clean of debris (e.g., cable, trash, and construction materials). The Project Applicant/Developer shall collect all microtrash and litter (i.e., anything shiny, such as broken glass), vehicle fluids, and food waste from the Project area on a daily basis. Workers shall be trained on the issue of microtrash: what constitutes microtrash, its potential effects on California condors, and how to avoid the deposition of microtrash.

**MM 7-7**

The Project shall incorporate avoidance and additional open space buffer features for this tricolored blackbird nesting area. Permanent impacts will be restricted to a distance of 400 feet from the nesting area excluding small impact areas associated with infrastructure and utilities along SR-138 immediately south of Quail Lake. The nesting area will be delineated by a qualified Ornithologist based on all available data (three years of site-specific data shall be used). Temporary impacts (i.e., construction noise) within 400 feet shall be restricted to the non-breeding season. The breeding season for this species shall be considered April 1 through July 1.

The Project shall include enhancement, restoration, and/or preservation of potentially suitable tricolored blackbird breeding and foraging habitat. Potentially suitable areas for enhancement and preservation include lower Oso Canyon in close proximity to Cement Plant Road, as well as any other created water bodies as part of the Project Drainage Plan, where feasible. Enhancement factors shall include the creation of bulrush marsh habitat or other substrate known to support breeding tricolored blackbirds; a persistent nearby standing water during the breeding season; and available adjacent foraging habitat with an appropriate food source.

**MM 7-8** Project construction activities (including, but not limited to, staging and disturbances to native and nonnative vegetation, structures, and substrates) shall occur outside of the avian breeding season, if feasible, which generally runs from February 1–August 31 (as early as January 1 for some raptors) to avoid take of birds or their eggs. “Take” means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture or kill (*California Fish and Game Code*, Section 86), and includes take of eggs or young resulting from disturbances that cause abandonment of active nests. Depending on the avian species present, a qualified Biologist may determine that a change in the breeding season dates is warranted.

If avoidance of the avian breeding season is not feasible, a qualified Biologist with experience in conducting breeding bird surveys shall conduct weekly bird surveys beginning 30 days prior to the initiation of Project activities, to detect protected native birds occurring in suitable nesting habitat that is to be disturbed and (as access to adjacent areas allows) any other such habitat within 500 feet of the disturbance area. The surveys shall continue on a weekly basis with the last survey being conducted no more than three days prior to the initiation of Project activities. If a protected native bird is found, the Project Applicant/Developer shall delay all Project activities within 300 feet of on- and off-site suitable nesting habitat (within 500 feet for suitable raptor nesting habitat) until August 31. Alternatively, the qualified Biologist could continue the surveys in order to locate any nests. If an active nest is located, Project activities within 300 feet of the nest (within 500 feet for raptor nests) or as determined by a qualified Biological Monitor, must be postponed until the nest is vacated; the juveniles have fledged; and there is no evidence of a second attempt at nesting. Flagging, stakes, or construction fencing shall be used to demarcate the inside boundary of the buffer of 300 feet (or 500 feet) between the Project activities and the nest. Project personnel, including all contractors working on site, shall be instructed on the sensitivity of the area. The Project Applicant/Developer shall provide the Department of Regional Planning with the results of the recommended protective measures described above to document compliance with applicable State and federal laws pertaining to the protection of native birds.

If the Biological Monitor determines that a narrower buffer between the Project activities and observed active nests is warranted, he/she shall submit a written explanation as to why (e.g., species-specific information; ambient conditions and birds' habituation to them; and the terrain, vegetation, and birds' lines of sight between the Project activities and the nest and foraging areas) to the Department of Regional Planning and, upon request, the CDFW. Based on the submitted information, the Department of Regional Planning (and the CDFW, if the CDFW requests) will determine whether to allow a narrower buffer.

The Biological Monitor shall be present on site during all grubbing and clearing of vegetation to ensure that these activities remain within the Project footprint (i.e., outside the demarcated buffer); to ensure that the flagging/stakes/fencing is being maintained; and to minimize the likelihood that active nests are abandoned or fail due to Project activities. The Biological Monitor shall send weekly monitoring reports to the Department of Regional Planning during the grubbing and clearing of vegetation, and shall notify the Department of Regional Planning immediately if Project activities damage active avian nests.

- MM 7-9** A qualified Biologist (retained by the Project Applicant/Developer with selection reviewed by the County) shall conduct a field survey no earlier than 20 days prior to any grading activity that would occur during the breeding season (i.e., April 1 through August 31) of native bat species that potentially utilize the site. This should be done to determine if active roosts of special status bats (such as pallid bat) are present in the applicable habitats on the site (e.g., woodlands). If active roosts are found, construction within 200 feet shall be postponed or halted until the roost is vacated and juveniles are self-sufficient, as determined by the Biologist.
- MM 7-10** The Project Applicant/Developer shall preserve grasslands, including native perennial grassland and associated wildflower field vegetation types, at a minimum 2:1 ratio within the approximate 27,408-acre mitigation preserve (see Table A). The Project would impact 6,416 acres of grasslands; therefore, a total of 12,832 acres of grassland mitigation acreage is required to bring impacts to a less than significant level.

**TABLE A  
GRASSLAND MITIGATION ACREAGES**

<b>Mitigation Area</b>	<b>Grasslands</b>	<b>Total Acreage</b>
<b>On-Site Unimpacted/SEA</b>		
On-Site Unimpacted/SEA	1,989	3,861
<i>Subtotal (Total On-Site Mitigation Area)</i>	1,989	3,861
<b>Off-Site Open Space</b>		
Area 1	1,641	6,417
Area 2	1,602	2,556
Area 3	3,059	4,183
Area 4	4,429	7,319
Area 5	643	643
Area 6	1,012	2,429
<i>Subtotal (Total Off-site Mitigation Area)</i>	12,386	23,547
<b>Total Mitigation Area</b>	<b>14,375**</b>	<b>27,408</b>
SEA: Significant Ecological Area		
**Goal for 2:1 Grassland Mitigation is 12,832 Acres		

Mitigation for loss of those areas modeled as native perennial grassland will provide similar habitat quality as that which was lost. The result shall be native perennial grassland and wildflower field values that are equal to or greater than the overall ecological functions and values of those lost as a result of Project implementation. Preservation shall include dedication and long-term management working towards the goal of a self-sustaining system. Long-term management will include focused major problematic non-native species eradication (e.g., feral pigs) where feasible. Preservation will occur on open space lands on the Project site and on other lands within Tejon Ranch.

As outlined in Table A above, the 14,375 acres of grassland preservation will occur in open space areas on site and in the six other areas. A full description of these areas is in PDF 7-2. Many of these grassland areas have been part of the expansive grassland studies conducted for the Project over the course of several years. Detailed plot analysis and modeling show the high level of similarity between these preserved grasslands and the grasslands within the Project impact area. In addition, the grasslands are contiguous with other preserved open space in the region and support other important biological functions (e.g., drainages and local wildlife movement pathways). As a result, the preserved grassland is part of a more watershed-level preservation allowing for long-term sustainment and a total value that is greater than the sum of its parts.

The preservation phasing through conservation easements shall be based on the percentage of total area of impact per phase of development, regardless of specific resource impacts. The specific location of the acreage to be dedicated within a particular phase will be chosen to maximize the replacement of resource values lost during that phase of construction while maintaining as much contiguous acreage as possible. In order to preserve an adequate quantity of grassland, lands outside the County of Los Angeles, within the County of Kern, would be used for mitigation. As each phase is proposed, a percentage of the mitigation preserve (which is equivalent to the percentage of that phase's impacts) shall be dedicated concurrent with the entitlement approval of that phase.

The open space preserve, including the grasslands within it, shall be preserved in perpetuity to offset Project impacts on native grasslands and wildflower fields prior to issuance of a grading permit for the Project site. The phasing of mitigation has been previously described. The Native Perennial Grassland and Wildflower Field Mitigation Plan will sufficiently offset and fully mitigate the impacts on native grasslands and wildflower fields associated with the Project.

**MM 7-11** This measure prescribes mitigation for other special status vegetation types including mixed oak woodland, oak trees, and other riparian and wetland vegetation types. Each of these three vegetation types is discussed separately (native grassland and wildflower fields are addressed in MM 7-10).

#### *Mixed Oak Woodlands*

The Project Applicant/Developer shall create mixed oak woodlands to achieve resulting vegetation/habitat values. Since there would be approximately 6.2 acres of oak woodland impacts, mitigation will result in the preservation of a minimum of 6.2 acres of mixed oak woodland and creation of a minimum of 6.2 acres of mixed oak woodland, which will include the establishment<sup>7</sup> of 322 oak trees completed as part of oak tree replacement in accordance with the County of Los Angeles oak tree permit requirements (see Oak Trees Section below). Oak trees established in created oak woodlands will be credited towards both oak woodland and oak tree mitigation requirements. If Project impacts are reduced through a reduction in Project disturbance limits in oak woodland areas, required mitigation acreage will be reduced accordingly.

In accordance with mitigation options outlined in Section 21083.4 of the *California Public Resources Code* (PRC), replacement of oak woodlands shall consist of no greater than ½ of the oak woodland mitigation requirement. Therefore, half of the 6.2 oak woodland impact acreage will be mitigated via the alternate option of preservation. The combined acreage of oak woodland preserved both on site (unimpacted/Significant Ecological Area [SEA]) and

<sup>7</sup> In Biology, "establish", in this sense, refers to vegetation (including seeds) that has been planted and is becoming a healthy, surviving plant with as much chance to survive as plants that have existed for a long period of time.

within the off-site mitigation areas is 3,102 acres and is expected to substantially exceed the required 50 percent of mitigation as preservation.

Mitigation through creation is typically implemented on lands with minimal habitat value (e.g., ruderal vegetation, graded slopes) rather than in areas with a substantial component of existing native vegetation. However, evidence of lack of naturally occurring recruitment on site indicates that the existing woodlands are likely to be eventually replaced by non-woodland vegetation. Based on the lack of naturally occurring replacement trees, it is anticipated that oak woodland planting is necessary to sustain the oak woodlands. Therefore, the goal of oak resource mitigation efforts will be to create and enhance oak woodlands. To maximize potential for success, oak woodlands will be created within and adjacent to the same areas where oak woodlands currently exist. This method will create future generations of oak trees and oak woodland on the site in these areas. Details of the oak woodland mitigation program are described below in items 1–10.

1. To mitigate for impacts to oak woodland and oak trees, site-specific native acorns will be collected. Acorns will be collected within the watershed area of the Project site to ensure that acorns collected are of a similar genetic stock to those existing on the site. Some acorns will be planted and maintained in containers, and others will be stored and planted directly on site within the Oak Mitigation Areas.
2. To maximize oak woodland biological values and the potential for long-term success, some locally collected oak acorns will be planted directly into the ground. These acorns will be planted in appropriate locations in the Oak Mitigation Areas. The locations identified for acorn planting will be reviewed by the County Forester.
3. Container plants will be propagated and maintained from locally collected acorns. In this way, more established container plants will be available for mitigation efforts, and they will contain the most suitable genetic variability appropriate for the region to increase mitigation success. The preferred method of propagation will include the establishment of a temporary nursery on the Project site. The nursery will include partial shade areas to reduce water loss and a constant water supply to supplement planted trees. Using the acorns collected from within the watershed area of the Project site, container plantings will be cultivated at this location. Development of trees on site will ensure that they are acclimated to the typical weather conditions at their eventual permanent location. If necessary, and in consultation with the County Forester, acorns collected from the site may be stored or propagated and maintained under contract with a reputable native plant nursery off site.
4. To provide overstory, midstory, and understory tree/plant coverage, some container plants and oak trees, grown from locally collected acorns, will be installed in addition to the application of native seed mixes. Since studies indicate that the younger the planting is, the more likely the

**Oak Tree/Oak Woodland Restoration/Creation Areas**

**Exhibit 5.7-16**

Centennial Project

D:\Projects\3\CEN\Centennial\MXD\EIR\Ex\_Oak\_Restoration\_20150915.mxd

chance is for successful establishment and long term viability<sup>8</sup> locally collected acorns as well as locally collected, nursery-cultivated young oak trees (one-gallon or five-gallon containers of oaks) would be planted on site.

5. The Project Applicant/Developer will provide an annual report to the County that will include an accounting of each of the following in the mitigation areas: (a) the number of acorns planted; (b) the number of germinated acorns (whether planted or natural) protected; (c) the number of new oak trees planted in mitigation areas, including the species of each tree planted; (d) the caliper of each new tree planted and/or protected; (e) the acreage of woodlands created and/or conserved in the mitigation areas.
6. Creation of structurally diverse oak woodland habitat within and contiguous to existing oak woodlands will be accomplished by planting locally collected oak acorns, plus yearly sowings of additional locally collected acorns, as well as, temporary irrigation, weed abatement, pest deterrence, and/or other maintenance tasks as needed to facilitate oak seedling germination and survival.
7. Prior to Project grading, locally collected acorns will be planted and grown. Once trees reach a diameter of one inch just above ground surface (i.e., basal height) within the Oak Tree/Oak Woodland Mitigation Areas, they will be appropriated as “mitigation trees” to be used for oak woodland and oak tree permit mitigation purposes with approval from the County Forester as part of the oak woodland and oak tree permit mitigation process and will be credited as a mitigation tree if the tree is determined to be healthy by the Los Angeles County Forester at the end of the monitoring period.
8. The required 12.4 acres of mixed oak woodland creation will occur within 473 acres of existing oak woodland (primary area) and 716 acres of adjacent low quality non-native grassland (secondary area, if needed) on the western portion of the Project site. Additional suitable areas may also be identified within reduced grading footprints following final detailed tract map production to the satisfaction of the County Forester. Mitigation planting areas will be refined within the proposed mitigation areas through a multi-variable query of existing Geographical Information System (GIS) data sets, and intensive field analysis to precisely identify suitable planting locations (e.g., localized soil types, microtopography). Created oak woodlands will have an approximate average density of 80 appropriately sized oak trees per acre at the end of the monitoring period (or other density as directed by the County Forester), while staying within the mitigation areas. The contiguity of the created woodland habitat within or adjacent to existing oak woodlands will be ecologically beneficial, and will also improve the logistics of

---

<sup>8</sup> Young and Evans 2000

restoration installation, maintenance, and monitoring, compared to a fragmented habitat creation program. These methods will help to ensure the success of created oak woodlands to replace the existing woodlands over time.

9. In order to implement the creation of habitat on the site and to ensure the persistence of the overall biological functions and values over time, the Project Applicant/Developer shall submit an Oak Woodland Habitat Mitigation Plan to the County for approval prior to the issuance of a grading permit for each tract map or combination of tract maps. The mitigation approach described in the Plan shall comply with Section 21083.4 of the *California Public Resources Code* (PRC), which was enacted by California Senate Bill (SB) 1334. County approval of the Plan shall be required prior to the initiation of any clearing or grading on the site that affects any oak woodland vegetation. The Oak Woodland Habitat Mitigation Plan shall be developed by a qualified Restoration Specialist, to be retained by the Project Applicant/Developer, and shall be subject to County approval. The objective of the Oak Woodland Habitat Mitigation Plan will be to preserve 6.2 acres of existing oak woodland and to create 6.2 acres of oak woodland. The Oak Woodland Habitat Mitigation Plan serves the purpose of satisfying the conditions of Section 21083.4 of the *California Public Resources Code*.
10. Implementation of the Oak Woodland Mitigation Plan will be the responsibility of the Project Applicant/Developer or its designated party; the Plan shall specify, the following:
  - a. **Personnel:** The responsibilities and qualifications of personnel required to implement and supervise the plan will be specified. The responsibilities of the Landowner, County staff, Specialists, and Maintenance Personnel that will supervise and implement the plan will also be included.
  - b. **Site Selection:** The mitigation site(s) will be determined in coordination with the project applicant/Developer and the County. The site(s) will be located in open space areas that will be managed in perpetuity through a conservation easement, open space dedication, performance bond, management at the Tejon Ranch Conservancy, or other method approved by the County.
  - c. **Native Species Seed Collection, Site Preparation, and Planting Implementation:** Under the supervision of the County Forester, site preparation will include (i) protection of existing native species; (ii) trash and weed removal; (iii) native species salvage and reuse (i.e., duff); (iv) soil treatments (i.e., imprinting, and/or decompacting); (v) erosion-control measures (i.e., rice or willow wattles); (vi) native seed mix application; and (vii) procedures for native seed collection from the site, including acorns of native oak species.

- d. **Schedule:** Restoration/revegetation sites will be established between October 1 and January 30. Seeding and planting of container plants will take place immediately after preparation of the mitigation sites and will take place under the supervision of the County Forester.
- e. **Maintenance Plan and Guidelines:** The Maintenance Plan, to be approved by the County, will include (i) weed control; (ii) herbivory control (e.g., feral pigs); (iii) trash removal; (iv) irrigation system maintenance; (v) maintenance training; (vi) replacement planting; and (vii) a vehicle washing program to capture invasive propagules. The Maintenance Plan will also indicate who is responsible for each of these listed tasks.
- f. **Monitoring Plan:** The monitoring plan, to be approved by the County, will include (i) qualitative monitoring (i.e., photographs and general observations); (ii) yearly quantitative monitoring (i.e., randomly placed transects to assess vegetation type coverage and systematically assess all mitigation oak trees); (iii) performance criteria as approved by the County; and (iv) annual reports that will be submitted to the County for five consecutive years after initial planting (or longer if the County requires) and following plan approval.
- g. **Long-Term Preservation:** Long-term preservation of the mitigation site(s) will be outlined in the Restoration Plan to ensure that they are not impacted by future development. An open space dedication, conservation easement, performance bond, management by the Tejon Ranch Conservancy, or other County-approved method will be used to ensure long-term preservation.
- h. **Growth/Vegetation Standards:** Growth/vegetation standards will be developed by a qualified Biologist in accordance with County and regulatory agency requirements.

### *Oak Trees*

The mitigation approach for replacing lost oak trees shall comply with the County of Los Angeles Oak Tree Ordinance (CLAOTO) requirements. The goal of this program is to replace impacted oak trees at a ratio of 3:1 for non-heritage oaks and 10:1 for heritage oaks in accordance with the County's oak tree permit requirements. This would result in the establishment of 322 oak trees. However, if Project impacts are reduced through a reduction in Project disturbance limits within oak woodland areas, required tree numbers will be reduced accordingly.

Mitigation trees are typically planted on lands with minimal habitat value (e.g., ruderal vegetation, graded slopes) rather than in areas with a substantial

component of existing native vegetation. To maximize potential for success, oak trees will be planted in the same areas where oak woodlands currently exist. This method will create future generations of oak trees and oak woodland on the site in these areas and will be done as described in Numbers 1-10 under the "Mixed Oak Woodlands" portion above. Additionally, quantitative tree monitoring data for all mitigation trees (whether for County of Los Angeles Oak Tree Ordinance [CLAOTO] mitigation or oak woodland mitigation) will be submitted to the County Forester yearly and, for convenience, will be included as an appendix to the annual report required in 10(f)(ii) above.

#### *Other Riparian and Wetland*

In addition, the Applicant shall create, enhance, and/or restore all impacted riparian and wetland vegetation types that are not considered jurisdictional by permitting resource agencies (i.e., those not mitigated through regulatory permit conditions) at a 1:1 ratio. This applies to areas mapped as alluvial scrub; riparian herb; rush riparian grassland; southern arroyo willow riparian; southern willow scrub; unvegetated wash; willow riparian forest; willow riparian woodland; alkali meadow; Baltic rush; and seeps and ephemeral ponds. These areas shall be included in the Streambed and Wetland Habitat Creation and Enhancement Plan discussed in MM 7-12, which shall be approved by the County prior to issuance of grading permits.

**MM 7-12** Prior to any fill of or alteration to drainage tributaries, wetlands, and/or riparian vegetation on the Project site, the Project Applicant/Developer shall obtain the appropriate regulatory agency permits and/or agreements from the U.S. Army Corps of Engineers (USACE), the California Department of Fish and Wildlife (CDFW), and the applicable Regional Water Quality Control Board (RWQCB). The Project Applicant/Developer shall comply with all mitigation measures specified in the regulatory agency permits and/or agreements. Pursuant to the permit requirements, the Project Applicant/Developer will develop a Storm Water Pollution Prevention Plan (SWPPP) that incorporates Best Management Practices (BMPs) for reducing or eliminating construction-related pollutants in the site runoff.

The Project is subject to the following Mitigation Performance Standards: As anticipated to be required by USACE, CDFW, and Regional Water Quality Control Board (RWQCB) regulatory permits, the Project Applicant/Developer shall create, enhance, and/or restore acreage to ensure that net habitat values are at least equal to those lost from Project implementation. Mitigation ratios are typically specified in the regulatory permits. However, if mitigation is conducted prior to impacts taking place, mitigation ratios can be pro-rated; this type of mitigation pro-rating allows time to evaluate if created, enhanced, and/or restored habitat values are at least equal to those that will eventually be lost from Project implementation. Under this scenario, it can be verified

that the restoration/creation goals have been accomplished or are proceeding satisfactorily.

The extent of drainages and wetlands that would be preserved under the Project will provide opportunities to expand and enhance the drainages, wetlands, and riparian vegetation on the Project site.

As discussed previously, a wetland functional assessment of the drainages and other aquatic features in the Project site was conducted by Glenn Lukos Associates in 2006 and 2009 in order to characterize and evaluate the functions of the site's drainages and riparian habitats (GLA 2009a). An update to that functional assessment was conducted in 2015 (BonTerra Psomas 2015a). Overall, aquatic resources on the site were evaluated in terms of Functional Capacity Units (FCU), which indicate more specifically the mitigation level necessary to restore riparian functions after Project implementation by providing a measure of the ability of a wetland area to perform typical wetland functions.

The purpose of the mitigation is to replace lost habitat value, as measured in FCU rather than based on a standard acreage ratio. Mitigation will include a combination of on-site and off-site preservation of jurisdictional resources; on-site and off-site enhancement/restoration of preserved jurisdictional resources in order to increase overall functional capacity; and the creation (expansion) of riparian/wetland habitats along degraded drainages, including Oso Creek and two of its tributaries in addition to the three other drainages (including the main drainage located along and immediately north of State Route [SR] 138).

The direct and indirect loss in on-site functional units will be mitigated through passive enhancement of open space areas, active enhancement of 6.5 acres of wetland, and creation of approximately 78.4 acres of wetland/riparian habitat (GLA 2009a). Following implementation of mitigation, the Project provides approximately 4,748.5 FCUs. Therefore, the proposed mitigation will result in a functional gain of 327.5 FCUs, thereby ensuring a net increase in functionality in the post-Project condition (GLA 2009a). In summary, implementation of the proposed jurisdictional resource mitigation will actually result in a net gain in the measurable functional capacity and therefore, the habitat values, of the on-site and off-site drainages and other aquatic features.<sup>9</sup>

To implement the creation/restoration/enhancement of streambed/wetland habitats on the site, the Project Applicant/Developer shall develop a Streambed and Wetland Habitat Creation and Enhancement Plan commensurate with regulatory agency permits and/or agreements. The purpose of this plan is to demonstrate the feasibility of creating the required

---

<sup>9</sup> For information about the functional values of the impacted jurisdictional resources and proposed mitigation areas, see GLA 2009b in Appendix 5.7-B.

mitigation acreage and to ensure that the overall biological functions and values are increased. The plan shall be developed by a qualified Restoration Specialist and shall be submitted to the County for approval. The Streambed and Wetland Habitat Creation and Enhancement Plan shall specify the following:

- **Personnel:** Responsibilities and qualifications of the personnel required to implement and supervise the plan will be specified. The responsibilities of the Landowner, Specialists, and Maintenance Personnel that will supervise and implement the plan will also be included.
- **Site Selection:** The sites for mitigation will be determined through coordination between the project applicant/Developer, the USACE, the CDFW, the applicable RWQCB, and the County.
- **Site Preparation and Planting Implementation:** Site preparation will include: (1) protection of existing native species; (2) trash and weed removal; (3) native species salvage and reuse (i.e., duff); (4) soil treatments (i.e., imprinting and/or decompacting); (5) erosion-control measures (i.e., rice or willow wattles); (6) seed mix application and quantities; and (7) procedures for seed collection from existing habitat on the site.
- **Schedule:** Establishment of restoration/revegetation sites will be conducted between October 1 and January 30. Seeding and planting of container plants will take place immediately after preparation of the restoration sites.
- **Maintenance Plan/Guidelines:** The maintenance plan will include (1) weed control; (2) herbivory control; (3) trash removal; (4) irrigation system maintenance; (5) maintenance training; (6) replacement planting; and (7) vehicle washing program to capture invasive propagules.
- **Monitoring Plan:** The monitoring plan will include (1) qualitative monitoring (i.e., photographs and general observations); (2) quantitative monitoring (i.e., randomly placed transects); (3) performance criteria, as approved by the USACE, the CDFW, and the applicable RWQCB; (4) biannual reports (i.e., two reports the first year) for the first year will be submitted to the USACE, the CDFW, the applicable RWQCB; and (5) annual reports, which will be submitted to all three agencies and the County for an additional four years after initial planting. The monitoring is planned for five years, but may be shorter or longer depending upon the performance of the mitigation sites.
- **Long-Term Preservation:** Long-term preservation of the mitigation sites will be outlined in the mitigation plan to ensure that they are not impacted by future development. An open space dedication, conservation easement, performance bond, management by the Tejon Ranch Conservancy, or other County-approved method will be used to ensure long-term preservation.

- **Performance Standards:** These will be developed by conducting a biological functions and values assessment (using an accepted method such as Hydrogeomorphic Modeling [HGM]) to establish a baseline for the overall biological value of the affected streambeds and riparian areas on the site. Revegetation will be considered successful at five years if the percent cover and species diversity of the restored and/or created habitat areas are similar to percent cover and species diversity of adjacent existing habitats, as determined by quantitative testing of existing, restored, and created habitat areas. Contingency measures shall also be described in the event that mitigation efforts are not successful.
- **Cattle Exclusion Methods:** Measures to exclude cattle from habitat creation areas and enhancement areas (where applicable) shall be identified and described.
- **Funding:** The funding source(s) for all proposed mitigation actions shall be identified.

The Streambed and Wetland Habitat Creation and Enhancement Plan shall be subject to approval by the County, the USACE, the CDFW, and the applicable RWQCB for impacts within the respective jurisdictional areas of these agencies. If pro-rated mitigation ratios are used, it shall be demonstrated that the mitigation performance standards have been accomplished. The accomplishment shall be verified by the USACE, the CDFW, and the applicable RWQCB based on the performance standards established above prior to the County's issuance of a grading permit. Implementation of these mitigation measures may serve the dual purpose of satisfying the conditions (or a portion of the conditions) of the agreements/permits of the USACE, the CDFW, and the applicable RWQCB.

**MM 7-13** The Project Applicant/Developer shall develop a Landscaping Plan for review and approval by the County Biologist, which includes a plant palette composed of non-invasive species that are adapted to the conditions found on the Project site and do not require high irrigation rates. The Landscaping Plan will also include a list of invasive plant species prohibited from being planted on the Project site. In addition, retail sales of these invasive plant species will be prohibited at any businesses (nurseries) located within the Project site. Landscape plans shall encourage planting of local natives typical of native vegetation within ten miles of the Project site.

The Homeowners Association shall supply future residents of the Project site with the list of invasive plant species from the Landscaping Plan that will be prohibited from being planted on the Project site and educational materials that emphasize the importance of adhering to the list. A list of local native plants shall be provided to homeowners.

**MM 7-14** The designated SR-138 underpass shall be located where the highway crosses the Project's western border near the current intersection with Cement Plant

Road. The width of the underpass shall be 100 feet and shall flare out on both sides of the highway to a 150-foot width in the Project open space adjacent to the highway. These specifications are expected to allow some local wildlife to safely pass between open space areas on opposite sides of the highway.

In addition, a 50-foot open space buffer will be incorporated on the eastern and western sides of Cement Plant Road; this buffer shall be from the southern side of the bridge that spans the California Aqueduct to the nearest open space polygon that meets the property edge. The undeveloped 50-foot buffer shall run parallel with the Aqueduct along its southern bank. This buffer may be temporarily disturbed during construction, but shall be retained as greenspace to increase connectivity for local wildlife between open space areas and potential Aqueduct crossing locations.

**MM 7-15** Waste and recycling receptacles that discourage foraging by wildlife species adapted to urban environments shall be installed by the Project Applicant/Developer in common areas (i.e., any area where public trash receptacles would be placed, such as parks, sidewalks, community centers, and walking trails) throughout the Project site. Documentation of the completion of this measure shall be submitted to the County prior to occupation of housing units.

The Homeowners Association shall supply an educational pamphlet to future residents of the Project site regarding: the importance of not feeding wildlife; information stating that trash (containing food) and microtrash that could potentially attract condors should not be accessible to wildlife; the necessity of keeping the ground free of fallen fruit from trees; and instructions about not leaving pet food outside.

**MM 7-16** All landscaping materials (including organic mulches) for common/public areas (i.e., parks and intervening unpaved areas which are not a part of any homeowner's parcel) shall be inspected and certified by landscape suppliers as being "free" of Argentine ants prior to planting. Additionally, container plants and other landscaping materials to be installed within common/public areas within 200 feet of the open space areas shall be inspected by a qualified restoration specialist for the presence of Argentine ants. Plants or other materials with Argentine ants shall be rejected.

Upon initiating landscaping within a development area, quarterly monitoring shall be initiated for Argentine ants along the development/construction-open space interface at sentinel locations where invasions could occur (e.g., where moist microhabitats that attract Argentine ants may be created). A qualified biologist shall determine the monitoring locations. Ant pitfall traps will be placed in these sentinel locations and operated on a quarterly basis to detect invasion by Argentine ants. If Argentine ants are detected during monitoring, direct control measures will be implemented immediately to help prevent the invasion from worsening.

These direct controls may include but are not limited to nest/mound insecticide treatment, or available natural control methods being developed. A general reconnaissance of the infested area would also be conducted to identify and correct the possible source of the invasion, such as uncontrolled urban runoff, leaking pipes, or collected water. Each site visit shall be followed up with a summary monitoring report sent electronically to Applicant indicating the status of the site. Monthly monitoring reports, as needed, shall be submitted to CDFG and the County of Los Angeles). Monitoring reports shall include remedial recommendations and issue resolution discussions when necessary. Monitoring and control of Argentine ants would occur for a 5-year period. After the first 5 years, the Homeowners Association or other entity will be responsible for controlling Argentine ants. Additionally, to further guard against Argentine ants, the Homeowners Association shall discourage irrigated landscape planting through distribution of educational information and other feasible methods to reduce the potential for importing Argentine ants.

To preclude the invasion of Argentine ants into preserved populations of round leaved filaree and crownscale and their associated buffers, controls will be implemented using an integrated pest management (IPM) approach. The controls include (1) Providing "dry zones" between development and round leaved filaree and crownscale populations, where typical soil moistures are maintained at levels below about 10% soil saturation, which will deter the establishment of nesting colonies of ants; and providing dry zone buffers of sufficient width to reduce the potential for Argentine ant activity within core habitat areas; (2) Where feasible, and/or appropriate, dry areas such as parking lots and roadways shall be built adjacent to the boundaries of these populations; (3) designing adjacent areas to slope away from the preserved populations to avoid runoff entering the area; (4) Pedestrian pathways placed next to preserve populations shall consist of decomposed granite or other gravel to minimize the holding of moisture, thereby preventing establishment of suitable habitat for Argentine ant colonies; (5) Ensuring that landscape container plants installed within 200 feet of preserved populations are ant free prior to installation to reduce the chance of colonies establishing in areas close to the preserved populations; (6) Maintaining natural hydrological conditions in the preserved populations areas, including the buffers, through project design features for roadways, French drains, irrigation systems, underground utilities, drainage pipes and fencing, storm drains, and any other BMP measures that apply to surface water entering the preserved populations areas; (7) Using drought resistant plants in fuel modification zones and minimizing irrigation to the extent feasible.

- MM 7-17** The Project Applicant/Developer shall implement a public awareness program (prior to the first occupancy permit) in an effort to restrict public access to the riparian and open space areas on the Project site to designated trails and to prevent unleashed domestic animals from entering these areas. This program shall include signs that identify the boundaries of ecologically

sensitive areas; the use of temporary fencing around sensitive areas that appear to be receiving a high level of disturbance until the disturbance is reversed; and promotion of public education and awareness of such areas. The Project Applicant/Developer shall be responsible for the initial development of the public awareness program and installation of interpretive signs and fencing. The Homeowners Association, the Project Applicant/Developer, or an acceptable Land Manager/Agency (as approved by the County) shall be responsible for maintaining this program, including signs and fencing.

Only passive recreational activities shall be permitted within the designated natural open space areas and shall be restricted to trails. Some areas may allow slightly greater impacts if designated as picnic and/or camping areas.

All dogs shall be required to be leashed while in the designated natural open space areas. In addition, all dogs and cats shall be required to be neutered or spayed; all dogs shall be required to have a microchip; and potential owners shall show evidence prior to entry into the Centennial Development, as required by Los Angeles County Code (Section 10.20.350).

**MM 7-18** Common area landscaping and restoration methods shall follow protocols to reduce the potential for the introduction of pathogens and pests into the Project site and to reduce the spread of pathogens and pests outside the Project site (should they inadvertently be introduced). Protocols for reducing the potential for introduction of pathogens and pests into the site via plant foliage/soil from nurseries supplying the material shall include the following anti-contamination procedures: sanitizing all containers, tools, and footwear (boots, pots, clippers, soil scoops, shovels) in soil potting areas; sanitizing all transplanting and prep tables; sanitizing plant storage locations (e.g., benches); sanitizing plant transportation devices (e.g., carts); sanitizing floor surfaces where plants are stored on a regular basis; and using anti-splash watering methods for particularly susceptible plant species. Field installation crews shall sanitize all tools and footwear during landscaping and restoration activities prior to using them or entering the site and shall install plants in a way that minimizes conditions that support pathogens and pests (e.g., minimizing standing water). All plant materials brought onto the site will be inspected by landscape/restoration personnel familiar with signs of pathogen and pest infestation. Should pathogens or pests be detected, the infected material shall be bagged, secured, and disposed of off-site to a contained location. Long-term control methods shall include monitoring to examine vegetation and surrounding areas for pests to evaluate trends and to identify when controls are needed; establishing action thresholds that trigger control actions; and implementing pest control methods—cultural, mechanical, environmental, and biological—and appropriate pesticides.

**MM 7-19** Prior to vegetation clearing or grading, additional surveys shall be performed to confirm that all oak trees within the impact and buffer areas are recorded. The Project Applicant/Developer will be required to comply with all

mitigation measures stipulated in the County-issued Oak Tree Permit pursuant to the County of Los Angeles Oak Tree Ordinance (CLAOTO) and the *County of Los Angeles Oak Woodlands Conservation Management Plan* (OWCMP). Trees would be planted pursuant to the Oak Woodland Restoration Plan discussed in MM 7-11.

**MM 7-20** All oak tree driplines within 50 feet of land clearing (including brush clearing) or areas to be graded shall be enclosed with temporary fencing for the duration of the clearing or grading activities. Fencing shall extend to the root protection zone (RPZ) (that area at least 15 feet from the trunk or half again as large as the distance from the trunk to the dripline, whichever is greater). No parking or storage of equipment, solvents, or chemicals that could adversely affect the trees shall be allowed within 25 feet of the trunk at any time. Fence removal shall occur only after the Project Biologist confirms the health of preserved trees.

All upslope grading and drainage shall be engineered to minimize resultant erosion, soil compaction, or drainage into preserved oak tree areas. Whenever possible, utilities shall be designed to avoid crossing under the canopies of preserved trees unless the utilities are installed by drilling under the root zones (where feasible) in order to avoid impacts associated with cutting roots. Feasibility of drilling under trees will be based on soil conditions. Utilities will be clustered whenever possible to lessen impacts to oak RPZs.

**MM 7-21** In order to ensure that no direct impacts to Significant Ecological Area (SEA) 17 occur, brush clearance zones shall be contained within the current Project impact boundary and no overlap with the adjacent SEA 17 shall occur. Vegetation management for fire abatement purposes is not authorized in SEA areas. An Implementation Plan, including fire risk abatement measures (including but not limited to vegetation management) required to comply with State and County fire prevention and response legal requirements, shall be submitted as part of the tentative tract map for portions of the Project site that border an SEA or mitigation preserve area. The Plan shall include this prohibition on vegetation clearance within these biologically sensitive areas.

**MM 7-22** If a golf course is developed as part of Project implementation, the Project Applicant/Developer shall prepare a Golf Course Management Plan that requires any golf course developed on the site to be built and managed in accordance with the Audubon Cooperative Sanctuary Program for Golf Courses (or equivalent), which is a cooperative effort between the United States Golf Association and Audubon International that is designed to promote ecologically sound land management and to conserve natural resources.

MM 11-3 from Section 5.11, Air Resources, will also be implemented to help reduce impacts to Biological Resources.

## 5.7.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

The direct and indirect impacts on biological resources that may result from implementation of the Project shall be mitigated to a less than significant level with implementation of the mitigation measures described above. Specific strategies to mitigate each impact to a level that is less than significant are included. Therefore, Project impacts are considered less than significant after mitigation. Cumulative impacts on biological resources are discussed in Section 7.0 of this document.

## 5.8 LAND USE, ENTITLEMENTS, AND PLANNING

### 5.8.1 INTRODUCTION

#### Purpose

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which was prepared pursuant to the California Environmental Quality Act (CEQA), requires that land use issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criteria for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

The land use analysis is based on field observations and review of aerial photographs and related planning documents referenced in this section. Environmental impacts associated with issues that affect land use compatibility (e.g., noise, agricultural resources, aesthetics, traffic) are addressed in their respective sections of this EIR. There would be no development within or direct impacts to Significant Ecological Areas (SEAs), or on any lands for which a habitat conservation plan (HCP) or a natural community conservation plans (NCCP) has been adopted as there are no HCPs or NCCPs on the Project site or off-site impact areas. The Project's consistency with the Air Quality Management Plan is discussed in Section 5.11, Air Resources; and consistency with the Regional Housing Needs Assessment is discussed in Section 5.9, Population, Housing, and Employment. These environmental issues are only discussed below to the extent that they would result in an incompatible land use.

As required by Section 65451(b) of the *California Government Code*, "a specific plan shall include a statement of the relationship of the specific plan to the general plan". The Project's consistency with an applicable land use plan, policy, or regulation is addressed throughout this EIR. Consistency with regional plans, the Los Angeles County General Plan (General Plan), and the Antelope Valley Area Plan (AVAP) is discussed below, with the consistency of specific elements of the AVAP also addressed in various sections.

#### Summary

The Project site is largely undeveloped and there are no residential communities on or near the site, except for scattered residences to the east of the site, north of State Route (SR) 138 and east of 290<sup>th</sup> Street West. The Project would not divide an established community.

The AVAP designates the Project site as within the West Economic Opportunity Area (EOA); AVAP also requires approval of a Specific Plan for a new master planned community in this EOA. Further, the Land Use Map includes an SP overlay designation over the site. In compliance with applicable Specific Plan County requirements and state law, the Project Specific Plan includes the location of the project's internal circulation network of roadways. Adding the internal Project site roadways meeting the criteria for inclusion on the Antelope Valley Area Plan Highway Plan (Map 3.1 of the AVAP, which includes major highways, secondary highways, limited secondary highways, parkways, and expressways), as well as

the Highway Plan Policy Map included in the General Plan (Figure 7.3, Highway Plan Policy Map), require AVAP and General Plan amendments to fill in the required roadway details within the Project site. Amending Map 3.1 to add internal project site roadways is also consistent with AVAP's requirement for a Specific Plan for a new master planned community in this West EOA. The Project remains consistent with the AVAP, which is part of the General Plan, and no text amendments to the AVAP or County General Plan are proposed.

The Project site would require a zone change to Specific Plan, in accordance with the County's Zoning Ordinance (Title 22 of the County Code), to conform to the General Plan designation as well as the AVAP requirement that a Specific Plan be completed for development in the West EOA. Since a Specific Plan would be adopted for the site, the Project would be consistent with the County's Hillside Management Areas (HMA) Ordinance, since the Specific Plan includes measures to protect sensitive hillside areas as described in Section 3.3, Conceptual Grading Plan, and Appendix 1-B, Hillside Design Guidelines in the Specific Plan.

The proposed grading on the Project site would exceed 100,000 cubic yards and a Conditional Use Permit (CUP) would be needed pursuant to Section 22.56.217 of the Los Angeles County Code. The Project also requires a CUP for the approval of Project-related infrastructure, including roadway circulation system, gas, telephone, cable and internet and electric lines within road right-of-way, a water system including domestic and recycled water tanks and pipelines and accessory booster pumps and storage ponds, sewage disposal pipelines and waste water reclamation facilities, water banks, water wells, flood control and drainage facilities, water treatment facilities, green waste composting, solid waste and materials recovery facilities and recycling centers and an electrical substation. The proposed zone change and CUPs are consistent with the County Code.

The increase in housing and employment that would occur with Project implementation is consistent with the projections for the Project site included in the traffic analysis zones (TAZs) and corresponding figures in the Southern California Association of Governments' (SCAG) 2012-2035 and 2016-2040 Regional Transportation Plan/Sustainable Communities Plan (RTP/SCS). The resident population of the Project at buildout is 82.46 percent of the projected resident population of traffic analysis zone (TAZ) 20280000 and TAZ 20281000 by 2035, but exceeds the Southern California Association of Governments (SCAG) projections for 2040. The 2016 Regional Transportation Plan/Sustainable Communities Plan (RTP/SCS) states that TAZ level data or any data at a geography smaller than the jurisdictional level is included in the draft growth forecasts for regional modeling purpose only, and is advisory and non-binding. As such, the exceedance of population growth projections at the Project site on a TAZ level is not considered a significant adverse impact, as discussed in Section 5.9, Population, Housing and Employment. Population, housing, and economic growth relative to the SCAG RTP/SCS would be less than significant as it relates to the exceedance of regional population projections and no mitigation is required.

The AVAP has been challenged in court, but no injunction against implementation of the plan has been sought or granted. The County's General Plan was adopted in October 2015, and was not challenged and is in effect. Consistent with land use law and the requirements of the California Environmental Quality Act (CEQA), these land use plans are being implemented

and the environmental impact reports (EIRs) prepared for each plan has been considered as part of this Project EIR and each is incorporated by reference. This EIR does not tier from, nor is it legally reliant upon, the EIRs for either the AVAP or the General Plan. Should the approval and adoption of the AVAP or its accompanying EIR be invalidated pending further environmental and policy review, one of the possible judicial remedies could effectively revive the now-superseded former Antelope Valley Areawide General Plan (AVAGP), the earlier Area Plan for this area of Los Angeles County. In that case, the Project would require an AVAGP amendment in addition to a zone change to Specific Plan and other entitlements, including a Conditional Use Permit for development within an SEA. Appendix 5.8-A to this Draft EIR includes a consistency analysis of the proposed Project and the AVAGP policies and provides graphic illustrations of the required AVAGP map amendment figures. As stated in the consistency analysis in Appendix 5.8-A, the Project would require map but not text amendments to the AVAGP. The Project would have less than significant land use impacts with the accompanying AVAGP plan amendments, zone change and other associated entitlements.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

All references cited for preparation of this analysis are listed in Section 5.8.8.

### 5.8.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

As previously indicated, one aspect of land use planning considered under CEQA is the consistency of the Project with relevant land use plans and regional growth projections. Relevant planning documents associated with the Project site include the Los Angeles County General Plan 2035, the 2015 AVAP, and the SCAG 2016–2040 RTP/SCS. The focus of the analysis is on consistency with plan elements (e.g., land use designations on the Project site and relevant policies regarding development and use of the Project site) and potential adverse impacts to the physical environment relative to these adopted plans and policies. This section is not intended to discuss other projects that are proposed within the same area or near the site, which would be considered cumulative projects and are discussed in Section 7.0. To provide a comprehensive evaluation of the General Plan documents, the evaluation of goals and policies for each element are consolidated in this section. However, the planning programs specific to a topical issue (e.g., biological resource conservation and air quality attainment) are discussed in the respective technical sections in Section 5.

## State

### *Land Use Planning Laws*

The requirements and authority for local municipalities (i.e., counties and cities) in California to prepare and administer general plans, including area plans, are contained in Sections 65300–65404 of the *California Government Code*. Area plans are not specifically mentioned in the statute; however, they are authorized under Section 65301(b), which allows individual sections of the general plan to be devoted to a particular subject or geographic area. In addition, they are also allowed as optional elements or subjects under Section 65303 (OPR 2001). The requirements for preparation and implementation of specific plans is contained in Sections 65450–65457 of the *California Government Code*. The requirements for the adoption and administration of zoning laws, ordinances, and other regulations by counties and cities is contained in Sections 65800–65912 of the *California Government Code*.

Specific plans, such as prepared for the Project, are a tool for the systematic implementation of the general plan, and establishes a link between implementing policies of the general plan and the individual development proposals in a defined area. Unlike a community or area plan, a specific plan is not a component of the general plan, but a separately adopted general plan implementation document. The provisions of Section 65450 et seq. of the *California Government Code* require that a specific plan be consistent with the adopted general plan of the jurisdiction within which it is located. In turn, all subsequent subdivision and development, all public works projects, and zoning regulations must be consistent with the specific plan (OPR 2001).

### ***Special Purpose District Laws***

The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (Section 56000 et seq. of the *California Government Code*) establishes the procedures for filing, noticing, elections, and approval of any changes in the organization of a city or special district. This law establishes a Local Agency Formation Commission (LAFCO) for each county in California and outlines LAFCO's functions as it relates to annexations, incorporations, consolidations, organizations/reorganizations, spheres of influence, mergers, detachments, disincorporations, and dissolutions.

The LAFCO for the County of Los Angeles would regulate any changes in the organization of public service providers serving or that would serve the Project site. It would be responsible for the following:

- Regulation of city or special district boundary changes;
- Establishment of spheres of influence—the probable physical boundaries and service area of a city or special district;
- Municipal service reviews, fiscal studies and feasibility studies to determine the need for reorganization or expansion of service boundaries;
- Initiation of special district consolidations or dissolutions; and
- Review of service agreements between public agencies and between public agencies and private parties.

## **Regional**

### ***Southern California Association of Governments Plans***

SCAG is the Metropolitan Planning Organization (MPO) for six counties: Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial Counties. The region had a 2015 population exceeding 18 million persons in an area that encompasses more than 38,000 square miles. As the designated MPO, the federal government mandates that SCAG research and draw up plans for transportation, growth management, hazardous waste management, and air quality. Among the leading activities SCAG undertakes are

- Maintaining a continuous, comprehensive, and coordinated planning process resulting in a Regional Transportation Plan (RTP) and a Federal Transportation Improvement Program (FTIP);
- Developing a Sustainable Communities Strategy (SCS) to reduce greenhouse gas emissions as required by applicable State law (Senate Bill [SB] 375) as an element of the RTP;
- Developing demographic projections;
- Developing integrated land use, housing, employment, transportation programs and strategies for South Coast Air Quality Management District (SCAQMD) planning purposes, as discussed further in Section 5.11, Air Resources;

- Serving as co-lead agency for air quality planning in the Central Coast and Southeast Desert air basin districts;
- Developing and ensuring that the RTP and the FTIP conform to the purposes of the State Implementation Plans for specific transportation-related criteria pollutants, per the Clean Air Act;
- Serving as authorized regional agency for intergovernmental review of proposed programs for federal financial assistance and direct development activities;
- Reviewing environmental impact reports for projects having regional significance to ensure they are in line with approved regional plans;
- Developing an area-wide, waste treatment management plan;
- Preparing the Regional Housing Needs Assessment for review and approval by the State, including planning for future population, housing, and employment growth throughout the SCAG region; and
- Preparing the Southern California Hazardous Waste Management Plan with the San Diego Association of Governments and the Santa Barbara County/Cities Area Planning Council.

SCAG plans applicable to the Project are the Regional Comprehensive Plan (RCP), the RTP/SCS, and Regional Housing Needs Assessment (RHNA). These plans are discussed below.

#### Regional Comprehensive Plan

SCAG's RCP provides a policy framework for regional planning in Southern California. The RCP calls for city and county involvement and coordination in addressing regional issues related to growth management and development. The RCP is divided into nine chapters that focus on a regional strategy to address the RCP's vision for future growth and development. Each chapter includes three levels of recommendations for the region: goals, outcomes, and an action plan that contains constrained policies (or near-term, feasible policies) and strategic initiatives (longer-term strategies).

The RCP only serves as a voluntary "toolbox" to assist local jurisdictions in preparing local plans and addressing local issues of regional significance. As identified in Resolution No. 08-502-1 (Resolution of the Southern California Association of Governments Accepting the 2008 Regional Comprehensive Plan for the SCAG Region), given its advisory nature, the 2008 RCP is not used in SCAG's Inter-Governmental Review (IGR) process for purposes of assessing project-level consistency with adopted SCAG plans under CEQA (SCAG 2008).

#### Regional Transportation Plan/Sustainable Communities Strategy

The Regional Transportation Plan (RTP) is a long-range transportation plan that is developed and updated by SCAG every four years to guide transportation investments throughout the region. The Sustainable Communities Strategy (SCS) is a required element of the RTP that integrates land use and transportation strategies to achieve California Air Resources Board (CARB) emissions reduction targets pursuant to Senate Bill (SB) 375.

On April 7, 2016, the SCAG Regional Council adopted the 2016–2040 RTP/SCS. The RTP/SCS combines the need for mobility with a “sustainable future” through a reduction in the amount of emissions produced from transportation sources. This would be made through the operation of low or no emission transportation systems by 2040. The RTP/SCS also focuses on the economy, with expectations of shortening the gap between the regional transportation system and economic vitality. To address the mobility challenge of the region’s continuing roadway congestion, the RTP/SCS proposes transportation investments in transit; passenger and high-speed rail; active transportation; transportation demand management; transportation systems management; highways; arterials; goods movement; aviation and airport ground access; and operations and maintenance projects. These are expected to indirectly create investment opportunities in the region. The 2016–2040 RTP/SCS, like the 2012–2035 RTP/SCS, includes population, household and employment projections in Traffic Analysis Zone (TAZ) maps. TAZ projections for the area that includes the Project site, which were also reflected in corresponding figures included in the 2012 RTP/SCS (SCAG 2012e) and 2016 RTP/SCS (SCAG 2016a), are consistent with the existing population and housing stock in the area and the projected household and employment components of the Project. The 2040 household projections at the TAZ level in the 2016 RTP/SCS are consistent with the proposed Project’s buildout estimates; however, the 2040 population projections by SCAG are less than the Project’s buildout population. The difference may be due to the average household size used in the projections, such that SCAG assumes a smaller household size.

### Regional Housing Needs Assessment

The Regional Housing Needs Assessment (RHNA) identifies the existing and projected housing needs of each jurisdiction (city and county) within the SCAG region. The future housing needs allocations also identifies the need for affordable housing units to meet future housing needs. The RHNA is discussed in greater detail in Section 5.9, Population, Housing and Employment, of this EIR.

## **County of Los Angeles**

### ***Los Angeles County General Plan***

The Los Angeles County General Plan 2035 was adopted in October 2015 and updates the prior General Plan. The General Plan was developed under five guiding principles: employ smart growth; ensure community services and infrastructure are sufficient to accommodate growth; provide the foundation for a strong and diverse economy; promote excellence in environmental resource management; and provide healthy, livable and equitable communities. These principles emphasize the concept of sustainability, so that the needs of the existing population are met without compromising economic, social, and environmental resources that would be available to future generations.

The General Plan serves as the foundational document for community-based plans for 11 planning areas (unincorporated County areas), including the Antelope Valley. The Antelope Valley is described as a predominantly rural area where significant growth has occurred and is expected. A number of rural town centers are located in the Antelope Valley and three Economic Opportunity Areas (EOAs) that are slated for more substantial, urbanized growth,

were designated in the AVAP along with a variety of policies to guide the future planning and development of these EOAs.

The Land Use Element of the General Plan designates the planned land use to direct development within the unincorporated areas of the County. It discusses the land uses in the unincorporated areas, land use tools, special management areas, and disadvantaged communities. It includes a Land Use Policy Map that sets the land use designations for the unincorporated areas and contains goals and policies related to land use and planning.

The Mobility Element discusses the County's transportation system, including freeways, highways and roads, public transit services, bikeways, pedestrian networks, the aviation network, railroads, harbors, parking and terminals. It includes a Highway Plan Policy Map and sets level of service (LOS) D as the desired minimum level of service. It also contains goals and policies related to the transportation needs of all users of a road or street, including pedestrians, bicyclists, users of public transit, motorists, children, seniors, and the disabled. The County's Bicycle Master Plan is a sub-element of the Mobility Element.

The Air Quality Element addresses air quality issues in the County and sets goals and policies to improve air quality and reduce greenhouse gas (GHG) emissions. It includes the Los Angeles County Community Climate Action Plan (CCAP) that establishes actions to reduce GHG emissions from the unincorporated areas of the County to 1990 levels by 2020. The analysis of the Project's consistency with the GHG reduction elements of the CCAP is included in Section 5.21, Climate Change.

The Conservation and Natural Resources Element discusses natural resources and public and private open space areas in the unincorporated County areas. It includes an Open Space Resources Policy Map and goals and policies for the acquisition, planning, and preservation of open space areas. It also addresses biological resources, Significant Ecological Areas (SEAs), National Forests, coastal zones and resources, sensitive habitats, and habitat linkages. Goals and policies call for the preservation of diverse biological resources and ecological systems. The Element addresses local water resources, including groundwater resources, watersheds, areas of special biological significance and marine protected areas. Goals and policies are provided for the protection of local surface and groundwater resources. Goals and policies for the protection of agricultural resources and mineral and energy resources in the County are also outlined in this element. Scenic resources, which include hillsides, scenic viewsheds, and ridgelines in the County are also discussed, along with goals and policies for their protection. In addition, goals and policies for the preservation of historic, cultural, and paleontological resources are provided. The Project's development area is not within an SEA. Additional information and analysis about the County's SEA program is included in Section 5.7, Biological Resources.

The Parks and Recreation Element discusses parks and recreational facilities that are available to residents of unincorporated areas and the region as a whole. These include public parks, trails, multi-benefit parks, school sites, private facilities, and greenways. The Element also discusses natural and historical resources in parks, recreational programs, park service areas, parkland funding, and park development. Goals and policies address the need for park and recreation opportunities for all users.

The Noise Element discusses the effects of noise, noise sources, noise regulations, and the need for noise reduction. It includes goals and policies to reduce excessive noise in the County.

The Safety Element discusses the different public safety hazards in the County. It includes a Seismic and Geotechnical Hazard Zones Policy Map that shows active earthquake fault traces, and areas subject to seismically induced landslides and liquefaction. It also includes a Flood Hazard Zones Policy Map that shows areas within the 100-year and 500-year floodplains. The Fire Hazard Severity Zones Policy Map shows the severity of fire hazards in the County. The Element sets goals and policies to prevent or minimize the loss of life and property damage due to these hazards. Emergency response plans, disaster routes, and service providers are also discussed to meet the goal and policies for effective emergency response management capabilities.

The Public Services and Facilities Element sets goals and policies for the adequate provision of public services, facilities and infrastructure to meet the demand of future growth and development. This Element addresses the need for early care and education, sanitary sewer services, libraries, water services and supplies, solid waste collection and disposal, and utility infrastructure (e.g., power, gas, and telecommunication networks).

The Economic Development Element discusses the County's economic sectors, jobs, employment areas, competitive disadvantages, and existing programs. The Employment Protection Districts Policy Map identifies Employment Protection Districts and also acknowledges the need to foster economic growth through revitalization and education; to attract target industries; and to improve the economy through land use policy and mobility infrastructure. It outlines the County's economic development goals and policies for maintaining a strong economy. Although there are no Employment Protection Districts in the Antelope Valley, the EOAs identified in the AVAP, are envisioned as employment growth areas as they were established based on their potential for economic growth and development while enabling the Antelope Valley to preserve its ecological and rural characteristics, as discussed further below.

The Housing Element addresses the housing needs of the unincorporated areas of the County and sets goals, policies, programs and objectives for the provision of adequate housing for existing and future residents. The County has been assigned a future housing need for 30,145 dwelling units. The 2014–2021 Housing Element identifies vacant and underutilized sites that would accommodate 48,543 dwelling units. Thus, there are adequate sites in the County to accommodate future housing needs. In addition, there are a number of programs to reduce constraints to housing development; to meet the needs of various households; and to match the housing needs of residents with the available housing stock.

The County General Plan also includes maintenance programs, such as annual progress reports, dataset updates, map maintenance, and General Plan updates. It also outlines the implementation programs that correspond to the goals and policies in the General Plan, along with the lead or partner agency responsible for program implementation and the timeframe for implementation.

### ***Antelope Valley Area Plan***

The *Antelope Valley Area Plan* (AVAP) was adopted in June 2015 as a component of the Los Angeles County General Plan. The AVAP applies to the unincorporated area of the Antelope Valley, which covers a geographic area of 1,800 square miles or 44 percent of the total County land area. This area surrounds the cities of Lancaster and Palmdale and is bound by San Bernardino County to the east, Ventura County to the west, Kern County to the north, and the Angeles National Forest and Santa Clarita Valley planning area to the south. Exhibit 4-2, *Antelope Valley Area Plan Land Use Designations*, shows the allowable land uses on the site.

The AVAP serves as the land use policy and guide for future development, and it discusses the conservation of resources in the Antelope Valley. It provides a more detailed set of goals and policies than the County General Plan and addresses specific issues in the Antelope Valley. It sets a specific vision for the area and a Rural Preservation Strategy that designates rural town center areas, rural town areas, rural preserve areas, and EOAs.

The Land Use Element of the AVAP includes goals and policies for the development or preservation of land in the Antelope Valley and includes a Land Use Policy Map that shows the allowable land uses and permitted development densities and intensities in the unincorporated areas. The Element also addresses Special Management Areas, major planned infrastructure projects, utility-scale renewable energy production facilities, Palmdale Regional Airport, and amendments to the Land Use Policy Map.

The land use designations on the site, as shown in Land Use Policy Map for the Antelope Valley West portion, include Open Space Conservation (OS-C), Rural Land 1 (RL1), Rural Land 2 (RL2), Rural Land 20 (RL20), Rural Land 10 (RL10), Residential (H5), Rural Commercial (CR), and Light Industrial (IL). As shown in Exhibit 4-2, the site is also located within the Economic Opportunity Area Overlay and the Specific Plan Overlay.

The Mobility Element outlines the transportation system improvements needed to serve the mobility needs of current and future residents and land uses. The Element includes goals and policies for the efficient movement of people and goods through the Antelope Valley through travel demand management; an efficient network of highways and streets; management of truck traffic; regional transportation options; local transit services; and bikeways and bike routes, trails, and pedestrian access. State Route (SR) 138 is designated as a proposed Expressway while the County Road south of SR-138 is designated as an existing Limited Secondary Highway.

The Conservation and Open Space Element seeks to protect the Antelope Valley's natural resources and open space areas in undisturbed natural and rural lands. Goals and policies for the preservation of water resources, biological resources, scenic resources, agricultural resources, mineral resources, air quality, energy resources, dark night skies and native vegetation conservation, green building practices, and open space are included in the Element. The Project site is identified to have Class 1 and Class 2 constraints, which identify Special Management Areas that require additional development regulations necessary to prevent the loss of life and property, and to protect the natural environment and important resources. Class 1 refers to land with minimal hazard, environmental and resources

constraints. Class 2 refers to land with moderate hazard, environmental and resources constraints. Constraints on the site include Agricultural Resource Areas, Flood Hazard Zones, Significant Ecological Areas, Hillside Management Areas, and Very High Fire Hazard Severity Zones. The Project avoids development in the SEA included in the AVAP and General Plan.

The Public Safety, Services and Facilities Element addresses the provision of fire protection, law enforcement, libraries, schools, and parks in the Antelope Valley. It sets goals and policies to reduce fire hazards, geologic hazards, and flood hazards and provide adequate law enforcement, disaster preparedness and emergency response. This Element also includes goals and policies for the provision of parks and recreational facilities, schools, libraries, and health facilities.

The Economic Development Element contains goals and policies that seek to promote sustainable economic development in the Antelope Valley while preserving the rural character and environmental resources of the area. The need for employment opportunities in the Valley would be met by employment-generating land uses (e.g., high-tech manufacturing, transportation and logistics, agriculture, renewable energy, construction and housing, recreation, tourism and filmmaking) in appropriate areas to increase the jobs-housing ratio of the Antelope Valley to 1.3 jobs per housing unit. The Element also acknowledges the need for regional and long-term economic development strategies and sets policies for future economic opportunities. The AVAP designates three EOAs (including the area encompassing the Project site) as targets for future economic development, to help preserve the character of existing towns and rural areas, and to help preserve open space and habitat areas in most of the Antelope Valley.

The AVAP contains implementation programs that include the Significant Ecological Area program, Agricultural Resource Areas Program, Economic Opportunity Areas, Transfer of Development Rights Program, Scenic Drives Program, and Community Standards Districts. The southern and western portion of the Project site, which is proposed for open space preservation, is designated as an SEA. The remainder of the Project site is in an EOA, and the central and eastern section of the site are located within a Future Rural Town Area. No development is proposed in an AVAP SEA.

The AVAP designates segments of Interstate (I) 5, SR-138, Gorman Ranch Road, and County Road as Scenic Drives.

The Center for Biological Diversity has filed a legal challenge to the approval of the AVAP and accompanying program EIR, contending that the County violated the California Environmental Quality Act (CEQA) during the approval process. In the event of an adverse litigation outcome, examples of potential judicial remedies include allowing the AVAP to remain in effect while correcting any CEQA non-compliance, invalidating the AVAP and effectively reviving the Antelope Valley Areawide General Plan (AVAGP), the earlier Area Plan for this area of Los Angeles County, or a judicial determination that any CEQA error did not rise to the level requiring revisions of the EIR or AVAP.

## ***Los Angeles County Code***

### **Zoning Ordinance**

Title 22, Planning and Zoning, of the Los Angeles County Code is the County's Zoning Ordinance. Allowable land uses, lot size, lot coverage, and building sizes and locations on the Project site are currently regulated through Title 22. The current zoning designations for the Project site are:

- **O-S (Open Space).** The O-S zone allows uses such as campgrounds, crops, animal grazing, and resource management areas used or proposed for the preservation, maintenance, and enhancement of recreational, natural and environmental resources.
- **RPD (Residential Planned Development).** The RPD zone allows uses (e.g., single-family residences and planned unit developments) and provides flexibility in the design of residential developments to encourage well-planned neighborhoods through creative and imaginative planning and to accommodate the unique characteristics or circumstances of the site.
- **CPD-DP (Commercial Planned Development – Development Program).** The CPD-DP zone allows uses such as commercial highway, service, office, parks/playgrounds, and retail uses, with a development program.
- **MPD-DP (Manufacturing Industrial Planned Development – Development Program).** The MPD-DP zone allows uses such as scientific research and development uses, schools, libraries and museums, institutional uses, and crops, with a development program.
- **A-1-2 (Light Agricultural – Two Acre Minimum Lot Size).** The A-1-2 zone allows uses such as crops, animal raising, single-family residences, greenhouses, and other low density residential uses.

The Project site also has a Specific Plan Overlay under the AVAP (discussed above), and the Project is seeking Specific Plan approval with corresponding zoning designation change as discussed further below. Exhibit 4-3, Antelope Valley Area Plan Zoning, shows the current zoning for the site.

### **Hillside Management Areas Ordinance**

In 1982, the County adopted the Hillside Management and Significant Ecological Areas Ordinance, which has been regulated through Section 22.56.215 of the County Code. As part of the General Plan adoption in 2015, discussed above, an updated Hillside Management Areas (HMA) Ordinance was adopted concurrently with the County's General Plan update, discussed above. The HMA Ordinance is found in Section 22.56.217 of the County Code.

Hillside Management Areas are defined as areas with 25 percent or greater natural slopes. A conditional use permit (CUP) is required for any development located wholly or partially in an HMA, with certain exceptions defined in Section 22.56.217(C) of the County Code. The purpose of the HMA Ordinance is to ensure that development preserves and enhances the

physical integrity and scenic value of HMAs, to provide open space, and to be compatible with and enhance community character. The Hillside Design Guidelines (Guidelines) include design measures for sensitive hillside design, and are required to be incorporated for development in HMAs, as specified in the Ordinance. In hillside areas with less than 25 percent natural slope, use of the Guidelines is optional but encouraged. The Guidelines include specific and measurable design techniques that can be applied to residential, commercial, industrial, and other types of projects. Some design techniques may be more appropriate or feasible than others, depending on the type of project, location, size, complexity, site constraints, and other design techniques incorporated into each project. The Guidelines also include measures to protect sensitive hillside areas, as discussed further in Section 3.3, Conceptual Grading Plan, and Appendix 1-B, Hillside Design Guidelines in the Specific Plan and in Section 5.1, Geotechnical, of this EIR.

#### Significant Ecological Areas Ordinance

The Significant Ecological Areas (SEA) Ordinance is one of the components of the County's SEA Program. (The other components are the General Plan policies and the SEA and Coastal Resources Policy Map [Figure 9.3 of the General Plan], both of which were updated in General Plan.)

The SEA Ordinance is the implementation tool of the SEA Program, and establishes the permitting standards and process for development within SEAs. The SEA Ordinance is currently found in Section 22.56.215 of the County Code. The SEAs are designated through the General Plan, and a CUP is required prior to the specified development (e.g., grading permits, adjustment of property lines, or enlargement of structures) that is in, or partly in, a designated SEA, with certain exceptions defined in Section 22.56.215(C) of the County Code. Exhibit 4-7, Centennial Project – Significant Ecological Area Zone, in Section 4.0, Project Description, depicts the Project site in relation to the SEA boundaries. As discussed below, the Project does not propose any development within an SEA.

### **5.8.3 ENVIRONMENTAL SETTING**

The Project site consists of approximately 12,323 acres of unincorporated County land located in the northwestern section of the Antelope Valley (North Los Angeles County) and just south of the Los Angeles County/Kern County line. The Antelope Valley is characterized by suburban and low-density rural communities that are primarily agricultural in character and at scattered locations throughout the Antelope Valley. Suburban communities in the Antelope Valley include the incorporated cities of Lancaster and Palmdale, while unincorporated communities include Acton, Antelope Acres, Gorman, Lake Hughes, Lake Los Angeles, Leona Valley, Littlerock, Pearblossom, Quartz Hill, Roosevelt, and Sun Village.

The Project site is a part of Tejon Ranch, an approximate 270,000-acre landholding that stretches from just south of the Project site in Los Angeles County to just north of SR-58 in Kern County. Approximately 9.0 percent of Tejon Ranch is located within Los Angeles County, and the Project site comprises approximately 4.5 percent of the total area of Tejon Ranch.

The Project site is generally bound by the Tehachapi Mountains to the northwest, the Antelope Valley to the east, the northern border of the San Gabriel Mountains to the south, and the Los Padres National Forest to the west. The site is approximately 35 miles north of the Santa Clarita Valley (Los Angeles County); approximately 50 miles south of the City of Bakersfield (Kern County) via SR-99 and I-5; and 36 miles and 43 miles northwest of the cities of Lancaster and Palmdale (Los Angeles County), respectively, via SR-138. The Project site's westerly border is approximately one mile east of I-5. SR-138 traverses the southern portion of the Project site in a general west-east alignment. The community of Gorman in Los Angeles County is adjacent to the I-5 and approximately four miles northwest of the I-5 and SR-138 junction.

### **On-Site and Bisecting Land Uses**

The Project site is largely undeveloped, with localized improvements related to ongoing livestock grazing and agriculture, as described below.

**Residence.** A residential dwelling unit is located near the center of the northern property line, which is occupied by a Tejon Ranch employee.

**Grazing Operations.** The Tejon Ranch Company currently leases a portion of the ranch, including the site, to an independent company for grazing and agricultural uses. Of the 12,323-acre Project site, approximately 10,950 acres (89 percent) are used for cattle grazing, which has occurred on the site for over 150 years. The maximum amount of cattle on site at one time was historically approximately 365 heads.

**Agricultural Activities.** On-site agricultural activities are discussed in detail in Section 5.5, Land Resources. There are approximately 1,000 acres of cultivated land within the eastern portion of the Project site. These include pivot fields that are managed for the production of alfalfa or a three-way forage mix (e.g., barley, oats, sedan grass). This area has been cultivated by the Tejon Ranch Company since 1998. Prior to 1998, the land was used primarily for grazing.

**California Aqueduct and Related Facilities.** The Project site is immediately south of the divergence of the California Department of Water Resources' (DWR's) California Aqueduct, where it becomes the East and West Branches. The West Branch of the California Aqueduct (Quail Lake Canal) runs south from the divergence, crosses through the Project site, and flows to the adjacent off-site Quail Lake Reservoir. While the West Branch bisects the Project site, it is not included within the Project boundaries. The Oso Pumping Plant, which is part of the aqueduct system, is located in the north-central portion of the Project site immediately east of the aqueduct as shown in Exhibit 4-18, Known Major Utilities in Project Area, but because this is a part of DWR's aqueduct system, it is also not part of the Project site. The East Branch, which turns southeast from the divergence, runs off site just north of the northeastern Project site boundary.

**High Desert Hunt Club.** The High Desert Hunt Club is private hunt club operated by Tejon Ranch on approximately 7,530 acres at the southern end of the ranch. Approximately 1,147 acres of the Hunt Club is located at the southern end of the Project site and 6,383 acres are

located off site, southeast of the Project site. The Hunt Club offers guided game bird hunting to members and guests. Access to this facility is provided by an existing dirt road off SR-138 at Tentrock Canyon. A historic adobe building (Beale Adobe) is located in the Tentrock Canyon area outside the Project site and serves as a staging area for hunters and as offices for the Hunt Club. The Hunt Club operates from 8:00 AM to 4:00 PM Thursday to Monday. It is open on Tuesdays and Wednesdays for guided valley quail hunts during the valley quail season, generally from October 17 to January 31 (CDFW 2016).

The area utilized by the Hunt Club includes a transitional area between the desert, foothill, and mountain environments within SEA No. 17, San Andreas. The northern boundary of the Hunt Club is generally defined by SR-138 (as shown in Exhibit 3-2, Project Vicinity Map, in Section 3.0, Environmental Setting), but Hunt Club activities occur in the more isolated areas south of the first ridge of foothills, which approximately follow the southeastern boundary of the site. No hunting activities currently occur between the area south of SR-138 and the top of the first ridge. The Hunt Club uses dirt roads, hiking trails or cleared areas, and other areas that are conducive for game fowl cover.

**Hunter's Camp.** A hunter's camp is located in the northwestern edge of the Project site, but is no longer in use. The camp consists of six trailers, a shooting range, and two outhouses. These structures are currently in a state of disrepair and are not habitable.

**Infrastructure–Roads.** SR-138 traverses through the southern portion of the Project site. The eastern Project site boundary is defined by 290<sup>th</sup> Street West and the northern extension of Margalo Drive. In addition, 300<sup>th</sup> Street West runs through the eastern portion of the site from SR-138 over the East Branch of the California Aqueduct and to the agricultural fields to the north. Gorman Post Road crosses the southwestern portion of the Project site and runs in a northwesterly direction from SR-138 to the community of Gorman by I-5. Cement Plant Road is a paved roadway that runs northwesterly and northerly from SR-138 through the Project site to provide access to the National Cement Plant that is located northwest of the site in Kern County. Several paved access roads are also present near the California Aqueduct and associated facilities. Other on-site paved roads lead to localized agricultural operations on the site. In addition, many unpaved roads exist as part of farming and grazing activities on the Project site.

**Infrastructure–Utilities.** Existing utilities on the site include overhead and underground utility lines owned by the Southern California Edison (SCE), Southern California Gas Company (SoCalGas), and AT&T. These utilities are discussed in detail in Section 5.20, Dry Utilities.

**Infrastructure–Water.** The site has an aboveground water storage tank at the southwestern portion of the Project site. A water well is present in the central portion in an area formerly used as a homestead and the Hunt Club receives its water from a spring and spring-fed well.

**State Route 138.** SR-138 runs in a general east-west direction through the southern section of the site. This highway is a currently a two-lane highway with paved shoulders, but the California Department of Transportation (Caltrans) is proposing to widen and realign SR-

138 into a four- to six-lane highway through and near the site, as part of its comprehensive Northwest 138 Corridor Improvement Project.

## Surrounding Land Uses

The following is a discussion of existing land uses in the vicinity of the Project site, as shown on Exhibit 3-3, Aerial Photograph and Project Boundary. The Tehachapi Mountains are near the northwestern and western perimeter of the site and rise up to approximately 5,400 feet above mean sea level (msl) west of the site. The elevation of the mountains gradually declines before reaching the Project site's valley floor where elevations are approximately 3,000 feet above msl at the northeastern portion of the site to approximately 4,250 feet above msl in the northwestern portion of the site. The Los Angeles County/Kern County jurisdictional boundary forms part of the Project site's northern border.

### North

- Most of the area immediately north of the Project site is owned by the Tejon Ranch within Kern County and is largely used for grazing.
- The Mountain Communities of Lebec, Frazier Park, Cuddy Valley, Lake of the Woods, and Pine Mountain Club are located northwest of the Project site in Kern County. Main access to these mountain communities is through I-5.
- The privately owned and operated National Cement Plant is northwest of the Project site (in Kern County, adjacent to the Kern County/Los Angeles County line). The cement plant is approximately one mile north of the Project site's northern boundary on property leased from the Tejon Ranch. Access to the cement plant is provided by National Cement Plant Road, which traverses the Project site and is generally located west of the California Aqueduct.
- The Oso Pumping Plant is owned and maintained by the DWR and is located in the northern portion of the Project site, along the West Branch of the Aqueduct. It can be accessed via 300<sup>th</sup> Street West and a road extending northwest to the Aqueduct.
- The East Branch of the California Aqueduct is immediately northeast of the Project site boundaries.
- The Alamo Power Plant, another component of the State Water Project (SWP), is located along the Aqueduct's East Branch immediately adjacent to the northeastern boundary of the site.
- North of the East Branch of the Aqueduct and the Alamo Power Plant is the Tehachapi East Afterbay, which is an operational storage and water reservoir component of the SWP.

### South

- Quail Lake, an unlined water storage facility owned and operated by the DWR, is located along the southwestern border of the Project site. The West Branch of the Aqueduct bisects the Project site in a general north-south direction and empties into Quail Lake.

- The Quail Lake Skypark Airport is a single strip, private airport located immediately southeast of Quail Lake and south of the Project site. This airport consists of a 3,000-foot runway.
- The High Desert Hunt Club, a private hunt club is partially located within the Project boundaries and largely located southeast and outside the Project site.
- There are a number of single-family residences south of the Project site along SR-138 and east of 300<sup>th</sup> Street West. Additionally, several residences are scattered on the hills south of the Project site along Ridge Route Road and Pine Canyon Road/County Road N2.
- The Angeles National Forest is located approximately 1.5 miles south of the Project site at the nearest point, east of I-5 and south of Pine Canyon Road/County Route N2.

### ***East***

- A number of residences are located along 300<sup>th</sup> Street West and east of the site north of SR-138 from 290<sup>th</sup> Street West to 280<sup>th</sup> Street West.
- Vacant land and agricultural land are also located east of the site.
- The residential community of Neenach is located approximately 2.6 miles to the east of the site (north of SR-138) and the Three Points community is located approximately 4.0 miles to the southeast (south of SR-138). Neenach and Three Points are both developed with light agricultural uses and single-family homes on large lots.
- The East Branch of the California Aqueduct runs through the agricultural lands east of the Project site.

### ***West***

- SCE's Bailey Electric substation is on the western portion of the site but is not part of the site.
- Undeveloped land in the Tehachapi Mountains borders the western perimeter of the site.
- The residential community of Gorman is located west of the site, adjacent to the I-5 and approximately four miles northwest of the I-5 and SR-138 junction. This community is developed with commercial uses that serve travelers on the I-5, some single-family homes, and light agricultural uses.
- I-5 runs north-south approximately one mile west of the western boundary of the Project site.
- The Hungry Valley State Vehicular Recreation Area (SVRA) in the Los Padres National Forest is located west of I-5 at the Gorman exit. This SVRA is an Off-Highway Vehicle (OHV) park that is owned and operated by the Off-Highway Motor Vehicle Recreation (OHMVR) Division of California State Parks. Recreation facilities in the SVRA are further discussed in Section 5.14, Parks and Recreation.

## 5.8.4 PROJECT DESIGN FEATURE

**PDF 8-1** The Centennial Project provides for the preservation of approximately 5,624 acres of on-site open space included within the Open Space designation (refer to Exhibit 4-11, Centennial Project – On-Site Open Space/Mitigation Area). The proposed on-site open space areas have been configured to:

- Preserve all SEA-designated land that is located within the Project site boundary;
- Avoid development on slopes greater than 25 percent that occur primarily in the western portion of the Project area; and
- Preserve and enhance oak woodlands, savannahs, and significant riparian areas.

## 5.8.5 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant land use impact if it would:

**Threshold 8-1** Physically divide an established community.

**Threshold 8-2** Be inconsistent with the applicable County plans for the subject property including, but not limited to, the General Plan, specific plans, local coastal plans, area plans, and community/neighborhood plans.

**Threshold 8-3** Be inconsistent with the County zoning ordinance as applicable to the subject property.

**Threshold 8-4** Conflict with Hillside Management criteria, Significant Ecological Areas conformance criteria, or other applicable land use criteria.

## 5.8.6 ENVIRONMENTAL IMPACTS

**Threshold 8-1** **Would the project physically divide an established community?**

The Centennial Project involves the development of residential uses, non-residential employment areas, retail uses, public facilities, recreational uses, and associated infrastructure on a site that is predominately undeveloped and used for cattle grazing and agriculture. Proposed land uses and development intensities are discussed in Section 4.0, Project Description, of this EIR. Development standards are provided in the *Centennial Specific Plan* (Appendix 4.0-A).

The Project site is not part of an established community. The site is approximately 35 miles north of the Santa Clarita Valley; approximately 50 miles south of the City of Bakersfield; approximately 36 miles northwest of the City of Lancaster and 43 miles northwest of the City of Palmdale. The community of Gorman is adjacent to the I-5, approximately four miles

northwest of the I-5/SR-138 junction. The community of Neenach is located 2.7 miles to the east. The community of Frazier Park is located approximately 12.5 miles to the northwest.

There is a residential area located immediately east of the site on 290<sup>th</sup> Street West and scattered residences are located along SR-138 and east of 300<sup>th</sup> Street West. As noted above, existing development within and surrounding the Project site is limited to scattered single-family residences south and east of the Project site, and a caretaker/employee residence on the site. However, these residences do not form an established community.

The existing residence on the site would be demolished and/or relocated when development occurs. This displacement would be voluntary and would not divide any established community.

Once developed, the Project would create residential villages and a new community that would be surrounded by areas of open space, agricultural land, and existing rural residential uses. No impact related to the division of established communities would occur.

The Project's potential impacts related to existing land uses, resources, and activities are discussed in other sections of this EIR, as follows:

- Cement Plant Operations – Section 5.3, Hazards and Fire Safety.
- Grazing Operations and Agricultural Activities – Section 5.5, Land Resources.
- Significant Ecological Areas – Section 5.7, Biological Resources.
- National Forests and Recreational Facilities – Section 5.14, Parks and Recreation.
- California Aqueduct and Related Facilities – Section 5.18, Water Resources.
- Dry Utility Relocations – Section 5.20, Dry Utilities.

Potential indirect impacts to adjacent residences, as associated with visual changes, air pollutant emissions, and increased traffic and noise, would not divide a community. These issues are further addressed in other sections of this EIR: Section 5.10, Traffic, Access, and Circulation; Section 5.11, Air Resources; Section 5.12, Noise; and Section 5.13, Visual Resources.

The proposed off-site water bank infrastructure are not contiguous to or in the vicinity of any established communities. The proposed utility infrastructure and roadway improvements would serve the Project and would not divide development on the Project site or existing land uses in the surrounding area. Therefore, no division of an established community would occur. There would be no impact.

***Impact Summary:*** There are no established communities in the Project area that would be divided with implementation of the Project. No impact would occur, and no mitigation is required.

**Threshold 8-2**      **Would the project be inconsistent with the applicable County plans for the subject property including, but not limited to, the**

**General Plan, specific plans, local coastal plans, area plans, and community/neighborhood plans?**

**Los Angeles County General Plan**

The Project is consistent with the five guiding principles of the Los Angeles County General Plan. Specifically, the Centennial Project uses “smart growth” strategies in the planning of residential and non-residential uses on the site that would include a variety of housing densities and types, with some located near commercial areas, places of employment, schools, parks, a library, and public facilities while at the same time providing a comprehensive roadway network, with amenities for walking and biking. Public facilities and utility lines and services would be located on site to “ensure community services and infrastructure are sufficient to accommodate growth”. As part of the Project, commercial and business park areas would be included to accommodate business investments and create employment opportunities for local residents and that would promote a “strong and diverse economy”. In addition, large expanses of open space (approximately 5,624 acres) would be provided at the western and southeastern sections of the site and in areas with sensitive biological resources to preserve the area’s “environmental resources”. Under the Specific Plan, reconfiguring an existing single-family home to accommodate a second dwelling unit is allowed only to the extent specified in a Tentative Tract Map, and only as allowed under applicable State law and local ordinances. . Without regard to whether a State density bonus is ever used on the Project site, the total number of dwelling units, inclusive of all product types, cannot exceed the number of dwelling units identified in the Project Description and considered in this EIR absent further CEQA review.

The Land Use Element of the County General Plan also promotes land use compatibility through complementary land uses that promote a balanced distribution of jobs, housing and services within the overall Project site. The Project implements this important General Plan concept by locating commercial areas, schools, and parks at the village cores to serve the demand for goods and services and meet the educational and recreational needs of the residents of the individual villages and balance the distribution of jobs, housing, and services within each village. Higher density housing would also be located near the village cores, with lower densities farther from the village cores, to provide a mix of housing types that will accommodate the needs and preferences of different households. In addition, the town center will accommodate mixed-use developments with high density residential uses and commercial areas that would serve the entire Centennial community and the surrounding areas. To promote the County’s health outcomes, a network of bikeways, trails and sidewalks would be provided throughout the Project site, along with scattered parks and recreational facilities. Allowable land uses include health clubs, health food stores, health service clinics, health retreats, and community gardens. Additionally, as discussed further in Section 5.5, Land Resources, the Project would accommodate a total of 50 acres of small-scale agriculture and agriculture-related uses, including, but not limited to community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, and commercial greenhouses. The Project would also allow preschools at the village cores and a medical center and a campus for a community college or other higher education facility in the Institutional/Civic and Business Park areas to meet the County’s early education and higher education policies.

The County General Plan addresses all unincorporated County areas and has broad goals and policies related to land use and planning. A review of the County General Plan shows that the Project site is located in Special Management Areas where safety hazards and/or environmental resources are present. The site is located within the Military Influence Area for Edwards Air Force Base where the floor elevation from the ground level is set at 200 feet. No conflict will occur since the maximum building height for the Project is 160 feet. The Fire Hazard Severity Zones Policy Map shows different areas of the site are subject to very high, high, and moderate fire hazards. The Safety Element also shows I-5 and SR-138 as disaster routes. No conflict with these issues would occur with the Project, as discussed in Section 5.3, Hazards and Fire Safety.

The Mobility Element identifies SR-138 as a proposed Expressway (controlled access highway with six to ten lanes). The Project would accommodate Caltrans' future widening and realignment of SR-138. This is addressed in Section 5.10, Traffic, Access and Circulation.

The Conservation and Natural Resources Element includes a Regional Habitat Linkages Map that identifies a wildlife movement corridor through the Project site that connects the Tehachapi Mountains and the Angeles National Forest. The Significant Ecological Areas and Coastal Resource Areas Policy Map also shows the San Andreas SEA on and near the western and southern edges of the site. Section 5.7, Biological Resources addresses wildlife corridors and Project consistency with the San Andreas SEA.

The Safety Element includes a Seismic and Geotechnical Hazard Zones Policy Map that shows the San Andreas Fault Zone along the northeastern edge of the Angeles National Forest, south and southwest of the site. Section, 5.1, Geotechnical, discusses the San Andreas Fault and seismic hazards on the site. The Flood Hazard Zones Policy Map shows the 100-year floodplain on Quail Lake and the East and West Branches of the California Aqueduct. This issue is addressed in Section 5.2, Hydrology and Flood.

The Economic Development Element states that the Antelope Valley has comparative advantages and unique opportunities for future economic growth and development, and the General Plan also identifies EOAs in the Antelope Valley that are planned for future growth and development. The Project would utilize this comparative advantage with the development of employment-generating uses on the site, consistent with the description of the Project site as part of the West EOA in the AVAP. Thus, the Project would not conflict with the Los Angeles County General Plan and no General Plan Amendment text or policy change is needed to allow the Project. Designated internal project site roadways would need to be added to Figure 7.3, Highway Policy Map, and this internal site roadway mapping would trigger the need for an amendment to this General Plan figure.

### ***Antelope Valley Area Plan***

The AVAP contains goals and policies that are specific to the issues in the Antelope Valley, and is a component of the County General Plan. The Project is consistent with applicable goals and policies of the AVAP. In addition to the goals and policies, a review of the AVAP shows three EOAs have been identified as areas where there are major opportunities for future growth and development. These EOAs have land use designations that would allow

for the development of a mix of residential, commercial, and light industrial uses but would preserve the rural character and ecological resources of the surrounding area.

The West EOA is located at the northwestern section of the Antelope Valley where future development is anticipated due to its location along the planned Northwest 138 Corridor Improvement Project, the I-5, and new commercial and housing developments in Kern County. This EOA covers the Project site and the Project would accommodate future development on the site, as planned in the West EOA in the AVAP.

The AVAP also calls for the development of a specific plan or similar planning activities in EOAs to ensure orderly and sustainable development and the provision of the required infrastructure and public utilities. The *Centennial Specific Plan* has been developed in compliance with this requirement. In compliance with applicable County requirements for Specific Plans and State law, the Centennial Specific Plan includes the location of the Project's internal circulation network of roadways and trails. Some of these internal roadways meet the criteria for being included in the AVAP Highway Plan (Map 3.1 of the AVAP, which includes major highways, secondary highways, limited secondary highways, parkways, and expressways). Amending Map 3.1 of the AVAP is being proposed to fill in the major roadways that are interior to the Project site, consistent with AVAP's requirement for a Specific Plan (inclusive of internal circulation roadways) for a new master planned community in this EOA. With the Map amendment, the Project remains consistent with the AVAP, and no text amendments to the AVAP are required.

The Land Use Policy map in the AVAP shows the land use designations, which would regulate permitted land uses and development densities/intensities. The Land Use Plan in the *Centennial Specific Plan* includes the same land uses as the designations for the site, with the boundaries of the different land uses generally aligning with the land use designations in the AVAP. No change in land use designation, additional growth, or reduction in the amount of open space is proposed by the Project.

The West EOA extends beyond the project site boundaries. While Centennial's infrastructure would not be sized to accommodate growth beyond that which is proposed for the Project, future nearby landowners could propose to connect to or build upon the Project's infrastructure to serve future development in the surrounding area. Any such future proposals would be subject to environmental analysis pursuant to CEQA, and must include the level of detail (e.g., residential and commercial size information, project footprint information, project water quantity and sources, etc.) required for a future project-level review process. Any such approvals of future development in the West EOA would also be a discretionary decision by the County. Since no such projects have been proposed, such details are not available and CEQA does not require speculation. In general, however, buildout of the approved AVAP has informed the cumulative impact analysis in this EIR and includes the additional incremental of development authorized within the West EOA but not included in the Project.

The EOAs also include areas that have the potential to develop as a future Rural Town Area, and are depicted on the AVAP's Rural Preservation Strategy map. Future Rural Town Areas are within EOAs that provide local employment and goods and services for the daily needs

of residents in the surrounding area. These town areas would accommodate local public facilities and commercial uses or a mix of commercial and residential uses served by a range of transportation options. The Project would include commercial and business park uses, public facilities, schools and parks, as well as residential uses, which is consistent with the future Rural Town Area identification of the site.

The Project would not conflict with the transportation system needed to serve the mobility needs of current and future residents and land uses, as discussed in the Mobility Element. The Project would provide an on-site circulation system and would accommodate future widening and realignment of SR-138, as it is developed as an Expressway by Caltrans. This is discussed further in Section 5.10, Traffic, Access and Circulation. As indicated above, the Project's internal circulation network includes internal roadways that meet the criteria for being included in the AVAP Highway Plan. Thus, an amendment to Map 3.1 of the AVAP is needed to show the major roadways that are interior to the Project site and that would serve the circulation needs of development that is consistent with the AVAP. Even with this Map Amendment, the Project remains consistent with the AVAP goals and policies and Land Use Policy Map, and no text amendments to the AVAP are proposed or required.

The Conservation and Open Space Element identifies the site to have Class 1 and Class 2 constraints. The preservation of natural resources is discussed in Section 5.7, Biological Resources. Protection from seismic and geologic hazards is addressed in Section 5.1, Geotechnical. Protection from flood hazards is addressed in Section 5.2, Hydrology and Flood.

The Public Safety, Services and Facilities Element addresses the provision of fire protection, law enforcement, libraries, schools, and parks in the Antelope Valley. The Project would provide on-site fire stations, a Sheriff's station, schools, parks and a library to serve residents of the site and surrounding area. Section 5.14, Parks and Recreation, Section 5.15, Education, Section 5.16, Fire and Law Enforcement Services, and Section 5.17, Other Public Services, discuss existing and proposed public services and facilities.

The Economic Development Element contains goals and policies that seek to promote sustainable economic development in the Antelope Valley, while preserving the rural character and environmental resources of the area. The Project is located in an EOA where business investments and employment centers would be located to spur economic growth and increase the jobs-housing ratio of the Antelope Valley. SCAG estimates the 2012 employment base of the North Los Angeles County Subregion at 181,089 jobs and its housing stock at 200,990 units (SCAG 2016c). This translates to a jobs-housing ratio of 0.90. As discussed in Section 5.9, Population Housing and Employment, the Project would have a jobs-housing ratio of 1.22, which would improve the overall jobs-housing balance in the subregion, consistent with the intent of the Economic Development Element of the AVAP.

Community-Specific Land Use Concepts in the AVAP do not apply to the Project site since the site is not located in an established community. A number of implementation programs are also discussed at the end of the AVAP. The Project would comply with applicable programs, such as the Significant Ecological Area program, Economic Opportunity Areas, Transfer of Development Rights Program, Scenic Drives Program, and Community Standards Districts.

In summary, the Project would implement the AVAP and would not conflict with it. An analysis of the Project’s consistency with the goals and policies of the AVAP is presented in Table 5.8-1 below.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<b>Chapter 2: Land Use Element</b>	
Goal LU 1: A land use pattern that maintains and enhances the rural character of the unincorporated Antelope Valley.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the <i>Antelope Valley Area Plan</i> (AVAP), as discussed above.
Policy LU 1.1: Direct the majority of the unincorporated Antelope Valley’s future growth to rural town center areas and identified economic opportunity areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP and would focus land use development and associated growth within the West Economic Opportunity Area (EOA) and future Rural Town Area as indicated on the Land Use Policy Map, where future development is planned and anticipated.
Policy LU 1.2: Limit the amount of potential development in rural preserve areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project does not propose development in designated rural preserve areas.
Policy LU 1.3: Maintain the majority of the unincorporated Antelope Valley as Rural Land, allowing for agriculture, equestrian and animal-keeping uses, and single-family homes on large lots.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP and would focus development within the West EOA, so as to retain the rural character in the rest of the Antelope Valley.
Policy LU 1.4: Ensure that there are appropriate lands for commercial and industrial services throughout the unincorporated Antelope Valley sufficient to serve the daily needs of rural residents and to provide local employment opportunities.	<b>Consistent.</b> The Project proposes commercial, business park, and institutional/civic land uses that will provide services to residents within the Project site and in the surrounding areas, consistent with the AVAP. Over 20,000 permanent jobs are expected to be created from Project employment uses.
Policy LU 1.5: Provide varied lands for residential uses sufficient to meet the needs of all segments of the population, and allow for agriculture, equestrian uses and animal-keeping uses in these areas where appropriate.	<b>Consistent.</b> The Project would provide residential land uses at varied densities to meet the needs of different segments of the population, consistent with the AVAP. The Project would also provide a network of trails for bicycling and hiking, including equestrian activities on the regional trail within the Project site.
Goal LU 2: A land use pattern that protects environmental resources.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP. The Project development boundary provides protection of environmental resources through the ongoing preservation of Significant Ecological Areas (SEAs), biological resource mitigation lands, and Tejon Ranch lands preserved under the Tejon Ranch Land Use and Conservation Agreement., and the Project’s land plan includes mixed uses and a range of densities at a neighborhood scale to promote pedestrian and bicycle use, and reduce automobile trips.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy LU 2.1: Limit the amount of potential development in Significant Ecological Areas, including Joshua Tree Woodlands, wildlife corridors, and other sensitive habitat areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> One of the Project Objectives is to avoid development within, and that would affect, established SEAs to minimize disturbance of high-value biological resources, including native grasslands, oak savannas, and oak woodlands, and preserve contiguous open space areas in order to keep its viability as wildlife habitat. The San Andreas SEA has been designated as Open Space in the Land Use Map for the Project, where development would not occur. The Project also preserves important regional wildlife corridors and the biological connectivity of regional open space lands, as discussed in Section 5.7, Biological Resources, of this EIR.</p>
<p>Policy LU 2.2: Limit the amount of potential development within Scenic Resource Areas, including water features, significant ridgelines, and Hillside Management Areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is not located in or near a designated Scenic Resource Area. The majority of the site has slopes less than 25% and the areas with the greatest slopes would be preserved as Open Space. Development within the Hillside Management Areas (HMAs) would be required to comply with hillside provisions within the Specific Plan, which have been designed to protect sensitive hillside conditions as discussed further in Section 3.3, Conceptual Grading Plan, and Appendix 1-B, Hillside Design Guidelines, in the Specific Plan.</p>
<p>Policy LU 2.3: Except within economic opportunity areas, limit the amount of potential development in Agricultural Resource Areas, including important farmlands designated by the State of California and historical farmland areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and future Rural Town Area as indicated on the AVAP Land Use Policy Map. While there are Agricultural Resource Areas at the eastern section of the site, the site is located within the West EOA, which would accommodate urban development in the Antelope Valley to preserve agricultural areas outside the EOAs.</p>
<p>Policy LU 2.4: Except within economic opportunity areas, limit the amount of potential development in Mineral Resource Areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and is outside Mineral Resource Areas.</p>
<p>Policy LU 2.5: Except within economic opportunity areas, limit the amount of potential development in riparian areas and groundwater recharge basins, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> Project development is located within the West EOA and would avoid or minimally impact riparian areas on the site by designating major drainage channels on the site as Open Space. Section 5.7, Biological Resources, discusses this issue in greater detail.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy LU 2.6: Except within economic opportunity areas, limit the amount of potential development near the National Forests and on private lands within the National Forests, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and outside the Angeles National Forest.</p>
<p>Goal LU 3: A land use pattern that minimizes threats from hazards.</p>	<p><b>Consistent.</b> The Project includes a Geologic Safety Zone that requires a 100-foot minimum setback in each direction from faults determined to be active to promote avoidance of fault-related hazards. Also, the proposed Floodplain Safety Zone would preclude habitable residential, commercial, school and institutional structures in the 100-year floodplain (Section 5.2, Hydrology and Water). In addition, the majority of areas with steep slopes south of State Route (SR) 138 and at the western portion of the site are designated as Open Space. Project Design Features (PDFs) and Mitigation Measures (MMs) have been provided for Valley Fever and wildfire hazards (Section 5.3, Hazards and Fire Safety).</p>
<p>Policy LU 3.1: Except within economic opportunity areas, prohibit new development on fault traces and limit the amount of development in Seismic Zones, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and the Project requires a 100-foot minimum setback in each direction from faults determined to be active, as part of the Geologic Safety Zone that is proposed on unnamed faults at the western section and on the San Andreas Fault Zone along the southwestern edge of the site (see Exhibit 5.1-2, Geologic Hazards). Section 5.1, Geotechnical, provides additional discussion of this issue.</p>
<p>Policy LU 3.2: Except within economic opportunity areas, limit the amount of potential development in Very High Fire Hazard Severity Zones, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and future tract maps are required to incorporate fuel modification setbacks in accordance with County standards and applicable Specific Plan requirements.</p>
<p>Policy LU 3.3: Except within economic opportunity areas, limit the amount of potential development in Flood Zones designated by the Federal Emergency Management Agency, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and includes a Floodplain Safety Zone that promotes public safety and protects water quality for development within areas subject to flooding (prior to development) to minimize flood hazards. The 100-year floodplain is shown in Exhibit 5.2-5, Receiving Channels of Concern and 100-Year Floodplain, and Section 5.2, Hydrology and Flood, discusses this issue in detail.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy LU 3.4: Except within economic opportunity areas, limit the amount of potential development on steep slopes identified as Hillside Management Areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA. The majority of the site has slopes less than 25% and the areas with the greatest slopes would be preserved as Open Space. Development within the Hillside Management Areas (HMAs) would be required to comply with hillside provisions within the Specific Plan, which have been designed to protect sensitive hillside conditions as discussed further in Section 3.3, Conceptual Grading Plan, and Appendix 1-B, Hillside Design Guidelines, in the Specific Plan.</p>
<p>Policy LU 3.5: Except within economic opportunity areas, limit the amount of potential development in landslide and liquefaction areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and the Project was designed to avoid both the landslide in the northwestern corner of the site and liquefaction hazards. The majority of proposed development areas are outside anticipated liquefiable zones; these liquefiable areas are proposed to remain as open space or to become greenways, detention/infiltration basins, and/or hydromodification facilities, with 5,624 acres designated as Open Space.</p>
<p>Policy LU 3.6: Except within economic opportunity areas, limit the amount of potential residential development in airport influence areas and near military lands, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and is not located within a designated airport influence area or near military lands.</p>
<p>Policy LU 3.7: All development projects located on parcels that are within an airport influence area shall be consistent with all policies of that airport's land use compatibility plan.</p>	<p><b>Consistent.</b> The Project is consistent with the AVAP. The Project site is located near the Quail Lake Skypark Airport. While this airport is not identified in the County's Airport Land Use Compatibility Plan, this is a private airport with a base of six aircraft and is not open to the general public; does not have a land use compatibility plan; and is not within a designated airport influence area, as discussed further in Section 5.3, Hazards and Fire Safety, of this EIR.</p>
<p>Goal LU 4: A land use pattern that promotes the efficient use of existing and/or planned infrastructure and public facilities.</p>	<p><b>Consistent.</b> The Project is a new development and incorporates several features to promote efficient use of infrastructure and public facilities. Table MV-1 of the Specific Plan outlines the planning and design metrics that are reflected in planned utility infrastructure and public facilities and services that would be provided to serve residents of the Project (Sections 3.10 and 3.11 of the Specific Plan). For example, the Project has an efficient use of land, and includes a balanced mix of uses that result in a jobs/housing balance that would reduce single-occupancy, automobile travel and overall vehicle miles traveled, as addressed in greater detail in</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	the Specific Plan and Section 5.10, Traffic, Access and Circulation, and Section 5.21, Climate Change, of the EIR. The Project also includes several sustainable design performance metrics, as described in the Mission and Vision and Appendix 2-A, Green Development Program, of the Specific Plan.
Policy LU 4.1: Direct the majority of the unincorporated Antelope Valley’s future growth to the economic opportunity areas and areas that are served by existing or planned infrastructure, public facilities, and public water systems, as indicated in the Land Use designations shown on the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP and public facilities and utility infrastructure systems would be provided to serve the Project.
Goal LU 5: A land use pattern that decreases greenhouse gas emissions.	<b>Consistent.</b> The Project includes a Green Development Program that requires the implementation of measures to reduce greenhouse gas emissions, including measures above and beyond regulatory requirements, and a land use pattern that is focused on promoting active transportation modes (e.g., walking and biking) with a network of trails and a village-based land plan to provide proximate schools, parks and neighborhood-serving commercial uses throughout the Centennial community. Also, greenhouse gas emissions are reduced by reducing single-occupancy automobile travel and vehicle miles traveled through efficient land use planning with a jobs/housing balance of 1.22, and with a comprehensive transportation plan, as described in greater detail in Section 5.21, Climate Change.
Policy LU 5.1: Ensure that development is consistent with the Sustainable Communities Strategy adopted in 2012, an element of the Regional Transportation Plan developed by the Southern California Association of Governments.	<b>Consistent.</b> One of the Project Objectives is to ensure consistency with the Southern California Association of Governments’ (SCAG’s) Sustainable Communities Strategy through development of an environmentally and economically sustainable master-planned community. The Project includes such features as a Green Development Program to reduce greenhouse gas (GHG) emissions and a Mobility Plan to further reduce GHG and promote wellness and other community goals with a robust mix of active transportation features.
Policy LU 5.2: Encourage the continued development of rural town centers that provide for the daily needs of surrounding residents, reducing the number of vehicle trips and providing local employment opportunities.	<b>Consistent.</b> The Project includes the development of nine villages that will each contain multiple land uses that enable residents to live closer to schools, shopping, neighborhood businesses and services, civic buildings, medical facilities, and employment centers. The Project includes multiple housing options, ranging from apartment homes close to the town center to single-family homes in lower-density areas. The

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	Project includes alternatives to automobile travel (e.g., bicycle network, trails and pedestrian system) and more efficient uses of land that would result in reduced single-occupancy automobile travel and vehicle miles traveled, as described in greater detail in Section 5.21, Climate Change.
Policy LU 5.3: Preserve open space areas to provide large contiguous carbon sequestering basins.	<b>Consistent.</b> The Project helps implement the Tejon Ranch Land Use and Conservation Agreement, and thereby preserves over 240,000 acres of contiguous open space areas (in perpetuity) both within the Project site and in the immediately adjacent Tejon Ranch and includes a plan for the ongoing maintenance of conserved open space areas, including mitigation areas, greenways, drainage corridors, and other natural resource features within the Project site. Approximately 5,624 acres of open space areas are located within the Project site.
Policy LU 5.4: Ensure that there is an appropriate balance of residential uses and employment opportunities within close proximity of each other.	<b>Consistent.</b> The Project includes the development of nine villages that will each contain multiple land uses that enable residents to live closer to schools, shopping, neighborhood businesses and services, civic buildings, medical facilities, and employment centers.
Goal LU 6: A land use pattern that makes the Antelope Valley a sustainable and resilient place to live.	<b>Consistent.</b> A key Project Objective is to implement the AVAP land use designation for the Project site and ensure consistency with SCAG’s Sustainable Communities Strategy, as described in greater detail in the Project Description and Section 5.21, Climate Change.
Policy LU 6.1: Periodically review changing conditions to ensure that land use policies are compatible with the Area Plan’s Rural Preservation Strategy, including economic opportunity areas.	<b>Not Applicable.</b> This is a County effort.
Policy LU 6.2: Ensure that the Area Plan is flexible in adapting to new issues and opportunities without compromising the rural character of the unincorporated Antelope Valley.	<b>Not Applicable.</b> This is a County effort.
<b>Chapter 3: Mobility Element</b>	
Goal M 1: Land use patterns that promote alternatives to automobile travel.	<b>Consistent.</b> The Project proposes a more efficient use of land through a jobs/housing balance of 1.22 that would reduce single-occupancy automobile travel and vehicle miles traveled as described further in Section 5.10, Traffic, Access and Circulation, of this EIR. The Project also includes the development of nine villages that will each contain multiple land uses that enable residents to live closer to schools, shopping neighborhood businesses and services, civic buildings, medical facilities, and employment centers,

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	encouraging less automobile travel. Non-automobile transportation modes are discussed as part of the Mobility Plan in the Specific Plan and Section 5.21, Climate Change.
Policy M 1.1: Direct the majority of the unincorporated Antelope Valley’s future growth to rural town centers and economic opportunity areas, to minimize travel time and reduce the number of vehicle trips, as indicated in the Land Use designations shown on the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project is located within the West EOA, and as such is consistent with the Land Use Policy Map of the AVAP.
Policy M 1.2: Encourage the continued development of rural town center areas that provide for the daily needs of local residents, reducing the number of vehicle trips and providing local employment opportunities	<b>Consistent.</b> The Project includes the development of nine villages that will each contain multiple land uses that enable residents to live closer to schools, shopping, neighborhood businesses and services, civic buildings, medical facilities, and employment centers.
Policy M 1.3: Encourage new parks, recreation areas, and public facilities to locate in rural town center areas, rural town areas, and economic opportunity areas.	<b>Consistent.</b> The Project is located within the West EOA, and is consistent with the Land Use Policy Map of the AVAP.
Policy M 1.4: Ensure that new developments have a balanced mix of residential uses and employment opportunities as well as park, recreation areas and public facilities within close proximity of each other.	<b>Consistent.</b> The Project includes the development of nine villages that will each contain multiple land uses that enable residents to live closer to schools, shopping, neighborhood businesses and services, civic buildings, medical facilities, and employment centers, as well as recreation areas.
Policy M 1.5: Promote alternatives to automobile travel in rural town center areas and rural town areas by linking these areas through pedestrian walkways, trails, and bicycle routes.	<b>Consistent.</b> The Project includes an extensive system of sidewalks, greenway trails, and community trails to serve as alternative means of transportation (e.g., bicycling and walking) on the Project site. The Project provides for achieving an 80% average, but no less than 50% of residential units to be located within ½ mile of a village core or the town center that includes commercial and mixed use developments; provides 100 percent of all dwelling units within a ¼ mile of a park no less than 10,000 square feet, a trailhead, a club house or other public amenity and parks 1 acre or more in size within a 5-minute walk of 80% of residential units; locates 90% of residential units within a 10-minute bike ride of retail and service uses; and locates 70% of residential units within a 15-minute bike ride of an employment area.
Goal M 2: Reduction of vehicle trips and emissions through effective management of travel demand, transportation systems, and parking.	<b>Consistent.</b> The Project includes a Mobility Plan that requires formation and ongoing operation of a Transportation Management Association (TMA) to implement ongoing transportation improvements and measures to reduce on-site single-occupancy automobile use by 30% in relation to standard Institute of Transportation Engineers (ITE) generation

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	rates for the overall Project, to reduce off-site peak hour commutes to and from the Project site in single-occupancy automobiles by 20%, and to manage parking demand and supply to further encourage non-automobile transit modes.
Policy M 2.1: Encourage the reduction of home-to-work trips through the promotion of home-based businesses, live-work units, and telecommuting.	<b>Consistent.</b> The Specific Plan allows live-work units and home-based businesses, and would provide high speed telecommunications infrastructure to allow telecommuting. The Project’s Transportation Management Association would also encourage these and other measures to reduce home-to-work trips on an ongoing basis.
Policy M 2.2: Encourage trip reduction through promotion of carpools, vanpools, shuttles, and public transit.	<b>Consistent.</b> The Project includes a Mobility Plan that requires formation and ongoing operation of a TMA to implement ongoing transportation improvements and measures to reduce on-site single-occupancy automobile use by 30% in relation to standard ITE-generation rates for the overall Project, and to reduce off-site peak hour commutes to and from the Project site in single-occupancy automobiles by 20%.
Policy M 2.3: In evaluating new development proposals, require trip reduction measures to relieve congestion and reduce air pollution from vehicle emissions.	<b>Consistent.</b> The Project includes a Mobility Plan and other GHG reduction measures to reduce air pollution from vehicle emissions, as discussed in the Mobility Plan and Section 5.21, Climate Change.
Policy M 2.4: Develop multi-modal transportation systems that offer alternatives to automobile travel by implementing the policies regarding regional transportation, local transit, bicycle routes, trails, and pedestrian access contained in this Mobility Element.	<b>Consistent.</b> The Project includes facilities for alternatives to automobile travel (e.g., public transit, bicycle network, and pedestrian system - with corresponding easements as described in the Specific Plan). The Project includes a Mobility Plan that requires formation and ongoing operation of a TMA to implement ongoing transportation improvements and measures to reduce on-site single-occupancy automobile use by 30% in relation to standard ITE-generation rates for the overall Project, and to reduce off-site peak hour commutes to and from the Project site in single-occupancy automobiles by 20%.
Policy M 2.5: As residential development occurs in communities, require transportation routes, including alternatives to automotive transit, to link to important local destination points such as shopping, services, employment, and recreation.	<b>Consistent.</b> The Project includes facilities for alternatives to automobile travel (e.g., public transit, bicycle network, and pedestrian system – with corresponding easements as described in the Specific Plan). As part of the Mobility Plan, the Project’s Circulation Plan includes major east-west roadways, to serve the Project’s east-west travel demand, to connect major on-site activity centers, and to lessen the Project’s traffic demand on SR-138. The Circulation Plan sets forth requirements for circulation design, roadway classifications; intersection controls; and traffic calming measures. Centennial traffic-calming design measures include narrower street widths to

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	<p>slow automotive traffic, roundabouts, speed tables, bulb-outs at intersections to restrict roadway width and narrow the pedestrians' crossing distance, raised intersections or crosswalks, chokers that narrow a roadway at mid-block, chicanes or lateral shifts that narrow street widths and also provide on-street parking or landscaping on alternate sides of the street, and textured pavement. Each component of the Mobility Plan incorporates Transportation Demand Management (TDM) features to reduce dependence on the automobile and a system of complete streets and multi-modal, non-motorized transportation facilities to provide for a more efficient use of transportation resources among Project occupants.</p> <p>The Project includes small- to medium-sized streets and blocks that allow for shorter walking distances to retail areas, parks, schools, and other destinations; pedestrian environments incorporated with public streets; parking behind buildings to encourage walking in retail areas along street frontages; and parks 1 acre or more in size within 0.25 mile of 80% of residences.</p> <p>Features of the Mobility Plan include commuter rideshare and transit; ride networking; car-share services; on-demand ridesharing; electric vehicle charging stations; preferential parking for carpools and vanpools; lunch shuttle service from business park to food establishments; bicycle connectivity through underpasses and overpasses connecting to the business park south of the SR-138; and transit routes and stops, including associated easements.</p>
<p>Policy M 2.6: Within rural town center areas, explore flexible parking regulations such as allowing residential and commercial development to meet parking requirements through a combination of on-site and off-site parking, where appropriate, or encouraging the provision of different types of parking spaces.</p>	<p><b>Consistent.</b> Although the Project does not contain a designated rural town center, the Project is designated as a future rural town area and establishes development standards that include parking requirements for each permitted land use designation. A number of Smart Parking metrics have been established that promotes shared and on-street parking facilities, as listed in Table MV-1 of the Specific Plan.</p>
<p>Goal M 3: An efficient network of major, secondary, and limited secondary highways to serve the Antelope Valley.</p>	<p><b>Consistent.</b> The amendment of the AVAP Highway Plan to show major roadways internal to the site would establish the highway system that would serve the Project and the surrounding area. The Project also includes secondary roads, and a network of localized roadways, as described further in Section 3.2 and Appendix 2-C, Mobility Plan, in the Specific Plan and in Section 5,10, Traffic, Access and Circulation, of this EIR. Roadway widths have been designed to be "right-</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	sized” taking into account Project features that reduce vehicular volumes below standardized design assumptions used to establish default roadway widths, as described further in the Specific Plan.
Policy M 3.1: Implement the adopted Highway Plan for the Antelope Valley, in cooperation with the cities of Lancaster and Palmdale. Ensure adequate funding on an ongoing basis through financing programs, such as grants, congestion pricing, bonding, fair share cost assignments, etc.	<b>Consistent.</b> The Project has and would contribute its fair share for improvements to the regional transportation system, as discussed in Section 5.10, Traffic, Access and Circulation. Also, the amendment of the Highway Plan to show major roadways internal to the site would establish the highway system that would serve the Project and the surrounding area.
Policy M 3.2: In rural areas, require rural highway standards that minimize the width of paving and placement of curbs, gutters, sidewalks, street lighting, and traffic signals, as adopted by the Department of Public Works.	<b>Consistent.</b> New roads will be “right-sized” and constructed in accordance with the standards in the <i>Centennial Specific Plan</i> , as adopted by the County and which incorporates rural features as well as the Project’s reduced automobile use metrics into its construction standards.
Policy M 3.3: Implement highway improvements only when necessitated by increasing traffic or new development or for safety reasons.	<b>Consistent.</b> New major highways, secondary highways, limited secondary highways, parkways, and expressways will be constructed as part of the Project, in accordance with the standards in the <i>Centennial Specific Plan</i> . The Project would also comply with the Centennial Transportation Improvement Program (CTIP) agreement with the County and Caltrans for roadway, freeway and highway improvements needed to serve the Project, as discussed in Section 5.10, Traffic, Access and Circulation.
Policy M 3.4: Maintain existing highways to ensure safety, and require adequate street and house signage for emergency response vehicles.	<b>Consistent.</b> Development on the Project site would comply with all applicable County of Los Angeles requirements for the condition of roads and signage for emergency response vehicles, including Fire Department code and ordinance requirements, to provide emergency access for the Sheriff’s and Fire Departments, and ambulance services, as discussed further in Section 5.16, Fire and Law Enforcement Services on this EIR. Highway improvements are addressed Section 5.10, Traffic, Access and Circulation.
Policy M 3.5: As future land use changes occur, periodically review traffic counts and traffic projections and revise the Highway Plan accordingly.	<b>Consistent.</b> The amendment of the AVAP Highway Plan to show major roadways internal to the site would establish the highway system that would serve the Project and the surrounding area
Policy M 3.6: Engage local communities and agencies in the planning and implementation of transportation improvements.	<b>Not Applicable.</b> This is a County effort.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Goal M 4: A network of local streets that support the rural character of the unincorporated Antelope Valley without compromising public safety.</p>	<p><b>Consistent.</b> The Project’s Mobility Plan proposes a multi-modal transportation system that will include a roadway system, transit routes, bikeways, and greenway trails and is designed to provide safe and efficient mobility throughout the community. Narrower lanes and street widths, bulb-outs, chokers, and chicanes will be provided as traffic calming measures, subject to approval by the County. Project street lighting is also required to comply with the rural street lighting standards, as described in Section 5.13, Visual Resources.</p>
<p>Policy M 4.1: Require rural local street standards that minimize the width of paving and placement of curbs, gutters, sidewalks, street lighting, and traffic signals, as adopted by the Department of Public Works.</p>	<p><b>Consistent.</b> New roads will be constructed in accordance with the standards in the <i>Centennial Specific Plan</i>, as adopted by the County and which incorporates rural features into its construction standards.</p>
<p>Policy M 4.2: Maintain existing local streets to ensure safety, and require adequate signage for emergency response vehicles.</p>	<p><b>Consistent.</b> Development on the Project site would comply with all applicable County of Los Angeles Fire Department code and ordinance requirements, including visible addresses. Narrower lanes and street widths, bulb-outs, chokers, and chicanes will be provided as traffic calming measures, subject to approval by the County.</p>
<p>Policy M 4.3: Encourage ongoing maintenance of private local streets to ensure public safety.</p>	<p><b>Consistent.</b> Ongoing maintenance of private local streets, drives and lanes will be provided by the homeowner’s association or other management entity.</p>
<p>Goal M 5: Long-haul truck traffic is separated from local traffic, reducing the impacts of truck traffic on local streets and residential areas.</p>	<p><b>Consistent.</b> The Project includes a Mobility Plan that provides for safe and efficient internal and external vehicular traffic flow that minimizes interactions between local traffic and truck traffic from the National Cement Plant and SR-138 by realigning National Cement Plant Road from its intersection with SR-138 to the western side of Quail Lake and tying into Gorman Ranch Road.</p>
<p>Policy M 5.1: Support development of the High Desert Corridor and the Northwest 138 Corridor Improvement Project, to provide a route for truck traffic between Interstate 5, State Route 14, and Interstate 15.</p>	<p><b>Not Applicable.</b> Development of the High Desert Corridor or the Northwest 138 Corridor Improvement Project is outside the scope of the Project. However, the Project would accommodate the realignment and widening of SR-138, as discussed in Section 5.10, Traffic, Access and Circulation.</p>
<p>Policy M 5.2: Direct truck traffic to designated truck routes and prohibit truck traffic on designated scenic routes, to the greatest extent feasible.</p>	<p><b>Consistent.</b> Truck traffic to and from the site during construction and operational site activities would utilize designated truck routes in accordance with existing County regulations. There are no scenic highways or scenic routes near the site. Truck use of roads identified as Scenic Drives in the AVAP would also be in accordance with existing regulations, including the County’s Transportation Permit.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy M 5.3: Require that designated truck routes are designed and paved to accommodate truck traffic, preventing excessive pavement deterioration from truck use	<b>Consistent.</b> While there are no designated truck routes on the site, any future truck routes would be designed and constructed in accordance with County standards.
Policy M 5.4: Add rest stops along designated truck routes to provide stopping locations away from residential uses.	<b>Not Applicable.</b> This is a County effort.
Policy M 5.5: Develop appropriate regulations for truck parking on local streets to avoid impacts to residential areas.	<b>Consistent.</b> The <i>Centennial Specific Plan</i> establishes development standards that include parking requirements for each permitted land use designation. Street parking would be regulated by the County Code.
Goal M 6: A range of transportation options to connect the Antelope Valley to other regions.	<b>Consistent.</b> Through the Transportation Management Association, the Project will facilitate the use of transit and other alternatives to single-occupancy automobile trips off site, and is required to reduce single-occupancy automobile commute trips as set forth in the Mobility Plan, as discussed further in Section 3.2 and Appendix 2-C in the Specific Plan.
Policy M 6.1: Support the development of Palmdale Regional Airport and encourage a range of commercial air travel options.	<b>Not Applicable.</b> This is a County effort.
Policy M 6.2: Support the development of William J. Fox Airfield as a facility for general aviation, air cargo operations, and commuter air travel.	<b>Not Applicable.</b> This is a County effort.
Policy M 6.3: Support the development of the High Desert Corridor and the Northwest 138 Corridor Improvement Project between Interstate 5, State Route 14, and Interstate 15, and encourage the participation of private enterprise and capital.	<b>Not Applicable.</b> Development of the High Desert Corridor or the Northwest 138 Corridor Improvement Project is outside the scope of the Project. However, the Project would accommodate the realignment and widening of SR-138, as discussed in Section 5.10, Traffic, Access and Circulation.
Policy M 6.4: Support increases in Metrolink commuter rail service, and support the expansion of commuter rail service on underutilized rail lines where appropriate.	<b>Not Applicable.</b> This is a County effort.
Policy M 6.5: Support the development of the California High Speed Rail System, with a station in Palmdale to provide links to Northern California and other portions of Southern California, and encourage the participation of private enterprise and capital.	<b>Not Applicable.</b> This is a County effort.
Policy M 6.6: Support the development of a high-speed rail system linking Palmdale to Victorville and Las Vegas, and encourage the participation of private enterprise and capital.	<b>Not Applicable.</b> This is a County effort.
Policy M 6.7: Establish a regional transportation hub in Palmdale with feeder transit service to the rural areas of the unincorporated Antelope Valley.	<b>Not Applicable.</b> This is a County effort.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

<b>Goal/Policy</b>	<b>Project Consistency</b>
Policy M 6.8: In planning for all regional transportation systems, consider and mitigate potential impacts to existing communities, and minimize land use conflicts.	<b>Consistent.</b> The Project would accommodate the realignment and widening of SR-138, as discussed in Section 5.10, Traffic, Access and Circulation.
Policy M 6.9: Engage regional agencies, such as Caltrans, SCAG, Metro, and the California High Speed Rail Authority in the implementation of an effective and efficient integrated multi-modal regional transportation network. Ensure adequate funding on an ongoing basis through financing programs, such as grants, congestion pricing, bonding, fair share cost assignments, etc.	<b>Not Applicable.</b> This is a County effort.
Goal M 7: Bus service is maintained and enhanced throughout the Antelope Valley.	<b>Consistent.</b> While the Project would not include bus service throughout the Antelope Valley, the Project’s Mobility Plan includes commuter rideshare and transit; ride networking; car-share services; on-demand ridesharing; electric vehicle charging stations; preferential parking for carpools and vanpools; lunch shuttle service from business park to food establishments; bicycle connectivity through underpasses and overpasses connecting to the business park south of the SR-138. Through the Transportation Management Association, a partnering arrangement will be established with the Antelope Valley Transit Authority to provide bus service to the Project site.
Policy M 7.1: Maintain and increase funding to the Antelope Valley Transit Authority for bus service.	<b>Not Applicable.</b> This is a County effort.
Policy M 7.2: Support increases in bus service to heavily traveled areas and public facilities, such as parks and libraries.	<b>Consistent.</b> While the Project would not include bus service throughout the Antelope Valley, the Project’s Mobility Plan includes higher density development areas that will facilitate future bus service on the Project site, as well as other alternative transportation modes, such as commuter rideshare and transit; ride networking; car-share services; on-demand ridesharing; electric vehicle charging stations; preferential parking for carpools and vanpools; lunch shuttle service from business park to food establishments; bicycle connectivity through underpasses and overpasses connecting to the business park south of the SR-138. Through the Transportation Management Association, a partnering arrangement will be established with the Antelope Valley Transit Authority to provide bus service to the Project site.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy M 7.3: Support increases in bus service to rural communities, linking them to a regional transportation hub in Palmdale and shopping and employment centers in Lancaster and Palmdale.</p>	<p><b>Consistent.</b> While the Project would not include bus service throughout the Antelope Valley, the Project’s Mobility Plan includes commuter rideshare and transit; ride networking; car-share services; on-demand ridesharing; electric vehicle charging stations; preferential parking for carpools and vanpools; lunch shuttle service from business park to food establishments; bicycle connectivity through underpasses and overpasses connecting to the business park south of the SR-138. Through the Transportation Management Association, a partnering arrangement will be established with the Antelope Valley Transit Authority to provide bus service to the Project site.</p>
<p>Policy M 7.4: Improve access for all people, including seniors, youth, and the disabled, by maintaining off-peak service and equipping transit services for wheelchairs and bicycles.</p>	<p><b>Consistent.</b> The Project, through the Specific Plan and the TMA, would provide convenient access to public bus transportation, carpooling, park and ride, special charter operations, on-demand car services, and similar types of activities related to local or off-site transit and transportation. Off-peak service hours and equipping transit services for wheelchairs and bicycles would be the responsibility of the transit operator and not the Developer/Applicant.</p>
<p>Policy M 7.5: Encourage the use of advanced technologies in the planning and operation of the transit system.</p>	<p><b>Consistent.</b> The Project will contribute fair-share funds to implement operational improvements (e.g., restriping and/or Intelligent Transportation Systems) to increase efficiency based on the projected traffic volumes, as discussed further in Section 5.10, Traffic, Access and Circulation of this EIR. The TMA will facilitate innovative transportation services such as on-demand car service and car-sharing.</p>
<p>Goal M 8: Alternative transit options in areas not reached by bus service.</p>	<p><b>Consistent.</b> The Project’s Mobility Plan includes Mobility Performance Standards, a Circulation Plan, programs for Complete Streets, Non-Motorized Transportation, Transit, and TDM. The Mobility Plan includes a comprehensive system of roadways and would accommodate a public transit system and other forms of transportation to promote alternatives to the use of the automobile through a coordinated network of public roadways, sidewalks, bikeways, and pedestrian trails.</p>
<p>Policy M 8.1: Support the expansion of dial-a-ride services to rural communities, linking them to a regional transportation hub in Palmdale and shopping and employment centers in Lancaster and Palmdale.</p>	<p><b>Not Applicable.</b> This is a County effort. The responsibility for the expansion or linking of dial-a-ride services to Lancaster and Palmdale is outside the scope of individual projects.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy M 8.2: Evaluate the feasibility of alternative transit options, such as community shuttle services and privately operated transit, to increase accessibility.	<b>Consistent.</b> The Project would develop a local backbone bus route along the major north/south collectors that would be provided connecting from SR-138 to the north end of the Project, which would be supplemented by feeder lines that loop through the Project (local transit routes). As with other unincorporated areas of Los Angeles County, funding for the local transit system would come from a combination of Proposition A funds and property taxes. The Transportation Management Association would also partner with the Antelope Valley Transit Agency and other stakeholders in providing cost-effective transportation options for the Project.
Goal M 9: A unified and well-maintained bicycle transportation system throughout the Antelope Valley with safe and convenient routes for commuting, recreation, and daily travel.	<b>Consistent.</b> The Project would include a system of Class I-IV bike lanes, community trails, and greenway trails that link residential, school, shopping, and employment areas.
Policy M 9.1: Implement the adopted Bikeway Plan for the Antelope Valley in cooperation with the cities of Lancaster and Palmdale. Ensure adequate funding on an ongoing basis	<b>Not Applicable.</b> While this is a County effort, the Project supports the Bikeway Plan by providing on-site links to regional trails.
Policy M 9.2: Along streets and highways in rural areas, add safe bicycle routes that link to public facilities, a regional transportation hub in Palmdale, and shopping and employment centers in Lancaster and Palmdale.	<b>Consistent.</b> The Project would include a variety of Class I-IV bike lanes, community trails, and greenway trails that link residential, school, shopping, employment areas, and transit centers within the Project.
Policy M 9.3: Ensure that bikeways and bicycle routes connect communities and offer alternative travel modes within communities.	<b>Consistent.</b> The Project would include Class I-IV bike lanes, community trails, and greenway trails that link residential, school, shopping, employment areas, and transit centers within the Project.
Policy M 9.4: Encourage provision of bicycle racks and other equipment and facilities to support the use of bicycles as an alternative means of travel.	<b>Consistent.</b> The Project would include bikeways, as well as other facilities, to support bicycle use, including bicycle facilities throughout the Project site, bicycle parking facilities with lockers and racks and showers for bicycling employee use; and bicycle connectivity through underpasses and overpasses connecting to the business park south of the SR-138.
Goal M 10: A unified and well-maintained multi-use (equestrian, hiking, and mountain bicycling) trail system that links destinations such as rural town centers and recreation areas throughout the Antelope Valley.	<b>Consistent.</b> The Project would include Class I-IV bike lanes, community trails, and greenway trails that link residential, school, shopping, and employment areas and that connect to the regional trail system (e.g., proposed alignment of the Pacific Crest Trail) while also accommodating equestrians.
Policy M 10.1: Implement the adopted Trails Plan for the Antelope Valley in cooperation with the cities of Lancaster and Palmdale. Ensure adequate funding on an ongoing basis.	<b>Not Applicable.</b> This is a County effort. While responsibility for the implementation of the Trails Plan for the Antelope Valley is outside the scope of individual projects, the Project supports the Trails Plan by providing on-site links to regional trails.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy M 10.2: Connect new development to existing population centers with trails, requiring trail dedication and construction through the development review and permitting process.	<b>Consistent.</b> One of the Project Objectives is to allow for recreational trail connections from the Project site to the Pacific Crest Trail to promote regional connectivity. The Project's trails will connect to the realigned Pacific Crest Trail and accommodate the Pacific Crest Trail through the site.
Policy M 10.3: Maximize fair and reasonable opportunities to secure additional trail routes (dedicated multi-use trail easements) from willing property owners.	<b>Consistent.</b> The Project includes a network of trails for bicycling and hiking throughout the site, with access to regional trails and that provide equestrian activities on the regional trail.
Policy M 10.4: Ensure trail access by establishing trailheads with adequate parking and access to public transit, where appropriate and feasible.	<b>Consistent.</b> The <i>Centennial Specific Plan</i> establishes development standards that include parking requirements for each permitted land use designation, with parking requirements for trailheads to be provided in accordance with County regulations, and the Mobility Plan requires ongoing coordination and facilitation of multi-modal transportation options.
Policy M 10.5: Locate and design trail routes to minimize impacts to sensitive environmental resources and ecosystems.	<b>Consistent.</b> Trails will be located along roads and in greenways and have been designed to minimize impacts to sensitive environmental resources and ecosystems. In addition to signs posted along trails cautioning against disturbance, trails will be designed to discourage people and pets entering any sensitive drainages.
Policy M 10.6: Where trail connections are not fully implemented, collaboratively work to establish safe interim connections.	<b>Consistent.</b> The Project incorporates a County regional hiking trail that would connect with the proposed realignment of the Pacific Crest Trail along 300th Street West.
Policy M 10.7: Ensure that existing trails and trailheads are properly maintained by the relevant agencies.	<b>Consistent.</b> On-site trails would be maintained by the Homeowner's Association, Landscape and Lighting Maintenance District (LLMD), or other similar entity. However, the proposed regional trail would be part of the County system under Department of Parks and Recreation and as such, maintained by the County.
Policy M 10.8: Solicit community input to ensure that trails are compatible with local needs and character.	<b>Consistent.</b> Input from various organizations and agencies was solicited during the planning phase of the Project.
Goal M 11: A continuous, integrated system of safe and attractive pedestrian routes linking residents to rural town center areas, schools, services, transit, parks, and open space areas.	<b>Consistent.</b> The Project locates school sites at central locations at various villages to reduce the need for busing and driving, with connecting trails and bikeways to encourage walking to schools. The Project design includes villages that link residents within walking distance to neighborhood schools, parks, and open space areas. Transit options are available throughout the Project site as administered by the Transportation Management Association.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy M 11.1: Improve existing pedestrian routes and create new pedestrian routes, where appropriate and feasible. If paving is deemed necessary, require permeable paving consistent with rural community character instead of concrete sidewalks.</p>	<p><b>Consistent.</b> New sidewalks, greenway trails, Class I–IV bike lanes, and community trails would be provided as part of the Project. Paving may include poly-pavement, decomposed granite, soilcrete, asphalt, concrete, or other suitable surface, subject to County review and approval.</p>
<p>Policy M 11.2: Within rural town center areas, require that highways and streets provide pleasant pedestrian environments and implement traffic calming methods to increase public safety for pedestrians, bicyclists, and equestrian riders.</p>	<p><b>Consistent.</b> The Project includes facilities for alternatives to automobile travel (e.g., public transit, bicycle network, and pedestrian system). The Circulation Plan sets forth requirements for roadway classifications, intersection controls, and traffic calming measures. The Project includes small- to medium-sized streets and blocks that allow for shorter walking distances to retail, parks, schools, and other destinations; pedestrian environments incorporated with public streets; parking behind buildings to encourage walking in retail areas along street frontages; and parks 1 acre or more in size within 0.25 mile of 80% of residences. Features of the Mobility Plan include bicycle connectivity through underpasses and overpasses connecting to the business park south of the SR-138. Equestrian trails, including safe passage across SR-138, are also provided.</p>
<p>Policy M 11.3: Within rural town center areas, promote pedestrian-oriented scale and design features, including public plazas, directional signage, and community bulletin boards.</p>	<p><b>Consistent.</b> The Project will provide pedestrian-oriented scale and design features through individual villages, each with a village core, and a town center for the Project. The village cores and town center have a Mixed Use (MU) overlay to allow for the development of a combination of commercial, office and residential uses in either vertically or horizontally (uses side by side) integrated projects. The MU overlay will create a live/work environment; add diversity and walkability to the town center; and reduce reliance on the automobile. The MU areas may include a "main street" atmosphere with on-street parking, wider sidewalks, safe and convenient pedestrian and vehicular access into and around the area, quality streetscape features, attractive storefronts, integrated sign programs, public plazas, courtyards, and architecture that creates a strong indoor/outdoor relationship.</p>
<p>Policy M 11.4: Within rural town center areas, encourage parking to be located behind or beside structures, with primary building entries facing the street. Encourage also the provision of direct and clearly delineated pedestrian walkways from transit stops and parking areas to building entries.</p>	<p><b>Consistent.</b> The <i>Centennial Specific Plan</i> includes requirements related to the amount and location of on-site parking, including front parking. Parking is required to be rear or alley loaded in the town center and village cores. The configuration of villages and the system of sidewalks, Class I–IV bike lanes, greenway trails, community trails will encourage walking in commercial areas along street frontages.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy M 11.5: Implement traffic calming methods in areas with high pedestrian usage, such as school zones.	<b>Consistent.</b> The <i>Centennial Specific Plan</i> includes standards for the use of various traffic calming methods, as described further in the Specific Plan and Mobility Plan.
<b>Chapter 4: Conservation and Open Space Element</b>	
Water Resources Goal COS 1: Growth and development are guided by water supply constraints.	<b>Consistent.</b> The Project includes an integrated water resources management approach to optimize the use of currently available water resources and those generated by the Project's operations, so as to minimize its impact on potable and non-potable water resources, as described in greater detail in Section 4.0, Project Description. For example, the Project includes two wastewater reclamation facilities (WRFs) for the tertiary treatment of all wastewater generated by Project uses. This recycled water will be delivered throughout the Project site for non-potable uses (e.g., irrigation), thereby reducing the Project's demand for imported water and groundwater resources. The Project will bank imported water supplies and include flood control/drainage facilities to increase groundwater recharge.
Policy COS 1.1: Require that all new development proposals demonstrate a sufficient and sustainable water supply prior to approval.	<b>Consistent.</b> The Project includes an integrated water resources management approach to optimize the use of currently available water resources and those generated by the Project's operations, so as to minimize its impact on potable and non-potable water resources, as described in greater detail in Section 5.18, Water Resources.
Policy COS 1.2: Limit the amount of potential development in areas that are not or not expected to be served by existing and/or planned public water infrastructure through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project will be served by identified water supplies and proposed public infrastructure, as described in greater detail in Section 5.18, Water Resources.
Policy COS 1.3: Limit the amount of potential development in groundwater recharge areas through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP, and includes an on- and off-site water bank to ensure efficient management of groundwater recharge. Groundwater recharge is also facilitated by preservation of open space lands within Tejon Ranch to the north and east of the Project site.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 1.4: Promote the use of recycled water, where available, for agricultural and industrial uses and support efforts to expand recycled water infrastructure.	<b>Consistent.</b> The Project's Green Development Program includes measures for reduced potable water consumption in part through recycled water use for landscape irrigation of public areas, including industrial uses in the Business Park, as described in greater detail in Section 5.18, Water Resources.
Goal COS 2: Effective conservation measures provide an adequate supply of clean water to meet the present and future needs of humans and natural ecosystems.	<b>Consistent.</b> One of the Project's Objectives is to provide a reliable water supply through use of an integrated water resources management approach that incorporates water conservation measures, among other measures, as described in greater detail in Section 5.18, Water Resources.
Policy COS 2.1: Require new landscaping to comply with applicable water efficiency requirements in the County Code.	<b>Consistent.</b> The Project's Green Development Program requires reduced potable water consumption through the use of drought-tolerant or native plants in greenways, transition areas, and rights-of-way; intelligent irrigation devices; and recycled water use primarily for landscape irrigation in residential common areas.
Policy COS 2.2: Require low-flow plumbing fixtures in all new developments.	<b>Consistent.</b> The Project's Green Development Program includes water conservation measures, such as the use of low-flow showerheads, faucets and toilets.
Policy COS 2.3: Require onsite stormwater infiltration in all new developments through the use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.	<b>Consistent.</b> The Project's integrated water resources management approach includes low impact development (LID) drainage concepts to infiltrate storm water on site, as described in greater detail in Section 5.2, Hydrology and Flood.
Policy COS 2.4: Discourage water intensive recreational uses, such as golf courses, unless recycled water is used to sustain these uses.	<b>Consistent.</b> The Project includes a recycled water system to meet the water demand for non-potable uses (e.g., irrigation) and reduce the need for potable water, as described in greater detail in Section 5.18, Water Resources.
Policy COS 2.5: Discourage the use of potable water for washing outdoor surfaces.	<b>Consistent.</b> The Project's Green Development Program includes a variety of water conservation measures, as described in greater detail in Section 5.18, Water Resources.
Policy COS 2.6: Support experiments in alternate forms of water provision and re-use, such as "air to water technology" and gray water systems.	<b>Consistent.</b> The Project would collect, treat, and recycle wastewater and grey water, as described further in Section 5.18, Water Resources.
Policy COS 2.7: Limit use of groundwater sources to their safe yield limits.	<b>Consistent.</b> The Project would utilize a mix of groundwater, imported water, and recycled water with use of an on-site water bank. Groundwater depths would also be monitored, and groundwater extraction quantities are allowed only to the extent permitted in the Antelope Valley Adjudication

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	Settlement Agreement (including ongoing Water Master management of extraction quantities to protect groundwater aquifer consistent with Agreement), as discussed further in Section 5.18, Water Resources.
Policy COS 2.8: Coordinate with federal, state, regional and local agencies to develop and implement new technologies in water management.	<b>Consistent.</b> During Project development, multiple agencies were consulted to develop and implement technologies in water management, which include for example recycled water treatment systems, automated irrigation systems, and efficient appliances, as described further in Section 5.18, Water Resources.
Goal COS 3: A clean water supply untainted by natural and man-made pollutants and contaminants.	<b>Consistent.</b> The Project would protect water quality through the implementation of PDFs and MMs, as discussed in Section 5.4, Water Quality.
Policy COS 3.1: Discourage the use of chemical fertilizers, herbicides and pesticides in landscaping to reduce water pollution.	<b>Consistent.</b> The Project would implement a Landscape Management Plan for common area landscaping that includes Integrated Pest Management (IPM), which focuses on long-term prevention or suppression of pest problems (i.e., insects and diseases) through a combination of techniques including the use of pest-resistant plants; biological controls; cultural practices; habitat modification; and the judicious use of pesticides according to treatment thresholds, when monitoring indicates pesticides are needed because pest populations exceed established thresholds, as addressed in Section 5.4, Water Quality.
Policy COS 3.2: Restrict the use of septic systems in areas adjacent to aqueducts and waterways to prevent wastewater intrusion into the water supply.	<b>Consistent.</b> The Project includes construction of a wastewater conveyance and reclamation system designed to accommodate all wastewater generated by development on the Project site, as well as a recycled water system. Septic systems will not be used to serve the Project.
Policy COS 3.3: Require a public or private sewerage system for land use densities that would threaten nitrate pollution of groundwater if unsewered, or when otherwise required by County regulations.	<b>Consistent.</b> The Project includes construction of a public sewerage system.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 3.4: Support preservation, restoration and strategic acquisition of open space to preserve natural streams, drainage channels, wetlands, and rivers, which are necessary for the healthy functioning of ecosystems.	<b>Consistent.</b> The Project includes a Green Development Program and a Drainage Plan that would provide a combination of infiltration basins, bioretention areas, swales, and LID techniques to mimic undeveloped storm water runoff rates and volumes and prevent water quality and hydromodification impacts to natural drainage systems. These systems would provide a storm water management system that is highly sustainable because of its use of natural systems to control runoff rates and promote groundwater recharge. Additionally, the Project includes the preservation of open space areas including streams, drainages, and watersheds within Tejon Ranch.
Policy COS 3.5: Protect underground water supplies by enforcing controls on sources of pollutants.	<b>Consistent.</b> The Project would be designed and developed to achieve benchmark water quality objectives and criteria regarding underground water supplies in accordance with Sections 401 and 404 of the Clean Water Act, and with storm water management programs to protect surface and ground waters, as described further in Section 5.4, Water Quality.
Policy COS 3.6: Support and encourage water banking facilities throughout the Antelope Valley, including within Significant Ecological Areas.	<b>Consistent.</b> An on-site water bank/infiltration basin area is proposed as part of the Project.
Biological Resources Goal COS 4: Sensitive habitats and species are protected to promote biodiversity.	<b>Consistent.</b> The Project will protect sensitive habitats and species through the designation of areas with sensitive habitats and species as Open Space. Authorized Open Space uses are described further in the Specific Plan, and measures to protect biological resources in Open Space areas are included in Section 5.7, Biological Resources.
Policy COS 4.1: Direct the majority of the unincorporated Antelope Valley's future growth to rural town centers and economic opportunity areas, minimizing the potential for habitat loss and negative impacts in Significant Ecological Areas.	<b>Consistent.</b> The Project will be located in a Future Town Center and the West EOA. No Project development is proposed to occur within an SEA.
Policy COS 4.2: Limit the amount of potential development in Significant Ecological Areas including the Joshua Tree Woodlands, wildlife corridors, and other sensitive habitat areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP, and specifically avoids development in SEAs and Joshua Tree Woodlands. As described in Section 5.7, Biological Resources, the Project protects open space that provides for wildlife corridors and other sensitive habitat areas, including SEAs.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy COS 4.3: Require new development in Significant Ecological Areas to comply with applicable Zoning Code requirements, ensuring that development occurs on the most environmentally suitable portions of the land.</p>	<p><b>Consistent.</b> The Project would preserve areas within the San Andreas SEA as Open Space.</p>
<p>Policy COS 4.4: Require new development in Significant Ecological Areas, to consider the following in design of the project, to the greatest extent feasible:</p> <ul style="list-style-type: none"> <li>• Preservation of biologically valuable habitats, species, wildlife corridors and linkages;</li> <li>• Protection of sensitive resources on the site within open space;</li> <li>• Protection of water sources from hydromodification in order to maintain the ecological function of riparian habitats;</li> <li>• Placement of development in the least biologically sensitive areas on the site, prioritizing the preservation or avoidance of the most sensitive biological resources onsite;</li> <li>• Design of required open spaces to retain contiguous undisturbed open space that preserves the most sensitive biological resources onsite and/or serves to maintain connectivity;</li> <li>• Maintenance of watershed connectivity by capturing, treating, retaining and/or infiltrating storm water flows on site; and</li> <li>• Consideration of the continuity of onsite open space with adjacent open space in project design.</li> </ul>	<p><b>Consistent.</b> The Project would preserve areas within the San Andreas SEA as Open Space.</p>
<p>Policy COS 4.5: Subject to local, state or federal laws, require new development to provide adequate buffers from preserves, sanctuaries, habitat areas, wildlife corridors, State Parks, and National Forest lands, except within Economic Opportunity Areas.</p>	<p><b>Consistent.</b> The Project site is located within the West EOA and would provide transition zones between Open Space areas and development areas as described further in the Specific Plan Open Space discussion and in Section 5.7, Biological Resources.</p>
<p>Policy COS 4.6: Encourage connections between natural open space areas to allow for wildlife movement.</p>	<p><b>Consistent.</b> The Project would allow for wildlife movement between natural open space areas through the implementation of PDFs and MMs, as discussed in Section 5.7, Biological Resources.</p>
<p>Policy COS 4.7: Restrict fencing in wildlife corridors. Where fencing is necessary for privacy or safety, require appropriate development standards that maximize opportunities for wildlife movement.</p>	<p><b>Consistent.</b> No fencing that would restrict wildlife movement is proposed in Open Space areas, which serve as wildlife corridors.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 4.8: Ensure ongoing habitat preservation by coordinating with the California Department of Fish and Game to obtain the latest information regarding threatened and endangered species.	<b>Consistent.</b> The Project provides for ongoing habitat preservation within designated Open Space; the latest information regarding sensitive plant and wildlife species is incorporated in Section 5.7, Biological Resources.
Policy COS 4.9: Ensure water bodies are well-maintained to protect habitat areas and provide water to local species.	<b>Not Applicable.</b> There are no water bodies on site and the maintenance of off-site water bodies is outside the scope of individual projects.
Policy COS 4.10: Restrict development that would reduce the size of water bodies, minimizing the potential for loss of habitat and water supply.	<b>Not Applicable.</b> There are no water bodies on site.
Scenic Resources Goal COS 5: The Antelope Valley’s scenic resources, including scenic drives, water features, significant ridgelines, buttes, and Hillside Management Areas, are enjoyed by future generations.	<b>Consistent.</b> The Project will preserve the majority of HMAs as Open Space and impacts on Scenic Drives would be less than significant, as discussed in Section 5.13, Visual Resources.
Policy COS 5.1: Identify and protect natural landforms and vistas with significant visual value, such as the California Poppy Preserve, by designating them as Scenic Resource Areas.	<b>Consistent.</b> The Project site is not located in or near a designated Scenic Resource Area and the Project would preserve natural landforms on the western and southeastern portions of the site, as well as retain natural drainages throughout the site.
Policy COS 5.2: Except within economic opportunity areas, limit the amount of potential development in Scenic Resource Areas through appropriate land use designations with very low densities in order to minimize negative impacts from future development.	<b>Consistent.</b> The Project site is located in the West EOA, and the Project site is not located in or near a designated Scenic Resource Area.
Policy COS 5.3: Require new development in Hillside Management Areas to comply with applicable Zoning Code requirements, ensuring that development occurs on the most environmentally suitable portions of the land.	<b>Consistent.</b> The majority of the site has slopes less than 25% and the areas with the greatest slopes would be preserved as Open Space. Development within HMAs would be required to comply with hillside provisions within the Specific Plan.
Policy COS 5.4: Require appropriate development standards in Hillside Management Areas that minimize grading and alteration of the land’s natural contours, ensure that development pads mimic natural contours, and ensure that individual structures are appropriately designed to minimize visual impacts.	<b>Consistent.</b> The majority of the site has slopes less than 25% and the areas with the greatest slopes would be preserved as Open Space. The Project would protect natural landforms on the western and southeastern portions of the site and on-site grading would mimic the existing topography, wherever feasible. Development within HMAs would be required to comply with hillside provisions within the Specific Plan
Policy COS 5.5: Require adequate erosion control measures for all development in Hillside Management Areas, both during and after construction.	<b>Consistent.</b> One of the Project objectives is to develop the site in a manner that minimizes grading, avoids steep slopes, and incorporates key natural topographical features of the site, while ensuring slope stability and erosion control. Development within HMAs would be required to comply with hillside provisions within the Specific Plan

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 5.6: Restrict development on buttes and designated significant ridgelines by requiring appropriate buffer zones.	<b>Not Applicable.</b> There are no buttes or ridgelines on the site.
Policy COS 5.7: Ensure that incompatible development is discouraged in designated Scenic Drives by developing and implementing development standards and guidelines for development within identified viewsheds of these routes (Map 4.2: Antelope Valley Scenic Drives).	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP and impacts on Scenic Drives would be less than significant with implementation of PDFs and MMs, as discussed in Section 5.13, Visual Resources.
Agricultural Resources Goal COS 6: Farming is a viable profession for Antelope Valley residents, contributing to the Valley's rural character and economic strength.	<b>Consistent.</b> The Project would require the conversion of 642 acres of on-site Prime Farmland to urban uses. However, the Project is located in an EOA, where urban development is planned including Farmland-designated areas. Farming continues to be a viable profession for Antelope Valley residents on lands not planned for urbanized development, such as the EOAs and rural town centers.
Policy COS 6.1: Limit the amount of potential residential development in Agricultural Resource Areas (Map 4.3: Agricultural Resource Areas) through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan, minimizing the potential for future land use conflicts.	<b>Consistent.</b> The Project would require the conversion of 642 acres of on-site Prime Farmland to urban uses, as discussed in Section 5.5, Land Resources. However, the Project is located in an EOA, where urban development is planned by the AVAP. The Project has also been designed with higher densities, and a mix of school, park and retail uses at the neighborhood scale, to increase the efficient utilization of land for the urbanized development planned in AVAP for the portion of the Project site (approximately 627 acres) that is also mapped as an ARA.
Policy COS 6.2: Limit incompatible non-agricultural uses in Agricultural Resource Areas. Where non-agricultural uses are necessary to meet regional or community needs, require buffering and appropriate development standards to minimize potential conflicts with adjacent agricultural uses.	<b>Consistent.</b> The Project does not propose incompatible non-agricultural uses within the Agricultural Resource Areas designated on the Project site. Although non-agricultural uses are proposed within the Agricultural Resource Areas designated on the Project site, those uses have sufficient buffering from adjacent agricultural uses. The Project would allow for continued grazing operations on portions of the Open Space preserve areas as a management tool for grassland conservation and would accommodate a total of 50 acres of small-scale agriculture and agriculture-related uses (e.g., community gardens, farmer's markets/fresh fruit and vegetable stands, growing and sales of nursery stock, commercial greenhouses).
Policy COS 6.3: Ensure that agricultural activities are included within the Antelope Valley's economic development strategies and pursue funding to support rural economic development and agriculture.	<b>Not Applicable.</b> Responsibility for Antelope Valley economic development strategies is outside the scope of individual projects.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy COS 6.4: Encourage the establishment of community farms, community gardens, and similar agricultural operations to produce local food and demonstrate the history, importance, and value of agriculture in the Antelope Valley.</p>	<p><b>Consistent.</b> The Project would reserve no less than 50 acres for small-scale agriculture and agriculture-related uses, including, but not limited to community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, commercial greenhouses, or other appropriate edible landscaping as discussed in Section 5.5, Land Resources.</p>
<p>Policy COS 6.5: Encourage the establishment of local farmer markets, roadside stands, wineries and tasting rooms, and other forms of “agricultural tourism” throughout the Antelope Valley to expand potential sources of farm income.</p>	<p><b>Consistent.</b> The Project’s Recreation/ Entertainment Overlay would accommodate a variety of uses, including a winery/tasting room, community gardens, and space for a farmers market or fresh fruit and vegetable stand. A total of 50 acres or more would be reserved on-site for small-scale agriculture and agriculture-related uses, including, but not limited to community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, commercial greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources.</p>
<p>Policy COS 6.6: Provide educational resources to farmers.</p>	<p><b>Not Applicable.</b> The Project would not include farming activities, but the Specific Plan would reserve 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources.</p>
<p>Policy COS 6.7: Investigate the feasibility of financial and/or zoning incentive programs for farmers, such as Williamson Act contracts, conservation easements and flexible zoning provisions.</p>	<p><b>Not Applicable.</b> The Project would not include farming activities, but the Specific Plan would reserve 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources.</p>
<p>Policy COS 6.8: Support innovative agricultural business practices, such as agricultural tourism and farmers’ cooperatives, necessary for adapting to changing economic and environmental conditions by streamlining regulations.</p>	<p><b>Consistent.</b> The Project’s Recreation/ Entertainment Overlay would accommodate a variety of uses, including a winery/tasting room, community gardens, and space for a farmers market or fresh fruit and vegetable stand. A total of 50 acres or more would be reserved on-site for small-scale agriculture and agriculture-related uses, including, but not limited to community gardens, farmers markets/fresh fruit and vegetable stands, growing and sales of nursery stock, commercial greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Goal COS 7: Farming practices are sustainable, balancing economic benefits with water and biological resource management priorities, and minimize greenhouse gas emissions and water pollution.</p>	<p><b>Not Applicable.</b> The Project would not include farming activities, but the Specific Plan would reserve 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources.</p>
<p>Policy COS 7.1: Promote agricultural uses which sequester carbon and fix nitrogen.</p>	<p><b>Not Applicable. Consistent.</b> The Project would not include farming activities, but the Specific Plan would reserve 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources. Project open space areas outside the development boundary would also include grazing, which is an ongoing agricultural use.</p>
<p>Policy COS 7.2: Support the use of alternative and renewable energy systems in conjunction with agricultural activities.</p>	<p><b>Not Applicable. Consistent.</b> The Project would not include farming activities, but the Specific Plan would reserve 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources. Project open space areas outside the development boundary would also include grazing, which is an ongoing agricultural use.</p>
<p>Policy COS 7.3: Encourage sustainable agricultural and water quality best management practices such as runoff detention basins, use of vegetation filter strips, and organic farming.</p>	<p><b>Not Applicable. Consistent.</b> The Project would not include farming activities, but the Specific Plan would reserve 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources. Project open space areas outside the development boundary would also include grazing, which is an ongoing agricultural use.</p>
<p>Policy COS 7.4: Ensure that agricultural activity is managed to minimize soil erosion and the release of contaminants into surface and groundwater resources.</p>	<p><b>Not Applicable. Consistent.</b> The Project would not include farming activities, but the Specific Plan would reserve 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources. Project open space areas outside the development boundary would also include grazing, which is an ongoing agricultural use.</p>
<p>Mineral Resources Goal COS 8: Mineral resources are responsibly extracted.</p>	<p><b>Not Applicable.</b> While the National Cement Plant is located northwest of the site in Kern County, the Project site does not contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 8.1: Allow new mineral resource extraction activities only in designated Mineral Resource Areas.	<b>Not Applicable.</b> While the National Cement Plant is located northwest of the site in Kern County, the Project site does not contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits. Also, the Project does not propose mineral extraction activities.
Policy COS 8.2: Where new mineral resource extraction activities are allowed, ensure that applications undergo full environmental review and public noticing. Require site remediation after completion of mineral resource extraction activities.	<b>Not Applicable.</b> While the National Cement Plant is located northwest of the site in Kern County, the Project site does not contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits. Also, the Project does not propose mineral extraction activities.
Policy COS 8.3: Provide strict enforcement of illegal or unpermitted mineral extraction activities.	<b>Not Applicable.</b> While the National Cement Plant is located northwest of the site in Kern County, the Project site does not contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits. Also, the Project does not propose mineral extraction activities.
Policy COS 8.4: Protect MRZ-2’s and access to MRZ-2’s in the Antelope Valley from incompatible development and discourage incompatible adjacent land uses.	<b>Not Applicable.</b> According to the California Geological Survey (CGS), the Project site is within an “unclassified” area of both the Saugus-Newhall and Palmdale Production-Consumption Regions (CGS 2015). The County General Plan and the AVAP do not identify “Mineral Resource Zones 2” within or near the Project site. Moreover, these documents do not identify mineral resources of interest anywhere in the northwestern quadrant of Los Angeles County.
Policy COS 8.5: Work collaboratively with agencies to identify Mineral Resource Zones in the Antelope Valley and to prioritize mineral land use classifications in regional efforts.	<b>Not Applicable.</b> This is a County effort.
Policy COS 8.6: Manage mineral resources in the Antelope Valley in a manner that effectively plans for the access to, and the development and conservation of mineral resources for existing and future generations.	<b>Not Applicable.</b> While the National Cement Plant is located northwest of the site in Kern County, the Project site does not contain mineral deposits of any economic importance or any otherwise “classified” mineral deposits.
Air QualityCOS 9: Improved air quality in the Antelope Valley.	<b>Consistent.</b> The Project has several design features intended to reduce or limit both stationary and mobile air pollutant emissions, as discussed in Section 5.11, Air Resources.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy COS 9.1: Implement land use patterns that reduce the number of vehicle trips, reducing potential air pollution, as directed in the policies of the Land Use Element.</p>	<p><b>Consistent.</b> The Project includes Specific Plan features to accommodate alternatives to automobile travel (e.g., public transit, bicycle network and pedestrian system), and a TMA to implement a range of mobility, transportation and parking demand management programs that would minimize traffic, pollution, and greenhouse gases. Efficient use of land and a balance of uses that result in a jobs/housing balance would also reduce single-occupancy automobile travel and vehicle miles traveled. Please see the Mobility Plan in Section 3.2 and Appendix 2-C of the Specific Plan and Section 5.10, Traffic, Access and Circulation for further details on these project features.</p>
<p>Policy COS 9.2: Develop multi-modal transportation systems that offer alternatives to automobile travel to reduce the number of vehicle trips, including regional transportation, local transit, bicycle routes, trails, and pedestrian networks, as directed in the policies of the Mobility Element.</p>	<p><b>Consistent.</b> The Project includes alternatives to automobile travel (e.g., public transit, bicycle network, and pedestrian system), as discussed in Section 3.2 and Appendix 2-C, Mobility Plan, of the Specific Plan and in Section 5,10, Traffic, Access and Circulation, of this EIR.</p>
<p>Policy COS 9.3: In evaluating new development proposals, consider requiring trip reduction measures to relieve congestion and reduce air pollution from vehicle emissions.</p>	<p><b>Consistent.</b> The Project includes alternatives to automobile travel (e.g., public transit, bicycle network and pedestrian system) that would minimize traffic, pollution, and greenhouse gases. Efficient use of land and a balance of uses that result in a jobs/housing balance would reduce single-occupancy automobile travel and vehicle miles traveled.</p>
<p>Policy COS 9.4: Promote recycling and composting throughout the Antelope Valley to reduce air quality impacts from waste disposal activities and landfill operations.</p>	<p><b>Consistent.</b> The Project would comply with waste diversion regulations and programs, as well as implement a Solid Waste Management Plan. With implementation of the Solid Waste Management Plan, 75% of solid waste generated from Project operation would be diverted from landfills through recycling, composting, and other methods, as described in greater detail in Section 5.17.3, Solid Waste Services.</p>
<p>Policy COS 9.5: Encourage the use of alternative fuel vehicles throughout the Antelope Valley.</p>	<p><b>Not Applicable.</b> Although use of alternative fuel vehicles throughout the Antelope Valley is outside the scope of individual projects, the Project will provide a refueling facility for alternative fuels if more than 5% of vehicles use such fuels, as described further in the Green Development Program.</p>
<p>Policy COS 9.6: Educate Antelope Valley industries about new, less polluting equipment, and promote incentives for industries to use such equipment.</p>	<p><b>Not Applicable.</b> Education of Antelope Valley industries about pollution and incentives is outside the scope of individual projects. Prospective industrial occupants of Centennial are required to comply with all applicable health and safety laws, including pollution reduction and pollution control laws. In general, new facilities seeking new permits from</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	environmental agencies are subject to more stringent requirements than existing facilities, and California’s environmental compliance laws and regulations are among the most stringent in the country. Additionally, regional pollution control agencies, such as the South Coast Air Quality Management District, implement more stringent air pollution reduction regulations than those of other regions even within California.
Policy COS 9.7: Encourage reforestation and the planting of trees to sequester greenhouse gas emissions.	<b>Consistent.</b> The Project includes planting of trees as part of the streetscape, greenways, and within the development site.
Policy COS 9.8: Coordinate with the Antelope Valley Air Quality Management District and other local, regional, state, and federal agencies to develop and implement regional air quality policies and programs.	<b>Not Applicable.</b> Development of regional air quality policies and programs is outside the scope of individual projects.
Energy Goal COS 10: Diverse energy systems that utilize existing renewable or waste resources to meet future energy demands.	<b>Consistent.</b> A minimum of 50% of the Project’s anticipated electrical energy demand at buildout shall be met by onsite renewable energy. Also, the Project shall equip 100% of all single-family detached homes to be “solar-ready” or equivalent, based on the latest technology. The Project’s two WRFs will include equipment to capture and reuse biogas for energy production. Further information on energy system and waste management features of the project are included in the Specific Plan’s Green Development Program (Appendix 2-A).
Policy COS 10.1: Encourage the use of non-hazardous materials in all individual renewable energy systems and all utility-scale renewable energy production facilities to prevent the leaching of potentially dangerous run-off materials into the soil and watershed.	<b>Consistent.</b> The Project allows solar and renewable energy generation facilities and energy conversion systems consistent with the County’s Renewable Energy Ordinance and related sections of Title 22 of the County Code. Compliance with the review procedures prescribed by said sections of Title 22 and the measures prescribed by the Water Quality and Hazardous Materials Sections of this EIR will ensure that potentially dangerous run-off materials will not leach into the soil and watershed.
Policy COS 10.2: Ensure that all individual renewable energy systems and all utility-scale renewable energy production facilities do not interfere with commercial and military flight operations or communication facilities. Consult with Edwards Air Force Base and U. S. Air Force Plant 42 on all proposed renewable energy projects that require discretionary approval.	<b>Consistent.</b> The Project allows solar and renewable energy generation facilities and energy conversion systems consistent with the County’s Renewable Energy Ordinance and related sections of Title 22 of the County Code.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 10.3: Encourage the safe and orderly development of biomass conversion facilities as an alternative to burning agricultural wastes.	<b>Not Applicable.</b> The Project does not propose the development of biomass conversion facilities that use agricultural wastes, but does include a municipal recycling/diversion facility that would create segregated types of solid waste to facilitate reuse at authorized off-site facilities.
Policy COS 10.4: Promote methane recapture at landfills for purpose of generating energy and reducing fugitive greenhouse gas emissions.	<b>Not Applicable.</b> The site is not a landfill, and the Project does not allow landfills.
Policy COS 10.5: Encourage the development of emerging energy technologies, such as “solar roads.”	<b>Not Applicable.</b> Development of emerging energy technologies is outside the scope of individual projects, but the Project’s Green Development Program allows for the deployment of innovative and emerging green technologies over time.
Policy COS 10.6: Encourage the development of Conversion Technologies such as anaerobic digestion and gasification for converting post recycled residual waste into renewable fuels and energy.	<b>Consistent.</b> The Project’s two WRFs will include equipment to capture and reuse biogas for energy production and the Project allows for a Materials Recovery Facility/Solid Waste Transfer Facility (MRF/SWTF) and green waste mulching and composting facility within the Utility land use designation.
Goal COS 11: Energy systems for use in public facilities that reduce consumption of non-renewable resources while maintaining public safety.	<b>Consistent.</b> A minimum of 50% of the Project’s anticipated electrical energy demand at buildout shall be met by onsite renewable energy. Also, the Project shall equip 100% of all single-family detached homes to be “solar-ready” or equivalent, based on the latest technology. Public buildings constructed as part of the Project will comply with federal, State, and local performance standards and green building laws and regulations that are applicable to that building.
Policy COS 11.1: Promote energy retrofits of existing public facilities throughout the County to complement and reduce dependence upon utility-scale renewable energy production facilities.	<b>Not Applicable.</b> Energy retrofits of existing public facilities are outside the scope of individual projects. Also, there are no public facilities on the site.
Policy COS 11.2: Promote the use of solar-powered lighting for highways, streets, and public facilities, including parks and trails.	<b>Consistent.</b> A minimum of 50% of the Project’s anticipated electrical energy demand at buildout shall be met by onsite renewable energy. Also, the Project shall equip 100% of all single-family detached homes to be “solar-ready” or equivalent, based on the latest technology.
Policy COS 11.3: Promote the use of renewable energy systems in public facilities, such as hospitals, libraries, and schools, to ensure access to power in the case of major disasters.	<b>Consistent.</b> While control on the use of renewable energy systems in public facilities (e.g., hospitals, libraries, and schools) is outside the scope of individual projects, a minimum of 50% of the Project’s anticipated electrical energy demand at buildout shall be met by onsite renewable energy, including public buildings constructed as part of the Project. These public buildings will also comply with federal, State,

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	and local performance standards and green building laws and regulations that are applicable to that building. Also, the Project's Green Development Program requires the Project to equip 100% of all single-family detached homes to be "solar-ready" or equivalent, based on the latest technology.
Goal COS 12: Individual energy systems for onsite use that reduce consumption of non-renewable resources and dependence on utility-scale energy production facilities.	<b>Consistent.</b> A minimum of 50% of the Project's anticipated energy demand at buildout shall be met by onsite renewable energy.
Policy COS 12.1: Promote the use of individual renewable energy systems throughout the County to complement and reduce dependence upon utility-scale renewable energy facilities.	<b>Consistent.</b> A minimum of 50% of the Project's anticipated energy demand at buildout shall be met by onsite renewable energy.
Policy COS 12.2: Require appropriate development standards for individual renewable energy systems to minimize potential impacts to surrounding properties. Simplify the permitting process for individual renewable energy systems that meet these development standards.	<b>Not Applicable.</b> Establishment of development standards is outside the scope of individual projects.
Goal COS 13: Utility-scale energy production facilities for offsite use that reduce consumption of nonrenewable resources while minimizing potential impacts on natural resources and existing communities.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Policy COS 13.1: Direct utility-scale renewable energy production facilities, such as solar facilities, to locations where environmental, noise, and visual impacts will be minimized.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Policy COS 13.2: Restrict development of utility-scale wind energy production facilities within the vicinity of Edwards Air Force Base to limit interference with military operations.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Policy COS 13.3: Require all utility-scale renewable energy production facilities to develop and implement a decommissioning plan, with full and appropriate financial guarantee instruments that will restore the full site to its natural state upon complete discontinuance of operations and will restore non-operational portions of the site while the remainder continues operating.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Policy COS 13.4: Promote the use of recycled water in utility-scale renewable energy production facilities to limit impacts on the available fresh water supply.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 13.5: Where development of utility-scale renewable energy production facilities cannot avoid sensitive biotic communities, require open space dedication within Significant Ecological Areas as a mitigation measure.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Policy COS 13.6: Ensure that all utility-scale renewable energy production facilities, such as solar facilities, do not create land use conflicts with adjacent agricultural lands or existing residential areas in the vicinity. Require buffering and appropriate development standards to minimize potential conflicts.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Policy COS 13.7: Limit the aesthetic impacts of utility-scale renewable energy production facilities to preserve rural character.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Policy COS 13.8: Coordinate with other jurisdictions to plan for utility-scale renewable energy production facilities in order to minimize impacts to sensitive biotic communities and existing residential areas.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Policy COS 13.9: Prohibit ground-mounted utility-scale renewable energy production facilities within Significant Ecological Areas and Economic Opportunity Areas.	<b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities on site.
Goal COS 14: Energy infrastructure that is sensitive to the scenic qualities of the Antelope Valley and minimizes potential environmental impacts.	<b>Consistent.</b> A new on-site dry utility backbone system consisting of joint and sole electric, natural gas, telephone, and cable television facilities would be installed underground within the roadway rights-of-way. The existing off-site 66-kilovolt (kV) electric lines that extend along SR-138, which passes adjacent to Quail Lake, would be relocated south of the Business Park area and may be placed underground, if feasible.
Policy COS 14.1: Require that new transmission lines be placed underground whenever physically feasible.	<b>Consistent.</b> A new on-site dry utility backbone system consisting of joint and sole electric, natural gas, telephone, and cable television facilities would be installed underground within the roadway rights-of-way. The existing off-site 66-kV electric lines that extend along SR-138, which passes adjacent to Quail Lake, would be relocated south of the Business Park area and placed underground, if feasible.
Policy COS 14.2: If new transmission lines cannot feasibly be placed underground due to physical constraints, require that they be collocated with existing transmission lines, or along existing transmission corridors, whenever physically feasible.	<b>Consistent.</b> A new on-site dry utility backbone system consisting of joint and sole electric, natural gas, telephone, and cable television facilities would be installed underground within the roadway rights-of-way. The existing off-site 66-kV electric lines that extend along SR-138, which passes adjacent to Quail Lake, would be relocated south of the Business Park area and may be placed underground, if feasible.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
<p>Policy COS 14.3: If new transmission lines cannot be feasibly be placed underground or feasibly collocated with existing transmission lines or along existing transmission corridors due to physical constraints, direct new transmission lines to locations where environmental and visual impacts will be minimized.</p>	<p><b>Consistent.</b> A new on-site dry utility backbone system consisting of joint and sole electric, natural gas, telephone, and cable television facilities would be installed underground within the roadway rights-of-way. The existing off-site 66-kV electric lines that extend along SR-138, which passes adjacent to Quail Lake, would be relocated south of the Business Park area and may be placed underground, if feasible.</p>
<p>Policy COS 14.4: Discourage the placement of new transmission lines on undisturbed lands containing sensitive biotic communities.</p>	<p><b>Consistent.</b> Transmission lines that cannot be relocated underground as physically feasible will be relocated into existing transmission corridors or within existing rights-of-way. No new transmission lines would be placed above ground on undisturbed areas and designated open space.</p>
<p>Policy COS 14.5: Discourage the placement of new transmission lines through existing communities or through properties with existing residential uses.</p>	<p><b>Consistent.</b> The Project would place new utility lines underground. A new on-site dry utility backbone system consisting of joint and sole electric, natural gas, telephone, and cable television facilities would be installed underground within the roadway rights-of-way. The existing off-site 66-kV electric lines that extend along SR-138, which passes adjacent to Quail Lake, would be relocated south of the Business Park area and may be placed underground, if feasible.</p>
<p>Policy COS 14.6: Review all proposed transmission line projects for conformity with the Goals and Policies of the Area Plan, including those listed above. When the California Public Utilities Commission is the decision-making authority for these projects, provide comments regarding conformity with the Goals and Policies of the Area Plan.</p>	<p><b>Not Applicable.</b> This is a County effort.</p>
<p>Policy COS 14.7: Require that electrical power lines in new residential developments be placed underground.</p>	<p><b>Consistent.</b> A new on-site dry utility backbone system consisting of joint and sole electric, natural gas, telephone, and cable television facilities would be installed underground within the roadway rights-of-way. The existing off-site 66-kV electric lines that extend along SR-138, which passes adjacent to Quail Lake, would be relocated south of the Business Park area and may be placed underground, if feasible.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Dark Night Skies Goal COS 15: Humans and wildlife enjoy beautiful dark Antelope Valley skies unimpeded by light pollution.	<b>Consistent.</b> The Specific Plan includes outdoor lighting standards that require downward direction and shielding to prevent spillover. Final lighting orientation and design shall be approved by the County of Los Angeles, Department of Public Works Building and Safety during the plan check process for individual developments.
Policy COS 15.1: Ensure that outdoor lighting, including street lighting, is provided at the lowest possible level while maintaining safety.	<b>Consistent.</b> The Specific Plan includes outdoor lighting standards that require downward direction and shielding to prevent spillover. Final lighting orientation and design shall be approved by the County of Los Angeles, Department of Building and Safety during the plan check process for individual developments.
Policy COS 15.2: Prohibit continuous all-night outdoor lighting in rural areas, unless required for land uses with unique security concerns, such as fire stations, hospitals, and prisons.	<b>Consistent.</b> The Project would be consistent with the County's Rural Outdoor Lighting District Ordinance.
Policy COS 15.3: Replace outdated, obtrusive, and inefficient light fixtures with fixtures that meet dark sky and energy efficiency objectives.	<b>Consistent.</b> The Specific Plan includes outdoor lighting standards that require downward direction and shielding to prevent spillover. Final lighting orientation and design shall be approved by the County of Los Angeles, Department of Building and Safety during the plan check process for individual developments.
Policy 15.4: Require compliance with the provisions of the Rural Outdoor Lighting District throughout the unincorporated Antelope Valley.	<b>Consistent.</b> The Project would be consistent with the County's Rural Outdoor Lighting District Ordinance.
Vegetation Conservation Goal COS 16: Native vegetation thrives throughout the Antelope Valley, reducing erosion, flooding, and wind-borne dust and sand.	<b>Consistent.</b> The Project includes the planting of native and/or drought-tolerant plant species consistent with the County's Drought-Tolerant Landscaping standards.
Policy COS 16.1: Except within Economic Opportunity Areas, require new development to minimize removal of native vegetation. Discourage the clear-scraping of land and ensure that a large percentage of land is left in its natural state.	<b>Not Applicable.</b> The Project site is located within the West EOA, and thus this policy does not apply. Approximately 7,200 acres within the Project site's total 12,323 acres would be graded. Native vegetation on the Project site and impacts are described in Section 5.7, Biological Resources.
Policy COS 16.2: Maximize the use of native vegetation in landscaped areas, provided that vegetation meets all applicable requirements of the Fire Department and the Department of Public Works.	<b>Consistent.</b> The Project includes the planting of native and/or drought-tolerant plant species consistent with the County's Drought-Tolerant Landscaping standards.
Green Building Goal COS 17: Buildings are sustainable, conserving energy, water, and other resources, and limiting greenhouse gas emissions.	<b>Consistent.</b> The Project includes a Green Development Program that requires all development to incorporate environmentally sustainable development practices in the design and construction of the Project.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 17.1: Promote green building techniques for the construction and operation of public and private buildings in the unincorporated Antelope Valley.	<b>Consistent.</b> The Project includes a Green Development Program that requires all development to incorporate environmentally sustainable development practices in the design and construction of the Project.
Policy COS 17.2: Require that new buildings be sited and designed in a manner that maximizes efficient use of natural resources, such as air and light, to reduce energy consumption, heat profiles, and greenhouse gas emissions.	<b>Consistent.</b> The Project includes a Green Development Program that requires all development within the Project site to incorporate environmentally sustainable development practices in the design and construction of the Project.
Policy COS 17.3: Promote energy retrofits of existing buildings.	<b>Not Applicable.</b> There are no existing buildings to be reused, and the promotion of energy retrofits is outside the scope of individual projects.
Policy COS 17.4: Promote the use of individual renewable energy systems and require appropriate development standards for such systems to minimize potential impacts to surrounding properties. Simplify the permitting process for individual renewable energy systems that meet these development standards.	<b>Consistent.</b> A minimum of 50% of the Project's anticipated electrical energy demand at buildout shall be met by on-site renewable energy.
Policy COS 17.5: Protect active and passive solar design elements and systems from shading by neighboring structures and trees through appropriate development standards.	<b>Consistent.</b> The Project's Green Development Program incorporates both active and passive solar design elements
Policy COS 17.6: Require new landscaping to comply with applicable water efficiency requirements in the County Code.	<b>Consistent.</b> The Project's Green Development Program incorporates the use of water-wise irrigation and drought-tolerant landscaping.
Policy COS 17.7: Require low-flow plumbing fixtures in all new developments.	<b>Consistent.</b> The Project's Green Development Program includes water conservation measures, such as the use of low-flow showerheads, faucets and toilets.
Policy COS 17.8: Require onsite stormwater infiltration in all new developments through use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.	<b>Consistent.</b> The Project's integrated water resources management approach includes LID drainage concepts to infiltrate storm water on site.
Policy COS 17.9: Require reduction, reuse, and recycling of construction and demolition debris.	<b>Consistent.</b> The Project's Green Development Program directs the preparation of a plan that will ensure the recycling or reuse of a minimum of 75% by weight of construction and demolition debris, which exceeds the 50% requirement of the County's Construction and Demolition Debris Recycling and Reuse Ordinance and Green Building Standards Code requirements.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Open Space Goal COS 18: Permanently preserved open space areas throughout the Antelope Valley.	<b>Consistent.</b> The Project would preserve 5,624 acres of on-site open space within the Open Space designation. Additional contiguous off-site open space would be preserved under the Tejon Ranch Conservation and Land Use Agreement.
<p>Policy COS 18.1: Encourage government agencies and conservancies to acquire mitigation lands in the following areas and preserve them as permanent open space:</p> <ul style="list-style-type: none"> <li>• Significant Ecological Areas, including Joshua Tree Woodlands, wildlife corridors, and other sensitive habitat areas;</li> <li>• Hillside Management Areas;</li> <li>• Scenic Resource Areas, including water features such as the privately owned portion of Elizabeth Lake, significant ridgelines, buttes, and other natural landforms;</li> <li>• Land adjoining preserves, sanctuaries, State Parks, and National Forests; and</li> <li>• Privately owned lands within the National Forest.</li> </ul>	<b>Consistent.</b> The Project site is not located in or near a designated Scenic Resource Area and does not include lands within the National Forest. The Project would preserve areas within the San Andreas SEA as Open Space. The majority of the site has slopes less than 25% and the areas with the greatest slopes would be preserved as Open Space. Development within HMAs would be required to comply with hillside provisions within the Specific Plan. The Project also includes off-site mitigation areas, as described in greater detail in Section 5.7, Biological Resources.
Policy COS 18.2: Ensure that open space acquisition is conducted in a fair and equitable manner.	<b>Not Applicable.</b> The Project does not involve open space acquisition. All open space to be dedicated is already owned by the Applicant.
Policy COS 18.3: Maintain permanently preserved open space areas to ensure attractiveness and safety.	<b>Consistent.</b> The Project would permanently preserve 5,624 acres of on-site open space within the Open Space designation.
Policy COS 18.4: Pursue funding for open space acquisition and maintenance on an ongoing basis.	<b>Consistent.</b> Pursuit of funding for acquisition and maintenance of open space beyond the Project boundaries and mitigation lands is outside the scope of individual projects.; however, the Project does include significant preservation of open space, and the Tejon Ranch Land Use and Conservation Agreement provides an ongoing funding source for maintenance of open space lands.
Policy COS 18.5: Provide parks and recreational facilities, as directed in the policies of the Public Safety, Services, and Facilities Element.	<b>Consistent.</b> The Project would provide various parks and recreational facilities, consistent with County policies as discussed in Section 5.14, Parks and Recreation.
Goal COS 19: New development meets open space objectives while maintaining rural character.	<b>Consistent.</b> The Project is located within the West EOA, and is consistent with the Land Use Policy Map of the AVAP and meets open space objectives of the AVAP.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy COS 19.1: When new development is required to preserve open space, require designs with large contiguous open space areas that maximize protection of environmental and scenic resources.	<b>Consistent.</b> The Project would preserve 5,624 acres of on-site open space within the Open Space designation, which would include large contiguous areas at the western and southern portions of the site and connected areas within other portions of the site.
Policy COS 19.2: Allow large contiguous open space areas to be distributed across individual lots so that new development preserves open space while maintaining large lot sizes that are consistent with a rural environment, provided that such open space areas are permanently restricted through deed restrictions.	<b>Consistent.</b> The Project will preserve contiguous open space areas (in perpetuity) and includes a plan for the ongoing maintenance of conserved open space areas, including mitigation areas, greenways, drainage corridors, and other natural resource features within the Project site. These large open space areas would be located at the western and southern portions of the site and would include connected areas within other portions of the site where no development will occur.
Policy COS 19.3: Pursue innovative strategies for open space acquisition and preservation through the land development process, such as Transfers of Development Rights, Land Banking, and Mitigation Banking, provided that such strategies preserve rural character.	<b>Consistent.</b> The Project would preserve 5,624 acres of on-site open space within the Open Space designation, which would include large contiguous areas at the western and southern portions of the site and connected areas within other portions of the site where no development will occur. This open space preservation approach includes more intensive development at and near the village cores and town center, and permanently preserves open space lands north and east of the Project site to help preserve the rural character of the region.
<b>Chapter 5: Public Safety, Services, and Facilities Element</b>	
Fire Hazards Goal PS 1: Protection of the public through fire hazard planning and mitigation.	<b>Consistent.</b> The Project has incorporated fuel modification setbacks and would involve development of up to four fire stations within the site.
Policy PS 1.1: Limit the amount of potential master-planned development in Very High Fire Hazard Severity Zones through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP, and has incorporated fuel modification setbacks, as described further in Section 5.3, Hazards and Fire Safety.
Policy PS 1.2: Require that all new developments provide sufficient access for emergency vehicles and sufficient evacuation routes for residents and animals.	<b>Consistent.</b> Development on the Project site would comply with all applicable County of Los Angeles Fire Department code and ordinance requirements, including emergency access and evacuation routes.
Policy PS 1.3: Promote fire prevention measures, such as brush clearance and the creation of defensible space, to reduce fire protection costs.	<b>Consistent.</b> The Project has incorporated fuel modification setbacks to reduce wildfire protection costs.
Policy PS 1.4: Provide strict enforcement of the Fire Code and all Fire Department policies and regulations.	<b>Consistent.</b> Development on the Project site would comply with all applicable County of Los Angeles Fire Department code and ordinance requirements.
Geological Hazards Goal PS 2: Protection of the public through geological hazard planning and mitigation.	<b>Consistent.</b> The Project is consistent with the AVAP by incorporating a Geologic Safety Zone into the Project and by following Project-specific plans, County

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	building code requirements, and other recommendations.
Policy PS 2.1: Limit the amount of potential development in Seismic Zones and along the San Andreas Fault and other fault traces, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> A Geologic Safety Zone has been incorporated into the Project that establishes review procedures and setbacks for areas subject to potential geologic and seismic constraints (e.g., surface fault rupture). This zone is applied to areas designated as Alquist-Priolo Earthquake Fault Zones and unnamed faults identified on the site as part of the Project's site-specific geotechnical investigations. Also, Section 2690 of the <i>California Public Resources Code</i> specifies that no human-occupied structures can be located within an Alquist-Priolo Earthquake Fault Zone unless specific investigations prove these areas to be free of active faulting.
Policy PS 2.2: Limit the amount of development on steep slopes (Hillside Management Areas) and within landslide and liquefaction areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP. The majority of the site has slopes less than 25% (outside HMAs) and the areas with the greatest slopes would be preserved as Open Space, including the areas with potential landslide and liquefaction hazards in the northwestern corner of the site as depicted in Exhibit 4-1, Conceptual Land Use Plan.
Policy PS 2.3: Prohibit the construction of new structures on or across a fault trace.	<b>Consistent.</b> A Geologic Safety Zone has been incorporated into the Project that establishes review procedures and setbacks for areas subject to potential geologic and seismic constraints (e.g., surface fault rupture). This zone is applied to areas designated as Alquist-Priolo Earthquake Fault Zones and unnamed faults identified on the site as part of the Project's site-specific geotechnical investigations. Also, Section 2690 of the <i>California Public Resources Code</i> specifies that no human-occupied structures can be located within an Alquist-Priolo Earthquake Fault Zone unless specific investigations prove these areas to be free of active faulting.
Policy PS 2.4: Ensure that new development does not cause or contribute to slope instability.	<b>Consistent.</b> Project development would require grading of sloped areas, as well as cutting and filling of some slope areas. Slopes would not be graded at angles steeper than a 2:1 ratio (horizontal to vertical), in accordance with the Project's Conceptual Grading Plan, County building code requirements, and other grading-related recommendations of the geotechnical reports to be prepared for each tract map.
Flood Hazards Goal PS 3: Protection of the public through flood hazard planning and mitigation.	<b>Consistent.</b> The Project includes a Floodplain Safety Zone that promotes public safety and protects water quality for development within areas subject to flooding (prior to development) to minimize flood hazards.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy PS 3.1: Limit the amount of potential development in Flood Zones designated by the Federal Emergency Management Agency through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.	<b>Consistent.</b> The Project includes a Floodplain Safety Zone that promotes public safety and protects water quality for development within areas subject to flooding (prior to development) to minimize flood hazards.
Policy PS 3.2: Require onsite stormwater filtration in all new developments through use of appropriate measures, such as permeable surface coverage, permeable paving of parking and pedestrian areas, catch basins, and other low impact development strategies.	<b>Consistent.</b> The Project's integrated water resources management approach includes LID drainage concepts to infiltrate storm water on site.
Policy PS 3.3: Review the potential local and regional drainage impacts of all development proposals to minimize the need for new drainage structures.	<b>Consistent.</b> This Draft EIR assesses the local and regional drainage impacts of the Project. Each future tract map for the Project shall provide Drainage Concept Plans to the County that incorporate the drainage facilities, storm water retention/detention basins, debris basins, hydromodification structures, flood control, and Best Management Practices (BMPs) that implement the flood control and storm water management performance standards specified in MMs.
Policy PS 3.4: Ensure that new drainage structures are compatible with the surrounding environment by requiring materials and colors that are consistent with the natural landscape. Discourage concrete drainage structures.	<b>Consistent.</b> One of the Project objectives is to promote water quality through effective watershed BMPs that preserve and integrate primary drainage corridors and greenways for storm water retention and filtration. This will include site-design, source-control, LID, hydromodification, flow-control and runoff water quality BMPs and treatment requirements to minimize the need for new large-scale drainage facilities. New drainage infrastructure would be designed, consistent with <i>Centennial Specific Plan</i> development standards, including landscaping and screening for Utility land uses.
Law Enforcement Goal PS 4: Protection of public safety through law enforcement and crime prevention strategies.	<b>Consistent.</b> The Project includes the provision of a Sheriff's Station on the site to provide law enforcement services and to deter crime.
Policy PS 4.1: Support an increased law enforcement presence in every Antelope Valley community and explore new funding mechanisms to expand law enforcement services.	<b>Consistent.</b> The Project includes the provision of a Sheriff's Station on the site to provide law enforcement services and to deter crime.
Policy PS 4.2: Support a strong law enforcement presence on highways and streets to strictly enforce speed limits and other vehicle safety laws.	<b>Consistent.</b> The Project would pay development fee for law enforcement services and provide a permanent on-site Sheriff's Station, with a store-front Sheriff's Station prior to the permanent Sheriff's Station.
Policy PS 4.3: Promote and support neighborhood watches to create more eyes and ears in the community.	<b>Consistent.</b> The Project proposes the development of villages that would have central cores surrounded by residential areas and open space. Neighborhood

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	Watch may be a program for the Homeowners Association.
Policy PS 4.4: Educate the public on crime prevention programs and resources offered by the Sheriff's Department.	<b>Consistent.</b> The County Sheriff's Department is expected to implement existing public education and crime prevention programs at the proposed on-site Sheriff's station.
Goal PS 5: Protection of public health, safety, and welfare through code enforcement.	<b>Not Applicable.</b> This is a County effort. Code enforcement is outside the scope of individual projects.
Policy PS 5.1: Support neighborhood preservation programs, such as graffiti abatement, removal of abandoned or inoperable vehicles, and removal of trash and debris.	<b>Consistent.</b> The Project would be subject to applicable County regulations and Homeowners Association guidelines for property maintenance. The Project would also implement a comprehensive residential and commercial curbside recycling program as part of the Green Development Program.
Policy PS 5.2: Strictly enforce laws against illegal dumping and support the Antelope Valley Illegal Dumping Task Force.	<b>Consistent.</b> Implementation of the Project would reduce the incidence of illegal dumping on the site. The Project would also be subject to applicable County regulations on illegal dumping.
Policy PS 5.3: Educate the public on existing codes and the value of maintaining their property, encouraging voluntary compliance.	<b>Consistent.</b> The Project would have Homeowners Association guidelines for property maintenance, which would be consistent with County code requirements.
Policy PS 5.4: Administer code enforcement activities in a fair, equitable, respectful, and cooperative manner.	<b>Not Applicable.</b> This is a County effort. Code enforcement is outside the scope of individual projects.
Policy PS 5.5: Create proactive code enforcement programs where desired by community residents.	<b>Not Applicable.</b> This is a County effort. Code enforcement is outside the scope of individual projects.
Disaster Preparedness and Emergency Response Goal PS 6: Government officials work with community members to promote community safety.	<b>Not Applicable.</b> This is a County effort. Government officials located in on-site facilities (e.g., fire and law enforcement) would be able to work with the Centennial community.
Policy PS 6.1: Ensure safety information is available at local public areas.	<b>Not Applicable.</b> This is a County effort, but may be a function of the Homeowners Association.
Policy PS 6.2: Encourage residents and business owners to create an evacuation plan and maintain emergency supplies.	<b>Not Applicable.</b> This is a County effort, but may be a function of the Homeowners Association.
Policy PS 6.3: Promote the formation and coordination of Certified Emergency Response Teams.	<b>Not Applicable.</b> This is a County effort, but may be a function of the Homeowners Association.
Policy PS 6.4: Provide assistance to local communities that wish to create a local emergency evacuation plan.	<b>Not Applicable.</b> This is a County effort, but may be a function of the Homeowners Association.
Policy PS 6.5: Strengthen coordination and collaboration between citizens, public agencies,	<b>Not Applicable.</b> This is a County effort, but may be a function of the Homeowners Association.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
and non-profit groups to plan for disaster response.	
Policy PS 6.6: Develop an inclusive master emergency plan that designates evacuation routes, emergency relief centers, emergency animal keeping shelters, and information centers in every Antelope Valley community.	<b>Not Applicable.</b> This is a County effort. Development of an emergency plan for the Antelope Valley is outside the scope of individual projects.
Goal PS 7: Emergency services that respond in a timely manner.	<b>Consistent.</b> The Project would construct and equip up to four on-site fire stations.
Policy PS 7.1: Require visible addresses on buildings and at entrances to properties as required by the Fire Code.	<b>Consistent.</b> Development on the Project site would comply with all applicable County of Los Angeles Fire Department code and ordinance requirements, including visible addresses.
Policy PS 7.2: Ensure that Fire Stations are adequately staffed.	<b>Consistent.</b> The Project would construct and equip up to four on-site fire stations, with the County Fire Department providing the appropriate staffing.
Policy PS 7.3: Strive for a timely response to every call for service.	<b>Consistent.</b> The Project shall maintain the County of Los Angeles Fire Department’s goal of a five-minute or less average response time at buildout of the Project.
Parks and Recreation Goal PS 8: Antelope Valley residents enjoy access to parks and recreational facilities.	<b>Consistent.</b> In addition to preserved open space areas, the Project would provide a variety of park types and a network of community trails, greenway trail, and Class I–IV bike lanes to facilitate access to these parks.
Policy PS 8.1: Maintain existing parks to ensure attractiveness and safety and make improvements as necessary. Ensure adequate funding on an ongoing basis.	<b>Consistent.</b> The Project would include parks and recreation amenities that would either be maintained by the Homeowners Association or deeded to the County for maintenance.
Policy PS 8.2: Provide recreational activities at parks that serve all segments of the population.	<b>Consistent.</b> The Project would provide various recreational facilities within public and private parks, a network of community trails, greenway trails, and Class I–IV bike lanes; private recreational facilities; and connections to regional trails and the Angeles National Forest to serve the recreational needs of all segments of the population.
Policy PS 8.3: Provide new parks as additional development occurs or as the population grows, with a goal of four acres of parkland for every 1,000 residents.	<b>Consistent.</b> The Project would provide public and private recreation amenities that meets or exceeds the acreage requirements of the County of Los Angeles General Plan local parkland standard.
Policy PS 8.4: Prioritize new parks for existing park deficient communities.	<b>Consistent.</b> The Project would provide public and private parkland and other recreation amenities, to serve future residents.
Policy PS 8.5: Encourage the use of school playgrounds and sporting fields for community recreation (“joint use”) when school is not in session.	<b>Consistent.</b> The proposed school sites are centrally located within the Villages and are generally adjacent to parks and minor and major greenway systems that offer pedestrian trail linkage. These school sites are conceptually located adjacent to parks to encourage joint use. Final school site locations would be

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	determined at when future tract maps are processed and in coordination with the respective school districts.
Policy PS 8.6: Within rural town center areas, promote the inclusion of parks, recreational facilities, and other gathering places that allow neighbors to meet and socialize.	<b>Consistent.</b> The Project would provide private and public parks and recreational facilities that would serve as gathering places for residents.
Policy PS 8.7: Provide trails, bikeways, and bicycle routes for recreational purposes, as directed in the policies of the Mobility Element.	<b>Consistent.</b> The Project would provide a network of trails for bicycling and hiking, including equestrian activities on the regional trail within the Project site.
Policy PS 8.8: Maintain existing facilities for public water recreation to ensure attractiveness and safety and make improvements as necessary. Ensure adequate funding on an ongoing basis.	<b>Not Applicable.</b> There are no existing public water recreation facilities on or near the site.
Policy PS 8.9: Provide new facilities for public water recreation in appropriate areas.	<b>Not Applicable.</b> The Project will not provide new facilities for public water recreation due to limited access to a large body of water.
Goal PS 9: Safe spaces for the recreational use of off-road vehicles and other motorized sporting.	<b>Not Applicable.</b> This is a County effort.
Policy PS 9.1: Reduce illegal off-road vehicle use by providing off-road vehicle trails and parks in appropriate areas.	<b>Not Applicable.</b> This is a County effort.
Policy PS 9.2: Reduce illegal drag racing by providing appropriate locations for safe and properly monitored drag racing.	<b>Not Applicable.</b> This is a County effort.
Policy PS 9.3: Provide strict enforcement of illegal off-road vehicle use and illegal drag racing.	<b>Not Applicable.</b> This is a County effort.
Schools Goal PS 10: A wide range of educational opportunities for Antelope Valley residents.	<b>Consistent.</b> The Project reserves sites through a “Schools” land use designation for five Kindergarten (K) through 8 <sup>th</sup> grade schools, one K-5 school, and one high school.
Policy PS 10.1: Coordinate with all Antelope Valley school districts to ensure that new schools are provided as additional development occurs or as the population grows.	<b>Consistent.</b> The reservation of school sites through a land use designation would allow the Gorman District, Westside Union School District (WUSD), and Antelope Valley Union High School District (AVUHSD) to acquire the sites and provide school facilities. The Project Applicant would either pay required Senate Bill 50 ( <i>California Government Code</i> , Section 65995) developer fees to the respective school districts, or enter into an agreement with the school districts to facilitate the financing, construction, and operation of new school facilities in the Project site to ensure the timely provision of schools corresponding to the phased development of the Project.
Policy PS 10.2: Encourage new schools to locate in rural town center areas, rural town areas, and economic opportunity areas, where they will be	<b>Consistent.</b> The proposed school sites are centrally located within the Villages and are generally adjacent

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
accessible by pedestrian walkways, trails, bikeways, and bicycle routes.	to parks and minor and major greenway systems that offer pedestrian trail linkage.
Policy PS 10.3: Encourage new schools to locate near parks and recreational facilities.	<b>Consistent.</b> The proposed school sites are centrally located within the Villages and are generally adjacent to parks and minor and major greenway systems that offer pedestrian trail linkage.
Policy PS 10.4: Encourage the use of school playgrounds and sporting fields for community recreation (“joint use”) when school is not in session.	<b>Consistent.</b> Although the applicant cannot compel a school district to allow “joint use” of their facilities, the proposed school sites are centrally located within the Villages and are generally adjacent to parks and minor and major greenway systems that offer pedestrian trail linkage.
Policy PS 10.5: Promote the creation of a four-year public university in the Antelope Valley to provide opportunities for continuing education and workforce development.	<b>Consistent.</b> The Project would accommodate a college campus as a permitted use in areas designated as Business Park, School, and Institutional/Civic and allowed subject to a Conditional Use Permit (CUP) in areas designated as Mixed Use, Commercial, and Recreation/Entertainment. Also, the Project would increase the local population of the Antelope Valley and would make a four-year public university in the Antelope Valley more viable.
Libraries Goal PS 11: Antelope Valley residents enjoy easy access to public library services.	<b>Consistent.</b> The Project proposes a library in the town center, which would be located within easy access to the rest of the Project site.
Policy PS 11.1: Maintain existing public libraries and make improvements as necessary. Ensure adequate funding on an ongoing basis.	<b>Consistent.</b> The Project would include a library in the town center. The Project Applicant would provide the land; construct the library; and would provide all furniture, fixtures, equipment, and materials for this library.
Policy PS 11.2: Expand public library collections and services to meet community needs.	<b>Consistent.</b> The Project would include a library in the town center.
Policy PS 11.3: Provide new public libraries as additional development occurs or as the population grows.	<b>Consistent.</b> The Project would include a library in the town center.
Policy PS 11.4: Encourage new public libraries to locate in rural town center areas, rural town areas, and economic opportunity areas, where they will be accessible by pedestrian walkways, trails, bikeways, and bicycle routes.	<b>Consistent.</b> The Project would include a library in the town center.
Policy PS 11.5: Provide bookmobile services in areas that are not served by permanent public libraries.	<b>Consistent.</b> The Antelope Valley is currently served by a bookmobile that provides library services to outlying areas. A library would be built on site to serve residents of the Project and the surrounding areas. The library is planned to be built and operational upon the occupancy of the 3,500 <sup>th</sup> residential unit. The Project anticipates utilizing the bookmobile for local residents until a permanent facility is built, as

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
	described in greater detail in Section 5.17.2, Library Services.
Policy PS 11.6: Encourage the use of technology in library operations to increase efficiency and accessibility.	<b>Consistent.</b> The proposed on-site library will offer online services, as provided by the County Library.
Health Facilities Goal PS 12: A range of facilities and service that maintain the health and well-being of Antelope Valley residents at all ages and income levels.	<b>Consistent.</b> The Project includes 110 acres of Institutional/Civic (I/C) land uses, which allows hospitals.
Policy PS 12.1: Provide preventative health services to reduce the need for emergency medical care.	<b>Consistent.</b> The Project includes 110 acres of I/C land uses, which allows hospitals.
Policy PS 12.2: Support the development of regional health care facilities in Lancaster and Palmdale.	<b>Not Applicable.</b> The Project is not located in the Cities of Lancaster or Palmdale.
Policy PS 12.3: Support existing community health care clinics in rural areas by preventing the encroachment of incompatible land uses. Allow expansion when required to meet community needs.	<b>Consistent.</b> While the Project is within an EOA, not a rural area, the 110 acres of I/C land uses includes hospitals as an allowed use.
Policy PS 12.4: Encourage the development of new community health care clinics where required to meet community needs. Encourage these clinics to locate in rural town center areas and economic opportunity areas, where they will be accessible by pedestrian walkways, trails, bikeways, and bicycle routes.	<b>Consistent.</b> The Project is a new development project which will allow new health care facilities within selected land use designations. The Project will support alternatives to automobile travel (e.g., public transit, bicycle network, and pedestrian system) throughout the proposed Villages.
Policy PS 12.5: Pursue funding to support daily operations at community health care clinics.	<b>Not Applicable.</b> Pursuit of funding to support daily operations at community health care clinics is outside the scope of individual projects.
<b>Chapter 6: Economic Development Element</b>	
Goal ED1: A healthy and balanced economic base in the Antelope Valley that attracts a wide range of industries and businesses and provides high-paying jobs for local residents.	<b>Consistent.</b> The Project would provide areas for non-residential development that would accommodate commercial and business park uses and improve the economic base of the Antelope Valley.
High-tech Manufacturing Policy ED 1.1: Promote the continued development of regional commercial and industrial employment centers in economic opportunity areas in the Antelope Valley.	<b>Consistent.</b> The Project allows commercial and business park uses that would accommodate employment centers.
Policy ED 1.2: Allow the development of commercial and industrial uses at the Palmdale Regional Airport site, provided that those uses are compatible with airport operations and do not restrict or prohibit future expansion of the airport.	<b>Not Applicable.</b> The Palmdale Regional Airport site is not part of, or near, the Project site.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
Policy ED 1.3: Support the growth of “high-tech” industries to employ the Antelope Valley population’s highly educated workforce.	<b>Consistent.</b> The business park uses that would be allowed on the site would support “high-tech” industries.
Transportation and Logistics Policy ED 1.4: Support the development of the High Desert Corridor and the Northwest 138 Corridor Improvement projects to improve the east-west movement of goods, particularly between the Antelope Valley and the industrial areas of Kern and San Bernardino counties and beyond.	<b>Not Applicable.</b> The development of the High Desert Corridor and the Northwest 138 Corridor Improvement Projects are outside the scope of individual projects. However, the Project would accommodate the realignment and widening of SR-138, as discussed in Section 5.10, Traffic, Access and Circulation.
Policy ED 1.5: Promote the development of an “Inland Port” in the Antelope Valley, providing additional employment in the trade and logistics sectors.	<b>Not Applicable.</b> The development of an “Inland Port” in the Antelope Valley is outside the scope of individual projects.
Policy ED 1.6: Support the development of a range of travel options that better connect the Antelope Valley to existing regional trade and employment in other regions, including the High Desert Corridor and the Northwest 138 Corridor Improvement Projects.	<b>Not Applicable.</b> The Project does not include the development of transportation routes. However, the Project would accommodate the realignment and widening of SR-138, as discussed in Section 5.10, Traffic, Access and Circulation.
Agriculture Policy ED 1.7: Promote farming and other agricultural activities that contribute to the Antelope Valley economy.	<b>Consistent.</b> The Specific Plan would reserve 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources. The Project would also allow for continued grazing operations on portions of the Open Space preserve areas as a management tool for grassland conservation.
Policy ED 1.8: Promote alternative sources of income for farmers, including commercial and industrial activities, to supplement their income during low production years and encourage them to continue farming in the Antelope Valley.	<b>Consistent.</b> The Project would include preserved open space outside the development envelope that would continue to be used for grazing, and reservation of 50 acres or more on site for agricultural use, such as community gardens, orchards, vineyards, groves, greenhouses, or other appropriate edible landscaping, as discussed in Section 5.5, Land Resources.
Policy ED 1.9: Support water management projects, including the use of modern technology to increase available water supply in the area, in conjunction with the Integrated Regional Water Management Plan.	<b>Consistent.</b> The Project includes an integrated water resources management approach to optimize the use of currently available water resources and those generated by the Project’s operations, so as to minimize its impact on potable and non-potable water resources, and would be consistent with the Antelope Valley Integrated Regional Water Management Plan.

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

<b>Goal/Policy</b>	<b>Project Consistency</b>
<p>Renewable Energy Policy ED 1.10: Promote small-scale, household based renewable energy systems to enable Antelope Valley residents to become energy independent.</p>	<p><b>Consistent.</b> A minimum of 50% of the Project's anticipated electrical energy demand at buildout shall be met by onsite renewable energy. Also, the Project shall equip 100% of all single-family detached homes to be "solar-ready" or equivalent, based on the latest technology.</p>
<p>Policy ED 1.11: Encourage the development of utility-scale renewable energy projects at appropriate locations and with appropriate standards to ensure that any negative impacts to local residents are sufficiently mitigated.</p>	<p><b>Not Applicable.</b> The Project does not propose utility-scale renewable energy production facilities.</p>
<p>Policy ED 1.12: Adopt regulations that ensure that local residents receive a fair share of the benefits of utility-scale renewable energy projects that are commensurate to their impacts.</p>	<p><b>Not Applicable.</b> This is a County effort. The Project does not propose utility-scale renewable energy production facilities.</p>
<p>Policy ED 1.13: Ensure early discussions with Edwards Air Force Base and U. S. Air Force Plant 42 regarding new industries, such as utility-scale renewable energy production facilities, to limit potential impacts on mission capabilities.</p>	<p><b>Not Applicable.</b> This is a County effort, and the Project does not include military lands.</p>
<p>Construction and Housing Policy ED 1.14: Promote appropriate types of residential development in the vicinity of existing communities and town centers that are in reach of existing infrastructure and utilities.</p>	<p><b>Consistent.</b> The Project includes the development of nine Villages that will each contain a mix of land uses that enable residents to live near schools, shopping, neighborhood businesses and services, civic buildings, medical facilities, and employment centers. The Project includes a mix of housing options within each Village, ranging from apartment homes close to the town center to single-family homes in lower-density areas.</p>
<p>Policy ED 1.15: Where appropriate, promote residential development as part of a wider mixed-use strategy in communities that desire such uses in their areas and where plans for major infrastructure and facilities are currently underway. These areas have been identified as economic opportunity areas as shown in the Land Use Policy Map (Map 2.1) of this Area Plan.</p>	<p><b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP, would include mixed use neighborhoods to promote walkability as described in the Specific Plan, and would focus land use development and associated growth within the West EOA and Future Rural Town Area where future development is planned and anticipated.</p>
<p>Recreation, Tourism and Filmmaking Policy ED 1.16: Preserve the scenic resources of the Antelope Valley, including Scenic Drives, Significant Ridgelines and Significant Ecological Areas, in such a way that can contribute to the economic activities in the area.</p>	<p><b>Consistent.</b> The Project is consistent with the Land Use Policy Map of the AVAP, avoids development in Significant Ecological Areas (SEAs), and impacts on Scenic Drives would be less than significant, as discussed in Section 5.7, Biological Resources and Section 5.13, Visual Resources.</p>
<p>Policy ED 1.17: Promote uses and activities that rely on the natural state of the environment to take advantage of the vast areas of relatively undisturbed natural areas in the Antelope Valley.</p>	<p><b>Not Applicable.</b> This is a County effort.</p>

**TABLE 5.8-1  
ANTELOPE VALLEY AREA PLAN CONSISTENCY ANALYSIS**

Goal/Policy	Project Consistency
These include recreational, tourism and film-making uses.	
Policy ED 1.18: Coordinate with the Los Angeles County Economic Development Corporation, the Greater Antelope Valley Economic Alliance, and other organizations to create and implement regional economic development strategies.	<b>Not Applicable.</b> This is a County effort.
Policy ED 1.19: Promote the creation of a four-year public university in the Antelope Valley to provide opportunities for continuing education and workforce development.	<b>Consistent.</b> The Project would accommodate a college campus as a permitted use in areas designated as Business Park, School, and Institutional/Civic and allowed subject to a CUP in areas designated as Mixed Use, Commercial, and Recreation/Entertainment. Also, the increase in population brought by the Project would make a university in the Antelope Valley more viable.
Policy ED 1.20: Support the development of a range of travel options that better connect the Antelope Valley to existing regional trade and employment centers in other regions, including the High Desert Corridor and the Northwest 138 Corridor Improvement Project, as directed in the policies of the Mobility Element.	<b>Consistent.</b> The Project includes facilities for alternatives to automobile travel (e.g., public transit, bicycle network, and pedestrian system). As part of the Mobility Plan, the Project's Circulation Plan includes major east-west roadways, to serve the Project's east-west travel demand, to connect major on-site activity centers, and to lessen the Project's traffic demand on SR-138. The Circulation Plan sets forth requirements for roadway classifications; intersection controls; and traffic calming measures. Each component of the Mobility Plan incorporates TDM features to reduce dependence on the automobile, provide for a more efficient use of transportation resources among Project occupants.
Policy ED 1.21: Ensure early discussions with Edwards Air Force Base and U. S. Air Force Plant 42 regarding new industries, such as utility-scale renewable energy production facilities, to limit potential impacts on mission capabilities.	<b>Not Applicable.</b> This is a County effort, and the Project does not involve military lands.
<p>AVAP: Antelope Valley Area Plan; EOA: Economic Opportunity Area; SEA: Significant Ecological Area; HMA: Hillside Management Area; SR: State Route; PDFs: Project Design Features; MMs: Mitigation Measures; SCAG: Southern California Association of Governments; GHG: greenhouse gasses; TMA: Transportation Management Association; ITE: Institute of Traffic Engineers; TDM: Transportation Demand Management; LLMD: Landscape and Lighting Maintenance District; MU: Mixed Use; WRF: wastewater reclamation facility; LID: low impact development; IPM: Integrated Pest Management; CGS: California Geological Survey; MRF/SWTF: materials recovery facility/solid waste transfer facility; kV: kilovolt; EIR: environmental impact report; BMP: Best Management Practice; WUSD: Westside Union School District; AVUHSD: Antelope Valley Union High School District; CUP: Conditional Use Permit, I/C: Institutional/Civic.</p>	
Source (goals and policies): LACDRP 2015a	

As discussed above, the Project is consistent with the goals and policies of the AVAP. Adding the internal Project site roadways meeting the criteria for inclusion on the Antelope Valley Area Plan Highway Plan (Map 3.1 of the AVAP, which includes major highways, secondary highways, limited secondary highways, parkways, and expressways), as well as the Highway Plan Policy Map included in the General Plan (Figure 7.3, Highway Plan Policy Map), require AVAP and General Plan amendments to fill in the required roadway details within the Project site. Amending Map 3.1 to add internal project site roadways is also consistent with AVAP's requirement for a Specific Plan for a new master planned community in this West EOA. The Project remains consistent with the AVAP, which is part of the General Plan, and no text amendments to the AVAP or County General Plan are proposed. With approval of the General Plan and AVAP amendments, zone change and other associated entitlements, the Project would have less than significant land use impacts.

Because the Project is consistent with the land use designations and applicable policies of the Los Angeles General Plan and Antelope Valley Area Plan, no mitigation is required.

The Project would require rezoning to Specific Plan (SP), consistent with the General Plan and AVAP; however, re-zoning to conform to applicable plan designations would not result in any significant environmental impacts and no mitigation is warranted. The Project would not require a Hillside Management CUP, but would comply with the HMA requirements by (1) locating development outside HMAs to the extent feasible; (2) locating development in the portions of HMAs with the fewest hillside constraints; and (3) using sensitive hillside design techniques tailored to the unique site characteristics. The primary hillside features are the western portion of Oso Canyon and the mountainous areas along the western and southern edges of the site generally within the designated Significant Ecological Area (SEA) 17. The Project would avoid all impacts within the SEA, and therefore avoid the majority of the steeply sloped areas of the site, as shown on Exhibit 4-19a, Centennial Project – Slope Analysis, in Section 4.0, Project Description. As shown the majority of the areas with steep slopes are avoided and will be preserved through the on-site mitigation lands, which include approximately 3,861 acres.

### ***Antelope Valley Areawide General Plan***

If the AVAP and the accompanying EIR is overturned as a result of the pending lawsuit filed by the Center for Biological Diversity (discussed above), one of the possible judicial remedies could be the reinstatement of the prior Antelope Valley Area General Plan (AVAGP) pending further environmental review and/or processing of the AVAP. The following discusses the entitlements that would be necessary to allow the Project if the outcome of the pending AVAP lawsuit is reinstatement of the AVAGP. Specifically, implementation of the Project would require the following amendments to the AVAGP, which are each discussed further below:

- Redesignate the AVAGP Land Use Policy Map land use designations on the Project site from “Non-Urban” and “Significant Ecological Areas” to “Specific Plan”. Changes to the “Significant Ecological Areas” designation would be for consistency with the adopted General Plan.
- Redesignate the AVAGP Hazards and Resources Map to reflect areas identified as hazards and resources within the *Centennial Specific Plan*.

- Modify the AVAGP Highway Plan Map to include arterial highways on the Project site that would be designated “Major Highway”, “Secondary Highway”, and “Limited Secondary Highway”.
- Modify the AVAGP Trails Map to include the trails on the Project Site.

The Land Use Policy Map in the AVAGP would have to be amended to change the Non-Urban designation to “Specific Plan”. Alternatively, the Project would require an amendment to the AVAGP land use designations to those that reflect the Conceptual Land Use Plan for the Project. This would include the Low, Low/Medium, Medium and High Density Residential, Major Commercial, Major Industrial, Public and Semi-Public Facilities, and Open Space land use designations. Appendix 5.8-A to this Draft EIR includes a consistency analysis of the proposed Project and the AVAGP policies and provides graphic illustrations of the required AVAGP map amendment figures itemized above. As stated in the consistency analysis in Appendix 5.8-A, the Project would require map, but not text, amendments to the AVAGP. This amendment would not be considered a significant impact, since the Project is otherwise consistent with the policies in the AVAGP as described above.

The Hazards and Resources Map identifies the following on portions of the Project site: Seismic Safety Management Area (through the southwestern corner of the Project site along the San Andres Fault); portions of Significant Ecological Areas along the western and southern boundaries (SEAs No. 58 and No. 59); Floodplain Management Area; Agricultural Opportunity Area; Bikeway (along Gorman Post Road); and Noise Management Area (along SR-138 and Gorman Post Road). The Project would comply with regulations for Alquist-Priolo Earthquake Fault Zones through the Geologic Safety Zone that is proposed on the portions of the site that are included in this fault zone. Development is not proposed in canyons and areas with slopes greater than 25 percent and grading activities would comply with County regulations. The proposed Floodplain Safety Zone would also regulate development within areas subject to flooding. The Project would continue to provide the Bikeway on Gorman Post Road. As discussed in greater detail in Section 5.5, Land Resources, the site is not currently a significant agricultural resource; rather, grazing has occurred on the majority of the site, with pivot fields limited to 1,000 acres at the eastern portion of the site. These pivot fields have only been used for growing a three-way forage mix for approximately ten years and are not planned to be in production long term.

With the Project, Agricultural Opportunity Areas on the site would be largely eliminated but grazing would be incorporated into and continued to be allowed in open space areas. The Project would preserve as Open Space the majority of the land within the site that is designated as SEA Nos. 58 and 59, and would have to provide off-site or on-site mitigation for areas that would be developed. Residential areas have been located away from SR-138 to reduce noise exposure to vehicle traffic. In addition, mitigation measures have been provided to reduce noise from construction, stationary and mobile sources. Modifications to the boundaries of these Special Management Areas may be needed with the Project, consistent with the County General Plan.

The Highway Plan Map shows SR-138 as a Freeway; Gorman Post Road as a Secondary Highway; and Old Ridge Road as a Limited Secondary Highway. The Project does not propose changes to these designations but would involve the designation of proposed arterial

highways on the site as Major Highway, Secondary Highway, or Limited Secondary Highway, as applicable. The Project would also continue to require an amendment of the General Plan Highway Map for the addition of interior Project roadways.

The Trails Plan in the AVAGP shows the alignment of the Pacific Crest Trail (PCT) crossing the site along the California Aqueduct or Cement Plant Road.<sup>1</sup> The PCT has since been realigned and the Project would accommodate the PCT, as discussed in Section 5.13, Visual Resources, and Section 5.14, Parks and Recreation. If the PCT is to remain along the Aqueduct or Cement Plant Road, this trail can be accommodated within the existing and proposed rights-of-way for these facilities. A modification of the AVAGP Trails Map may also be needed to include the trails on the site as County trails. The Project would continue to preclude development within an SEA, since the SEA boundaries were approved by independent County approval of General Plan 2035.

In summary, if approval of the AVAP is invalidated, then a possible judicial remedy would be reinstatement of the AVAGP, in which case the Project would require amendments to the AVAGP, as listed above, but the amendments would not be considered a significant impact, since the Project is otherwise consistent with the policies in the overriding 2035 General Plan. The Project would continue to require an amendment to the General Plan Highway Map as described above. The Project would have less than significant land use impacts with the AVAGP plan amendments, zone change and other associated entitlements.

## Regional Land Use Plans

The Project is consistent with regional and local plans and policies. The Project would also implement a number of strategies and actions in the RTP/SCS. Project consistency with the RHNA is addressed in Section 5.9, Population, Housing, and Employment. No conflict with SCAG's regional growth projections would occur since SCAG's growth projections anticipates increases in population, households, and employment in the North Los Angeles Subregion and future household and employment projections for the area that includes the Project site are consistent with the housing and employment estimates for the Project.

The increase in housing and employment that would occur with Project implementation is consistent with the projections for the Project site included in the traffic analysis zones (TAZs) and corresponding figures in the Southern California Association of Governments' (SCAG) 2012-2035 and 2016-2040 Regional Transportation Plan/Sustainable Communities Plan (RTP/SCS). The resident population of the Project at buildout is 82.46 percent of the projected resident population of traffic analysis zone (TAZ) 20280000 and TAZ 20281000 by 2035, but exceeds the Southern California Association of Governments (SCAG) projections for 2040. The 2016 Regional Transportation Plan/Sustainable Communities Plan (RTP/SCS) states that TAZ level data or any data at a geography smaller than the jurisdictional level is included in the draft growth forecasts for regional modeling purpose only, and is advisory and non-binding. As such, the exceedance of population growth projections at the Project site on a TAZ level is not considered a significant adverse impact, as discussed in Section 5.9, Population, Housing and Employment. Population, housing, and economic growth relative to

---

<sup>1</sup> The scale and accuracy of exhibit does not allow for identification of an accurate location.

the SCAG RTP/SCS would be less than significant as it relates to the exceedance of regional population projections and no mitigation is required.

***Impact Summary:*** The Project would require amendments to the General Plan Master Plan of Highways and the AVAP Highway Plan to show the internal circulation network proposed onsite. These amendments would establish the highway system that would serve the Project and would be consistent with goals and policies of the *Los Angeles County General Plan* and *Antelope Valley Area Plan (AVAP)*. The Project would not conflict with the applicable plans and policies of SCAG. If approval of the AVAP is invalidated, the Project would require amendments to the AVAGP, as listed above. However, the amendments would not be considered a significant impact since the Project is otherwise consistent with the policies in the overriding General Plan.

**Threshold 8-3**      **Would the project be inconsistent with the County zoning ordinance as applicable to the subject property?**

### **County of Los Angeles Code**

Implementation of the Project would require a zone change of the Project site to Specific Plan, as discussed further below, consistent with the Specific Plan requirement included in the AVAP. Once adopted, the *Centennial Specific Plan* would serve as zoning regulation for the Project.

The required zone change must comply with Chapter 22.16 of County Code, as it relates to the purpose, need, and procedures for a zone change, including findings that the zone change will be in the interest of public health, safety and general welfare; in conformity with good zoning practice; and is consistent with the adopted general plan for the area.

The Project is consistent with the principal considerations set forth in Chapter 22.16 of the County Code for the issuance of a zone change. The Project is consistent with the General Plan and implements the requirements of the AVAP by including a balance of land uses consistent with the intent and the land use designations set forth within the West EOA. The Project includes a mix of housing options within each Village, ranging from apartment homes close to the town center to single-family homes in lower-density areas. A full range of light industrial, business, and other commercial uses are planned that are intended to yield a broad range of employment opportunities, from retail services to large corporate employers. The opportunities for employment diversity increases the overall economic sustainability of the Project and the West EOA.

In support of the AVAP's prioritization for the preservation of natural open space resources, development within areas of significant biological value would be minimized and there would be no disturbance or development within the designated Significant Ecological Area (SEA) on the Project site. In support of the AVAP's goal of reducing single-occupancy vehicle use, the Project includes alternatives to automobile travel (e.g., public transit, bicycle network and pedestrian system) that would minimize traffic, pollution, and greenhouse

gases. Efficient use of land and a balance of uses that result in a jobs/housing balance would reduce single-occupancy automobile travel and vehicle miles traveled.

The Project would not require a CUP for development in HMAs, as discussed below; compliance with the hillside grading requirements in the Specific Plan would ensure the Project would not conflict with the County's Grading Ordinance and comply with the intent of the HMA Ordinance to preserve and enhance the physical integrity and scenic value of HMAs, to provide open space, and to be compatible with and enhance community character. However, proposed grading on the site is estimated at more than 100 million cubic yards; thus, a CUP would be needed pursuant to Section 22.56.217 of the Los Angeles County Code. As required under Section 22.56.090 of the County Code, preliminary findings have been prepared to show that Project grading would not adversely affect public health, peace, comfort and general welfare or be materially detrimental to adjacent users through compliance with the regulations in the Specific Plan, the mitigation measures in the EIR, and applicable County regulations. The size of the Project site (i.e., 12,323 acres) is reflective of the proposed grading under the Conceptual Grading Plan and complies with the Hillside Design Guidelines in the Specific Plan. The Conceptual Grading Plan has been designed to enhance community character and preserve significant open space, as well as allow the Project to be compatible with land uses in the surrounding area. The Project would also be adequately served by roads, sidewalks, trails, and future transit services (see Section 5.10, Traffic, Access, and Circulation) and other public facilities (e.g., fire stations, Sheriff station, schools, library, etc.) and infrastructure (i.e., water, wastewater, drainage, dry utilities) that would be provided/constructed as part of the Project (see Sections 5.14 through 5.20 of the EIR).

The Project also requires a CUP for approval of Project-related infrastructure, including the roadway circulation system, gas, telephone (traditional and wireless services), cable and internet and electric lines within roadway rights-of-way, a water system including domestic and recycled water tanks and pipelines and accessory booster pumps and storage ponds, sewage disposal pipelines and waste water reclamation facilities, water banks, water wells, flood control and drainage facilities, water treatment facilities, green waste composting, solid waste and materials recovery facilities and recycling centers, and an electrical substation. The Project would also include the realignment of National Cement Plant Road, the construction of bridges over the Aqueduct, and improvements to the SR-138 intersections. This CUP is intended to provide a master or programmatic approval of the proposed infrastructure that would be needed to serve the Project. As required under Section 22.56.090 of the County Code, preliminary findings have been prepared to show that the proposed infrastructure would not adversely affect public health, peace, comfort and general welfare or be materially detrimental to adjacent users; that there are adequate areas for these infrastructure and they would be compatible with uses in the surrounding area; and that they would be adequately served by roads and other public facilities and infrastructure.

As discussed under Threshold 8-2, as described above, the Project is consistent with the AVAP with the amendment of the AVAP Highway Plan to add internal project site roadways into Map 3.1 of the AVAP and with the applicable plans and policies of SCAG, and implementation of the Project's development in the West EOA is consistent with the goals

and policies of the AVAP. Because the AVAP has already designated the Project site as an EOA slated for future development, and requires a rezone to Specific Plan, rezoning in conformance with the AVAP would not result in any significant environmental impacts. The proposed zone change and CUPs would be consistent with the County Code and no mitigation is required.

### ***Centennial Specific Plan***

Upon approval of the zone change to Specific Plan and adoption of the *Centennial Specific Plan* (Appendix 4.0-A), the Specific Plan would serve as the regulatory framework for all development on the Project site. The *Centennial Specific Plan* details the permitted land uses, allowable development densities, infrastructure requirements, and public services to be provided on site. Additionally, the *Centennial Specific Plan* establishes the regulatory structure for all future actions on the Project site. Chapter 4 of the *Centennial Specific Plan* states how the Plan will be administered and implemented.

The Specific Plan's Administration and Implementation section describes actions that the Applicant can request. The process for each is explained. In particular, the *Centennial Specific Plan* details the procedures required for such actions as (1) making adjustments to maps, infrastructure, lot lines, street alignments, and trails; (2) making changes to the grading footprint; (3) switching designations from an attached housing product to a detached and vice versa; (4) approving subdivision maps; and (5) modifying building footprints and relocating appurtenant structures. Transfers within and between developments are allowed subject to the regulations stated in the *Centennial Specific Plan*. Future changes and what these might entail are not known as this time; however, for any change of the magnitude that would require an amendment to the *Centennial Specific Plan*, appropriate CEQA documentation would also be required. This would involve addressing any environmental issue that would be affected by the proposed change and mitigation measures would be included as appropriate.

Should there be a conflict between the *Centennial Specific Plan* and existing County ordinances, the provisions of the *Centennial Specific Plan* would prevail, rather than the regulations of Title 21, Subdivisions (Subdivision Ordinance), or the zoning standards established by Title 22 of the Los Angeles County Code. Topics not addressed by the *Centennial Specific Plan* shall be governed by the rules and regulations in Titles 21 and 22 of the Los Angeles County Code. The Project would be developed consistent with the *Centennial Specific Plan*. Therefore, impacts related to the initial inconsistency with the County zoning ordinance would be less than significant and no mitigation would be required.

### **Local Agency Formation Commission Policies**

The Project site is not located within a designated sphere of influence and would not require annexation to a city. There are a number of special districts that serve the Antelope Valley area, some of which include the Project site (such as the Antelope Valley – East Kern Water Agency, Consolidated Fire Protection District, and Antelope Valley Resource Conservation District). However, other special districts do not include or include only a portion of the site, such as the Antelope Valley Health Care District (includes eastern end of the site only),

Antelope Valley Mosquito and Vector Control District, and Lancaster Cemetery District (includes eastern end of the site only). Annexation of the Project site into the service areas of these special districts would require approval by the Local Agency Formation Commission (LAFCO) for the County of Los Angeles. Since the services provided by these special districts are not considered “backbone municipal services”, annexation of the site is not required. Should annexation be proposed, an increase in property taxes could occur, which would be used to fund the operations of the special districts. The Project would not conflict with LAFCO policies related to the annexation of the site in to these special districts. Impacts would be less than significant and no mitigation would be required.

***Impact Summary:*** The Project would require a zone change for the site to Specific Plan, a CUP for grading, and a CUP for Project-related infrastructure, in accordance with the County Code. Once adopted, as described above, the *Centennial Specific Plan* would provide the regulatory framework for future land uses and development on the site. The Project would not conflict with LAFCO policies related to the Project.

**Threshold 8-4      Would the project conflict with Hillside Management criteria, Significant Ecological Areas conformance criteria, or other applicable land use criteria?**

As discussed previously, Sections 22.56.217 and 22.56.215 of the County Code require a CUP for lot line adjustments, subdivisions, new construction, or building expansion in HMA- or SEA-designated areas, respectively. Small portions at the western and southeastern sections of the Project site are designated as HMAs and the majority of these areas are also proposed by the Project to be preserved as Open Space (PDF 8-1).

In accordance with Section 22.56.217, Hillside Management Areas – Additional Regulations, Subsection C.7., a conditional use permit is required for any development located wholly or partly in a Hillside Management Area, except for development within any adopted Specific Plan, provided that such development complies with the provisions of that Specific Plan. Therefore, a CUP would not be required for development in Hillside Management Areas, since the Project includes approval of a Specific Plan. However, the Project would comply with the Hillside Design Guidelines by (1) locating development outside HMAs to the extent feasible; (2) locating development in the portions of HMAs with the fewest hillside constraints; and (3) using sensitive hillside design techniques tailored to the unique site characteristics. Exhibit 4-19a, Centennial Project – Slope Analysis, in Section 4.0, Project Description, shows the existing slopes on the Project site. Most of the on-site areas with slopes over 25 percent are proposed as Open Space. The primary hillside features are the western portion of Oso Canyon and the mountainous areas along the western and southern edges of the site generally within the designated SEA 17. The Project would avoid all impacts within the SEA, and therefore avoid the majority of the steeply sloped areas of the site. Exhibit 4-19b, Centennial Project – Conceptual Grading Plan, in Section 4.0, Project Description, shows the confinement of development to relatively flat areas and shows a general grading approach that would eliminate the potential safety threat of steep slopes. However, some areas with slopes over 25 percent would be graded. Based upon the preliminary slope analysis, approximately 26 percent of slopes greater than 25 percent will

be affected by grading and many of these slope areas are small and isolated. The Conceptual Grading Plan depicts the general grading approach for the topography of the Project Site and has been designed to eliminate the potential safety threat posed by development in areas with steep slopes. As shown the majority of the areas with steep slopes are avoided and will be preserved through the on-site mitigation lands, which include approximately 3,861 acres.

Implementation of the Conceptual Grading Plan and compliance with the Hillside Design Guidelines in Appendix 1-B of the Specific Plan, as described above, would make the Project consistent with the County's goals and policies related to hillside management. Thus, no conflict with Hillside Management criteria would occur with Project development. As discussed above, proposed grading on the site would require a CUP pursuant to Section 22.56.217 of the Los Angeles County Code. This impact is considered less than significant and no mitigation is required.

The San Andreas SEA includes the western section of the site, which is proposed as Open Space. There would be no land use development within the SEA; therefore, no conflict with the San Andreas SEA would occur with the Project, as discussed in Section 5.7, Biological Resources, and no permits or mitigation would be required.

Portions of the eastern section of the site are within designated Agricultural Resource Areas (ARA) and Goal COS 6 addresses the protection of ARAs; however, limits on development in ARAs are not applicable within the EOAs (AVAP Policy LU 2.3). Since the Project site is located within the West EOA where future development is planned, in order to preserve agricultural areas outside the EOAs, there would be no conflict with this land use designation and no permits or land use mitigation is required; agricultural mitigation measures are included in Section 5.5, Land Resources.

***Impact Summary:*** The Project would comply with the Hillside Design Guidelines, which would be incorporated into the hillside provisions within the Specific Plan. The CUP for the proposed grading is needed to allow the estimated volume of grading but would be consistent with the County Code. Therefore, impacts would be less than significant. The Project would not involve development with the San Andreas SEA; and while there are Agricultural Resource Areas on the site, the site is located in an EOA, where future development is planned to preserve agricultural areas outside the EOAs. No conflict to County policies for Hillside Management areas, Significant Ecological Areas, and Agricultural Resource Areas would occur; impacts would be less than significant.

### 5.8.7 MITIGATION MEASURES

With approval of the required entitlements, including the General Plan Amendment, zone change, and CUPs as discussed above and LAFCO annexation into existing special districts, no significant impacts related to land use, entitlements and planning would occur; therefore, no mitigation measures are necessary. The Project would also have less than significant land use impacts with the AVAGP plan amendments, zone change and other associated entitlements.

## 5.8.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

A General Plan Amendment to the General Plan Master Plan of Highways and the AVAP Highway Plan, a zone change for the Project site to Specific Plan, and the CUPs for grading over 100,000 cubic yards and for Project-related infrastructure would be consistent with the requirements of the County General Plan, Antelope Valley Area Plan, and County Zoning Ordinance. Impacts are considered less than significant since the Project would not conflict with applicable regional or County land use plan, policy, or criteria.

## 5.9 POPULATION, HOUSING, AND EMPLOYMENT

### 5.9.1 INTRODUCTION

#### **Purpose**

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that population, housing, and employment issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criteria for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

The analysis in this section addresses the impacts on population, housing, and employment that would result from implementing the proposed Project. The analysis focuses on the northern part of the County as described in the County's Antelope Valley Area Plan (AVAP), and the generally overlapping North Subregion of Los Angeles County (as designated by the Southern California Association of Governments (SCAG), which is where the Project site is located). The North Los Angeles County Subregion includes all land within Los Angeles County north of the northern border of the City of Los Angeles. It extends from the eastern border of Los Angeles County west to the Ventura County border; includes the Santa Clarita and Antelope Valleys and the incorporated Cities of Lancaster, Palmdale, and Santa Clarita.

There is no wholly reliable population, housing, or employment data after 2010, as the U.S. Census is conducted every ten years. All data provided for non-Census years, or years after 2010, should be viewed as demographic projections or estimates.

#### **Summary**

Implementation of the Project would result in (1) the introduction of a maximum of 19,333 housing units; (2) the creation of an estimated 23,675 permanent jobs; and (3) a maximum resident population of approximately 57,150 persons at Project buildout, which is estimated to occur in 2035. As detailed below, the estimate of a buildout population of approximately 57,150 persons serves as a conservative estimate used for impact analysis, since the number of dwelling units constructed in each planning area are not likely to be at maximum densities but would vary within the density range. Similarly, household sizes may differ from the averages used and the resulting resident population would likely be less than 57,150 persons.

Under the Specific Plan, reconfiguring an existing single family home to accommodate a Living Suite is permissible and does not create a new dwelling unit. Without regard to whether a state density bonus is ever used on the Project site, the total number of dwelling units, inclusive of all product types, cannot exceed the number of dwelling units identified in Section 4.0, Project Description and considered in this EIR absent further CEQA review.

While the Project would increase the resident population in the Antelope Valley, it would be located in an area designated for future development as an Economic Opportunity Area (EOA) in the 2015 AVAP. The site is part of the West EOA, which is located along State Route (SR) 138, near Interstate (I) 5, east and west of the California Aqueduct. Most of the land in the vicinity of the Project site is designated as Open Space in the AVAP and is expected to remain undeveloped. Development on approximately 4,109 acres in the immediate Project area designated for potential development (e.g., areas with Rural Land, Rural Commercial, and Rural Mixed Use designations) within this EOA may also occur, although no applications are pending. The land immediately to the west (Gorman Post Ranch) currently has a development application pending with the County of Los Angeles for future residential development, although it is not consistent with the 2015 AVAP.

As stated in Policies LU 1.1 and LU 1.2 of the AVAP, future development in the Antelope Valley shall be directed into rural town center areas and EOAs, while limiting development in rural preserve areas. Consistent with the AVAP and the intent of EOAs, the Project would accommodate growth in the Antelope Valley through new residential, commercial and light industrial developments, while preserving the rural character and ecological resources of the surrounding areas. The site is also identified as a Future Rural Town Area which would serve as a transition between rural town centers and rural preserve areas, and where future development is anticipated. Thus, population growth associated with the Project is consistent with anticipated population increases under the AVAP.

SCAG projects that Los Angeles County will experience substantial growth between 2012 and 2040 (SCAG 2016c). The Project site is also located in traffic analysis zones (TAZs)<sup>1</sup> where future growth is expected (SCAG 2012e). Future growth in the County is expected to occur as infill development in urban centers, as well as new development on vacant lands. The Project would lead to growth in employment, housing, and population on largely vacant land. The proposed Project is consistent with the household and employment projections for the area that includes the Project site in the SCAG's 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (SCAG 2012e) and 2016 RTP/SCS (SCAG 2016a), and the proposed Project is consistent with the demographic projections in the AVAP.

As discussed in Section 5.8, Land Use, Entitlement and Planning, the Project would implement the guiding principles, goals and policies of SCAG's Regional Comprehensive Plan (RCP) and RTP/SCS as they relate to livability, economic prosperity, and sustainability through the development of walkable, mixed use communities at emerging centers and along major transportation corridors. At the same time, the Project would conserve natural resources and open space. The development of housing and job opportunities at the site, schools, parks and public facilities, and a circulation system (including roads, greenways, bikeways and trails) would reduce vehicle trips and their associated emissions. These Project features would promote sustainability consistent with regional goals.

The Project would also contribute to meeting the State-mandated Regional Housing Needs Assessment (RHNA) housing production goals for the unincorporated areas of the County

---

<sup>1</sup> SCAG divides the entire region into traffic analysis zones (TAZs) as a basic geographic unit for its growth projections.

and would be consistent with the regional effort to boost housing production to meet regional housing needs. Much of the land near the Project site is not suitable for further development beyond that which would be implemented as part of the proposed Project.

The AVAP intends to provide a jobs/housing ratio of 1.3 jobs per dwelling unit in the unincorporated area of the Antelope Valley, within designated EOAs. The Economic Development Element of the AVAP sets a strategy of designating areas for light and heavy industrial uses near major transportation corridors and/or a concentration of skilled labor force in EOAs. The Project would implement this strategy, and would provide an estimated jobs/housing ratio of 1.22, through the development of commercial and business park uses on the site, for use by high-tech manufacturing, transportation, and logistics companies. The Project would also include residential development to create a mixed use community within the West EOA, consistent with the Land Use Policy Map in the AVAP.

In summary, implementation of the Project is considered growth accommodating rather than growth inducing at a regional level based on SCAG projections. Therefore, would be less than significant in relation to planned growth in the region. However, because the Project would substantially increase population and housing relative to the existing Project site conditions, this increase in population and housing on the Project site is considered significant and unavoidable. However, no mitigation would be appropriate since the Project is consistent with approved growth plans in the region.

There would be less than significant impacts related to the potential displacement of people or housing units as a result of the Project since the majority of the Project site is undeveloped. An existing residence of a Tejon employee is located near the northern boundary of the Project site. This residence would be left in place until development occurs near this area, at which time a notice would be provided and displacement would be voluntary. The residence would then be demolished or relocated.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations

- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
    - Population
    - Housing
    - Employment
  - Off-site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

The main references used in this section include the AVAP, which designates areas for development in the unincorporated areas of the Antelope Valley, and the EIR for the AVAP, which provides buildout projections for population, households, and employment. SCAG's latest growth forecasts were adopted in 2016 and included forecasts at the regional, county, city, subregional, and TAZ levels. Population estimates for the proposed Project assume an average household size of 3.17 persons per household for single-family detached units and 2.38 persons per household for attached and multi-family units (based on data provided by the County Department of Regional Planning) as derived from the Mission Village EIR (SCH No. 2005051143) and the Landmark Village EIR (SCH No. 2004021002).

The analyses in this EIR relied on the 2012 and 2016 Growth Forecasts used by SCAG in the RTP/SCS for the region. Where applicable, California Department of Finance (DOF) population and housing estimates for intervening years are also provided. Additional information was provided by various references listed in Section 5.9.9, below. Affordable housing information for the Project was derived from the Centennial Affordable Housing Implementation Plan (please see Appendix 3-C of the *Centennial Specific Plan*, which is EIR Appendix 4.0-A).

## 5.9.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

### Plans and Policies

#### *Federal*

No federal plans or policies have been identified that relate to population, housing, and employment.

## ***State***

### Housing Element Law

State law requires each City and County to adopt a general plan, with a mandatory Housing Element. Housing Elements are required to be updated every five to eight years and must address the availability of an adequate supply of housing affordable to workers, families, and seniors. Local governments must plan to meet their existing and projected housing needs of all economic segments of the community, including their share of the regional housing need. The State Department of Housing and Community Development (HCD) assigned a target range of 409,060 to 438,030 units to the 6-county SCAG region, including Los Angeles County, for the period 2014–2021 (HCD 2011).

## ***Regional***

SCAG functions as the Metropolitan Planning Organization (MPO) for six Southern California counties: Imperial, Orange, Riverside, San Bernardino, Ventura, and Los Angeles. Regional plans are prepared and adopted by SCAG, which is the Council of Governments for the County of Los Angeles, the CEQA Lead Agency for this project. As stated in Section 5.8, Land Use, Entitlements and Planning, the federal government mandates that SCAG research and draw up plans for transportation, growth management, hazardous waste management, and air quality for its region. SCAG has developed a number of plans to achieve these regional objectives. The most applicable to population, housing, and employment are the RCP (SCAG 2008) and RHNA (SCAG 2012d).

### Regional Comprehensive Plan (RCP)

The 2008 RCP calls for City and County involvement and coordination in addressing regional issues related to growth management and development. It serves as an advisory document for preparing local plans and handling issues of regional significance, such as land use and housing, open space and biological habitats, water, energy, air quality, solid waste, transportation, security and emergency preparedness, economy, and education.

There are three levels of recommendations for the region: goals, outcomes, and an action plan that contains constrained policies (or near-term, feasible policies) and strategic initiatives (longer-term strategies) for each regional issue. However, the RCP only functions as a voluntary “toolbox” to assist local jurisdictions in making General Plans, Specific Plans, and individual projects more sustainable. As identified in Resolution No. 08-502-1 (Resolution of the Southern California Association of Governments Accepting the 2008 Regional Comprehensive Plan for the SCAG Region), given its advisory nature, the 2008 RCP is not used in SCAG’s Inter-Governmental Review (IGR) process (SCAG 2008).

### Regional Housing Needs Allocation (RHNA)

The RHNA provides an allocation of the existing and future housing needs by jurisdiction that represents the jurisdiction’s fair share allocation of the projected regional population growth. The future housing needs allocations are broken down by income level so that each jurisdiction is responsible for the development of affordable housing units to meet future housing needs.

SCAG defines “existing needs” as the number of low-income households overpaying for housing (defined as paying more than 30 percent of their income), as well as those in severe overcrowded conditions, farm worker needs for housing, and affordable housing units at risk of conversion to market rate housing. It defines “future needs” as the number of additional housing units by income level that will have to be created in each City and unincorporated County area as a fair share of the region’s projected housing needs based on the estimated population growth in the city and region. The breakdown of future housing needs by income level allows each jurisdiction to be responsible for the development of affordable housing units throughout the region and avoid the concentration of low income households.

### ***County***

#### County of Los Angeles General Plan and Antelope Valley Area Plan (AVAP)

The *County of Los Angeles General Plan* and AVAP address population, housing, and employment issues that affect the County. Relevant goals and policies in the AVAP include those listed below from the Land Use, Economic Development, and Housing Elements:

#### *Land Use Element*

- **Policy LU 1.1:** Direct the majority of the unincorporated Antelope Valley’s future growth to rural town center areas and identified economic opportunity areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

#### *Economic Development Element*

**Goal ED1:** A healthy and balanced economic base in the Antelope Valley that attracts a wide range of industries and businesses and provides high-paying jobs for local residents.

- **Policy ED 1.1:** Promote the continued development of regional commercial and industrial employment centers in economic opportunity areas in the Antelope Valley.
- **Policy ED 1.3:** Support the growth of “high-tech” industries to employ the Antelope Valley population’s highly educated workforce.
- **Policy ED 1.14:** Promote appropriate types of residential development in the vicinity of existing communities and town centers that are in reach of existing infrastructure and utilities.
- **Policy ED 1.15:** Where appropriate, promote residential development as part of a wider mixed use strategy in communities that desire such uses in their areas and where plans for major infrastructure and facilities are currently underway. These areas have been identified as economic opportunity areas as shown in the Land Use Policy Map (Map 2.1) of this Area Plan.

#### *Los Angeles County Housing Element*

The 2014–2021 Housing Element of the County identifies the County’s existing and projected housing needs in the unincorporated areas, its goals, policies, and programs to meet these

needs; and actions that would encourage housing development in the County to address its housing needs. The County has a future housing need for 30,145 new dwelling units for the 2014–2021 planning period and there are adequate sites in the County to build these units. The County has also developed programs to reduce regulatory barriers and provide incentives for housing development.

A consistency analysis of the proposed Project with the specific goals and policies with the County’s relevant plans, policies and regulations is provided in the Land Use, Entitlements, and Planning section (Section 5.8) in this document.

### 5.9.3 ENVIRONMENTAL SETTING

#### Population

##### *Regional*

##### Southern California Association of Governments (SCAG)

As part of its regional planning efforts, SCAG adopted growth projections for its use in the update of regional plans. These projections are based on coordination with the SCAG Plans and Programs Technical Advisory Committee, the DOF, County and local jurisdictions, County Transportation Commissions, the general public, and other major stakeholders. In accordance with interagency coordination, these projections are based on anticipated trends in employment, national growth, migration patterns, and internal birth rates. SCAG’s growth projections include increased population and development activities for the area that includes the Project site.

Data from the 2012 and 2016 RTP/SCS is included in this section to best present the most recent population, housing, and employment projections for the SCAG region. As shown in Table 5.9-1, SCAG Region Population Projections, the SCAG region is anticipated to increase by approximately 1,073,000 residents between 2012 and 2020 and by 2.743 million between 2020 and 2040, for a total population of over 22 million people by 2040.

**TABLE 5.9-1  
SCAG REGION POPULATION PROJECTIONS**

	2000 <sup>a</sup>	2010 <sup>b</sup>	2016 <sup>c</sup>			
SCAG Region	16,516,006	18,051,534	18,954,083			
2012 Projections <sup>d</sup>			<b>2008</b>	<b>2020</b>	<b>2035</b>	
			17,895,000	19,663,000	22,091,000	
2016 Projections <sup>e</sup>			<b>2012</b>	<b>2020</b>	<b>2035</b>	<b>2040</b>
			18,322,000	19,395,000	21,486,000	22,138,000
SCAG: Southern California Association of Governments						
Sources:						
<sup>a</sup> DOF 2011, <sup>b</sup> DOF 2012, <sup>c</sup> DOF 2016, <sup>d</sup> SCAG 2012a, <sup>e</sup> SCAG 2016c.						

As stated above, SCAG's growth forecasts serve as the most current projections, and were informed by input from the County and other local jurisdictions, and continue to show planned future development consistent with the Project on the Project site. The Project's planned population and housing growth is also consistent with the County's Antelope Valley Area Plan, as discussed further in, Section 5.8, Land Use, Entitlements and Planning.

### **County of Los Angeles**

Los Angeles County, which includes the Project site, has been, and continues to be, the most populous county in the Southern California region. In 2000, the County's population including cities, totaled 9,519,338 persons (DOF 2011). The DOF estimates the County's January 2016 population at 10,241,335 persons (DOF 2016).

Table 5.9-2, Los Angeles County Population, includes data from the 2000 and 2010 U.S. Census included in the DOF estimates of the current Los Angeles County population. The County population is estimated to have increased by 7.6 percent or 721,997 people between 2000 and 2016.

**TABLE 5.9-2  
LOS ANGELES COUNTY POPULATION**

	<b>2000<sup>a</sup></b>	<b>2010<sup>a</sup></b>	<b>2016<sup>b</sup></b>
Lancaster	118,718	156,633	157,094

Los Angeles County Total	9,519,338	9,818,605	10,241,335
N/A: Not available			
Sources:			
<sup>a</sup> DOF 2011, <sup>b</sup> DOF 2016, <sup>c</sup> SCAG 2016d.			

Table 5.9-3 presents SCAG's 2012 projections and 2016 projections for the County. SCAG's 2012 projections show the Los Angeles County population was projected to increase by approximately 1.11 million people between the DOF 2016 data (10,241,335 residents) and SCAG's projected 2035 population (11,353,000 residents) (SCAG 2012a). SCAG's 2016 projections show an increase of 0.90 million people between the DOF 2016 data (10,241,335 residents) and SCAG's projected 2035 population (11,145,100 residents) and an increase of 1.27 million people between the DOF 2016 data (10,241,335 residents) and SCAG's projected 2040 population (11,514,800 residents) (SCAG 2016b).

**TABLE 5.9-3

### North Los Angeles County Subregion

The North Los Angeles County Subregion includes all land in Los Angeles County north of the northern border of the City of Los Angeles and all cities and unincorporated communities bordering the southern edge of the Angeles National Forest. The population of North Los Angeles County, which includes the Project site, was estimated at 658,755 persons in 2010, which was 6.7 percent of the total County population of 9,818,605 persons (SCAG 2016d). The 2012 resident population of this Subregion is estimated at 657,825 persons (SCAG 2016e). The unincorporated area within this Subregion is projected to have 186,918 residents in 2020 and 312,291 residents in 2040 (SCAG 2017).

From 2000 to 2016, the City of Santa Clarita grew by 45.4 percent, while the Cities of Palmdale and Lancaster grew by 37.2 percent and 32.3 percent, respectively. This population growth is a result of both natural increase (births) and immigration from other regions. These rates exceed Los Angeles County's overall rate of 7.6 percent for the same time period (DOF 2011, 2016).

From DOF's 2016 data to SCAG's projected 2040 population, the resident population is anticipated to grow in the Cities of Santa Clarita (19.4 percent), Lancaster (33.6 percent), and Palmdale (25.9 percent) (DOF 2016, SCAG 2016b). The population of North Los Angeles County is also projected to increase by 49.86 percent from SCAG's 2012 to 2040 estimates (SCAG 2016e). The unincorporated areas in North Los Angeles County would also grow from a 2012 estimate of 143,325 persons to 186,875 persons by 2020 (30.4 percent) and to 312,240 persons by 2040 (17.2 percent) (SCAG 2012b, 2016d, 2016e).

Table 5.9-2 (above) indicates that the North Los Angeles County Subregion will continue to represent a growing portion of the County's population, increasing to 7.2 percent of the County population in 2020 and to 8.6 percent of the County population in 2040 (SCAG 2016e). This trend is, in part, due to the developed characteristics of eastern, central, and southern Los Angeles County, where land for additional development is in limited supply.

Much of the undeveloped land in western Los Angeles County is constrained by environmental factors. Thus, the North Los Angeles County Subregion represents the most viable area for substantial future growth and development in the County.

### *Antelope Valley*

The AVAP was adopted by the Los Angeles County Board of Supervisors on June 16, 2015 (LACDRP 2015b). As part of the AVAP, population projections were provided through the year 2035. Since the Antelope Valley is not a Census Designated Place (i.e., a region identified by the U.S. Census Bureau for statistical purposes), all data in Table 5.9-4, Population Projections for the Antelope Valley are projections based on development and demographic estimates by the County, SCAG and DOF. (SCAG's 2012 and 2016 projections for the Cities of Lancaster and Palmdale are provided in Table 5.9-3 above.)

**TABLE 5.9-4

<sup>a</sup> Los Angeles County 2015c, <sup>b</sup> DOF 2016, <sup>c</sup> SCAG 2016b					

### *Project Site*

There is an existing residential dwelling unit located east of the Aqueduct and near the center of the northern property line. Assuming an average household size of 3.52 persons per household (January 2016 average for unincorporated areas of the County) (DOF 2016), the Project site would have a resident population of approximately 4 individuals.

SCAG's growth projections included a breakdown at the TAZ level. The Project site is located in portions of two TAZs and population projections for these TAZs are provided in Table 5.9-5 below. TAZ 20280000 includes the area north of SR-138 and east of I-5. TAZ 20281000 includes the area south of SR-138 (see Exhibit 5.9-1). As shown, significant population growth is anticipated in TAZ 20280000, which covers the portion of the Project site north of SR-138.

TAZ projections for the area that includes the Project site, which were also reflected in corresponding figures included in the 2012 RTP/SCS (SCAG 2012e) and 2016 RTP/SCS (SCAG 2016a), are consistent with the existing population and housing stock in the area and the projected household and employment components of the Project. The 2040 household projections at the TAZ level in the 2016 RTP/SCS are consistent with the proposed Project's

Centennial Project

# Exhibit 5.9-1

buildout estimates; however, the 2040 population projections by SCAG are less than the Project's buildout population. The difference may be due to the average household size used in the projections, such that SCAG assumes a smaller household size.

The Project's population and housing levels are consistent with the County's approved AVAP, as discussed in greater detail in Section 5.8, Land Use, Entitlements and Planning.

### ***Kern County***

Kern County occupies approximately 8,200 square miles and is located directly north of Los Angeles County and the Project site. The resident population in the Kern County is centralized in the Bakersfield metropolitan area, which includes the Cities of Bakersfield and Arvin, as well as the unincorporated communities of Oildale, Lamont, Buttonwillow, Old River, Pumpkin Center, Rosedale, and Greenfield. In 2016, the population of Bakersfield (379,110 persons) made up approximately 42.8 percent of the population in Kern County (886,507 persons) (DOF 2016).

The population in Kern County has experienced consistent growth over the past several decades. Between 2000 and 2010, the population rose by 26.9 percent from approximately 661,645 persons to 839,631 persons (DOF 2011). Between 2010 and 2016, the population grew by 5.6 percent. Approximately 34.9 percent of the County's population (309,425 persons) live in the unincorporated areas in 2016 (DOF 2016).

Based on adopted growth forecasts, the Kern County population is anticipated to increase into the foreseeable future, as shown in Table 5.9-6, Kern County Population Projections.

**TABLE 5.9-6

## Ventura County

For the purposes of the analyses included in this EIR and this Section, data from Ventura County were not included. While the Project site is located approximately six miles east of the northeastern corner of Ventura County, no population centers or major transportation routes are located in Ventura County in the regional vicinity of the Project site. Land in Ventura County in the Project vicinity includes the Los Padres National Forest and the Hungry Valley State Vehicular Recreation Area, which would not accommodate future development. The nearest cities to the Project site in Ventura County are the Cities of Fillmore and Ojai, located 27 miles and 35 miles southwest of the Project site, respectively. Both cities are located immediately south of the Los Padres National Forest and neither city serves as a major regional population or employment center. The largest city in Ventura County (by population), Oxnard, is located approximately 44 miles southwest of the Project site. As the Project site is physically and economically separated from population and employment centers within Ventura County, Ventura County will not be analyzed further in this document.

## Housing

### Regional

#### Southern California Association of Governments (SCAG)

In 2000, the 6-county SCAG region had a total of 5,722,035 housing units (DOF 2007) and 6,464,184 units in 2016 (DOF 2016). Table 5.9-7, SCAG Region Household Projections, projects the number of households in the SCAG region through 2040. According to the 2012 projections, the number of households is expected to increase at an average growth rate of about 1.3 percent per year between 2008 and 2035 (SCAG 2012a). The 2016 projections show a slower growth of 0.93 percent from 2012 to 2040 (SCAG 2016c).

**TABLE 5.9-7  
SCAG REGION HOUSEHOLD PROJECTIONS**

	2000 <sup>a</sup>	2010 <sup>b</sup>	2016 <sup>c</sup>			
SCAG Region	5,722,035	6,326,167	6,464,184			
2012 Projections <sup>d</sup>			<b>2008</b>	<b>2020</b>	<b>2035</b>	
			5,814,000	6,458,000	7,325,000	
2016 Projections <sup>e</sup>			<b>2012</b>	<b>2020</b>	<b>2035</b>	<b>2040</b>
			5,885,000	6,415,000	7,172,000	7,412,000
Sources: <sup>a</sup> DOF 2007, <sup>b</sup> DOF 2011, <sup>c</sup> DOF 2016, <sup>d</sup> SCAG 2012a, <sup>e</sup> SCAG 2016a.						

Comparing the DOF data included in Table 5.9-7 and Table 5.9-1, SCAG Region Population Projections, population in the region rose at a faster rate (5.0 percent) than did the number of housing units (2.2 percent) between 2010 and 2016 (DOF 2011, 2016). This has increased population-to-household ratios, which has, in turn, increased the average household size.

**Los Angeles County**

Los Angeles County, which includes the Project site, has the largest housing stock of any county in the Southern California region. In 2016, the County's housing stock totaled 3,504,061 units (DOF 2016). Table 5.9-8, Los Angeles County Housing Stock, includes data on the County's historic housing stock from 2000 to 2016.

**TABLE 5.9-8

Los Angeles County Total	3,228,000	3,513,000	3,852,000	3,257,600	3,493,700	3,809,300	3,946,600
Sources: a SCAG 2012a, b SCAG 2016b, c SCAG 2016d, d SCAG 2016e.							

Table 5.9-10, Los Angeles County 2015 Housing Units by Type, details the breakdown of existing housing units in Los Angeles County. This data shows that nearly half (49.2 percent) the housing stock in the County is comprised of single-family detached residential units; a bigger portion (70.67 percent) of the housing stock in the unincorporated areas are single-family detached residential units (DOF 2016).

**TABLE 5.9-10  
LOS ANGELES COUNTY 2016 HOUSING UNITS BY TYPE**

Housing Type	Number of Units	Percent of Total Units
Single-Family Detached	1,722,821	49.17%
Single-Family Attached	230,228	6.57%
Multifamily, 2-4 Units	286,298	8.17%
Multifamily, 5 or More Units	1,206,417	34.43%
Mobile Homes, Other	58,297	1.66%
<b>Total Units</b>	<b>3,504,061</b>	<b>100.00%</b>
Source: DOF 2016.		

A result of housing production in the County not meeting demand is a potential long-term upward trend in housing prices. While often viewed as a boon by existing property owners, escalating prices result in more families unable to own homes, therefore promoting out-migration to surrounding counties.

#### North Los Angeles County Subregion

##### *Regional Housing Needs Assessment (RHNA)*

As identified above, the SCAG develops the RHNA to identify existing and future housing needs for the region. SCAG uses the County's median household income to determine housing affordability in each county. RHNA housing allocations are divided into five categories, which are each based on the County's median household income for a family of four persons:

- **Extremely Low Income:** Less than 30 percent of the County median family income.
- **Very Low Income:** A maximum of 50 percent of the County median family income.
- **Low Income:** A maximum of 80 percent of the County median family income.
- **Moderate Income:** A maximum of 120 percent of the County median family income.
- **Above Moderate Income:** More than 120 percent of the County median family income.

Income limits are also adjusted for household size so that larger households have higher income limits than smaller households. The adjustments in income based on household size are as follows:

Number of Persons in Household	Income Adjustment
1	70%
2	80%
3	90%
4	Base (100%)
5	108%
6	116%
7	124%
8	132%

With the median income in Los Angeles County at \$64,800 in 2016, the income limits per household size are provided in Table 5.9-11.

**TABLE 5.9-11  
LOS ANGELES COUNTY INCOME LIMITS (2016)**

Household Income Category	Number of Persons in Household							
	1	2	3	4	5	6	7	8
Extremely Low Income	\$18,250	\$20,850	\$23,450	\$26,050	\$28,440	\$32,580	\$36,730	\$40,890
Very Low Income	\$30,400	\$34,750	\$39,100	\$43,400	\$46,900	\$50,350	\$53,850	\$57,300
Lower Income*	\$48,650	\$55,600	\$62,550	\$69,450	\$75,050	\$80,600	\$86,150	\$91,700
Median Income	\$45,350	\$51,850	\$58,300	\$64,800	\$70,000	\$75,150	\$80,350	\$85,550
Moderate Income	\$54,450	\$62,200	\$70,000	\$77,750	\$83,950	\$90,200	\$96,400	\$102,650

\* Lower income exceeding the median income is an anomaly for this County due to US Department of Housing and Urban Development (HUD) historical adjustments to median income. Households low income figures are derived from very low income figures that are not adjusted by HUD for exceptions.

Source: HCD 2016.

In accordance with the RHNA, the County's Housing Element states that for the entirety of the unincorporated areas of the County, 30,145 new housing units are needed to meet its future housing needs between 2014 and 2021. Part of this housing need would be provided in the unincorporated areas located within the North Los Angeles County Subregion. Housing development would also occur in the cities of Lancaster, Palmdale and Santa Clarita to meet their future housing needs. Table 5.9-12, Future Housing Needs: 2014–2021 provides the breakdown of future housing needs by income level.

**TABLE 5.9-12  
FUTURE HOUSING NEEDS: 2014–2021**

Household Income Category	Future Housing Needs			
	Unincorporated Areas (Countywide)	Lancaster	Palmdale	Santa Clarita
Very Low Income	7,854	627	1,395	2,208
Lower Income	4,650	384	827	1,315
Moderate Income	5,060	413	898	1,410
Above Moderate Income	12,581	1,086	2,332	3,389
<b>Total</b>	<b>30,145</b>	<b>2,510</b>	<b>5,452</b>	<b>8,322</b>

Source: SCAG 2012d.

The unincorporated areas of the North Los Angeles County Subregion (specifically, the Santa Clarita and Antelope Valley areas) account for a substantial proportion of new home construction and existing home resale activity in Los Angeles County. SCAG projects that the North Los Angeles County Subregion would have 245,473 households by 2020 and 331,399 households by 2040, an increase of 85,926 households over 20 years (SCAG 2016e). The unincorporated area within this Subregion is projected to have 69,982 households in 2020 and 116,546 households in 2040 (SCAG 2017).

In the County's Housing Element, the housing potential in the Newhall Ranch Specific Plan and the Northlake Specific Plan are included in the Adequate Sites Inventory for the North Los Angeles County Subregion.

Although the RHNA targets for the unincorporated County area as a whole are not broken down by subregion or community, the proposed Project would help meet the demand for housing and the need for affordable housing in the North Los Angeles County Subregion, which includes unincorporated County areas. Thus, these housing goals are applicable to the proposed Project.

#### *Antelope Valley*

The AVAP, adopted by the Los Angeles County Board of Supervisors in 2015, does not include detailed housing stock data, but the EIR for the AVAP provides housing stock information for the Antelope Valley area, as provided in Table 5.9-13.

**TABLE 5.9-13  
ANTELOPE VALLEY HOUSING STOCK**

	2000	2010	2013	Post-2035/Buildout
Unincorporated Area	21,803	26,962	24,739	106,180

Source: LACDRP 2015c

*Project Site*

The site contains very limited development. As noted above, the existing residence of a Tejon employee is located at the northern central boundary of the site.

As discussed above, the SCAG 2012 and 2016 TAZ projections for households on the areas including the Project site are consistent with the Project's proposed housing development, and SCAG's household growth projections for the TAZs that include the Project site are provided in Table 5.9-14 below.

***Kern County***

Kern County Council of Governments (KCOG) has developed housing projections for the cities and unincorporated area of Kern County as part of its RHNA and for use in its RTP. The projections show that Kern County is anticipated to experience substantial housing growth over the next decade. This growth is projected to approximately keep pace with the County's projected population increase. Between 2016 and 2030, Kern County's population is anticipated to grow by 36.3 percent, and over the same time period, the housing stock is projected to increase by 43.1 percent. Table 5.9-15, Kern County Housing Projections, outlines Kern County's existing and projected housing stock. Much of Kern County's growth is projected to occur in the Bakersfield Metropolitan Area (approximately 50 miles north of the Project site).

**TABLE 5.9-15  
KERN COUNTY HOUSING PROJECTIONS**

	2000 <sup>a</sup>	2010 <sup>b</sup>	2013 <sup>b</sup>	2016 <sup>c</sup>	2020 <sup>b</sup>	2023 <sup>b</sup>	2030 <sup>b</sup>
Unincorporated Area	100,694	112,117	113,221	114,052	136,200	139,400	147,300
Kern County Total	231,567	284,367	288,624	294,401	352,300	371,800	421,200
Sources: <sup>a</sup> DOF 2011, <sup>b</sup> KCOG 2014a, <sup>c</sup> DOF 2016.							

Kern County is not part of the SCAG region and the SCAG RHNA does not identify the housing needs for Kern County. The KCOG and the HCD have determined that Kern County will

require a substantial increase in housing stock over the next several years. According to the Kern County RHNA, Kern County's allocation of housing units for the period between January 2013 and December 2023 is 67,675 units. Table 5.9-16, Kern County Future Housing Need: 2013–2023, provides a breakdown of housing needs by income level. As with the SCAG, affordability categories discussed previously, the income levels are based on the median household income within Kern County, which was \$57,900 in 2015.

**TABLE 5.9-16  
KERN COUNTY FUTURE HOUSING NEED: 2013–2023**

Income Level	Future Housing Need			
	Total for Kern County	Percentage	Unincorporated Area	Percentage

## Employment

### Regional

#### Southern California Association of Governments (SCAG)

Historically, the SCAG region has experienced significant job growth. The data provided represents the most current projections and were adopted as part of the 2016–2040 RTP/SCS. The SCAG region's employment base decreased by 3.43 percent between 2000 and 2010 (SCAG 2012a). However, Table 5.9-17, SCAG Region Employment Projections, shows that regional employment between 2012 and 2040 is forecasted to increase by approximately 2.432 million jobs or at a rate of 1.17 percent per year to 2040.

**TABLE 5.9-17  
SCAG REGION EMPLOYMENT PROJECTIONS**

Note: The grayed-out boxes do not apply or have corresponding data.

**Los Angeles County**

During the period between 2007 and 2013, an approximately 3.3 percent decrease in the number of jobs occurred Countywide, with an 11 percent decrease in the unincorporated County area (SCAG 2015a). As shown in Table 5.9-18, Los Angeles County Employment Base, the County experienced a decline in employment in most areas due to the economic recession.

**TABLE 5.9-18

N/A - Not available Sources: <sup>a</sup> SCAG 2015a, <sup>b</sup> SCAG 2012a, <sup>c</sup> SCAG 2016d.				

Table 5.9-19 provides SCAG's employment projections. According to SCAG's 2012 forecasts, employment growth rates in Los Angeles County are expected to be positive for the foreseeable future, with an increase to 4,558,000 jobs by 2020 and to 4,827,000 jobs by 2035 (SCAG 2012a). SCAG's 2016 forecasts shows employment growth rates in Los Angeles County will increase to 4,662,500 jobs by 2020 and to 5,225,800 jobs by 2040 (SCAG 2016b). As shown in the table, SCAG expects a lower growth rate for the County as a whole, with higher job growth in the unincorporated area and in the Cities of Lancaster, Palmdale and Santa Clarita.

**TABLE 5.9-19  
LOS ANGELES COUNTY EMPLOYMENT PROJECTIONS**

	2012 Projections <sup>a</sup>			2016 Projections <sup>b</sup>

### North Los Angeles County Subregion

SCAG projects that the North Los Angeles County Subregion will experience a higher job growth rate than the County as a whole. As shown in Table 5.9-19 above, between 2020 and 2035, the North Los Angeles County Subregion is projected to experience a 22.1 percent increase in employment, compared to an 8.6-percent increase in the County as a whole. Between 2035 and 2040, the job base in this Subregion would increase by another 8.7 percent. This Subregion is projected to account for 12.3 percent of the County's new job growth between 2020 and 2040 (SCAG 2016e). The unincorporated area within this Subregion is projected to have 43,648 jobs in 2020 and 84,624 jobs in 2040 (SCAG 2017).

### *Antelope Valley*

The AVAP, adopted by the Los Angeles County Board of Supervisors in 2015, does not include detailed employment data and the EIR for the AVAP only includes the SCAG estimates of 38,608 jobs in 2008 in the unincorporated areas of the Antelope Valley and the Santa Clarita Valley; with a projection of 64,875 jobs by 2020 and 97,763 jobs by 2035. A 2013 employment base in the unincorporated Antelope Valley area of 31,838 jobs and a Post-2035 buildout estimate of 102,513 jobs is also provided in the AVAP EIR (LACDRP 2015c).

### *Project Site*

While the site includes a portion of the High Desert Hunt Club and a large portion of the site is used for grazing and agricultural activities, there are no employees permanently stationed at the site.

SCAG's employment growth projections for the TAZs that include the Project site (see Exhibit 5.9-1) are provided in Table 5.9-20 below. As shown, employment growth is anticipated in both TAZs that include the Project site, and includes employment generation associated with implementation of the Project.

### ***Unemployment***

Unemployment rates are variable, based on local, regional, and national economic conditions. Table 5.9-21, Unemployment Rates, lists the unemployment rates in 2000, 2010 and 2016, as calculated by the State Economic Development Department.

**TABLE 5.9-21  
UNEMPLOYMENT RATES**

	2000 <sup>a</sup>	2010 <sup>b</sup>	2016 <sup>c</sup>
State of California	5.0%	12.4%	5.0%
Los Angeles County	5.7%	12.6%	4.8%
Palmdale	–	15.5%	6.5%
Lancaster	–	17.5%	5.4%
Santa Clarita	–	7.8%	4.4%
Kern County	9.0%	15.9%	9.2%
Sources: <sup>a</sup> EDD 2015, <sup>b</sup> EDD 2013, <sup>c</sup> EDD 2016a, 2016b.			

### **Los Angeles County**

As shown in Table 5.9-21 above, in April 2015, unemployment in Los Angeles County was estimated to be 4.8 percent (EDD 2016b). This is lower than the State's 2016 unemployment rate, which is calculated at 5.0 percent. The unemployment rate for the North Los Angeles County Subregion is not calculated separately in State publications, although unemployment rates for the incorporated cities in North Los Angeles County are included as part of Table 5.9-21.

As shown, the City of Santa Clarita experienced the lowest unemployment rate (4.4 percent) of any city within North Los Angeles County in 2016, and has historically experienced unemployment rates below regional averages (EDD 2016b).

Kern County

As shown in Table 5.9-21 above, Kern County experienced higher unemployment rates than the State as a whole. This is likely due to the seasonal nature of the agricultural sector of the Kern County economy (Bakersfield Californian 2006).

Table 5.9-22, Kern County Employment Projections, provides an estimate of the employment base within Kern County in 2010 and employment projections out to 2040. The projections indicate that employment in Kern County will increase by 55.6 percent over the next 3 decades.

**TABLE 5.9-22  
KERN COUNTY EMPLOYMENT PROJECTIONS**

	2010 <sup>a</sup>	2015 <sup>a</sup>	2020	2035	2040

#### 5.9.4 PROJECT DESIGN FEATURES

**PDF 9-1** The Centennial Affordable Housing Implementation Plan (see Appendix 3-C of the *Centennial Specific Plan*, which is in Appendix 4.0-A of this EIR) would be adopted in conjunction with the proposed Project. Consistent with the goals of the *County of Los Angeles General Plan's* Housing Element, it is required that affordable units be developed as part of the Project and would include single-family attached, multi-family attached, and mixed-use units that would be deed and rent restricted.

While the number of affordable homes per community will be adjusted through the approval process, a minimum of 10 percent of the dwelling units proposed in the Centennial Project (about 1,933 dwelling units) would be designated as affordable units. The timing of the provision of restricted affordable housing units would be 1,000 affordable units by the time the first 10,000 units are built; 1,500 affordable housing units by the time of completion of 15,000 units; and 1,933 affordable housing units at buildout of the Project's 19,333 units. The product mix of affordable housing (e.g., age-restricted, family, and other product types) will be determined based on demographic conditions and housing needs at the time the affordable housing is proposed to be built.

Under the Centennial Affordable Housing Implementation Plan, home buyers of affordable units would be eligible to receive a percentage of any appreciation with respect to the value of their property over time, depending upon the homebuyer's length of ownership; all affordable rental homes will maintain affordable monthly rents for a minimum of 30 years.

### 5.9.5 THRESHOLD CRITERIA

Based on the County of Los Angeles Environmental Checklist, the Project will have a significant impact on population, housing, and employment if it would:

**Threshold 9-1** Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).

**Threshold 9-2** Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere.

**Threshold 9-3** Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

**Threshold 9-4** Cumulatively exceed official regional or local population projections.

### 5.9.6 ENVIRONMENTAL IMPACTS

In this impact analysis, the thresholds are taken out of order to better group issues for analysis.

**Threshold 9-1** **Would the project induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?**

**Threshold 9-4** **Would the project cumulatively exceed official regional or local population projections?**

### On-Site Impacts

#### *Population*

##### Regional

As discussed in Section 5.8, Land Use, Entitlement and Planning, the Project would implement the guiding principles, goals, and policies of the Regional Comprehensive Plan and the RTP/SCS as they relate to livability, economic prosperity, and sustainability through the development of walkable, mixed use communities at emerging centers and along major transportation corridors. At the same time, the Project would conserve natural resources and open space. The development of both housing and job opportunities at the site, along with nearby schools, parks and public facilities, and a circulation system that would include roads, greenways, bikeways and trails would reduce vehicle trips and their associated emissions. These Project features would promote sustainability consistent with regional goals.

Demographic projections developed as part of SCAG's adopted 2012–2035 and 2016-2040 RTP/SCS includes the Project site, as reflected in corresponding figures in SCAG's 2012

RTP/SCS (SCAG 2012e) and 2016 RTP/SCS (SCAG 2016a), and are the most recently updated demographic projections available for the Project site and regional vicinity. The local jurisdictions and regional projections formally adopted by SCAG have been used to determine Project conformity with these projections.

The total anticipated increase in population generated by development of the Centennial Project (i.e., 57,150 people) represents approximately 2.08 percent of the projected population increase (2,743,000 persons) for the SCAG region between 2020 and 2040, as shown in Table 5.9-1, SCAG Region Population Projections. This increase in population generated by the Project would represent 6.02 percent of SCAG's 2012 projected population increase (949,000 persons) between 2020 and 2035 and 4.81 percent of SCAG's 2016 projected population increase (1,188,600 persons) between 2020 and 2040 for Los Angeles County as a whole (as shown in Table 5.9-3, Los Angeles County Population Projections).

The Project is consistent with the SCAG projections for the North Los Angeles County Subregion and the Antelope Valley in the 2012–2035 RTP/SCS at the TAZ level, where as many as 27,203 new residents are expected from 2008 to 2020 and an additional 37,689 residents from 2020 to 2035 within the TAZ covering the portion of the site north of SR-138 (TAZ 20280000) (SCAG 2012e). The total projected increase is 64,892 residents, of which, 57,150 persons would be residents of the Project.

Under the 2016 RTP/SCS, as many as 50,194 new residents expected from 2012 to 2040 within the TAZ covering the portion of the site north of SR-138 (TAZ 20280000) and 1,017 new residents within the TAZ covering the portion of the Project site south of SR-138 (TAZ 20281000) (SCAG 2015d). The total projected increase is 51,872 residents for the two TAZs covering the Project site, who are all expected to be residents of the Project. Therefore, the resident population of the Project at buildout would be 82.46 percent of the projected resident population of TAZ 20280000 and TAZ 202810000 by 2035, but would exceed the SCAG projections for 2040. As discussed further below under Housing, this suggests that SCAG projections assume a smaller average household size for the area. At the same time, the 2016 RTP/SCS states that TAZ level data or any data at a geography smaller than the jurisdictional level is included in the draft growth forecasts for regional modeling purpose only, and is advisory and non-binding.

The Project is consistent with the population and housing projections included in the approved AVAP, as discussed in greater detail in Section 5.8, Land Use, Planning and Entitlements.

Section 6.0, Growth-Inducing Impacts, contains a detailed analysis of the proposed Project's potential to induce growth. Regional population forecasting is affected by many variables such as economic cycles and demographics. Additionally, the removal of impediments to growth (e.g., constructing utility infrastructure and service systems in a previously undeveloped region) can induce growth. Specifically, at the Project site, the construction of roads, water treatment and delivery systems, sewers, wastewater reclamation facilities, telephone lines, power facilities and services, schools, parks, a library, and police and fire facilities would together reduce obstacles to growth in the northwestern region of Los Angeles County. While Centennial's infrastructure would not be sized to accommodate

growth beyond that which is proposed for the Centennial Project, future nearby landowners could propose to connect to or build upon the Project's infrastructure to serve future development in the surrounding area. Any such future proposals would be subject to environmental analysis pursuant to CEQA, and must include the level of detail (e.g., residential and commercial size information, project footprint information, project water supply quantity and sources, etc.) required for a future project-level review process. Any such approvals of future development in the West EOA would also be a discretionary decision by the County. Since no such projects have been proposed, such details are not available and CEQA does not require speculation. In general, however, buildout of the approved AVAP has informed the cumulative impacts analysis in this EIR and includes the additional increment of development authorized within the West EOA but not included in the Project.

While the Project site is approximately 50 miles south of the City of Bakersfield, much of the surrounding land is unavailable for development. As identified in Section 4.0, Project Description, on June 17, 2008, the Tejon Ranch Company entered into a Conservation and Land Use Agreement (Conservation Agreement) with Audubon California, the Endangered Habitats League, the Natural Resources Defense Council, the Planning and Conservation League, and the Sierra Club (Resource Groups). The Conservation Agreement covers the Centennial lands and allows the Tejon Ranch Company and its development partners to pursue approvals to develop portions of the Tejon Ranch, including the Project site, while providing for the designation of open spaces and the dedication or sale of conservation easements over approximately 240,000 acres of the Tejon Ranch property (approximately 90 percent of the Ranch). Approximately 9,220 acres would be preserved as Open Space in Los Angeles County outside of the Project site, which is included within a total of 23,547 acres of off-site areas that would be set aside for preservation to mitigate impacts to biological resources (see Exhibit 4-12, Off-Site Open Space Preserve/Mitigation Areas). Another 5,624 acres would have an Open Space land use designation on the Project site.

The San Gabriel Mountains and the Angeles National Forest are located south of the Project site. This area is subject to physical and government ownership constraints, including the Los Padres National Forest, the Hungry Valley State Vehicular Recreation Area, and the Angeles National Forest, which total approximately 2.6 million acres—are expected to remain undeveloped. Exhibit 3-4, Local Area Constraints, included in Section 3.0, Environmental Setting, depicts the locations of many of these constraints in relation to the Project site boundary. Other development constraints in the Project area include the steep slopes and rugged terrain in the Tehachapi Mountains to the northwest and the San Gabriel Mountains to the south, and the San Andreas Fault that runs through these mountains. This area also contains environmentally sensitive areas, such as the San Andreas Significant Ecological Area (SEA), as discussed in Section 5.7, Biological Resources.

An additional constraint to development is water supply in the Antelope Valley. Although water supply is not a constraint for the proposed Project, as described in Section 5.18, Water Resources, including recycled water, other future development projects in the area would be constrained if their development was not anticipated in the AVAP and/or the Court-approved adjudication Judgment and Physical Solution (California Superior Court 2015; see Appendix 5.18-E).

Another constraint is the Antelope Valley Area Plan and related provisions of the County General Plan, which focus new urban development in designated locations, including the Project site which is in the West EOA. Development located outside this and other areas designated for future development could occur only if the Board of Supervisors made a policy choice to amend the Antelope Valley Area Plan to allow development not currently allowed.

Notwithstanding these constraints on additional development in the Project vicinity, the existence of the Project makes it reasonably foreseeable that additional development proposals seeking AVAP amendments would be made outside the West EOA.

### Los Angeles County

The AVAP would lead to a total of 106,180 dwelling units, 405,410 residents, and 134,351 jobs in the unincorporated Antelope Valley at buildout, with the majority of this growth in EOAs. As described in Section 4.0, Project Description, the Centennial Project proposes development of a maximum of 19,333 dwelling units, ranging from multi-family attached apartment homes to low-density, single-family detached units. Under the Specific Plan, reconfiguring an existing single family home to accommodate a Living Suite is permissible and does not create a new dwelling unit. Without regard to whether a State density bonus is ever used on the Project site, the total number of dwelling units, inclusive of all product types, cannot exceed the number of dwelling units identified in Section 4.0, Project Description and considered in this EIR absent further CEQA review.

The Project is proposed for development in phases with full buildout over 20 years. Based on this assumption, the proposed Project is estimated to be fully built out and occupied by 2035, with an estimated resident population of approximately 57,150 people. This projection was made using a population generation factors from the Mission Village EIR (SCH No. 2005051143) and the Landmark Village EIR (SCH No. 2004021002), which assumed an average household size of 3.17 persons per household for single-family detached units and 2.38 persons per household for attached and multi-family units (based on data provided by the County Department of Regional Planning).

A maximum of 14,098 single family detached units and 5,235 multi-family units would be constructed on the site (Placeworks 2017). The buildout population would likely be lower than the estimated 57,150 residents, due to variations in development densities and household sizes. However, in this EIR, a maximum buildout population of approximately 57,150 residents is assumed, as it provides a conservative measure by which to analyze specific population-related impacts.

As stated in Policies LU 1.1 and LU 1.2 of the AVAP, future development in the Antelope Valley shall be directed into rural town center areas and economic opportunity areas, while limiting development in rural preserve areas. Consistent with the AVAP and the intent of EOAs, the Project would accommodate growth in the Antelope Valley through new residential, commercial and light industrial developments, while preserving the rural character and ecological resources of the surrounding areas.

The AVAP projects population increases in the Antelope Valley, mainly within EOAs, where future development will be directed. The Land Use Plan in the Centennial Specific Plan

reflects the land use designations for the site, as contained in the AVAP. The Project would lead to growth and development (and a corresponding increase in population) in areas of the Antelope Valley that have been planned for future development under the AVAP, as provided in its Land Use Policy Map and Rural Preservation Strategy.

As stated above, the AVAP anticipates a buildout population 405,410 residents in the unincorporated area. Since the site is located within the West EOA where future growth and development is planned, the Project is consistent with growth projections for the Antelope Valley. While the West EOA covers a larger area than just the site, a large area surrounding the site is designated as Open Space in the AVAP and is expected to remain undeveloped. The land immediately to the west (Gorman Post Ranch) currently has a development application pending with the County of Los Angeles for future residential development, although it is not consistent with the 2015 *Antelope Valley Area Plan*. Development in this area is also constrained by steep topography and the presence of the San Andreas Earthquake Fault. Areas to the north and southeast would remain as open space in accordance with the Conservation Agreement between the Tejon Ranch and various agencies and groups. Thus, other future development in the West EOA would be limited to privately owned properties to the south and east of the site.

Since the Project's estimated population of 57,150 residents would represent 14.1 percent of the buildout population of the Antelope Valley's unincorporated area, the Project would not be taking up a large portion of future growth planned for the area. Rather, it would result in a population increase that would be in accordance with County projections and would not lead to substantial growth on the Project site or in the Antelope Valley. The site is also identified as a Future Rural Town Area which would serve as a transition between rural town centers and rural preserve areas, and where future development is anticipated. Thus, population growth associated with the Project is consistent with anticipated population increases under the AVAP.

## ***Housing***

### Regional

Based on the SCAG's household projections presented in Table 5.9-7, SCAG Region Household Projections, the total number of housing units proposed by the Centennial Project (i.e., 19,333 units), if all occupied, would represent approximately 1.94 percent of the projected 997,000 household increase for the SCAG region between years 2020 and 2040. The total number of housing units proposed by the Project, if all occupied, would represent approximately 4.27 percent of the projected 452,900-household increase for Los Angeles County between years 2020 and 2040. The Project would also provide 22.5 percent of the projected increase of 85,926 households in the North Los Angeles County Subregion. At the TAZ level, as many as 9,771 new dwelling units are expected from 2012 to 2020 and an additional 12,013 dwelling units from 2020 to 2040 in the TAZ covering the portion of the site north of SR-138. This projected 21,784-dwelling-unit increase would include future development (of 19,333 units or 88.75 percent) on the Project site. TAZ household projections for the area that includes the Project site, which were reflected in corresponding figures included in the 2012 RTP/SCS (SCAG 2012e) and 2016 RTP/SCS (SCAG 2016a), are consistent with the housing capacity of the Project. In addition, limited development in areas

adjacent to the site is anticipated due to environmental, ownership, and regulatory constraints. Thus, no conflict with SCAG projections would occur. Related impacts from the proposed Project would be less than significant.

Since the 2040 household projections at the TAZ level in the 2016 RTP/SCS are consistent with the proposed Project's buildout estimates, but the 2040 population projections by SCAG are less than the Project's buildout population, the difference may be due to the average household size used in the projections. SCAG assumes a smaller household size (assumes an average household size of 2.3 persons per household in TAZ 20280000 and TAZ 20281000) than estimated for the Project (assumes an average household size of 3.17 persons per household for single-family detached units and 2.38 persons per household for attached and multi-family units). Since the Project is consistent with SCAG's household projections, and the TAZ level data is considered advisory and non-binding, the exceedance in population projections at the TAZ level for the 2016 RTP/SCS is not a significant adverse impact as it relates to the exceedance of regional population projections.

#### *Regional Housing Needs Assessment*

The Project would contribute to meeting the State-mandated Regional Housing Needs Assessment (RHNA) housing production goals for the County and would be consistent with the regional effort to boost housing production to meet regional housing needs. Also, much of the land near the Project site is not suitable for further development beyond that which would be implemented as part of the proposed Project.

The 2014–2021 RHNA identifies the need for approximately 30,145 new dwelling units in unincorporated Los Angeles County, of which 12,504 units would have to be for very low and lower income households and 5,060 units for moderate income households. The Project would contribute to meeting the RHNA housing production goals for the County and would be consistent with the regional effort to boost housing production in unincorporated areas of Los Angeles County to meet regional housing needs.

In accordance with the Centennial Affordable Housing Implementation Plan (PDF 9-1), the Project would also include a minimum of 10 percent or 1,933 units that would be affordable to either very low, low, or moderate income households. A mix of single family attached, multi-family attached, and mixed-use units would be provided throughout the Project site. A total of 387 units or 20 percent of the affordable units would be affordable to very low income households. A total of 483 units or 25 percent of the affordable units would be affordable to low income households. The remaining 1,063 units or 55 percent of the affordable units would be affordable to moderate income households. These units would include for sale units that would be deed restricted for sale to very low, low and moderate income households and for rent units that would be restricted for rent to very low, low, and moderate income households. Affordable housing product segmentation (e.g., senior, family, and other product types) would be determined based on demographic data and market demand at the time the units were proposed for construction. Section 4.5.17 in Section 4.0, Project Description, of this Draft EIR summarizes the Affordable Housing Program that is provided in Appendix 3-C of the Centennial Specific Plan.

The timing of the provision of restricted affordable housing units would be 1,000 affordable units by the time the first 10,000 units are built; 1,500 affordable housing units by the time of completion of 15,000 units; and 1,933 affordable housing units at buildout of the Project's 19,333 units. While the number of affordable homes per community will be adjusted through the approval process, the total number of affordable homes proposed in Centennial will remain at a minimum of ten percent of the total development.

### Los Angeles County

Housing development in the Antelope Valley area of Los Angeles County would occur in the incorporated cities of Lancaster and Palmdale, as well as in other unincorporated areas of the Antelope Valley. Development in these unincorporated areas has been planned by the County in its recently adopted AVAP, where future growth would be accommodated largely in EOAs. Since the Project site is located in the West EOA, it is anticipated to accommodate future growth. This future growth would be regulated by the Land Use Policy Map in the AVAP. The Centennial Project proposes development in accordance with the Land Use Policy Map and would locate residential development in areas designated as residential areas and at permitted densities. The AVAP estimates an increase of 81,441 dwelling units in the Antelope Valley unincorporated areas from 2013 to buildout. The Project's 19,333 dwelling units would make up 23.74 percent of this housing stock increase. Thus, the Project's future housing development would be consistent with the AVAP and no conflict with the County's projected housing stock growth would occur.

## **Employment**

### Regional

The total number of permanent jobs created by the Centennial Project is anticipated to be approximately 23,675 jobs (Placeworks 2017). This will include jobs at on-site commercial uses, business parks, commercial recreation uses, and public facilities (e.g., fire stations, schools, library, and Sheriff's station).

SCAG's 2012 growth forecasts show an employment increase to 9,441,000 jobs by 2035 and the 2016 projections show 9,838,616 jobs by 2040 in the entire SCAG region (SCAG 2012a, 2016a). SCAG's 2016 growth forecasts show an employment increase to 9,572,000 jobs by 2035 and 9,872,000 jobs by 2040 in the entire SCAG region (SCAG 2016c). The Project's 23,675 jobs would represent only 0.24–0.25 percent of the projected 2035 and 2040 job base. Based on the 2016 employment projections presented for the SCAG region shown in Table 5.9-17, SCAG Region Employment Projections, the Project would represent approximately 1.73 percent of the projected 1,365,000 employment increase between years 2020 and 2040. No conflict at the regional level would occur.

At the TAZ level, SCAG projects a 6,643-job increase from 2012 to 2020 for TAZ 202800000 (north of SR-138) and a 2,855-job increase for TAZ 20281000 (south of SR-138) for the same time period. An increase of 16,766 jobs for TAZ 202800000 but 468 new jobs for TAZ 20281000 are expected from 2012 to 2040. A total of 23,931 jobs in both TAZs is projected by 2040 (SCAG 2012e, 2015d). The Project's 23,675 jobs would represent 98.93 percent of the projected 2040 jobs base of 23,931 jobs in both TAZs. Using SCAG's 2016 projections for

a larger employment base in the region by 2040, the Project would make up a lower percentage of the future employment base in the region. Since the Project would not lead to job growth in exceedance of projections, no conflict would occur.

### Los Angeles County

The Centennial Project would create approximately 23,675 new permanent jobs. Based on the 2016 employment projections presented for Los Angeles County, as shown in Table 5.9-19, Los Angeles County Employment Projections, the total number of permanent jobs created by the Project would represent approximately 4.20 percent of the projected 563,300 employment increase for Los Angeles County between years 2020 and 2040 (SCAG 2016b).

Job growth in the unincorporated County area of the Antelope Valley is anticipated with future non-residential development, as planned in the AVAP to occur primarily in EOAs. The Project proposes commercial and business park uses in areas designated by the Land Use Policy Map of the AVAP for these uses. The Project also proposes commercial areas, schools, and institutional uses within the residential villages, consistent with the implementation program for the West EOA, as contained in the AVAP. Specifically, land use adjustment may occur in the West EOA such that areas designated as Residential 5 (H5) may be converted to General Commercial (CG) or Public and Semi-public (P) designations without amending the AVAP, as long as the resulting residential densities do not exceed those provided in the AVAP and no change in unmitigated significant impacts occurs. The conversion of residential to commercial areas may also occur, provided the amount of planned commercial building square footage does not result in any new unmitigated significant impacts.

As discussed earlier, a buildout employment base of 134,351 jobs is estimated for the unincorporated area. Approximately 23,675 jobs (or 17.62 percent of the buildout estimate) would be provided by the Project. These jobs would also represent 23.09 percent of the 102,513-job increase from 2008 to buildout. Thus, job creation by the Project is not expected to conflict with AVAP projections.

### ***Jobs-Housing Ratio***

The AVAP intends to provide a jobs/housing ratio of 1.3 jobs per dwelling unit in the unincorporated area of the Antelope Valley. The Economic Development Element of the AVAP sets a strategy of designating areas for light and heavy industrial uses near major transportation corridors and/or a concentration of skilled labor force in EOAs. The Project would implement this strategy through the development of commercial and business park uses on the site and along SR-138, for use by high-tech manufacturing, transportation, and logistics companies. In addition, commercial areas, schools, and institutional uses are proposed within the residential villages, which would also increase the employment base at the site and in the area. The Project would generate a total of approximately 23,675 jobs on site, which would expand the employment base in an area that is largely rural residential in land use and would improve the jobs-housing ratio in the Antelope Valley. The Project would also include residential development to create a mixed use community in the West EOA, consistent with the AVAP's Land Use Policy Map and Rural Preservation Strategy.

While the Project would have an on-site jobs-housing ratio of 1.22 at buildout, the Project would create jobs in the West EOA where job growth is planned by the County and in areas that are designated for non-residential development on the AVAP's Land Use Policy Map. Thus, the Project would positively contribute to the attainment of the target jobs/housing ratio of 1.3 jobs per dwelling unit for the unincorporated area of the Antelope Valley. Also, the Project would not cause an imbalance among jobs, housing, and population. Rather, the Project would achieve the economic development objectives for the Antelope Valley through a balanced urban development located adjacent to critical transportation and water infrastructure.

In summary, implementation of the Project is considered growth accommodating rather than growth inducing at a regional level based on SCAG projections. Therefore, would be less than significant in relation to planned growth in the region. However, because the Project would substantially increase population and housing relative to the existing Project site conditions, this increase in population and housing on the Project site is considered significant. However, no mitigation would be appropriate since the Project is consistent with approved growth plans in the region. This represents a significant and unavoidable impact.

### **Off-Site Impacts**

The proposed off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings would not, by themselves, directly or indirectly generate any permanent new resident population, housing, or jobs not associated with operation of the Project. No impact would occur.

**Impact Summary:** The proposed Project would introduce a maximum of 19,333 housing units, approximately 57,150 residents, and approximately 23,675 jobs at the site at full buildout. This growth would occur in the West EOA, where future growth is planned and would be in accordance with the AVAP's Land Use Policy Map. TAZ projections for the area that includes the Project site, which are reflected in corresponding figures included in the 2012 RTP/SCS (SCAG 2012e) and 2016 RTP/SCS.

Based on the estimated number of households and employment-generating uses on site at Project buildout, the Centennial Project would create a projected ratio of 1.22 jobs per dwelling unit. While this ratio would be lower than the AVAP goal of 1.3 jobs per dwelling unit, the Project would assist in providing housing and employment opportunities in the unincorporated Antelope Valley area consistent with the AVAP resident and employment projections. Thus, it would not cause an imbalance between jobs, housing and population, but would support the AVAP's jobs-housing goal. In summary, implementation of the Project is considered growth accommodating rather than growth inducing at a regional level based on SCAG projections. Therefore, would be less than significant in relation to planned population, housing, and employment growth in the region. However, because the Project would substantially increase growth

relative to the existing Project site conditions, this increase in population and housing on the Project site is considered significant. However, no mitigation would be appropriate since the Project is consistent with approved growth plans in the region. This represents a significant and unavoidable impact.

**Threshold 9-2**      **Would the project displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?**

**Threshold 9-3**      **Would the project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?**

### **On-Site Impacts**

Implementation of the Centennial Project would not displace a substantial number of housing units or people since 94 percent of the Project site is currently used for cattle grazing and the remaining 6 percent is currently farmed agricultural land or natural open space. Section 3.0, Environmental Setting, details the current uses and structures on site. There is one occupied residential dwelling unit located east of the Aqueduct and near the center of the northern property line. This residential structure includes accessory structures and several trailers that are used to support grazing and property caretaking activities. The residence would be demolished and/or relocated and its inhabitants would be displaced during development of Village 5.

However, the Project Applicant/Developer would provide notice to the Tejon Ranch employee and site residents. The loss of one dwelling unit is minor in light of the total number of dwelling units proposed by the Project. Thus, displacement impacts from Project implementation would be less than significant.

### **Off-Site Impacts**

There is no housing or on-site employment located in the locations of proposed off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings. These features would be located on private (i.e., Tejon Ranch-owned) property or within public rights-of-way. Therefore, no impact related to displacement of housing or people would occur due to the off-site Project features.

***Impact Summary:*** There would be less than significant impacts related to potential displacement of people or housing units as a result of implementing the Centennial Project. The majority of the Project site is undeveloped; there is one residential unit and several accessory structures and occupied trailers on the site. This unit would be demolished and/or relocated and the existing household would be displaced voluntarily as development occurs on the site. Impacts related to housing or population displacement would be less than significant.

## **Consistency with Antelope Valley Area Plan**

As discussed above, the Project would be consistent with the location and extent of growth and development proposed in the AVAP. Relevant goals and policies in the AVAP address the need to improve the economic base of the Antelope Valley and promote mixed use development, while preserving the rural character of the valley. The Project is consistent with these goals and policies since it includes areas for non-residential development that would increase job opportunities in the West EOA, as planned by the AVAP, and since the Project proposes a mixed-use development on the site that has been planned for future development under the AVAP. The Project would not conflict with goals and policies in the AVAP that address population, housing, and employment issues.

Section 6.0, Growth-Inducing Impacts, presents the analysis of possible indirect impacts due to growth wholly or partially induced by Project implementation. Section 7.0, Cumulative Impacts, presents the analysis of the Project's impacts in combination with anticipated impacts related to regional growth and local projects.

### **5.9.7 MITIGATION MEASURES**

While the Project's impacts on population, housing, and employment would be considered a significant impact when compared to the existing Project site conditions, no mitigation would be appropriate because the Project is consistent with approved growth plans in the region.

### **5.9.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION**

The proposed Project is consistent with the population, household, and employment projections contained within the 2012--2035 RTP/SCS and the 2016-2040 RTP/SCS projections, and the demographic projections in the AVAP. However, because the Project would substantially increase growth relative to the existing Project site conditions and no mitigation would be appropriate, this increase in population and housing on the Project site is considered significant and unavoidable.

In summary, implementation of the Project is considered growth accommodating rather than growth inducing at a regional level based on SCAG projections. Therefore, would be less than significant in relation to planned growth in the region. However, because the Project would substantially increase population and housing relative to the existing Project site conditions, this increase in population and housing on the Project site is considered significant and unavoidable. However, no mitigation would be appropriate since the Project is consistent with approved growth plans in the region.

## 5.10 TRAFFIC, ACCESS, AND CIRCULATION

### 5.10.1 INTRODUCTION

#### **Purpose**

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA) Guidelines, requires that traffic, access, and circulation issues be evaluated as part of the environmental documentation process. The traffic impacts from the proposed Centennial Project are analyzed under existing and future conditions. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criteria for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### **Summary**

This section of the EIR analyzes traffic conditions with and without the Project in the near-term (under Existing conditions) and long-term cumulative (under 2035 buildout conditions for Los Angeles County and 2040 buildout conditions for Kern County).

Potential traffic increases associated with Project implementation would affect traffic operations and levels of service at roadways internal to the site and at roadways and freeways serving the site. These impacts would be addressed by a range of on-site and off-site Project improvements and the implementation of Project Design Features (PDFs) and mitigation measures (MMs). The PDFs and MMs include new internal roads, improved intersection configurations, and the addition of traffic signals that have been incorporated into the Project and payment of fair share fees for needed freeway and expressway improvements, as identified below. With the incorporation of PDFs and the recommended MMs, Project impacts to traffic on State Route (SR) 138, streets intersecting SR-138 in the Project vicinity, freeway mainline segments, freeway interchange ramps, and arterial roadway intersections will be less than significant.

The Project Applicant intends to implement and fund State transportation facility mitigation measures through a proposed Centennial Transportation Improvement Program (CTIP) agreement with the California Department of Transportation (Caltrans). The CTIP would provide funding contributions, phasing, guarantees of payments, and collection of third-party contributions for MM implementation. Alternatively, the Project will pay a fair share contribution towards the construction of transportation facilities that will mitigate for potential Project impacts (see MM 10-3, MMs 10-6 through MM 1-28, and MMs 10-31 through 10-45). With these traffic mitigation measures, there will not be a significant Project or cumulative impact from Project traffic. The Project will also be in compliance with the Los Angeles County and Kern County Congestion Management Programs (CMPs). The Project will incorporate PDFs to reduce vehicle use and promote alternative transportation, including transit use, in compliance with applicable transportation plans, policies, and regulations. However, if Caltrans does not implement planned and required improvements

on State facilities, the Project would contribute to significant unavoidable impacts since the County (as the Lead Agency) lacks jurisdiction and control over State highway facilities, and cannot mandate the construction of improvements to these facilities.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (Please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - Methodology
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts – A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## Methodology

The traffic study includes evaluation of on-site roadway and access needs and off-site analysis consisting of peak hour evaluation of freeway mainlines, major connectors such as the Interstate (I) 5/SR-138 and SR-14/SR-138 interchanges, interchange ramps at key growth locations (e.g., Santa Clarita Valley), arterial roadways and intersections within the Project site, and multi-lane highways.

Due to the significant size of the Project study area, multiple sources of traffic forecast volumes have been utilized to prepare a comprehensive set of future condition traffic volumes. The traffic forecasts for the study area roadway system were produced using a combination of sources: The North County Sub-Area Travel Demand Forecasting Model, the

Kern Council of Governments (Kern COG) Regional Transportation Plan (RTP) model, and the Santa Clarita Valley Consolidated Traffic Model (SCVCTM). For detailed on-site traffic data, a focused window model, the Centennial Traffic Model (CTM), was developed specifically for use in the traffic study. Existing conditions were characterized from traffic counts in Los Angeles County and Kern County during 2014 and 2015 (see Appendix 5.10-A). Future transportation conditions for Los Angeles County locations south of the Fort Tejon/I-5 interchange were evaluated by using data from a travel demand model that is a derivative of the Southern California Association of Governments' (SCAG's) 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) model which includes forecasts to 2035. Future transportation conditions for Kern County locations along I-5 and SR-99 north of the Fort Tejon/I-5 interchange were evaluated by using data from Kern COG's 2014 RTP/SCS model, which includes forecasts to 2040. Brief descriptions of each of these models follow.

### ***The North County Sub-Area Travel Demand Forecasting Model***

The North County Sub-Area Travel Demand Forecasting Model (North County sub-area model) was originally developed for use in the Northwest 138 Corridor Improvement Project in conjunction with Los Angeles County Metropolitan Transportation Authority (Metro) and Caltrans. The North County sub-area model is a derivative of the SCAG 2012 RTP/SCS model and is consistent with SCAG's regional forecasts. The model was refined for use in the *Antelope Valley Area Plan* (AVAP), which was adopted by the County in June 2015. The sub-area model reflects socioeconomic projections and transportation network improvements contained in the SCAG 2012 RTP/SCS and produces traffic forecasts for the year 2035. The model-area includes northern Los Angeles County, including the Santa Clarita Valley and the Cities of Lancaster and Palmdale), and portions of Kern County.

The AVAP version of the North County sub-area model was used to derive year 2035 future forecasted volumes for highway and roadway links in the study area (generally south of the Fort Tejon/I-5 interchange), with and without the maximum land use and development allowed under the Project. The North County sub-area model produced average daily traffic (ADT) volumes and AM and PM peak period volumes that were converted to peak hour estimates. The sub-area model was also used to analyze project impacts directly due to the Project. A special select zone model run was prepared to reflect the Project's trip generation quantities, and the resulting traffic volumes forecasts were assigned to the sub-area model's roadway network. The resulting traffic volumes represent the quantity of Project traffic on each of the roadway links in the study area. These volumes are incrementally added to the existing condition traffic counts to derive the existing plus Project scenario.

### ***Santa Clarita Valley Consolidated Traffic Model***

The Santa Clarita Valley Consolidated Traffic Model (SCVCTM) is a traffic demand model for the Santa Clarita Valley area of Los Angeles County. It was designed as a windowed model with a substantially higher level of detail than the associated regional models. The model has the capability for peak hour and ADT analysis, and is used by both the City of Santa Clarita and the County of Los Angeles as a forecasting tool for a variety of traffic studies in the Santa Clarita Valley.

The SCVCTM was originally prepared by the City of Santa Clarita and the County of Los Angeles in 1992 and has been updated for use for a variety of applications since that time. The SCVCTM utilizes detailed land use data and has the ability to provide traffic volume forecasts for a long-range cumulative setting. The buildout version of the model is based on the One Valley One Vision (OVOV) County Area Plan and City of Santa Clarita General Plan, which were adopted by the County and the City, respectively, in 2012.

The SCVCTM modeled area encompasses all of the Santa Clarita Valley, including the City of Santa Clarita as well as the adjacent unincorporated portions of Los Angeles County. The westerly boundary of the model area is the Ventura County line and the easterly boundary is just east of Agua Dulce Canyon Road. The northern boundary of the traffic model area is just north of the Castaic community and the southern boundary represents the confluence of the I-5 and SR-14 freeways. While the area modeled by the SCVCTM is within the modeled area of the North County sub-area model, the SCVCTM produces forecasts at a higher level of detail for the Santa Clarita Valley.

### ***Centennial Traffic Model Forecasts***

For on-site analyses, a special windowed land use-based model, the CTM was prepared, providing detailed traffic forecasting for the Project site itself. The external travel pattern relationships are derived from the AVAP version of the North County sub-area model and hence it is directly compatible with the area-wide modeling procedures utilized for the Project's off-site impact analysis.

The primary purpose of the CTM is to provide traffic forecasts for the Specific Plan area based on the specific land use designations of the planning areas and to evaluate Project access. Detailed intersection evaluation is provided with peak hour intersection design and intersection capacity evaluation. CTM is utilized to determine peak hour forecasts for primary access points along SR-138.

### ***SCAG and Kern COG Travel Models***

SCAG is responsible for the development and maintenance of regional travel demand forecasting models for the six county region: Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial. The SCAG 2012 RTP/SCS model includes forecasts for 2035 that were updated based on the recently approved AVAP and are utilized for evaluating potential Project impacts in locations south of the Fort Tejon/I-5 interchange in Los Angeles County. An informal check was also made against 2016–2040 RTP/SCS data released by SCAG, and the check indicated consistency with both the 2012–2035 RTP/SCS and the 2016–2040 RTP/SCS for the Centennial area.

The 2014 Kern COG RTP/SCS addresses regional transportation issues in the County of Kern. The Kern COG model was originally developed in 1996, with the latest comprehensive update occurring in support of the 2014 RTP/SCS. The 2014 Kern COG RTP/SCS model includes forecasts to 2040 and provides the most recent estimates available for evaluating potential Project impacts along I-5 and SR-99 north of the Fort Tejon/I-5 interchange in Kern County. The Draft Kern COG 2015-2050 Regional Growth Forecast Draft report was also informally consulted for growth assumption consistency.

### ***Future Transportation Settings***

Buildout of the Centennial Project is assumed to occur over a 20-year time frame and will accompany the long-term development of the Antelope Valley and the surrounding area. The Specific Plan buildout analysis is carried out for the long-range 2035 cumulative conditions time frame that was utilized for evaluation of the AVAP and OVOV Area Plan/General Plan. The Kern COG RTP/SCS 2040 forecasts were used for I-5 and SR-99 segments and ramps north of the Fort Tejon/I-5 interchange in Kern County. The long-range cumulative versions of the traffic models noted above were thereby used as the appropriate mechanisms for preparing long-range traffic volume forecasts.

## **5.10.2 RELEVANT PLANS, POLICIES, AND REGULATIONS**

### **Regional**

#### ***SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)***

SCAG is the Metropolitan Planning Organization (MPO) for six counties: San Bernardino, Orange, Riverside, Los Angeles, Ventura, and Imperial, which encompasses an area of more than 38,000 square miles with a population exceeding 19 million persons. As the designated MPO, the federal government mandates that SCAG research and prepare plans for transportation, growth management, hazardous waste management, and air quality. SCAG has developed a number of plans to achieve these regional objectives, including the 2012–2035 RTP/SCS, which was the current RTP/SCS at the time of the Project’s NOP.

The 2016–2040 RTP/SCS was adopted by SCAG on April 7, 2016, which is a long-range transportation plan that provides a vision for regional transportation investments over a period of 20 years or more. Using growth forecasts and economic trends, the RTP/SCS considers the role of transportation in a more holistic light, including economic factors, environmental issues, and quality-of-life goals. It provides an opportunity to identify transportation strategies that address mobility needs for the future, while demonstrates compliance with Senate Bill (SB) 375 (discussed in Section 5.21, Climate Change) to ensure that the SCAG region can meet its regional GHG reduction targets set by the California Air Resources Board (CARB). The RTP/SCS exceeds the targets issued by CARB (which are an 8-percent reduction by 2020 and a 13-percent reduction by 2035), and would result in an 8

percent reduction by 2020, an 18 percent reduction by 2035, and a 21 percent reduction by 2040 (SCAG 2016).

The goals of the 2016–2040 RTP/SCS are as follows (SCAG 2016):

- Goal 1:** Align the plan investments and policies with improving regional economic development and competitiveness.
- Goal 2:** Maximize mobility and accessibility for all people and goods in the region.
- Goal 3:** Ensure travel safety and reliability for all people and goods in the region.
- Goal 4:** Preserve and ensure a sustainable regional transportation system.
- Goal 5:** Maximize the productivity of our transportation system.
- Goal 6:** Protect the environment and health of our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking).
- Goal 7:** Actively encourage and create incentives for energy efficiency, where possible.
- Goal 8:** Encourage land use and growth patterns that facilitate transit and active transportation.
- Goal 9:** Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.

The Project’s consistency with these goals is discussed in Section 5.8, Land Use, Entitlements, and Planning. Outcomes for these goals include mobility/accessibility, reliability, location efficiency, productivity, safety and health, economic well-being, cost effectiveness, system sustainability, and environmental quality, with the corresponding performance measures outlined in Table 5.10-1, RTP/SCS Performance Measures.

**TABLE 5.10-1  
RTP/SCS PERFORMANCE MEASURES**

<b>Outcome</b>	<b>Performance Measure/Indicator</b>	<b>Definition</b>	<b>Performance Target</b>
Location Efficiency	Share of growth in High-Quality Transit Areas (HQTAs)	Share of the region's growth in households and employment in HQTAs	Improvement(increase) over No Project Baseline
	Land consumption	Greenfield land consumed and refill land consumed	Improvement (decrease) over No Project Baseline
	Vehicle Miles Traveled (VMT)	Average daily vehicle miles driven per person	Improvement (decrease) over No Project Baseline
	Transit Mode Share	The share of total trips that use transit for work and non-work trips	Improvement (increase) over No Project Baseline
	Average distance for work and non-work trips	The average distance traveled for work or non-work trips	Improvement (decrease) over No Project Baseline
	Percent of trips less than 3 miles	The share of work and non-work trips which are fewer than 3 miles	Improvement (increase) over No Project Baseline
	Work trip length distribution	The statistical distribution of work trip length in the region	Improvement (increase) over No Project Baseline
Mobility and Accessibility	Person delay per capita	Delay per capita can be used as a supplemental measure to account for population growth impacts on delay	Improvement (decrease) over No Project Baseline
	Person delay by facility type	Delay: Excess travel time resulting from the difference between a reference speed and actual speed	Improvement (decrease) over No Project Baseline
	Truck delay by facility type	Delay: Excess travel time resulting from the difference between a reference speed and actual speed	Improvement (decrease) over No Project Baseline
	Travel time distribution for transit, SOV, HOV for work and non-work trips	Travel time distribution for transit, SOV, and HOV for work and non-work trips	Improvement (increase) over No Project Baseline
Safety and Health	Collision rates by severity by mode (per 100 million vehicle miles)	Collision rate per 100 million vehicle miles by mode and number of fatalities and serious injuries by mode (all, bicycle/ pedestrian)	Improvement (decrease) over No Project Baseline
	Criteria pollutants emissions (tons per day)	CO, NOx, PM2.5, PM10, and VOC	Meet federal air quality conformity requirements (FR)
	Air pollution-related health measures	Pollution-related respiratory disease incidence and cost	Improvement (decrease) over No Project Baseline
	Physical activity-related health measures	Physical activity/weight related health issues and costs	Improvement over No Project Baseline
	Mode share of walking and bicycling	Mode share of walking and biking for work trips, non-work trips and all trips	Improvement (increase) over No Project Baseline
Environmental Quality	Greenhouse gas emissions	CO, NOx, PM2.5, PM10, and VOC Per capita greenhouse gas emissions (CO <sub>2</sub> )	Meet State GHG reduction targets (SR)

**TABLE 5.10-1  
RTP/SCS PERFORMANCE MEASURES**

<b>Outcome</b>	<b>Performance Measure/Indicator</b>	<b>Definition</b>	<b>Performance Target</b>
Economic Well Being	Additional jobs supported by improving competitiveness	Number of jobs added to the economy as a result of improved transportation conditions which make the region more competitive	Improvement (increase) over No Project Baseline
	Additional jobs supported by transportation investment	Total number of jobs supported in the economy as a result of transportation expenditures	Improvement (increase) over No Project Baseline
Investment Effectiveness	Benefit/cost ratio	Ratio of monetized user and societal benefits to the agency transportation costs	Greater than 1.0
Transportation System Sustainability	Cost to preserve multimodal system to current and state of good repair	Annual costs per capita required to preserve the regional multimodal system to current conditions	Improvement (decrease) over No Project Baseline
<p>RTP/SCS: Regional Transportation Plan/Sustainable Communities Strategy; AQTA: High-Quality Transit Area; VMT: vehicle miles traveled; SOV: single-occupancy vehicle; HOV: high-occupancy vehicle; CO: carbon monoxide; FR: Federal Air Quality Conformity Requirements; CO<sub>2</sub>: carbon dioxide; SR: State GHG Reduction Targets; NO<sub>x</sub>: oxides of nitrogen; PM<sub>2.5</sub>: fine particulate matter with a diameter of 2.5 microns or less; PM<sub>10</sub>: respirable particulate matter with a diameter of 10 microns or less; VOC: volatile organic compounds; SCAG: Southern California Association of Governments</p> <p>Notes: Performance measures tied to goals for reliability, preservation, productivity, health, energy efficiency, and security cannot currently be reliably forecasted and are not included in Table 5.1. However, SCAG has identified related measures to be used for monitoring purposes, and these are discussed in the Performance Measures technical report.</p> <p>Performance measures are assessed at the regional level. SCAG encourages, but does not require, agencies to be consistent with the RTP/SCS performance measures to the extent practical in their subregional and project-level planning studies.</p> <p>Source: SCAG 2016.</p>			

### ***Federal Transportation Improvement Program (SCAG Region)***

The Federal Transportation Improvement Program (FTIP) is the implementation tool for the SCAG RTP/SCS and includes a listing of highway improvements, transit, rail and bus facilities, high occupancy vehicle lanes, signal synchronization, intersection improvements, freeway ramps and other transportation projects that have been proposed by cities and local agencies in the SCAG region. The 2015 FTIP lists federally funded projects and regionally significant projects for the six-year period 2014/2015–2019/2020 and was developed in compliance with State and federal requirements. The 2015 FTIP has been reviewed and adopted by SCAG. It has also been given an air quality conformity determination by the Federal Highway Administration (FHWA)/Federal Transit Administration (FTA). The 2015 FTIP includes completion of the Project Approval and Environmental Document (PA&ED) for alternative improvements to SR-138 from I-5 to SR-14.

### ***Kern COG 2014 RTP/SCS and Transportation Improvement Program***

As discussed above, the 2040 projections from the 2014 Kern COG RTP/SCS provide the most recent forecasts of future conditions for evaluating potential Project impacts to I-5 and SR-99 in Kern County north of the Fort Tejon/I-5 interchange. The Kern COG is the federally

designated Metropolitan Planning Organization and State-designated Regional Transportation Planning Agency responsible for preparing and updating the RTP/SCS for Kern County. The 2014 RTP/SCS is a 26-year blueprint that establishes a set of regional transportation goals, policies, and actions intended to guide development of the planned multimodal transportation systems in Kern County. The 2014 RTP/SCS also includes measures that implement State requirements to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 5 percent per capita by 2020 and 10 percent per capita by 2035 as compared to 2005. Consistent with State and Federal transportation planning requirements, the Kern COG is responsible for preparing a Transportation Improvement Program (TIP) in cooperation with member agencies and Caltrans for all highways, streets, roads, aviation, transit and guideway projects in the Kern County area that use federal or State funding. Projects listed in the Ken County FTIP are designed to be consistent with, and implement, the Regional Transportation Plan for Kern County.

## **County**

### ***Congestion Management Program for Los Angeles County***

Sections 65088 through 65089 of the *California Government Code* require that a congestion management program be developed, adopted and updated biennially for every county. The program would have to address increasing traffic congestion on California's freeways and highways by linking transportation, land use, and air quality decisions and through coordination between State, regional, county, and city transportation and land use agencies, transit providers, and air pollution control districts.

The Congestion Management Program (CMP) for Los Angeles County was developed and is implemented by Metro, as the Congestion Management Agency for the County. The CMP was last updated in 2010 and addresses the impact of local growth on the regional transportation system. The CMP calls for (1) monitoring the designated CMP highway and roadway system; (2) a multi-modal system performance analysis; (3) a Transportation Demand Management Program to promote alternative modes of transportation; (4) a Land Use Analysis Program; (5) a seven-year capital improvement program of projects on the CMP highway and roadway system; and (6) a deficiency plan to maintain LOS standards.

The CMP requires cities and the County to monitor land use and roadway performance by individual jurisdictions and provide guidelines for preparing a Traffic Impact Analysis (TIA). The CMP also sets the LOS standard in Los Angeles County at LOS E, except where base year LOS is worse than E. The CMP highway system includes monitoring stations on the SR-14 and SR-138 in the Antelope Valley. The SR-14 and SR-138 monitoring stations operated at LOS D or better during the AM and PM peak hours in 2009 (Metro 2010).

### ***Congestion Management Program for Kern County***

The Congestion Management Program for Kern County (Kern CMP) is a section of the Kern COG RTP/SCS that is intended to relate population growth, traffic growth, and land use decisions to transportation system performance standards and air quality improvements. The Kern CMP contains six sections, including a land use impact analysis, multi-modal

performance standards, a regional traffic model, transportation demand management programs, a capital improvement program and a deficiency plan. As discussed below in Threshold 10-4, the traffic analysis considered potential Project impacts to State highway locations along I-5 and SR-99 in Kern County that are in the Kern CMP. The Project would be consistent with the CMP goals and objectives.

### ***County of Los Angeles General Plan and Antelope Valley Area Plan***

The *County of Los Angeles General Plan* and *Antelope Valley Area Plan* address traffic, access, and circulation issues that affect the County and the unincorporated area of the Antelope Valley. Relevant goals and policies in the Antelope Valley Area Plan include the following:

#### Land Use Element

**Policy LU 5.1:** Ensure that development is consistent with the Sustainable Communities Strategy adopted in 2012, an element of the Regional Transportation Plan developed by the Southern California Association of Governments.

**Policy LU 5.4:** Ensure that there is an appropriate balance of residential uses and employment opportunities within close proximity of each other.

#### Mobility Element

**Goal M 1:** Land use patterns that promote alternatives to automobile travel.

**Policy M 1.1:** Direct the majority of the unincorporated Antelope Valley's future growth to rural town centers and economic opportunity areas, to minimize travel time and reduce the number of vehicle trips, as indicated in the Land Use designations shown on the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy M 1.2:** Encourage the continued development of rural town center areas that provide for the daily needs of local residents, reducing the number of vehicle trips and providing local employment opportunities.

**Policy M 1.3:** Encourage new parks, recreation areas, and public facilities to locate in rural town center areas, rural town areas, and economic opportunity areas.

**Policy M 1.4:** Ensure that new developments have a balanced mix of residential uses and employment opportunities as well as park, recreation areas and public facilities within close proximity of each other.

**Policy M 1.5:** Promote alternatives to automobile travel in rural town center areas and rural town areas by linking these areas through pedestrian walkways, trails, and bicycle routes.

**Goal M 2:** Reduction of vehicle trips and emissions through effective management of travel demand, transportation systems, and parking.

**Policy M 2.1:** Encourage the reduction of home-to-work trips through the promotion of home-based businesses, live-work units, and telecommuting.

**Policy M 2.2:** Encourage trip reduction through promotion of carpools, vanpools, shuttles, and public transit.

**Policy M 2.3:** In evaluating new development proposals, require trip reduction measures to relieve congestion and reduce air pollution from vehicle emissions.

**Policy M 2.4:** Develop multi-modal transportation systems that offer alternatives to automobile travel by implementing the policies regarding regional transportation, local transit, bicycle routes, trails, and pedestrian access contained in this Mobility Element.

**Policy M 2.5:** As residential development occurs in communities, require transportation routes, including alternatives to automotive transit, to link to important local destination points such as shopping, services, employment, and recreation.

**Policy M 2.6:** Within rural town center areas, explore flexible parking regulations such as allowing residential and commercial development to meet parking requirements through a combination of on-site and off-site parking, where appropriate, or encouraging the provision of different types of parking spaces.

**Goal M 3:** An efficient network of major, secondary, and limited secondary highways to serve the Antelope Valley.

**Policy M 3.1:** Implement the adopted Highway Plan for the Antelope Valley, in cooperation with the cities of Lancaster and Palmdale. Ensure adequate funding on an ongoing basis through financing programs, such as grants, congestion pricing, bonding, fair share cost assignments, etc.

**Policy M 3.2:** In rural areas, require rural highway standards that minimize the width of paving and placement of curbs, gutters, sidewalks, street lighting, and traffic signals, as adopted by the Department of Public Works.

**Policy M 3.3:** Implement highway improvements only when necessitated by increasing traffic or new development or for safety reasons.

**Policy M 3.4:** Maintain existing highways to ensure safety, and require adequate street and house signage for emergency response vehicles.

**Policy M 3.5:** As future land use changes occur, periodically review traffic counts and traffic projections and revise the Highway Plan accordingly.

**Policy M 3.6:** Engage local communities and agencies in the planning and implementation of transportation improvements.

**Goal M 4:** A network of local streets that support the rural character of the unincorporated Antelope Valley without compromising public safety.

**Policy M 4.1:** Require rural local street standards that minimize the width of paving and placement of curbs, gutters, sidewalks, street lighting, and traffic signals, as adopted by the Department of Public Works.

**Policy M 4.2:** Maintain existing local streets to ensure safety, and require adequate signage for emergency response vehicles.

**Policy M 4.3:** Encourage ongoing maintenance of private local streets to ensure public safety.

**Goal M 5:** Long-haul truck traffic is separated from local traffic, reducing the impacts of truck traffic on local streets and residential areas.

**Policy M 5.1:** Support development of the High Desert Corridor and the Northwest 138 Corridor Improvement Project, to provide a route for truck traffic between Interstate 5, State Route 14, and Interstate 15.

**Policy M 5.2:** Direct truck traffic to designated truck routes and prohibit truck traffic on designated scenic routes, to the greatest extent feasible.

**Policy M 5.3:** Require that designated truck routes are designed and paved to accommodate truck traffic, preventing excessive pavement deterioration from truck use.

**Policy M 5.4:** Add rest stops along designated truck routes to provide stopping locations away from residential uses.

**Policy M 5.5:** Develop appropriate regulations for truck parking on local streets to avoid impacts to residential areas.

**Goal M 6:** A range of transportation options to connect the Antelope Valley to other regions.

**Policy M 6.1:** Support the development of Palmdale Regional Airport and encourage a range of commercial air travel options.

**Policy M 6.2:** Support the development of William J. Fox Airfield as a facility for general aviation, air cargo operations, and commuter air travel.

**Policy M 6.3:** Support the development of the High Desert Corridor and the Northwest 138 Corridor Improvement Project between Interstate 5, State Route 14, and Interstate 15, and encourage the participation of private enterprise and capital.

**Policy M 6.4:** Support increases in Metrolink commuter rail service, and support the expansion of commuter rail service on underutilized rail lines where appropriate.

**Policy M 6.5:** Support the development of the California High Speed Rail System, with a station in Palmdale to provide links to Northern California and other portions of Southern California, and encourage the participation of private enterprise and capital.

**Policy M 6.6:** Support the development of a high-speed rail system linking Palmdale to Victorville and Las Vegas, and encourage the participation of private enterprise and capital.

**Policy M 6.7:** Establish a regional transportation hub in Palmdale with feeder transit service to the rural areas of the unincorporated Antelope Valley.

**Policy M 6.8:** In planning for all regional transportation systems, consider and mitigate potential impacts to existing communities, and minimize land use conflicts.

**Policy M 6.9:** Engage regional agencies, such as Caltrans, SCAG, Metro, and the California High Speed Rail Authority in the implementation of an effective and efficient integrated multi-modal regional transportation network. Ensure adequate funding on an ongoing basis through financing programs, such as grants, congestion pricing, bonding, fair share cost assignments, etc.

**Goal M 7:** Bus service is maintained and enhanced throughout the Antelope Valley.

**Policy M 7.1:** Maintain and increase funding to the Antelope Valley Transit Authority for bus service.

**Policy M 7.2:** Support increases in bus service to heavily traveled areas and public facilities, such as parks and libraries.

**Policy M 7.3:** Support increases in bus service to rural communities, linking them to a regional transportation hub in Palmdale and shopping and employment centers in Lancaster and Palmdale.

**Policy M 7.4:** Improve access for all people, including seniors, youth, and the disabled, by maintaining off-peak service and equipping transit services for wheelchairs and bicycles.

**Policy M 7.5:** Encourage the use of advanced technologies in the planning and operation of the transit system.

**Goal M 8:** Alternative transit options in areas not reached by bus service.

**Policy M 8.1:** Support the expansion of dial-a-ride services to rural communities, linking them to a regional transportation hub in Palmdale and shopping and employment centers in Lancaster and Palmdale.

**Policy M 8.2:** Evaluate the feasibility of alternative transit options, such as community shuttle services and privately operated transit, to increase accessibility.

**Goal M 9:** A unified and well-maintained bicycle transportation system throughout the Antelope Valley with safe and convenient routes for commuting, recreation, and daily travel.

**Policy M 9.1:** Implement the adopted Bikeway Plan for the Antelope Valley in cooperation with the cities of Lancaster and Palmdale. Ensure adequate funding on an ongoing basis.

**Policy M 9.2:** Along streets and highways in rural areas, add safe bicycle routes that link to public facilities, a regional transportation hub in Palmdale, and shopping and employment centers in Lancaster and Palmdale.

**Policy M 9.3:** Ensure that bikeways and bicycle routes connect communities and offer alternative travel modes within communities.

**Policy M 9.4:** Encourage provision of bicycle racks and other equipment and facilities to support the use of bicycles as an alternative means of travel.

**Goal M 10:** A unified and well-maintained multi-use (equestrian, hiking, and mountain bicycling) trail system that links destinations such as rural town centers and recreation areas throughout the Antelope Valley.

**Policy M 10.1:** Implement the adopted Trails Plan for the Antelope Valley in cooperation with the cities of Lancaster and Palmdale. Ensure adequate funding on an ongoing basis.

**Policy M 10.2:** Connect new development to existing population centers with trails, requiring trail dedication and construction through the development review and permitting process.

**Policy M 10.3:** Maximize fair and reasonable opportunities to secure additional trail routes (dedicated multi-use trail easements) from willing property owners.

**Policy M 10.4:** Ensure trail access by establishing trailheads with adequate parking and access to public transit, where appropriate and feasible.

**Policy M 10.5:** Locate and design trail routes to minimize impacts to sensitive environmental resources and ecosystems.

**Policy M 10.6:** Where trail connections are not fully implemented, collaboratively work to establish safe interim connections.

**Policy M 10.7:** Ensure that existing trails and trailheads are properly maintained by the relevant agencies.

**Policy M 10.8:** Solicit community input to ensure that trails are compatible with local needs and character.

**Goal M 11:** A continuous, integrated system of safe and attractive pedestrian routes linking residents to rural town center areas, schools, services, transit, parks, and open space areas.

**Policy M 11.1:** Improve existing pedestrian routes and create new pedestrian routes, where appropriate and feasible. If paving is deemed necessary, require permeable paving consistent with rural community character instead of concrete sidewalks.

**Policy M 11.2:** Within rural town center areas, require that highways and streets provide pleasant pedestrian environments and implement traffic calming methods to increase public safety for pedestrians, bicyclists, and equestrian riders.

**Policy M 11.3:** Within rural town center areas, promote pedestrian-oriented scale and design features, including public plazas, directional signage, and community bulletin boards.

**Policy M 11.4:** Within rural town center areas, encourage parking to be located behind or beside structures, with primary building entries facing the street. Encourage also the provision of direct and clearly delineated pedestrian walkways from transit stops and parking areas to building entries.

**Policy M 11.5:** Implement traffic calming methods in areas with high pedestrian usage, such as school zones.

### Conservation and Open Space Element

**Policy COS 9.2:** Develop multi-modal transportation systems that offer alternatives to automobile travel to reduce the number of vehicle trips, including regional transportation, local transit, bicycle routes, trails, and pedestrian networks, as directed in the policies of the Mobility Element.

### Economic Development Element

**Policy ED 1.4:** Support the development of the High Desert Corridor and the Northwest 138 Corridor Improvement projects to improve the east-west movement of goods, particularly between the Antelope Valley and the industrial areas of Kern and San Bernardino counties and beyond.

**Policy ED 1.5:** Promote the development of an “Inland Port” in the Antelope Valley, providing additional employment in the trade and logistics sectors.

**Policy ED 1.6:** Support the development of a range of travel options that better connect the Antelope Valley to existing regional trade and employment in other regions, including the High Desert Corridor and the Northwest 138 Corridor Improvement Projects.

A consistency analysis of the proposed Project with applicable goals and policies in the County’s General Plan, AVAP, and other relevant plans, policies and regulations is provided in Section 5.8, Land Use, Entitlements, and Planning.

## **5.10.3 ENVIRONMENTAL SETTING**

The Project site is located east of the Golden State Freeway (I-5) and adjacent to SR-138 in northwestern unincorporated Los Angeles County. The northern boundary of the Project site extends to the Los Angeles/Kern County line and the southern boundary extends south of SR-138. The western boundary is approximately one mile east of I-5 and the eastern Project site boundary is defined by 290<sup>th</sup> Street West and the northern extension of Margalo Drive.

The Project site comprises approximately 12,323 acres of largely undeveloped land that is primarily used for grazing, with 1,000 acres used for agricultural purposes. SR-138 runs through the southern section of the site. In addition, 300<sup>th</sup> Street West runs through the eastern portion of the site from SR-138 over the East Branch of the California Aqueduct and to the agricultural fields to the north. Gorman Post Road crosses the southwestern portion of the Project site and runs in a northwesterly direction from SR-138 to the community of Gorman by I-5. Cement Plant Road is a paved roadway that runs northwesterly and northerly from SR-138 through the Project site to provide access to the National Cement Plant that is located northwest of the site in Kern County. Several paved access roads are also present near the West Branch of the California Aqueduct and associated facilities, which cut through the site. Other on-site paved roads lead to localized agricultural operations on the site. In addition, many unpaved roads exist as part of farming and grazing activities on the Project site.

Since Project-related traffic will utilize roadways within a much broader study area, for purposes of the analysis summarized in this section, the study area includes both local and the major regional roadways within an area defined by the northern end of the Santa Clarita Valley, the Palmdale/Lancaster area, and the southern Bakersfield region.

The Project site is approximately 35 miles north of the City of Santa Clarita and can be accessed via I-5. The site is approximately 50 miles south of the City of Bakersfield in Kern County, via I-5 and SR-99. The cities of Lancaster and Palmdale are located approximately 36 miles and 43 miles east of the Project site, respectively, via SR-138 and the Antelope Valley Freeway (SR-14) (see Exhibit 5.10-1, Project Site Location and Vicinity).

The following existing traffic conditions describe the current transportation system, traffic volumes, and operating conditions on the highway system in the study area. The existing traffic conditions described below provide the baseline for developing the study area's estimated future traffic conditions.

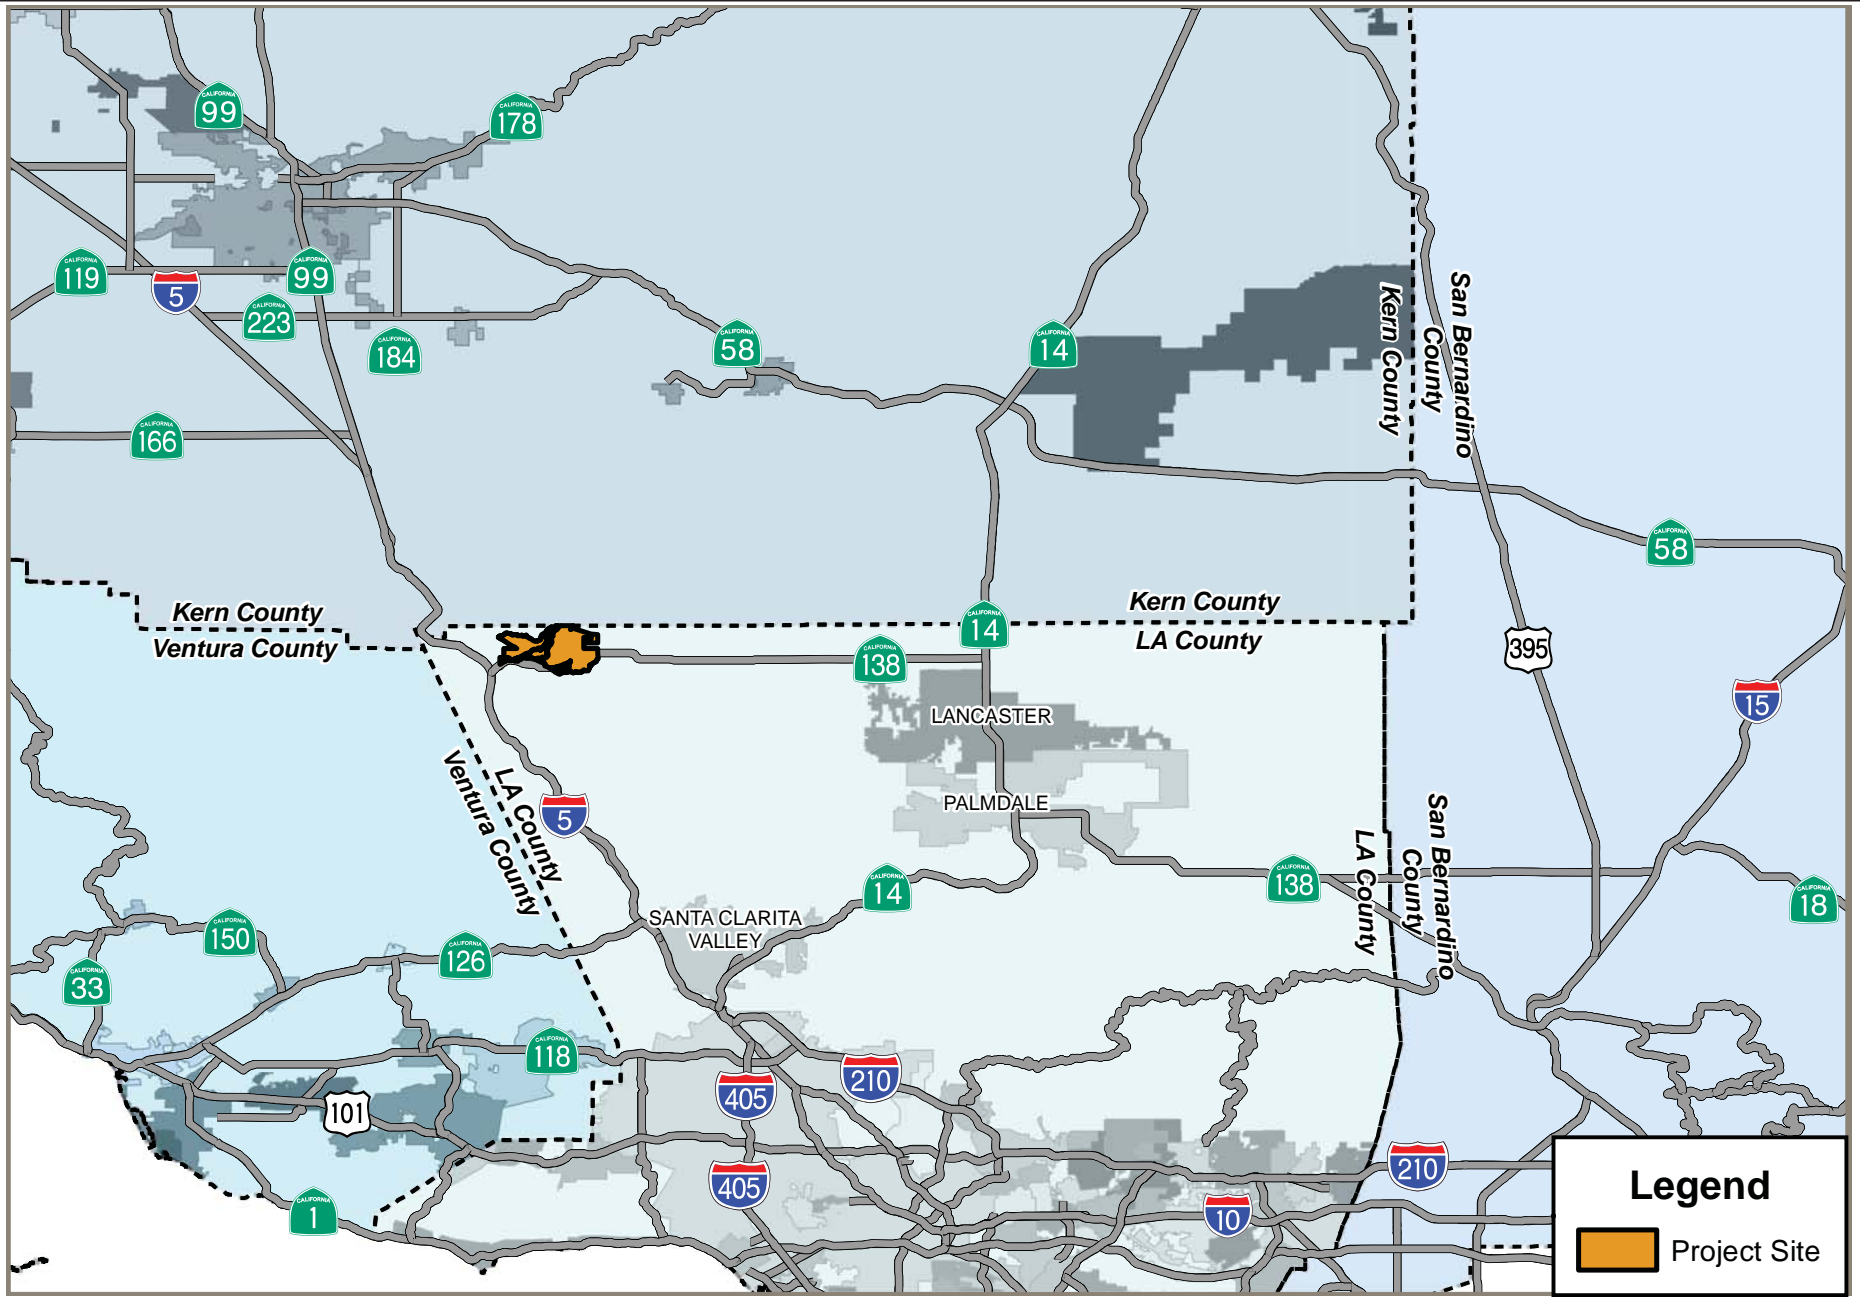

### **Existing Highway System**

The Golden State Freeway (or I-5) is located approximately one mile west of the site and currently has four lanes in each direction in the vicinity of the Project site. The SR-14 serves the eastern edge of the study area. The SR-14 freeway is currently two lanes in each direction in the vicinity of the SR-138/SR-14 partial cloverleaf interchange. Connecting I-5 to SR-14 as an east-west roadway is SR-138, which has a grade-separated, Y-style interchange with I-5 and four lanes from I-5 to approximately one mile east, where it transitions to a two-lane rural highway standard. SR-138 provides direct access to the Project site. The I-5 freeway continues north from the SR-138 intersection to Tejon Summit, located at the approximate border of Los Angeles County and Kern County, and then descends for approximately 6 miles at a 6 percent average grade from the Fort Tejon/I-5 interchange to the Grapevine Road/I-5 interchange on the San Joaquin Valley floor. The freeway has three mixed use and one truck lane in each direction in the grade area. SR-99 branches west from I-5 farther north in the valley and extends north through Bakersfield.

The highway system in the study area is illustrated in Exhibit 5.10-2, Study Area Highway System – Existing (2014 and 2015) Conditions.

Freeway capacities on a per-lane basis within the Project study area were derived for existing conditions using the methodology outlined in the *2010 Highway Capacity Manual* (TRB 2010). Table 5.10-2, Capacities for Freeways and Expressways– Existing Conditions, summarizes the capacities of freeways and regional highways (I-5, SR-14, SR-138 and SR-99) and the parameters used for their derivation.

### Existing Traffic Volumes

Daily traffic volumes for representative locations within the study area are provided in Exhibit 5.10-3, Average Daily Traffic Volumes – Existing Conditions. Peak hour turning movement volumes at intersections along SR-138 in the vicinity of the Project site are provided in Exhibit 5.10-4, AM Peak Hour Intersection Volume Counts on SR-138 (Existing Conditions) and Exhibit 5.10-5, PM Peak Hour Intersection Volume Counts on SR-138 (Existing Conditions). SR-138, the only regional roadway that currently exists adjacent to the Project site, has an existing ADT of about 5,000 between I-5 and SR-14 (see Exhibit 5.10-3).

Existing traffic counts used for the intersection analysis were collected in 2014 and 2015. Counts for intersections near the Project site, along SR-138/Avenue D, were collected in July 2015. Counts for intersections in Kern County were collected in July 2015 and counts for ramp-arterial intersections along the I-5 freeway in the Castaic area and Santa Clarita Valley area were collected between 2014 and 2015.

For State highways, traffic count data was obtained from the Caltrans Traffic Census, the Caltrans Performance Measurement System (PeMS) and the Los Angeles County Department of Public Works Machine Count Traffic Volumes database. These traffic counts represent 2014 and 2010 conditions, which is the most current data available from Caltrans and the County, respectively, at this time.

Table 5.10-3 provides the ICU and LOS analysis conducted for select intersections in the study area. As shown, all intersections operate at LOS D or better.

PM Peak Hour Intersection Volume Counts on SR-138 (Existing Conditions)

Exhibit 5.10-5

Centennial Project

Annual average daily traffic (AADT), ADT, peak hour freeway volumes and the corresponding vehicle to capacity (V/C) ratios for existing peak hour conditions are shown in Table 5.10-4 (northbound and eastbound directions) and Table 5.10-5 (southbound and westbound directions). Existing (2014 and 2015) AADT volumes were obtained from the Caltrans Traffic Census. For SR-138, mid-block and intersection counts were collected. The most accurate indication of congestion is average speeds, which have been obtained for freeway segments known to have recurring peak hour congestions. Based on average speeds, the areas of the I-5 from the Santa Clarita Valley area to the I-405 junction experience peak hour speeds indicative of recurring congestion. In addition, congestion on the SR-14 occurs in the westbound direction in the AM, and eastbound during the PM.

Peak hour volumes and the corresponding V/C ratios for select freeway on-ramps and off-ramps that have the potential to be affected by the Project are presented in Table 5.10-6. Ramp volume data was derived using the same methodology used for the freeway mainline segments.

AADT: annual average daily traffic (2-way volumes on the SR-99 are average daily traffic (ADT) volumes); V/C: volume-to-capacity ratio; Btw: Between; SR: State Route; Jct: junction; I: Interstate; NB: northbound; SB: southbound; WB: westbound; EB: eastbound ; M – number of mixed flow lanes; #T – number of truck lanes; #H – number of HOT lanes; #A – number of auxiliary lanes

For freeway segments located in LA County (i.e., SR-138, SR-14 and I-5) and Kern County freeway segments on the I-5 from Fort Tejon Interchange to the LA/Kern County line, existing volumes represent 2014 conditions. For remainder of freeway segments located in Kern County (i.e., SR-99 and I-5 from the Grapevine Grade to SR-99), existing volumes represent 2015 conditions.

Source: Stantec 2017 (Table 2-3).

### ***Existing Transit Service***

Given the rural nature of existing conditions on and near the site, no transit service is currently available in the Project area.

### **Future Setting**

The North Los Angeles County area is projected to experience substantial growth over the next 20 years, and this anticipated growth is reflected in the demographic projections contained in the Antelope Valley Area Plan (AVAP). The North County sub-area model was used to evaluate the traffic impacts of the AVAP and encompasses the northern portion of Los Angeles County, including the cities of Lancaster, Palmdale, Santa Clarita, as well as the southern portion of Kern County, including Bakersfield, Arvin, Frazier Park, Rosamond, Taft/Maricopa and Tehachapi. It also reflects the socioeconomic projections and transportation network improvements contained in the SCAG 2012 RTP/SCS model. As discussed above, traffic counts and the most recent forecasts for 2040 in the 2014 Kern COG RTP/SCS model were used to analyze potential Project impacts along I-5 and SR-99 in Kern County.

Transportation improvements will occur with future growth, some of which are currently committed and others are planned or in the planning stages. An evaluation of long-range conditions without the Project is provided in the analysis under Threshold 10-1 in Section 5.10.6, Environmental Impacts, below.

The future traffic conditions (long-range setting) assumes the SCAG and Los Angeles County year 2035 projections for the North Los Angeles County area and the surrounding region and the Kern COG 2040 projections for I-5 and SR-99 north of the Fort Tejon/I-5 interchange. Growth in the Cities of Palmdale and Lancaster, Kern County and Santa Clarita Valley areas, as well as regional facilities, such as I-5, where which trips to and from Centennial will be oriented, are primary considerations in the traffic analysis, along with specific approved or proposed projects in the vicinity of the Project site, such as:

- Tejon Mountain Village (north of the Project in Los Angeles County)
- Tejon Ranch Commerce Center (north of the Project in Kern County)
- Gorman Post Ranch (proposed west of the Project in Los Angeles County)
- Grapevine Specific Plan (proposed north of the Project in Kern County)

### ***Highway System***

Caltrans Transportation Concept Reports for I-5 and SR-14 indicate planned improvements to these facilities, but for some of these segments there is currently no set construction schedule.

Caltrans approved a Final Environmental Impact Report/Environmental Assessment (EIR/EIS) for the I-5 High Occupancy Vehicle (HOV)/Truck Lanes Project SR-14 to Parker Road ("I-5 Improvement Project") in September 2009. The project includes the addition of one HOV lane in each direction on I-5 from the SR-14 Interchange north to Parker Road; truck climbing lanes in each direction from the SR-14 Interchange to Calgrove Boulevard

(northbound) and Pico Canyon Road/Lyons Avenue (southbound); and full auxiliary lanes within portions of the Project study area. Caltrans completed construction of the truck lanes in December 2014. In May 2013, Caltrans approved a Supplemental EIR/Environmental Reevaluation (EIR/ER) for the improvement project that replaces the planned HOV lanes with high occupancy toll (HOT) lanes. The HOT lane project currently is in the design phase and Caltrans estimates the improvements will be completed by 2022. As a result, these improvements are included in the long-range analysis below.

In the vicinity of the Project site, Caltrans is planning to widen SR-138 from two lanes to four or more lanes from I-5 to SR-14, consistent with the recommendations in the North County Combined Highway Corridors Study. The study showed that this highway will experience an increase in traffic volumes (not related to the proposed Project) that will ultimately exceed the capacity of the existing two-lane highway. Caltrans is currently in the process of preparing the Project Approval and Environmental Document (PA&ED) for this expressway project.

The Northwest 138 Corridor Improvement Project expands on the North County Combined Highway Corridor Study and evaluates operational improvements for SR-138 from I-5 to SR-14. In 2013, Caltrans and Metro initiated the draft Northwest State Route 138 Corridor Improvement Project Environmental Impact Report/Statement (draft NW SR-138 EIR/EIS) for improvements to SR-138 between I-5 and SR-14. In July 2016, Caltrans released the draft NW SR-138 EIR/EIS that identified build alternatives that would improve mobility, operations, enhance safety and accommodate foreseeable increases in travel on the SR-138 and in northern Los Angeles County. Both the draft NW SR-138 EIR/EIS and the Centennial Specific Plan Traffic Study addressed similar mainline segments and study intersections along the SR-138 corridor.

The NW SR-138 EIR/EIS evaluated the following long-range scenarios:

- No Build (2040) Alternative
- Build (2040) Alternative 1 – Freeway/Expressway
  - Build Alternative 1 with Antelope Acres Loop Design Option
- Build (2040) Alternative 2 – Expressway/Limited Access Conventional Highway
- Transportation System Management (TSM) Alternative

Specified sets of improvements were analyzed as part of the build alternatives and included mainline widening, connector improvements, access type and intersection control treatments. The analysis of the build alternatives with the forecasted demand concluded the following:

- One or more segments and study intersections on the SR-138 would operate at LOS E under No Build conditions, which exceeds the Caltrans LOS D threshold. Therefore, improvements are warranted.
- With the improvements analyzed as part of the Build Alternative 1, all study intersections and SR-138 mainline would operate at LOS D or better.

- With the improvements analyzed as part of the Build Alternative 2, all study intersections and SR-138 mainline would operate at LOS D or better.
- The TSM alternative would result in LOS E at study intersections and SR-138 mainline, therefore that alternative was removed from consideration.

While specified sets of improvements were analyzed as part of the build alternatives, the Transportation Analysis Report (TAR) also listed additional access types and control treatment options for the Build Alternatives. The analysis of the additional options is documented in the Supplemental Intersection Control Evaluation report (ICE Report). In the ICE Report, multiple improvement options for consideration along the corridor are reported in addition to the analyzed treatments, and the report notes that the options have been explored and can be selected for implementation at the appropriate time.

The draft NW SR-138 EIR/EIS, TAR and ICE Report do not identify a preferred alternative and Caltrans has deferred the selection of a preferred alternative to the Final EIR/EIS. Caltrans has also reserved the right to determine the specific preferred intersection control based on the traffic and safety data at the time the improvements occur.

A regional high capacity goods movement facility along the SR-58 and/or E-220 corridor between I-5 in Kern County and I-15 in San Bernardino County has been identified in regional planning analyses as a route for goods movement between the San Joaquin Valley and the I-15/I-40 interchange area. This facility will provide an effective by-pass route for truck trips between the Central Valley area and areas such as Southern California, Arizona, Nevada and Mexico. A significant byproduct of the goods movement corridor is a reduction in truck traffic along the I-5 corridor through the Tejon Pass and the Santa Clarita Valley.

### ***Projected Traffic Volumes***

As discussed under Methodology above, Year 2035 and Year 2040 (for Kern County freeways) traffic forecasts are based on The North County Sub-Area Travel Demand Forecasting Model, the Santa Clarita Valley Consolidated Traffic Model (SCVCTM), and the Centennial Traffic Model (CTM), coordinated with the 2012 SCAG RTP/SCS and the 2014 Kern COG RTP/SCS models. Projected traffic volumes are provided in the analysis below under the without project conditions.

## **5.10.4 PROJECT DESIGN FEATURES**

The following project design features (PDFs) are proposed to reduce the need to use automobiles for routine travel, to facilitate walking and other alternative modes of transportation, and to reduce length of vehicle trips that are taken by Centennial residents.

- PDF 10-1** The Project includes a Mobility Plan, included as Section 3.2 of the Specific Plan, which provides an extensive system of sidewalks, greenway trails, and community trails to serve as alternative means of transportation on the Project site. (Greenway trails and community trails would accommodate both pedestrians and bicyclists.) The Project, through the Mobility Plan, aims to:

- Reinforce and serve the Land Use Plan;
- Provide multiple modes of accessibility for internal and external trips by future residents, employees and visitors;
- Provide residents and employees with multiple opportunities for using alternative (non-auto/motorized) modes of transportation;
- Provides for 80 percent on average, but no less than 50 percent of residential units to be located within one-half mile of a Village Core or the Town Center that includes retail and service uses;
- Provide parks within a 5-minute walk (0.25 mile) of 80 percent of all residential units;
- Includes a variety of measures to reduce on-site single-occupancy automobile use by 30 percent; and
- Includes a variety of measures to reduce off-site peak hour commutes in single-occupancy automobiles by 20 percent.

As part of the Mobility Plan, the Project's Circulation Plan includes major east-west roadways, to serve the Project's east-west travel demand, to connect major on-site activity areas, and to lessen the Project's traffic demand on SR-138. The Circulation Plan sets forth requirements for roadway classifications; intersection controls; and traffic calming measures.

Each component of the Mobility Plan incorporates Transportation Demand Management (TDM) features to reduce dependence on the automobile, provide for a more efficient use of transportation resources among Project occupants, and thereby reduce pollutant emissions. The key TDM elements that are inherent in the overall Mobility Plan are:

- Sidewalks, greenway trails, and community trails that link residential, schools, shopping, and employment areas;
- Creation and ongoing operation of a Transportation Management Association (TMA) to fund and manage the operation of ongoing transportation programs, including but not limited to transit and on-demand services;
- Small- to medium-sized streets and blocks that allow for shorter walking distances to retail, parks, schools, and other destinations;
- Pedestrian environments incorporated with public streets;
- Parking behind buildings to encourage walking in retail areas along street frontage;
- Parks within 0.25 mile of 80 percent of all residences; and
- Two underpasses and one overpass over SR-138 to facilitate both pedestrian and bike access to employment areas.

- PDF 10-2** The Project strategically locates schools, parks and commercial areas with a range of service and retail uses at the village centers to facilitate pedestrian access (i.e., linked to the network of sidewalks, greenway trails and community trails); although the final school site locations are subject to final approval by the applicable school district and are subject to change.
- PDF 10-3** The Project locates higher density residential uses adjacent to commercial areas in village centers and includes a Mixed-Use Overlay District that permits residential uses in commercial areas. This land-use configuration places larger populations within commercial areas to encourage pedestrian activity and to reduce vehicle trips.
- PDF 10-4** The Project's Technology Plan, included as Section 3.9 of the Specific Plan, requires a community intranet with access for homeowners associations; interest groups; local event scheduling; schools; library facilities; carpool and transit services; other on-site entertainment and amenities. The intranet will reduce the need for people to use automobile travel to obtain information and will provide easily accessible information to facilitate telecommuting and alternate means of transportation beyond the individual automobile.

### 5.10.5 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

- Threshold 10-1** Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit.
- Threshold 10-2** Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways.
- Threshold 10-3** Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks.
- Threshold 10-4** Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
- Threshold 10-5** Result in inadequate emergency access.

**Threshold 10-6** Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

## Performance Criteria

The traffic analysis determined the potential Project impacts on freeway mainline segments,<sup>3</sup> freeway ramps, arterial roads, and rural highways. The impact criteria are based on capacity and volume. Capacity refers to the vehicle-carrying ability of a road segment, while volume is a measure of existing or forecasted traffic. The ratio between the volume and the capacity gives a volume-to-capacity (V/C) ratio, and a corresponding level of service (LOS) is defined based on the V/C ratio. The V/C methodology is specified by the Congestion Management Plan (CMP) for Los Angeles County. Caltrans utilizes the methodology described in the Highway Capacity Manual (HCM) to estimate density and LOS for freeway analysis. The HCM methods have been utilized to derive the capacities employed for the V/C calculations in order to address the preferences of both the CMP and Caltrans for the analysis.

Traffic LOS ranges from A (free flow conditions) to F (severe traffic conditions). A description of each LOS for arterial roads and freeway segments is provided in Table 5.10-7 below.

**TABLE 5.10-7  
LEVEL OF SERVICE DESCRIPTIONS**

LOS	Arterial Roads	Freeway Segments
A	Describes primarily free-flow operations at average travel speeds, usually about 90 percent of the free-flow speed for the given street class. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at signalized intersections is minimal.	Describes free-flow operations. Free-flow speeds prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream. The effects of incidents or point breakdowns are easily absorbed at this level.
B	Describes reasonably unimpeded operations at average travel speeds, usually about 70 percent of the free-flow speed for the street class. The ability to maneuver within the traffic stream is only slightly restricted, and control delays at signalized intersections are not significant.	Represents reasonably free flow, and free-flow speeds are maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high. The effects of minor incidents and point breakdowns are still easily absorbed.
C	Describes stable operations; however, ability to maneuver and change lanes in midblock locations may be more restricted than at LOS B, and longer queues, adverse signal coordination, or both may contribute to lower average travel speeds of about 50 percent of the free-flow speed for the street class.	Provides for flow with speeds at or near the free-flow speed of the freeway. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver. Minor incidents may still be absorbed, but the local deterioration in service will be substantial. Queues may be expected to form behind any significant blockage.
D	Borders on a range in which small increases in flow may cause substantial increases in delay and decreases in travel speed. LOS D may be due to adverse signal progression, inappropriate signal	The level at which speeds begin to decline slightly with increasing flows and density begins to increase somewhat more quickly. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical

<sup>3</sup> A freeway mainline segment is a portion of a freeway/highway between ramps that consists of a continuous roadway without stop signs, stop lights, or intersections.

**TABLE 5.10-7  
LEVEL OF SERVICE DESCRIPTIONS**

LOS	Arterial Roads	Freeway Segments
	timing, high volumes, or a combination of these factors. Average travel speeds are about 40 percent of free-flow speed.	and psychological comfort levels. Even minor incidents can be expected to create queuing, because the traffic stream has little space to absorb disruptions.
E	Characterized by significant delays and average travel speeds of 33 percent or less of the free-flow speed. Such operations are caused by a combination of adverse signal progression, high signal density, high volumes, extensive delays at critical intersections, and inappropriate signal timing.	At its highest density value, LOS E describes operation at capacity. Operations at this level are volatile, because there are virtually no usable gaps in the traffic stream. Vehicles are closely spaced, leaving little room to maneuver within the traffic stream at speeds that still exceed 49 miles per hour. Any disruption of the traffic stream, such as vehicles entering from a ramp or a vehicle changing lanes, can establish a disruption wave that propagates throughout the upstream traffic flow. At capacity, the traffic stream has no ability to dissipate even the most minor disruption, and any incident can be expected to produce a serious breakdown with extensive queuing. Maneuverability within the traffic stream is extremely limited, and the level of physical and psychological comfort afforded the driver is poor.
F	Characterized by urban street flow at extremely low speeds, typically one-third to one-fourth of the free-flow speed. Intersection congestion is likely at critical signalized locations, with high delays, high volumes, and extensive queuing.	Describes breakdowns in vehicular flow. Such conditions generally exist within queues forming behind breakdown points. LOS F operations within a queue are the result of a breakdown or bottleneck at a downstream point. LOS F is also used to describe conditions at the point of the breakdown or bottleneck and the queue discharge flow that occurs at speeds lower than the lowest speed for LOS E, as well as the operations within the queue that forms upstream. Whenever LOS F conditions exist, they have the potential to extend upstream for significant distances.
Source: Stantec 2017 (Table 1-1) from Highway Capacity Manual 2010.		

Table 5.10-8 provides the V/C ranges that correspond to LOS A through F for arterial roads and freeway segments. The V/C ranges listed for arterial roads are those used by the County of Los Angeles and are typical for local jurisdictions in the study area. The V/C ranges listed for freeway segments are based on the V/C and LOS relationships specified in the *2010 Highway Capacity Manual* (HCM 2010) for basic freeway sections with free-flow speeds of 75 miles per hour (mph).

**TABLE 5.10-8  
VOLUME/CAPACITY RATIO LEVEL OF SERVICE RANGES**

LOS	V/C Ratio Range	
	Arterial Roads and Intersections <sup>a</sup>	Freeway Segments (FFS = 75 mph) <sup>b</sup>
A	0.00-0.60	0.00-0.34
B	0.61-0.70	0.35-0.56
C	0.71-0.80	0.57-0.76
D	0.81-0.90	0.77-0.90
E	0.91-1.00	0.91-1.00
F	Above 1.00	Above 1.00

V/C Ratio: volume-to-capacity ratio; FFS: free flow speed; mph: miles per hour  
<sup>a</sup> Traffic Impact Analysis Report Guidelines  
<sup>b</sup> Highway Capacity Manual 2010  
Source: Stantec 2017 (Table 1-2).

This evaluation focuses on those parts of the day when such congestion typically occurs. The impact criteria are separated according to four fundamental components of the circulation system: freeway mainline segments, freeway ramps, arterial roads, and rural highways. Peak hour data (AM and PM) is used in all cases to establish V/C and LOS measures and to define what constitutes an adverse traffic impact. The following sections describe the impact criteria (i.e., V/C calculation methodology, LOS performance standards, and traffic impact thresholds) for the four circulation system components.

### ***Impact Criteria for Freeway Mainline Segments***

The impact analysis for freeway mainline segments is based on peak hour volumes by direction. Table 5.10-9, LOS Criteria for Basic Freeway Segments, shows the relationship between the three basic measurements for traffic (speed, density, and volume) and how they translate to LOS. Freeway mainline capacities were derived with the methodology utilized in the HCM 2010. A maximum service flow rate that corresponds to LOS E is determined based on the segment's free flow speed, and this maximum rate is adjusted to account for prevailing roadway and traffic conditions such as terrain, grade, and the proportion of trucks within the traffic stream.

**TABLE 5.10-9  
LOS CRITERIA FOR BASIC FREEWAY SEGMENTS**

Criteria	LOS				
	A	B	C	D	E
<b>FFS = 75 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	45
Minimum speed (mi/h)	75.0	74.8	70.6	62.2	53.3
Maximum V/C	0.34	0.56	0.76	0.90	1.00
Maximum service flow rate (pc/h/ln)	820	1,310	1,750	2,110	2,400
<b>FFS = 70 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	45
Minimum speed (mph)	70.0	70.0	68.2	61.5	53.3
Maximum V/C	0.32	0.53	0.74	0.90	1.00
Maximum service flow rate (pc/h/ln)	770	1,250	1,690	2,080	2,400
<b>FFS = 65 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	45
Minimum speed (mph)	65.0	65.0	64.6	59.7	52.2
Maximum V/C	0.30	0.50	0.71	0.89	1.00
Maximum service flow rate (pc/h/ln)	710	1,170	1,630	2,030	2,350
<b>FFS = 60 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	45
Minimum speed (mph)	60.0	60.0	60.0	57.6	51.1
Maximum V/C	0.29	0.47	0.68	0.88	1.00
Maximum service flow rate (pc/h/ln)	660	1,080	1,560	2,010	2,300
<b>FFS = 55 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	45
Minimum speed (mph)	55.0	55.0	55.0	54.7	50.0
Maximum V/C	0.27	0.44	0.64	0.85	1.00
Maximum service flow rate (pc/h/ln)	600	990	1,430	1,900	2,250
LOS: level of service; FFS: free flow speed; mph: miles per hour; pc/mi/ln: passenger cars per mile per lane; V/C: volume-to-capacity ratio; pc/h/ln: passenger cars per hour per lane.					
Notes: The exact mathematical relationship between density and V/C has not always been maintained at LOS boundaries because of the use of rounded values. Density is the primary determinant of LOS. The speed criterion is the speed at maximum density for a given LOS.					
Source: Stantec 2017 (Table 1-3) from Highway Capacity Manual 2010.					

Table 5.10-10, Freeway Mainline Performance Criteria, provides the impact criteria for analyzing freeway mainline segments within the study area, as specified by Caltrans and by the Los Angeles County CMP. Caltrans's goal is to maintain no worse than LOS E in urban areas and LOS C or D in rural areas (refer to Figure 1-4 in EIR Appendix 5.10-A). However, Caltrans acknowledges that this is not always feasible for some rural areas due to constraints such as geological, structural, or right-of-way conditions. To achieve conformity in the evaluation of freeway mainline segments and acknowledging that there exist some such rural segments as described above within the study area, Caltrans has agreed that, for

evaluation of the study area for the Project, LOS E is to be uniformly utilized as the performance criterion for freeways studied for the purpose of determining significant Project impacts within the study area, the following exception:

1. LOS D for the rural areas of Interstate 5 from the Parker Road interchange in Los Angeles County to the State Route 99 interchange in Kern County, LOS E from Parker Road to State Route 138, and LOS D from State Route 138 to State Route 99 interchange are to be utilized as the performance criteria. LOS D for segments on the SR-99 and SR-14.

(Refer to Appendix 5.10-B for the referenced correspondence from Caltrans).

**TABLE 5.10-10  
FREEWAY MAINLINE PERFORMANCE CRITERIA**

<b>Performance Standard</b>
LOS D <sup>a</sup> – Rural areas unless specified otherwise.
LOS E <sup>a</sup> – Urban areas, I-5 south of Parker Road, and SR-14 from Santa Clarita to Palmdale
<sup>a</sup> or existing LOS, whichever is worse, for the purpose of determining significant Project impacts. In rural areas, Caltrans goal is to maintain conditions no worse than LOS D.
These performance standards are applicable for the Project study only, based on Caltrans evaluation of specific factual conditions, and does not constitute a statewide standard.
In rural areas, Caltrans goal is to generally maintain conditions no worse than LOS D
<b>Impact Threshold</b>
A freeway mainline segment is considered to be adversely impacted if each of the following conditions are met:
1. The segment is forecasted to operate deficiently (i.e., worse than the performance standard).
2. Compared to the V/C in the No-Project Alternative, the V/C in the With-Project Alternative increases by greater than or equal to 0.02 (the impact threshold specified in the CMP).
LOS: level of service; I: Interstate; V/C: volume-to-capacity ratio; CMP: Congestion Management Program.
Source: : Stantec 2017 (Table 1-4)

***Criteria for Freeway Ramps***

Impacts to freeway interchange ramps were evaluated for the AM and PM peak hours. The freeway ramp carrying capacities for the study area’s existing and anticipated ramp configurations are based on information in the *Highway Design Manual* (HDM) and *The Ramp Meter Design Manual*, respectively, of the Traffic Study (Appendix 5.10-A) and refinements in various planning studies for freeway interchanges. The capacities for calculating ramp V/C ratios are summarized in Table 5.10-11, Freeway Ramp Performance Criteria, together with the overall impact criteria for freeway ramps within the study area. Capacities are listed for two basic types of interchanges: freeway to arterial road and freeway to freeway. The performance standard of LOS E is consistent with the performance standard for freeway mainline segments as noted above.

**TABLE 5.10-11  
FREEWAY RAMP PERFORMANCE CRITERIA**

<b>V/C Calculation Methodology</b>
<p>LOS to be based on peak hour V/C ratios calculated using the following ramp capacities: Freeway to Arterial Road Interchanges:</p> <ol style="list-style-type: none"> <li><i>Metered On-Ramps:</i> <ul style="list-style-type: none"> <li>A maximum capacity of 900 vph for a 1-lane metered on-ramp with only 1 mixed-flow lane at the meter.</li> <li>A maximum capacity of 1,080 (20% greater than 900) vph for a 1-lane metered on-ramp with 1 mixed-flow lane at the meter plus 1 HOV preferential lane at the meter.</li> <li>A maximum capacity of 1,500 vph for a 1-lane metered on-ramp with 2 mixed-flow lanes at the meter.</li> <li>A maximum capacity of 1,800 vph for a 2-lane metered on-ramp (with mainline auxiliary lane for second lane) with 2 mixed-flow lanes at the meter.</li> </ul> </li> <li><i>Non-Metered On-Ramps and Off-Ramps:</i> <ul style="list-style-type: none"> <li>A maximum capacity of 1,500 vph for a 1-lane ramp.</li> <li>A maximum capacity of 2,250 (50% percent greater than 1,500) vph for a 2-lane on-ramp that tapers to 1 merge lane at or beyond the freeway mainline gore point and for a 2-lane off-ramp with only 1 auxiliary lane.</li> <li>A maximum capacity of 3,000 vph for a 2-lane on-ramp that does not taper to 1 merge lane and for a 2-lane off-ramp with 2 auxiliary lanes.</li> </ul> </li> <li><i>Freeway to Freeway and SR-138 to I-5 Interchanges:</i> <ul style="list-style-type: none"> <li>A maximum capacity of 2,000 vph for a 1-lane ramp.</li> <li>A maximum capacity of 4,000 vph for a 2-lane ramp.</li> </ul> </li> </ol>
<b>Performance Standard</b>
<ol style="list-style-type: none"> <li>LOS E<sup>a</sup> (peak hour ICU less than or equal to 1.00) <sup>a</sup> or existing LOS, whichever is worse.</li> </ol>
<b>Impact Threshold</b>
<p>A freeway ramp is considered to be adversely impacted if each of the following conditions are met:</p> <ol style="list-style-type: none"> <li>The ramp is forecasted to operate deficiently (i.e., worse than the performance standard)</li> <li>Compared to the V/C in the No-Project Alternative, the V/C in the With-Project Alternative increases by greater than or equal to 0.02.</li> </ol>
<p>V/C: volume-to-capacity ratio; LOS: level of service; HOV: high occupancy vehicle; vph: vehicles per hour; SR: State Route; ICU: intersection capacity utilization. Source: : Stantec 2017 (Table 1-5)</p>

### ***Criteria for Arterial Roads***

The capacity of the arterial road system is generally limited by the capacity of the system's intersections. Therefore, the peak-hour performance of intersections is the most representative measure for evaluating the arterial road system and potential impacts. The intersection capacity utilization (ICU) methodology is applied for signalized intersections. The County of Los Angeles uses the ICU method for planning analyses and is the specified methodology in the Los Angeles County CMP.

The ICU methodology adds the V/C ratios for the critical movements of an intersection. The ICU ranges that correspond to LOS A through F for arterial roads and signalized intersections are equal to the V/C ranges shown in Table 5.10-8. The ICU calculation methodology and associated impact criteria applied for the study area arterial system are based on the criteria of the applicable jurisdiction and are summarized in Table 5.10-12. LOS D (ICU not to exceed 0.90) has been utilized as the design standard for new intersections within the Project site.

**TABLE 5.10-12  
ARTERIAL INTERSECTION PERFORMANCE CRITERIA**

<b>V/C Calculation Methodology</b>		
LOS to be based on peak hour ICU values calculated using the following assumptions:		
Saturation Flow Rate: 1,600 vphpl for all lanes except dual left-turn lanes 2,880 vph (total) for dual left-turn lanes 1,750 vphpl for all lanes at City of Santa Clarita intersections		
Clearance Interval: 0.10 (ICU)		
<b>Performance Standard</b>		
<i>County of Los Angeles Intersections:</i> LOS D (peak hour ICU less than or equal to 0.90) for new (future) intersections. LOS C (peak hour ICU less than or equal to 0.80) or future No-Project conditions LOS, whichever is worse, for existing intersections.		
<i>State Highways and County of Kern Intersections:</i> LOS D or existing LOS, whichever is worse.		
<b>Impact Threshold</b>		
An intersection is considered to be adversely impacted if each of the following conditions are met:		
1. The intersection is forecasted to operate deficiently (i.e., worse than the performance standard).		
2. Compared to the ICU in the No-Project Alternative, the ICU in the With-Project Alternative increases by the following:		
<u>Pre-Project ICU*</u>	<u>Project ICU Increment</u>	<u>Applicable Jurisdiction</u>
0.71–0.80 (LOS C)	greater than or equal to 0.04	LA County Arterials Only
0.81–0.90 (LOS D)	greater than or equal to 0.02	LA County/City of Santa Clarita Arterials Only
> 0.90 (LOS E/F)	greater than or equal to 0.01	All
HOV: high occupancy vehicle; LOS: level of service; ICU: Intersection Capacity Utilization; vphpl: vehicles per hour per lane; vph: vehicles per hour.		
For LA County intersections, Project impacts are identified by comparing existing conditions to existing plus Project conditions. For cumulative conditions, cumulative impacts on SR-138 are identified by comparing existing conditions to cumulative with-Project conditions. For other locations, impacts are identified by comparing cumulative no-Project conditions to cumulative with-Project conditions.		
For Kern County, Caltrans and City of Santa Clarita intersections, Project impacts are identified by comparing existing to existing plus Project conditions. For cumulative conditions, cumulative impacts are identified by comparing cumulative no-Project conditions to cumulative with-Project conditions.		
If the LOS and net increase in ICU meets the two criteria listed above, the intersection is identified as being significantly impacted either by the Project or by a combination of cumulative and Project traffic.		
* The City of Santa Clarita utilizes the With Project ICU to determine the ICU impact threshold.		
Source: Stantec 2017 (Table 1-6).		

### ***Criteria for Rural Highways***

The SR-138, a two-lane rural highway, passes through the Project site. The HCM 2010 emphasizes average travel speeds and vehicles' abilities to use the opposing lane of traffic while passing. According to the HCM 2010 methodology, the LOS for a two-lane rural highway is heavily influenced by the traffic flows in both directions. Thus, LOS is emphasized rather than actual capacity. By contrast, the HCM 2010 methodology for assessing capacity on multi-lane rural highways considers the average flow rate across two lanes, and in this case the LOS addresses actual "capacity" rather than simply the ability to pass.

The HCM 2010 criteria for two-lane rural highways are presented in Table 5.10-13, LOS Criteria for Two-Lane Rural Highways.

**TABLE 5.10-13  
LOS CRITERIA FOR TWO-LANE RURAL HIGHWAYS**

LOS	Maximum Two-Way Service Flow Rate (pc/h) <sup>a</sup>	Percent of Time Delayed By Slow Vehicles <sup>a,b</sup>	Average Speed (mph) <sup>a</sup>	Maximum Two-Way Volume <sup>c</sup>
A	490	≤ 35	≥ 55	1,500/1,680
B	780	36-50	50-54	1,750/1,960
C	1,190	51-65	45-49	2,000/2,240
D	1,830	66-80	40-44	2,250/2,520
E	3,200	> 80	< 40	2,500/2,800

LOS: level of service; pc/h: passenger cars per hour; mph: miles per hour; HCM: Highway Capacity Manual  
<sup>a</sup> HCM Methodology (maximum directional flow = 1,700 pc/h).  
<sup>b</sup> Also referred to as “Percent of Time-Spent-Following”.  
<sup>c</sup> County guidelines, lower value is for 70/30 directional split and higher value is for 50/50 directional split.  
 Source: Stantec 2017 (Table 1-7).

For the SR-138 analysis, the HCM 2010 methodology was used to calculate LOS. As specified by Caltrans, the analysis considers the percent of time-spent-following instead of average speed. Table 5.10-14, Two-Lane Rural State Highway Performance Criteria, summarizes the overall impact criteria for analyzing two-lane State highways within the study area.

**TABLE 5.10-14  
TWO-LANE RURAL STATE HIGHWAY PERFORMANCE CRITERIA**

Performance Standard
LOS D or existing LOS, whichever is worse.
Impact Threshold
A 2-lane rural State highway is considered to be adversely impacted if each of the following conditions are met: 1. The segment is forecasted to operate deficiently (i.e., worse than the performance standard). 2. Compared to the “percent of time delayed by slow vehicles” in the No-Project scenario, the “percent of time delayed by slow vehicles” in the With-Project scenario increases by greater than or equal to 2%.
LOS – level of service Source: Stantec 2017 (Table 1-8).

The impact analysis for multi-lane rural highways is based on peak-hour volumes by direction. The HCM 2010 methodology was used for calculating the capacities used to derive peak hour V/C ratios. First, the maximum service flow rate that corresponds to LOS E is determined based on the segment’s free flow speed. Using this value, a service flow rate is calculated based on prevailing roadway and traffic conditions such as terrain, grade, and the proportion of trucks within the traffic stream. Table 5.10-15, LOS Criteria for Multiple Lane Rural Highways, shows the relationship between traffic speed, density, volume, and how each translates to LOS.

**TABLE 5.10-15  
LOS CRITERIA FOR MULTIPLE LANE RURAL HIGHWAYS**

Criteria	LOS				
	A	B	C	D	E
<b>FFS = 60 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	40
Average speed (mi/h)	60.0	60.0	59.4	56.7	55.0
Maximum V/C ratio	0.30	0.49	0.70	0.90	1.00
Maximum service flow rate (pc/h/ln)	660	1,080	1,550	1,980	2,200
<b>FFS = 55 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	41
Average speed (mph)	55.0	55.0	54.9	52.9	51.2
Maximum V/C ratio	0.29	0.47	0.68	0.88	1.00
Maximum service flow rate (pc/h/ln)	600	990	1,430	1,850	2,100
<b>FFS = 50 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	43
Average speed (mph)	50.0	50.0	50.0	48.9	47.5
Maximum V/C ratio	0.28	0.45	0.65	0.86	1.00
Maximum service flow rate (pc/h/ln)	550	900	1,300	1,710	2,000
<b>FFS = 45 mph</b>					
Maximum density (pc/mi/ln)	11	18	26	35	45
Average speed (mph)	45.0	45.0	45.0	44.4	42.2
Maximum V/C ratio	0.26	0.43	0.62	0.82	1.00
Maximum service flow rate (pc/h/ln)	290	810	1,170	1,550	1,900
LOS: level of service; FFS: free flow speed; mph: miles per hour; pc: passenger cars; mi: mile; ln - lane; V/C: Volume/Capacity Ratio; h: hour.					
The exact mathematical relationship between density and V/C has not always been maintained at LOS boundaries because of the use of rounded values. Density is the primary determinant of LOS. LOS F is characterized by highly unstable and variable traffic flow. Prediction of accurate flow rate, density, and speed at LOS F is difficult.					
Source: Stantec 2017 (Table 1-9).					

Table 5.10-16, Multiple Lane Rural Highway Performance Criteria, summarizes the performance criteria specified by Caltrans for multi-lane rural highways.

**TABLE 5.10-16  
MULTIPLE LANE RURAL HIGHWAY PERFORMANCE CRITERIA**

Performance Standard
LOS D or existing LOS, whichever is worse.
Impact Threshold
A multi-lane rural highway segment is considered to be adversely impacted if each of the following conditions are met:
<ol style="list-style-type: none"> <li>1. The segment is forecasted to operate deficiently (i.e., worse than the performance standard).</li> <li>2. Compared to the V/C in the No-Project Alternative, the V/C in the With-Project Alternative increases by greater than or equal to 0.02.</li> </ol>

### 5.10.6 ENVIRONMENTAL IMPACTS

**Threshold 10-1**      **Would the project conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?**

The Project would result in additional housing, commercial and job-creating land uses and residents at the northwestern corner of Los Angeles County and would add new vehicle trips to the area's roadway circulation network. The site is located on SR-138, a State Route that currently experiences very low traffic volumes. The site is also located between the I-5 and SR-14, which provide two options for north-south travel. Project trips would be a combination of trips occurring within the Project site (internal trips) and trips occurring between the Project site and external locations (external trips).

#### **Traffic Assumptions**

For the purpose of measuring impacts to the regional highway network, the quantity and distribution of Project trips are derived using the North County sub-area model. Socioeconomic data that corresponds to the proposed Project was coded into the model, which estimates the number of vehicle trips to be generated by the Project.

Trips are estimated for the critical AM and PM peak periods, as well as each of the off-peak periods. Average daily traffic (ADT) volumes represent the sum of the peak and off-peak periods. Since the North County sub-area model is a derivative of the SCAG regional travel demand forecasting model, the trip generation estimates for the Project are consistent with SCAG's regional forecasting methodology in the 2012 RTP/SCS model.

The SCAG model utilizes traffic analysis zones (TAZs), which are geographic subunits of the overall SCAG region, to analyze traffic flow patterns and volumes. The SCAG analysis methodology uses projections of socioeconomic variables, such as housing, population, and employment to generate estimates of the number and location of trips within and to and from each TAZ. The TAZs that include the Project area are shown in Exhibit 5.10-6, SCAG Traffic Analysis Zones (TAZ). The socioeconomic data that is used by SCAG for analysis purposes in the TAZs are summarized in Table 5.10-17. The Specific Plan area represents approximately 83 percent of the total planned dwelling unit development (19,333 of 23,197 units) included in the AVAP and SCAG RTP/SCS projections for the TAZs.

**TABLE 5.10-17  
PROJECT AREA SCAG TAZ SOCIOECONOMIC DATA SUMMARY**

Year	Population*	Housing*	Employment*
2012	4,686 residents	1,635 units	1,156 jobs
2035	89,310 residents	23,197 units	20,361 jobs
Growth	84,624 residents	21,562 units	19,205 jobs
SCAG: Southern California Association of Governments; TAZ: Traffic Analysis Zone			
* Data represents TAZs 20280000 and 20281000 (from Antelope Valley Area Plan [AVAP])			
Source: Stantec 2017 (Table 3-1).			

The Centennial Project has been designed to balance residential and non-residential uses and to balance number of on-site jobs available with on-site housing units to encourage local trips. Because of the balanced land use plan, all jobs could be filled by workers in the community and all service needs could be met by on-site retail and other service land uses. Non-work activities such as schools, parks, library facilities, and retail have been planned on the Project site in an effort to meet the needs of residents at buildout, reducing the need to access such services by making trips external to the Project.

A portion of the Project workforce and resident population can be expected to live or work outside the Project area and would commute to jobs outside or within the Centennial Specific Plan area. A portion of the on-site residents and workers would also be expected to travel for services and amenities outside of the Project. The North County sub-area traffic model estimates the volume of external and internal trips within a geographic area, such as the Project, based on parameters such as population and employment and the relative distances between areas for which trips will be made. The traffic model used for the Project analysis was the same model used by the County and other public agencies for transportation planning studies in the region, including the 2015 AVAP and General Plan update, and is consistent with the SCAG regional model.

Table 5.10-18, Internal/External Trip Ends, shows the estimated ADT and peak hour trips for the Project and the corresponding internal and external components that produce the overall internal trip capture percentages derived by the North County sub-area traffic model. A “trip end” refers to a trip start or destination point. Each internal trip is considered to have two Project-generated trip ends because the trip has both a start and end point within the site. Each external trip is considered to have a single Project-generated trip end because only

## SCAG Traffic Analysis Zones (TAZ)

## Exhibit 5.10-6

Centennial Project

the trip termination point (for inbound trips) or start point (for outbound trips) is located in the Project site. Centennial includes schools, parks, and retail shopping areas within the Project site located and sized to meet the Project’s residential and workforce needs. Most of the trips generated by travel to and from these locations will be internal to the Project area. In addition, at buildout, the Project will include approximately 10.1 million square feet (sf) of commercial office, shopping/retail, and industrial land uses that will provide approximately 23,675 jobs, many of which would be filled by future Centennial residents. As shown in Table 5.10-18, about 140,492 (65 percent) of the average daily total of 216,400 trip ends that would be generated by the Project at buildout will be internal to and both originate and end within the site.

**TABLE 5.10-18  
INTERNAL/EXTERNAL TRIP ENDS**

		AM Peak Hour			PM Peak Hour			ADT
		IB	OB	Total	IB	OB	Total	
Trip ends	Internal	4,975	4,975	9,951	5,422	5,422	10,844	140,492
	External	2,344	4,146	6,489	4,378	2,144	6,521	75,908
	Total	7,319	9,121	16,440	9,800	7,566	17,366	216,400
	<b>Internal %</b>	<b>68%</b>	<b>55%</b>	<b>61%</b>	<b>55%</b>	<b>72%</b>	<b>62%</b>	<b>65%</b>

IB: inbound; OB: outbound.; ADT: average daily trips  
Source: Stantec 2017 (Table 3-2).

As discussed above, each internal trip has two trip ends, and each external trip has one trip end within the Project site. Table 5.10-19, Trip End and Trip Summary, summarizes the average daily total trips that would be generated by the Project at buildout and shows that 48 percent will be internal to the Project, and 52 percent would be external.

**TABLE 5.10-19  
TRIP END AND TRIP SUMMARY**

Trip Type	Trip Ends	% Of Total Trip Ends	Trips	% Of Total Trips
Internal	140,492	65	70,246	48
External	75,908	35	75,908	52
<b>Total</b>	<b>216,400</b>	<b>100</b>	<b>146,154</b>	<b>100</b>

Trip end: One end of a trip (e.g., a driveway count).  
 Trip: Occurs from a point of origin to a point of destination and involves 2 trip ends (1 at each end of the trip).  
 Internal: Both the origin and destination trip ends are on site.  
 External: One trip end (either origin or destination) on site, the other trip end (either destination or origin) off site.  
 Source: Stantec 2017 (Table 3-3).

An average single-family residential unit generates approximately nine “home-based” trips per day. On average, about two of these nine trips are directly between home and work with no stops in-between. The remaining home-based trips are between the home and a non-work activity such as school, shopping, or recreation (see Appendix 5.10-A). Most of these

services and amenities will be located within the Project site, and the Project has been designed to include all the services that generate non-work trips by residents and on-site workers. Consequently, as shown in Tables 5.10-18 and 5.10-19, nearly two-thirds of all Project-generated trip ends and half of all trips will be internal to the site.

## **Trip Distribution**

The percent of Project trips on each major roadway serving the Project site that would occur at buildout is shown in Exhibit 5.10-7. Interactions between Centennial and the outside region were derived from the North County sub-area traffic model. The results indicate that the Santa Clarita Valley area will be primarily characterized by out-commuting from Centennial. For Lancaster, Palmdale and Kern County, the amount of in- and out-commuting is generally balanced, but with a slight bias towards out-commuting to Centennial (see Appendix 5.10-A).

## **On-Site Impacts**

The Project would generate vehicle trips that will require an internal roadway circulation network. As described in PDF 10-1, the Project includes a Mobility Plan, which will provide an extensive system of sidewalks, greenway trails, and community trails to serve as alternative means of transportation on the Project site. It is estimated that 40 percent of the trips made on-site would be 3 miles or less in length, which is a comfortable biking distance that most people can make in less than 15 to 20 minutes, and close to 70 percent of the trips would be 4 miles or less. Also, four percent would be one mile or less in length (see Table 3-8 of Traffic Study [Appendix 5.10-A]). Centennial's planned circulation network and transit system are discussed in Section 4.5.5, Mobility Plan, of the Project Description. MM 10-29 requires that this Mobility Plan be implemented to provide an adequate on-site circulation system. The ADT volumes within the internal Project roadway system at buildout are shown in Exhibit 5.10-8, On-Site Average Daily Traffic Volumes with Proposed Project Buildout.

In addition, a number of PDFs would reduce vehicle trips. Specifically, the Project strategically locates schools, parks and commercial areas in the village centers to facilitate pedestrian access (PDF 10-2). The Project also locates the highest density residential uses adjacent to commercial areas and includes a Mixed-Use Overlay District that permits residential uses in commercial areas. This land-use configuration places larger populations within key commercial areas to encourage pedestrian activity and to reduce vehicle trips (PDF 10-3). The proposed on-site roadway system includes major east-west roadways, to serve the Project's east-west travel demand, to connect major on-site activity areas, and to lessen the Project's traffic demand on SR-138 (PDF 10-4). The Project's Technology Plan requires a community intranet to allow online access to public and shared information to facilitate telecommuting and reduce the need for automobile travel (PDF 10-4). MM 10-1 requires implementation of the community intranet.

The internal circulation system for the Project has been designed to serve the estimated future traffic volumes (using the roadway capacities included in the AVAP) and for all roadways to operate within acceptable levels of service (LOS C) within the proposed circulation system (PDFs 10-1 and 10-3). Since the internal roadways would meet

Centennial Project

established performance criteria and the Project includes the construction of these roadways and the internal circulation network under MM 10-29 and MM 10-30 (e.g., community trails, greenway trails, and sidewalks), impacts would be less than significant.

MM 10-2 requires the preparation of traffic studies prior to the approval of each tentative tract map to identify necessary on-site roadway network and intersection configurations required to meet applicable performance objectives.

SR-138 is a State highway adjacent to but not part of the site. As discussed in more detail in Appendix 5.10-A, Project access and SR-138 intersection conditions at buildout were analyzed to determine the intersection improvements that would be required to meet applicable performance standards. Four Project access locations along SR-138 would require the installation of traffic signals as the Project is developed. MM 10-23 requires that these intersections be signalized when monitoring indicates that traffic signals meet warrants, which define applicable thresholds for installation at each location.

As stated below, the SR-138 and all intersections along SR-138 from the I-5 to 30<sup>th</sup> Street West (off site) would be impacted by the Project. MM 10-3 requires the Project Applicant to seek to enter into a Centennial Transportation Improvement Program (CTIP) agreement with the County and Caltrans that would identify, mitigate, and fund traffic mitigation measures for the Project. If implemented, the CTIP would include specific traffic improvements, proposed scheduling, funding mechanisms, and monetary or in-kind contributions by the Project Applicant in order to ensure that traffic impacts will be mitigated to a less than significant level. The CTIP would also provide Caltrans with a private funding commitment that would assist with obtaining public funding for regional traffic improvements, including planning and obtaining matching grants for construction. These funding commitments would assist with the timely completion of improvements that would alleviate existing or anticipated congestion along SR-138 and I-5 and reduce potentially adverse air quality and greenhouse gas impacts associated with traffic congestion.

An initial estimate of the Project's equitable share of potential impacts to State facilities has been prepared in accordance with Caltrans guidelines for traffic impact studies (see Section 5.3 and Table 5-5 in the Traffic Study [Appendix 5.10-A]). Equitable share calculations would be used to identify the monetary or in-kind contributions that the Project will make to achieve the objectives of the CTIP. In the event that a CTIP is not entered into, MM 10-3, MM 10-6 through MM 10-28, and MMs 10-31 through 10-45 require that the Project Applicant contribute fair share funding towards the improvements required to mitigate for Project impacts.

MM 10-4 requires that the Project Applicant work with the County and/or Caltrans to establish a traffic mitigation fee program, assessment district or other equivalent program to mitigate vehicular trips accessing the SR-138 corridor between I-5 and SR-14. If implemented, the program would establish a fair share contribution and payment system for new development to ensure that the required improvements for SR-138 are fully funded.

The County's Construction and Encroachment Permit Requirements call for construction activities on public rights-of-way to be performed in accordance with the current Standard

Specifications for Public Works Construction (Greenbook) and Additions and Amendments to the Standard Specifications for Public Works Construction (Graybook), including Traffic Control Provisions. To avoid traffic disruption during the construction phases of each development, MM 10-5 requires that temporary traffic controls in accordance with the Greenbook and Graybook and a Transportation Management Plan be prepared and implemented during Project construction activities.

Impacts would be less than significant after compliance with the Greenbook and Graybook and the implementation of MMs 10-1 through 10-5, MM 10-29, MM 10-30, and MM 10-23.

## **Off-Site Impacts**

### ***Existing Plus Project Scenario***

Exhibit 5.10-9, Average Daily Traffic Volumes – Project Only, shows the Project-generated ADT volumes that would be distributed onto the study area roadway system.

An evaluation of the off-site impacts to SR-138 roadway segments and intersections and freeway mainline segments and ramps due to buildout of the Specific Plan under existing plus Project conditions was prepared by directly adding the traffic that would be generated by the Project to existing conditions. The purpose of this analysis is to differentiate the significant impacts due only to the Project from the significant impacts that would occur from other traffic sources. To provide a conservative analysis, the Project traffic forecasts do not reflect supplemental reductions for trip reducing measures, such as TDM measures that would be implemented by the Project (see MM 10-29 and MM 10-30). Exhibit 5.10-10, Average Daily Traffic Volumes – Existing (2014 and 2015) Plus Project, shows the existing plus Project ADT volumes on the study area roadway system.

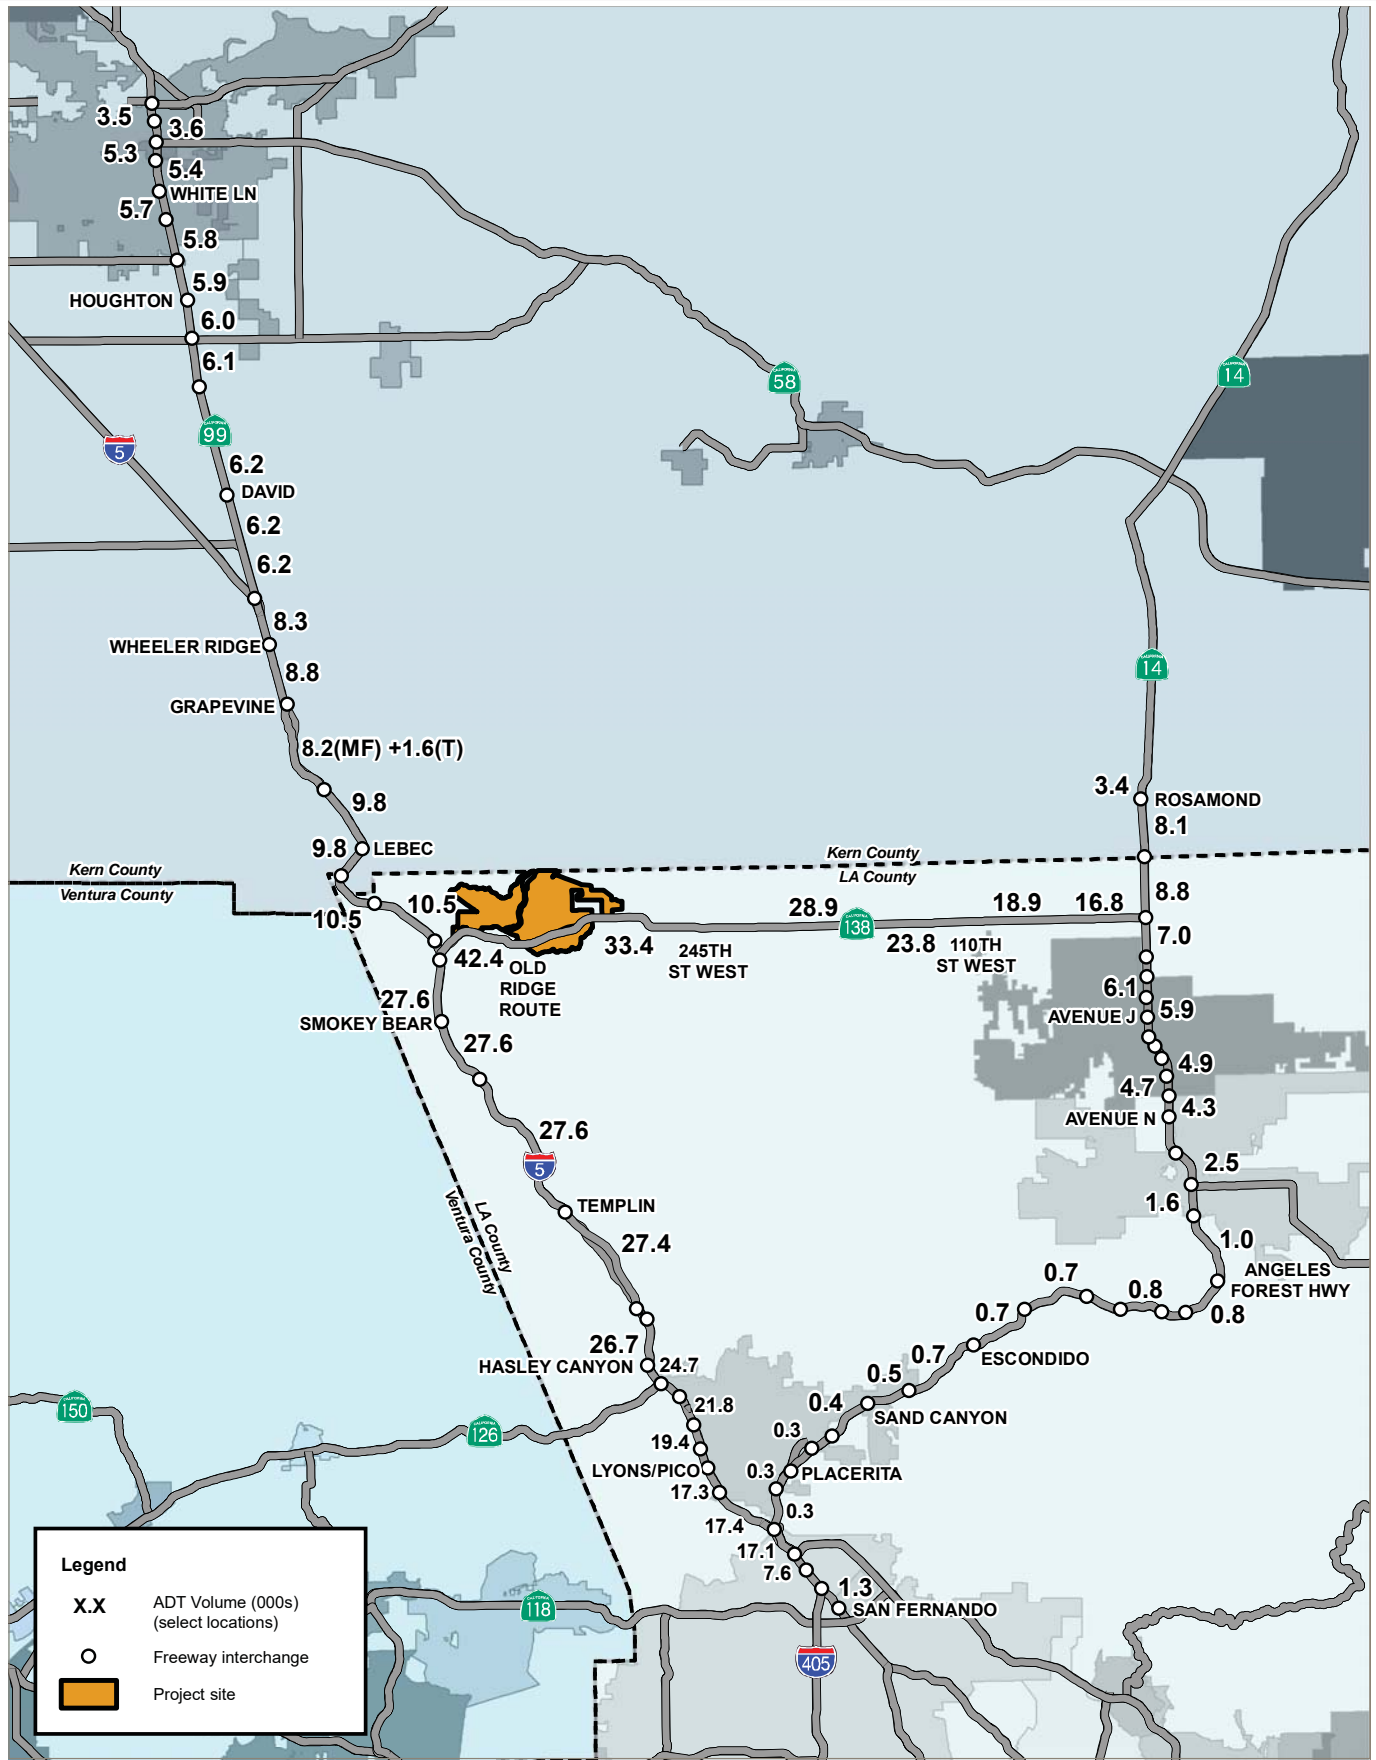

The existing plus Project analysis conservatively assumes that the existing background traffic conditions do not change, other than changes directly due to the Project, over the approximate 20-year time frame required to build the Project. The analysis does not include other approved, planned and anticipated projects that would also change traffic patterns in the study area over time.

### ***State Route 138 Highway Segments***

Using the two-lane highway methodology in the HCM 2010, the LOS for each segment of SR-138 under existing and existing plus Project conditions are provided in Table 5.10-20.

### Average Daily Traffic Volumes - Existing (2014 and 2015) Plus Project

Exhibit 5.10-10

Centennial Project

As shown, eight segments of SR-138 from Gorman Post Road to SR-14 would be significantly impacted by the Project under existing plus Project conditions:

61. **Between Gorman Post Road and Old Ridge Route Road:** eastbound (EB) morning peak hour (AM), EB PM (afternoon peak hour), WB AM, WB PM
62. **Between Old Ridge Route Road and 300th St West:** EB AM, EB PM, westbound (WB) AM, WB PM
63. **Between 300th St West and Three Points Road:** EB AM, EB PM, WB AM, WB PM
64. **Between Three Points Road and 245th St West:** EB AM, EB PM, WB AM, WB PM
65. **Between 245th Street West and 190th St West:** EB AM, EB PM, WB AM, WB PM
66. **Between 190th St West and 110th Street West:** EB AM, EB PM, WB AM, WB PM
67. **Between 110th St West and 60th Street West:** EB AM, WB PM
68. **Between 60<sup>th</sup> St West and SR-14:** EB AM, WB PM

The addition of one lane in each direction on SR-138 from Gorman Post Road to 190<sup>th</sup> Street, with right-of-way reserved for a six-lane expressway between I-5 and 300th Street West, would provide adequate capacity and mitigate Project impacts to the eight SR-138 segments under existing plus Project conditions to less than significant levels (see Table 4-11 and Table 4-12 of the Traffic Study [Appendix 5.10-A]). The Project is required to contribute to funding for SR-138 improvements under an approved CTIP, in conjunction with an approved traffic mitigation fee program or by making fair share contributions in accordance with MM 10-23, MMs 10-3 through 10-20, and MM 10-27.

### ***Freeway Mainline Segments***

The peak hour V/C ratios on freeway mainline segments with and without Project traffic is provided in Table 5.10-21.

Notes:

**Boldface text** denotes LOS exceeds the performance standard

ADT: annual average daily traffic

Cap: capacity

L: Lanes

V/C - volume-to-capacity ratio

Vol: Volume

Btw: between

SR: State Route

M: Mixed flow lane

MF: Mixed flow lanes

T: Truck lane

Jct: junction

SR: State Route

I: Interstate

Source: Stantec 2017 (Table 4-2).

LOS	Freeway Segment V/C Ranges
A	0.00-0.30
B	0.31-0.56
C	0.57-0.76
D	0.77-0.90
E	0.91-1.00
F	Above 1.00

Existing volumes represent 2014 conditions for freeway segments located in LA County (i.e., SR-138, SR-14 and I-5) and Kern County freeway segments on the I-5 from Fort Tejon Interchange to the LA/Kern County line.

Existing volumes represent 2015 conditions for freeway segments located in Kern County (i.e., SR-99 and I-5 from the Grapevine Grade to SR-99).

As shown, the Project would not cause a significant adverse impact on the I-5, SR-99, and SR-14 freeways under existing plus Project conditions.

***Freeway Interchange Ramps***

The peak hour traffic volumes at freeway interchange ramps for existing plus Project conditions are provided in Table 5.10-22.

 \* Connector ramps with no auxiliary lane at freeway mainline  
**Boldface type** denotes exceeds performance threshold  
 Source: Stantec 2017 (Table 4-3).

Table 5.10-22 shows that no significant impact to freeway interchange ramps would occur under existing plus Project conditions. However, the connector ramp from westbound SR-138 to southbound I-5 is forecasted to have more than 1,500 vehicles per hour, which would result in the need for an auxiliary lane at the point where the connector ramps meet the I-5 mainline. The connector ramp currently has two lanes that tapers to a single lane at the connection with I-5, and no mainline auxiliary lane is provided. The Project is required to contribute to funding for this improvement under an approved CTIP, in conjunction with an approved traffic mitigation fee program, or by making fair share contributions in accordance with MM 10-23, MM 10-3, MM 10-4, MM 10-21, and MMs 10-32 through 10-35. The ramp improvement would reduce potential existing plus Project impacts at this location to less than significant levels.

### ***Arterial Roadway Intersections***

An ICU analysis was conducted for intersections along the SR-138, select intersections in Kern County (per the request of Caltrans and the County of Kern Department of Public Works), and I-5 ramp-arterial intersections in the Castaic area and Santa Clarita Valley (per the request of the Los Angeles County Department of Public Works) under Existing Plus Project Conditions. The resulting ICU values and LOS are summarized in Table 5.10-23. To provide a conservative assessment of potential Project impacts, no future roadway improvements are assumed in the analysis. Impacts are identified based on the performance criteria of the jurisdiction in which each intersection is located.

ICU: intersection capacity utilization; LOS: level of service; SR: State Route; N/A: not applicable; I: Interstate; NB: northbound; SB: southbound  
**Boldface type** denotes significant impact.  
Performance Criteria is outlined in Table 5.10-12 (Table 1-6 in Traffic Study).  
\* This location is a roundabout; therefore, the LOS shown is based on average delay (sec/veh)  
<sup>1</sup> denotes Los Angeles CMP route and cross street  
<sup>2</sup> denotes Kern County CMP principal arterial  
Source: Stantec 2017 (Table 4-4).

As shown in Table 5.10-23, several intersections along the SR-138 would be impacted by the Project under existing plus Project conditions. Improvements that will mitigate these impacts to less than significant levels include the following:

- 1. Westerly Access and SR-138** Widen SR-138 to a four-lane highway from westerly Project entrance to 290th Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions. Construct intersection to include two northbound (NB) left-turn lanes, three NB through lanes and one NB right-turn lane. In the SB direction, construct two left-turn lanes, three through lanes and one free-flow right-turn lane. In the EB direction, construct three left-turn lanes and one right-turn lane. In the WB direction, construct two left-turn lanes and a free-flow right-turn lane. Install traffic signal. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-7 and Traffic Study MM-2)
- 2. Central Access and SR-138** Widen SR-138 to a four-lane highway from the westerly Project entrance to 290th Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions. In the NB and southbound (SB) directions, construct two left-turn lanes, three through lanes and one right-turn lane. In the EB direction, construct two left-turn lanes and one right-turn lane. In the WB direction, construct two left-turn lanes and a free-flow right-turn lane. Install a traffic signal and include SB and NB right-turn overlap phasing. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-8 and Traffic Study MM-3)
- 3. 300th St W and SR-138** Widen SR-138 to a four-lane highway from westerly Project entrance to 290th Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions. Construct two left-turn lanes and one right-turn lane in the EB direction and two left-turn lanes and dual right-turn lanes in the WB direction. In the NB direction, construct two left-turn lanes, three through lanes, and one right-turn lane. In the SB direction, construct two left-turn lanes, three through lanes and one free-flow right-turn lane. Install traffic

signal and include WB right-turn overlap phasing. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-9 and Traffic Study MM-4)

**4. 290th St W and SR-138**

Widen SR-138 to a four-lane highway from westerly Project entrance to 290th Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions. Additional intersection improvements include two EB left-turn lanes, one WB right-turn lane, two SB left-turn and two SB right-turn lanes. Install traffic signal. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-10 and Traffic Study MM-5)

**5. Margalo Dr and SR-138**

Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West, with roadway augmentation at intersection, approximately  $\frac{1}{4}$  mile in length for the west and east legs resulting in three through lanes in the WB and EB directions. Additional intersection improvements include one EB left-turn lane and one WB right-turn lane. Install traffic signal. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-11 and Traffic Study MM-6)

**6. Three Points Rd and SR-138**

Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West with roadway augmentation at intersection, approximately  $\frac{1}{4}$  mile in length for the west and east legs resulting in three through lanes in the WB and EB directions. Additional improvements include adding one NB left-turn lane and one SB left-turn lane. Or contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-12 and Traffic Study MM-7)

**7. 245th St W and SR-138**

Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West with roadway augmentation

at intersection, approximately  $\frac{1}{4}$  mile in length for the west and east legs resulting in three through lanes in the WB and EB directions. Additional improvements include adding one NB left-turn lane and one SB left-turn lane and one dedicated EB right-turn lane. Install traffic signal. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-13 and Traffic Study MM-8)

**8. 230th St W and SR-138**

Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West. Additional improvements include one SB left-turn lane, one SB right-turn lane and one EB left-turn lane. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-14 and Traffic Study MM-9)

**9. 190th St W and SR-138**

Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West with roadway augmentation at intersection, approximately  $\frac{1}{4}$  mile in length for the west and east legs resulting in three through lanes in the WB and EB directions. Additional improvements include adding one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane and one dedicated EB right-turn lane. Install traffic signal. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-15 and Traffic Study MM-10)

**10. 170th St W and SR-138**

Roadway augmentation at intersection, approximately  $\frac{1}{4}$  mile in length for the east and west legs, resulting in two through lanes in the WB and EB directions at the intersection. Additional improvements include one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-16 and Traffic Study MM-11)

**11. 110th St W and SR-138**

Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in two through lanes in the WB and EB directions at the intersection. Additional improvements include one EB left-turn lane, one WB left-turn lane, two NB left-turn lanes, one SB left-turn lane and two SB right-turn lanes. Install traffic signal. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-17 and Traffic Study MM-12)

**12. 90th St W and SR-138**

Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in two through lanes in the WB and EB directions at the intersection. Additional improvements include one EB left-turn lane, one WB left-turn lane, one NB left-turn lane, and one SB left-turn lane. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-18 and Traffic Study MM-13)

**13. 60th St W and SR-138**

Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in two through lanes in the WB and EB directions at the intersection. Additional improvements include one EB left-turn lane, one WB left-turn lane, one NB left-turn lane, and one SB left-turn lane. Install traffic signal. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-19 and Traffic Study MM-14)

**14. 30th St W and SR-138**

Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in two through lanes in the WB and EB directions at the intersection. Additional improvements include adding one EB left-turn lane and one WB left-turn lane. Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-20 and Traffic Study MM-15)

In addition, the Project would impact the I-5 SB Ramps and Sedona/The Old Road intersection under existing plus Project conditions. The following improvement that will mitigate this impact to a less than significant level:

1. **I-5 SB Ramps and Sedona/The Old Road** Addition of a second southbound left-turn lane from The Old Road to the I-5 Southbound On-Ramp. (MM 10-22 and Traffic Study MM-34)

The Project is required to contribute to funding for these improvements under an approved CTIP, in conjunction with an approved traffic mitigation fee program, or by making fair share contributions in accordance with MM 10-23, MM 10-3, MM 10-6, MMs 10-7 through 10-20, and MM 10-27 (SR-138) and MM 10-22 (SR-138 and I-5 SB Ramps and Sedona/The Old Road intersections). These improvements would reduce potential existing plus Project impacts at the intersections to less than significant levels.

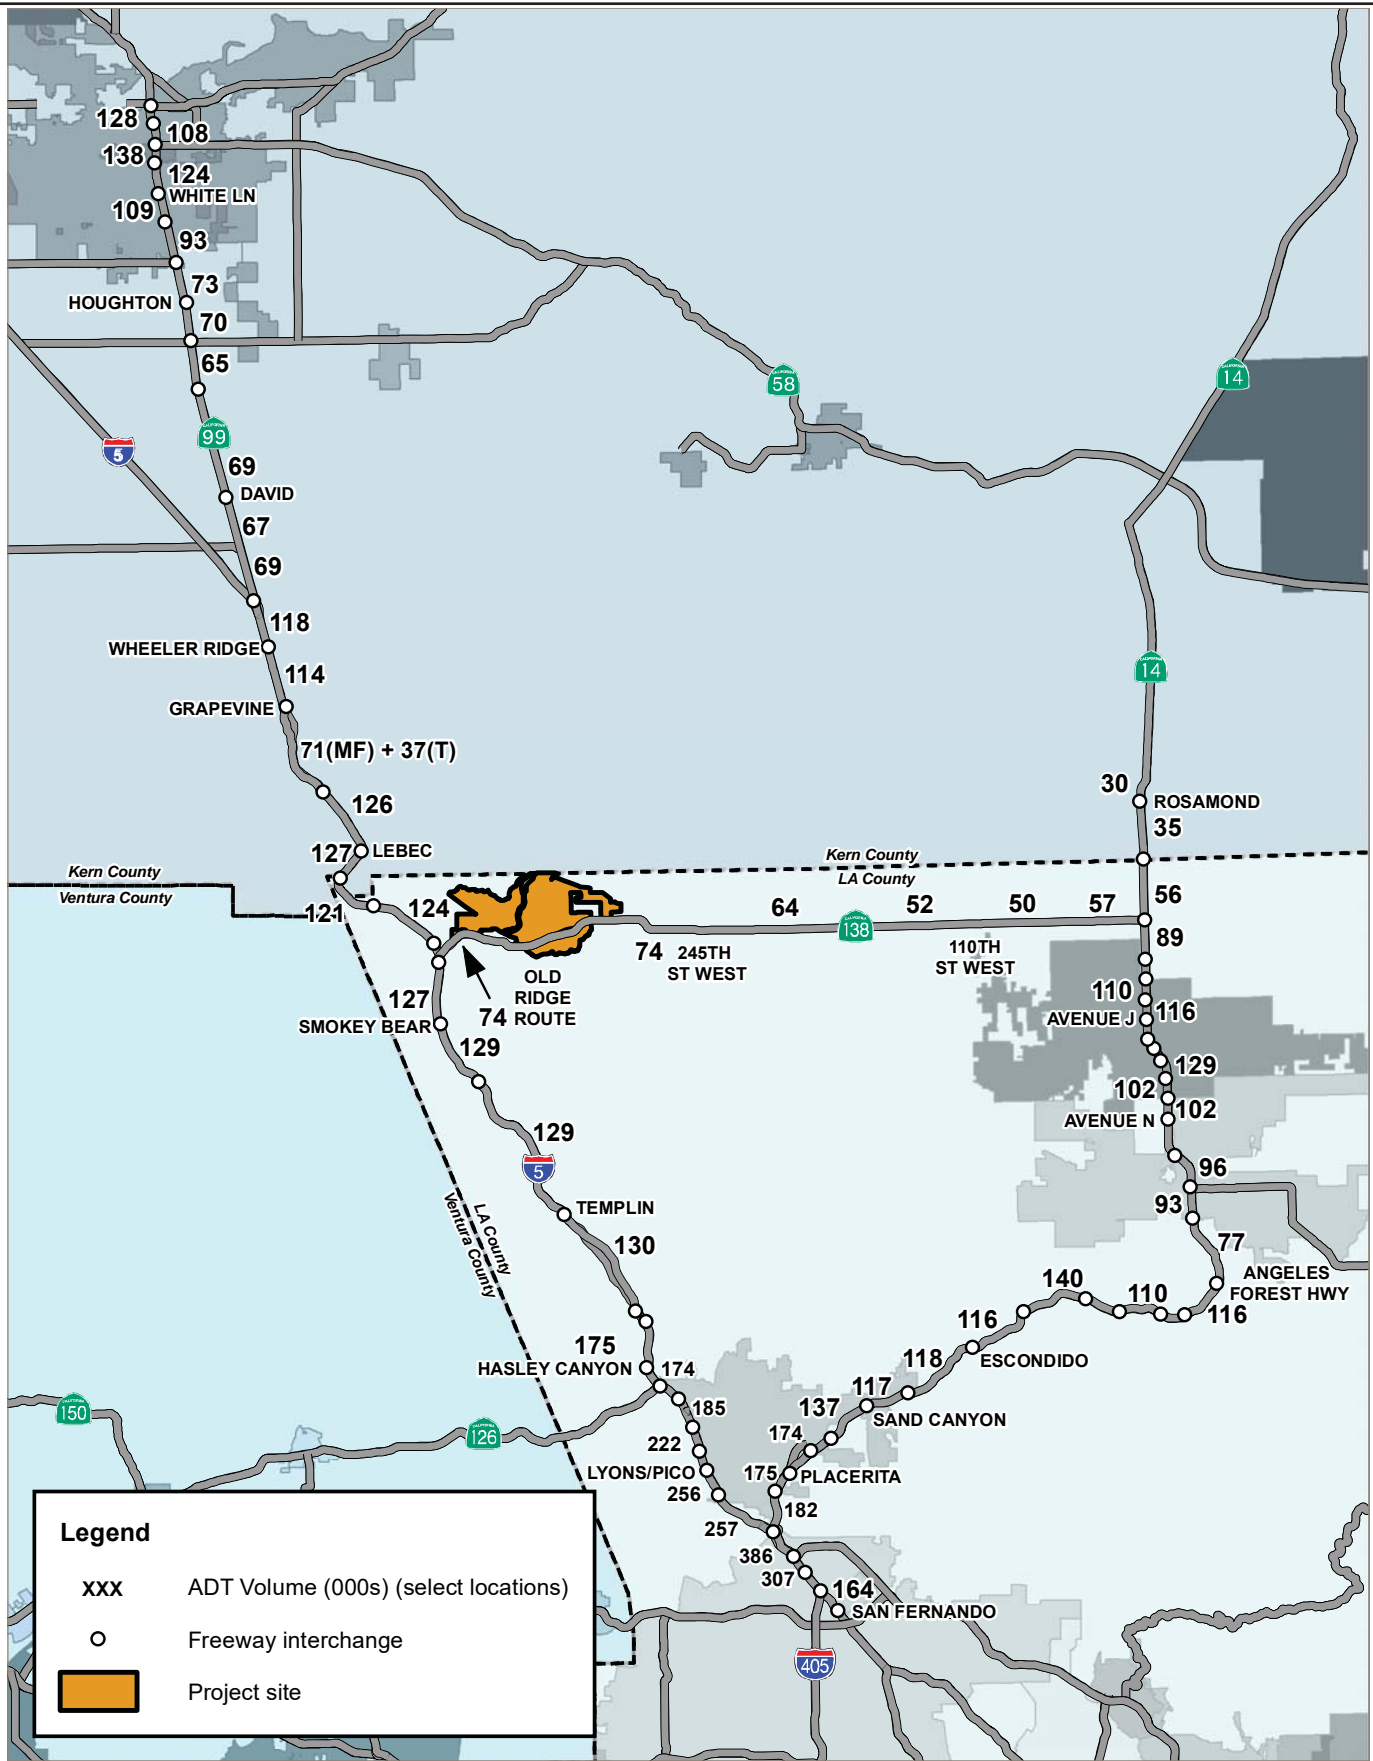

### ***Cumulative Plus Project Scenario***

Potential future Project impacts were evaluated by using the most current forecasts of traffic conditions in 2035 for locations in Los Angeles County south of the Fort Tejon/I-5 interchange (SCAG 2012 RTP/SCS model) and 2040 for I-5 and SR-99 locations north of the Fort Tejon/I-5 interchange (Kern COG 2014 RTP/SCS model). The amount of traffic that would be generated under future conditions in developed areas outside the Project site would not change with or without the Project. Future vehicle trips without the Project would be distributed throughout the region in response to future employment areas and residential areas. As discussed above, this distribution would be affected by the development of the Project because a proportion of Project residents would be expected to commute to external work sites or other amenities, and a proportion of residents in other locations, such as Lancaster, Palmdale and the Santa Clarita Valley, would likely travel to Centennial for work and other purposes. Under cumulative conditions, the Project would result in a net increase or net decrease in traffic volumes depending on the forecasted changes in internal and external trips.

Cumulative traffic volumes with the Project for representative locations within the study area are illustrated in Exhibit 5.9-11, Average Daily Traffic Volumes – Cumulative (2035 and 2040) with Project. These forecasts are based on the long-range assumptions for regional growth in the AVAP, the SCAG RTP/SCS model, the Kern COG 2014 RTP/SCS model and from the buildout of the Project site. To provide a conservative assessment, the cumulative with Project traffic analysis does not reflect supplemental reductions for trip reducing measures, such as the TDM measures that the Project is required to implement under MM 10-30.

### ***State Route 138 Highway Segments***

Forecasted traffic volumes for SR-138 in 2035, with and without Project traffic are listed in Table 5.10-24. The analysis shows that traffic on the existing two-lane highway is forecasted to exceed available capacity in several locations under cumulative conditions with and without the proposed Project.

ADT: average daily trips; EB: eastbound; V/C: volume-to-capacity ratio; LOS: level of service; WB: westbound; Btw: between; Jct: junction; I: Interstate  
**Bold** denotes LOS does not meet the performance standard and therefore exceeds impact threshold.  
Source: Stantec 2017 (Table 4-5).

As shown, all segments on the SR-138 from I-5 to SR-14 are forecasted to exceed available capacity based on the current highway configuration. The following segments of SR-138 would be significantly impacted by the Project under cumulative with Project conditions:

- 60. **Between Jct I-5 and Gorman Post Road: WB AM, EB PM**
- 61. **Between Gorman Post Road and Old Ridge Route Road: EB AM and PM, WB AM and PM**
- 62. **Between Old Ridge Route Road and 300th St West: EB AM and PM, WB AM and PM**
- 63. **Between 300th St West and 245th St West: EB AM and PM, WB AM and PM**
- 65. **Between 245th Street West and 170th St West: EB AM and PM, WB AM and PM**
- 66. **Between 170th St West and 110th St West: EB AM and PM, WB AM and PM**
- 67. **Between 110th St West and 60th St West: EB AM and PM, WB AM and PM**
- 68. **Between 60<sup>th</sup> St West and Jct SR-14 North: EB AM and PM, WB AM and PM**

As discussed above, improvements to SR-138 will be required under future conditions regardless of whether the Project is developed as proposed. To address these future transportation requirements, Caltrans and Metro are considering the implementation of the Northwest 138 Corridor Improvement Project under which SR-138 would be upgraded to a limited access expressway consistent with the analysis by the County for the AVAP. An EIR for the Northwest 138 Corridor Improvement Project is being prepared for public review and comment by Caltrans and Metro. All SR-138 highway segments would operate within acceptable performance criteria under cumulative with Project conditions if SR-138 is improved to include (a) the upgrade of SR-138 to a six-lane expressway from I-5 to 300th Street West; (b) the upgrade of SR-138 to a four-lane expressway from 300th Street West to SR-14 with one auxiliary lane in each direction from 300th Street West to 245th Street; (c) the upgrade of SR-138 to a limited access facility with grade-separated interchanges; (d) Kern COG RTP/SCS improvement projects on SR-58 between I-5 in Kern County and I-15 in San Bernardino County, which could include development of a high capacity goods

movement facility along the SR-58 and/or E-220<sup>4</sup> corridors; and (e) the inside and outside shoulders of I-5 between the Fort Tejon and Grapevine Road interchanges and between the SR-138 and Lake Hughes Road interchanges are strengthened and widened (see Table 4-11 of the Traffic Study [Appendix 5.10-A]). With these improvements, all potential impacts to SR-138 highway segments under cumulative with Project conditions would be less than significant (see Table 4-14 of the Traffic Study [Appendix 5.10-A]).

MM 10-3 and MM 10-4 require the Project Applicant to seek to enter into a CTIP and transportation mitigation fee program that would fully mitigate for all impacts to SR-138 highway segments under cumulative plus Project conditions or to contribute fair share funding for the required improvements. MMs 10-6 through 10-21, MM 10-23, MM 10-27, and MMs 10-32 through 10-35 require fair share funding mitigation for impacts to SR-138 segments, intersections and I-5 ramps. MM 10-23 requires that the Project dedicate right-of-way along the segment of the SR-138 that runs adjacent to the Project site to ensure that sufficient land is reserved for future rights-of-way that would be used to widen and realign SR-138 at these locations. MM 10-24 requires fair share funding toward the widening of SR-138, including the addition of an auxiliary lane in each direction (six lanes total) from I-5 to 300th Street West and from 300th Street West to 245th Street West. Compliance with these mitigation measures or the fair share contributions towards the improvements described above would reduce potential cumulative plus Project impacts to SR-138 highway segments to less than significant levels.

### ***Freeway Mainline Segments***

Forecasted traffic volumes for freeway mainline segments in 2035 and 2040, with and without Project traffic are listed in Table 5.10-25. The table shows that, 7 freeway segments on the I-5, and 5 segments on the SR-14, would operate over the LOS performance standard. However, the Project would only contribute to a significant impact under the applicable criteria on 6 mainline segments on the I-5.

---

<sup>4</sup> The E-220 corridor is the High-Desert Corridor, which runs from SR-14 in Los Angeles County to I-15 in San Bernardino County.

		For freeway segments located in LA County (i.e., SR-138, SR-14 and I-5) and Kern County freeway segments on the I-5 from Fort Tejon Interchange to the LA/Kern County line, volumes represent 2035 cumulative conditions. For freeway segments located in Kern County (i.e., SR-99 and I-5 from the Grapevine Grade to SR-99), volumes represent 2040 cumulative conditions. *Capacity of High Occupancy Vehicle (HOV) or High Occupancy Toll (HOT) Lane: 1,600 vehicles/hour/lane *Capacity of Auxiliary Lane: 1,000 vehicles/hour/lane																

*This page intentionally left blank*

The following freeway mainline segments would be significantly impacted by the Project under the cumulative plus Project conditions:

**I-5 Freeway**

- 3. **Between Grapevine and Fort Tejon Road:** NB PM, SB PM.
- 11. **Between Smokey Bear Road and Vista Del Lago Road:** NB PM
- 12. **Between Vista Del Lago Road and Templin Highway:** NB PM
- 13. **Between Templin Highway and Lake Hughes Road:** NB PM
- 14. **Between Lake Hughes Road and Parker Road:** SB AM

All affected freeway segments would operate within acceptable performance criteria under cumulative with Project conditions with the following improvements (see Exhibit 10-26, which excerpts the pre- and post-mitigation analysis of impacted freeway segments under Cumulative Plus Project conditions, and Table 4-16 of the Traffic Study [Appendix 5.10-A] for a complete freeway mainline pre- and post-mitigation analysis):

- **I-5 between Parker Road and SR-14:** Add one HOV or HOT lane in each direction
- **I-5 between Lake Hughes and Parker:** Add one auxiliary lane in each direction
- Development of a high capacity goods movement facility along the SR-58 and/or E-220 corridors between I-5 in Kern County and I-15 in San Bernardino County.

Caltrans approved the I-5 High Occupancy Vehicle (HOV)/Truck Lanes Project SR-14 to Parker Road project in 2009. The project initially consisted of adding a high-occupancy vehicle (HOV) lane in each direction between SR-14 and Parker Road in northern Santa Clarita Valley and adding an auxiliary truck lane in each direction between SR-14 and Pico Canyon Road/Lyons Avenue. In 2013, Caltrans approved the replacement of the planned HOV lanes with high occupancy toll (HOT) lanes and this modification is currently in the design phase. The HOT lanes are currently estimated for completion by 2022. A regional high capacity goods movement facility along the SR-58 and/or the E-220 corridor between I-5 in Kern County and I-15 in San Bernardino County is in the planning stages and included in the Kern COG RTP/SCS. MM 10-3 and MM 10-4 require the Project Applicant to seek to enter into a CTIP and transportation mitigation fee program that would fully mitigate for all impacts to freeway segments under cumulative plus Project conditions or to contribute fair share funding for the required improvements. MM 10-26 requires fair share funding for Kern COG RTP/SCS improvement projects on SR-58 between I-5 in Kern County and I-15 in San Bernardino County, which could include development of a high capacity goods movement facility along the SR-58 and/or E-220 corridors the high capacity goods movement facility along the SR-58 and/or E-220 corridors in Kern County. MM 10-31 requires fair share funding for the addition of one auxiliary lane in each direction between Lake Hughes and Parker roads, the addition of one HOV or HOT lane in each direction between Parker Road and SR-14, and MM 10-28 for the strengthening and widening of the inside and outside shoulders of I-5 between the Fort Tejon and Grapevine Road and SR-138 and Lake Hughes Road interchanges.

MMs 10-29 and 10-30 also require the implementation of on-site programs to reduce vehicle trips (see PDFs 10-1 through 10-4), including the formation of a Transportation Management Association (TMA) that would coordinate and manage the following programs:

1. Ride Share Program
2. Transit Program
3. Commuter Bus Program

As shown in Table 5.10-26, compliance with these mitigation measures and fair share contributions towards the improvements described above would reduce potential cumulative plus Project impacts to freeway mainline segments to less than significant levels.

For freeway segments located in LA County (i.e., I-5) and Kern County freeway segments on the I-5 from Fort Tejon Interchange to the LA/Kern County line, volumes represent 2035 cumulative conditions.  
 For freeway segments located in Kern County (i.e., I-5 from the Grapevine Grade to SR-99), volumes represent 2040 cumulative conditions.

***Freeway Interchange Ramps***

Potential impacts to freeway ramps under cumulative plus Project conditions were evaluated for study area locations, including within the Santa Clarita Valley as identified by the Los Angeles County Department of Public Works. Cumulative with and without peak hour AM and PM traffic volumes for conditions at northbound/eastbound and southbound/westbound freeway ramps are summarized in Table 5.10-27.

The table shows that significant impacts would occur under cumulative with Project conditions at the SR-14 northbound off-ramp to SR-138 (AM peak hour) and at the SR-14 southbound on-ramp from SR-138 (PM peak hour). The I-5/SR-138 interchange connector ramps from westbound SR-138 to southbound I-5 and from northbound I-5 to eastbound SR-138 would also exceed 1,500 vehicles per hour, which is the capacity of the single lane connections to I-5 at these locations.

V/C: volume-to-capacity ratio; ADT: average daily trips; Cap: capacity; Vol: volume; I: Interstate; SR: State Route; NB: northbound; SB: southbound; WB: westbound; EB: eastbound; Jct: junction  
 \* Connector ramps with no auxiliary lane at freeway mainline  
 See Table 5.10-11 for ramp performance criteria (Table 1-5 of Traffic Study).  
**Boldface type** denotes an intersection that exceeds performance threshold.  
 Source: Stantec 2017 (Table 4-7).

All affected freeway ramps would operate within acceptable performance criteria under cumulative with Project conditions with the following improvements (see Table 4-17 of the Traffic Study [Appendix 5.10-A]):

- **WB SR-138 to SB I-5 Connector:** add two auxiliary lanes to the I-5 mainline connector ramp;
- **NB I-5 Off Ramp to SR-138:** add two auxiliary lanes to the I-5 mainline before the northbound I-5 to eastbound SR-138 connector ramp;
- **NB SR-14 Off Ramp to SR-138:** add one mainline auxiliary lane and a second off-ramp lane for the SR-14 northbound off ramp to SR-138; and
- **SB SR-14 On Ramp from SR-138:** add a second lane on the SR-14 southbound on-ramp from SR-138.

MM 10-3 and MM 10-4 require the Project Applicant to seek to enter into a CTIP and transportation mitigation fee program that would fully mitigate for all impacts to freeway ramps under cumulative plus Project conditions or to contribute fair share funding for the required improvements. MM 10-32 requires fair share funding for the addition of two auxiliary lanes at the connector ramp from westbound SR-138 to southbound I-5; MM 10-33 requires the addition of two auxiliary lanes at the connector ramp mainline before the northbound I-5 to eastbound SR-138 connector ramp; MM 10-31 requires the construction of one auxiliary lane and a second off-ramp lane for the SR 14 northbound off ramp to SR-138; and MM 10-35 requires the construction of a second lane on the SR-14 southbound on-ramp from SR-138. Compliance with these mitigation measures and the fair share contributions towards the improvements described above would reduce potential cumulative plus Project impacts to freeway ramps to less than significant levels (see Table 4-17 of the Traffic Study [Appendix 5.10-A]).

### ***Arterial Roadway Intersections***

An ICU analysis for long-range cumulative conditions was conducted for key intersections within the study area, including all intersections along SR-138, select intersections in Kern County (per the request of Caltrans and the County of Kern Department of Public Works) and ramp-arterial intersections in the Castaic area and Santa Clarita Valley (per the request of the Los Angeles County Department of Public Works) under cumulative plus Project conditions.

The ICU analysis for all intersections in the study area compared cumulative without Project to cumulative with Project impacts to identify Project-related impacts. The resulting ICU values and LOS for these locations are summarized in Table 5.10-28.

As requested by Los Angeles County, the ICU analysis of SR-138 intersections compared cumulative plus Project conditions with existing conditions to identify potential impacts. If implemented, the proposed Northwest 138 Corridor Improvement Project (discussed above) would reduce the number of access locations along the SR-138 corridor from existing levels to meet freeway and expressway standards. Certain existing intersections with SR-138 would be eliminated and access to SR-138 would be obtained by other means (such as by

way of parallel access roads connecting to the remaining intersections). To reflect the more limited access along SR-138 that would occur under future conditions, the cumulative analysis is based on the assumptions utilized by the County of Los Angeles in the AVAP EIR analysis. The results of the SR-138 ICU analysis under cumulative plus Project conditions are summarized in Table 5.10-29.

<sup>1</sup> not an existing intersection  
<sup>2</sup> denotes Los Angeles CMP route and cross street  
Note: The SR-138 freeway/expressway configuration results in a reduced number of access locations to the SR-138 due to expressway intersection spacing requirements.  
**Boldface type** – denotes significant impact.  
Performance Criteria is outlined in Table 5.10-12 (Table 1-6 of Traffic Study).  
Source: Stantec 2017 (Table 4-9).

The LOS summary in Table 5.10-29 shows that the following intersections along SR-138 would be impacted under cumulative plus Project conditions compared with existing conditions (see Table 4-9 of the Traffic Study [Appendix 5.10-A]):

1. Westerly Access and SR-138
2. Central Access and SR-138
3. 300th St W and SR-138
4. 290th St W and SR-138
7. 245th St W and SR-138
9. 190th St W and SR-138
11. 110th St W and SR-138
13. 60th St W and SR-138

Certain of these intersections will be constructed to serve the Project (the Westerly Access and SR-138 and Central Access and SR-138 intersections) and others will be improved in conjunction with the planned and required improvements to SR-138. With these improvements, which would be supported by Project fair share contributions under the CTIP (MM 10-3), traffic mitigation fee program (MM 10-4), and/or fair share contributions as required by MM 10-3 and MMs 10-6 through 10-25, MM 10-27, and MMs 10-32 through 10-35, SR-138 intersections would operate at acceptable levels under cumulative with Project conditions (see Table 4-15 of the Traffic Study [Appendix 5.10-A]).

The LOS summary in Table 5.10-28 intersections shows that the following 11 intersections would be impacted under cumulative plus Project conditions:

15. SR-14 SB Ramps and SR-138
16. SR-14 NB Ramps and SR-138
22. I-5 NB Ramps and Lake Hughes
26. I-5 SB Ramps and Sedona/Old Road
31. I-5 SB Ramps and Magic Mountain
32. I-5 NB Ramps and Magic Mountain
33. I-5 SB Ramps and Valencia
34. I-5 NB Ramps and Valencia
35. I-5 SB Ramps and McBean
39. I-5 SB Ramps and Calgrove
40. I-5 NB Ramps and Calgrove

Mitigation measures that would reduce impacts to the 11 affected intersections to less than significant levels include the following:

- 15. SR-14 SB Ramps and SR-138** Reconfigure interchange to include two eastbound through lanes and three westbound through lanes. In the southbound direction, add a second right-turn lane. Also, install traffic signal and include right-turn overlap phasing. Or contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-36 and Traffic Study MM-31)
- 16. SR-14 NB Ramps and SR-138** Reconfigure interchange to include two eastbound through lanes and two westbound through lanes. In the northbound direction, add two left-turn lanes. Also, install traffic signal. Or contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative). (MM 10-37 and Traffic Study MM-32)
- 22. I-5 NB Ramps and Lake Hughes** Add one lane to the northbound off-ramp and restripe the configuration to include one left-turn, one shared left/right-turn lane, and one dedicated right-turn lane. (MM 10-38 and Traffic Study MM-33)
- 26. I-5 SB Ramps and Sedona/The Old Road** Add a second southbound left-turn lane. (MM 10-22 and Traffic Study MM-34)
- 31. I-5 SB Ramps and Magic Mountain** Restripe the southbound off-ramp to provide two left-turn lanes, one shared left-turn/through lane, and one right-turn lane. (MM 10-39 and Traffic Study MM-35)
- 32. I-5 NB Ramps and Magic Mountain** Convert the shared through/right-turn lane to a shared left-/through/right-turn lane. (MM 10-40 and Traffic Study MM-36)
- 33. I-5 SB Ramps and Valencia** Stripe a third westbound through lane. (MM 10-41 and Traffic Study MM-37)

- |                                      |   |
|--------------------------------------|---|
| 34. <b>I-5 NB Ramps and Valencia</b> | Traffic signal modification to add a northbound right-turn overlap phase. (MM 10-42 and Traffic Study MM-38)  |
| 35. <b>I-5 SB Ramps and McBean</b>   | Restripe the dedicated westbound right-turn lane to a shared through/right-turn lane. (MM 10-43 and Traffic Study MM-39)                                    |
| 39. <b>I-5 SB Ramps and Calgrove</b> | Add second eastbound through lane and a de-facto right-turn lane. In the westbound direction, add a second through lane. (MM 10-44 and Traffic Study MM-40) |
| 40. <b>I-5 NB Ramps and Calgrove</b> | Restripe to add a westbound de-facto right-turn lane. (MM 10-45 and Traffic Study MM-41)  |

As shown in Table 5.10-31, construction of the improvements for the 11 intersections would reduce impacts to less than significant levels. MM 10-3, 10-4 and MMs 10-36 through 10-45 require that the Project provide fair share funding for all of the improvements required to mitigate potential intersection impacts under cumulative plus Project conditions.

The improvements to SR-138 and related intersections, and the improvements included in MMs 10-36 through 10-45 for other intersections, as shown in Table 5.10-29B, would ensure

that the Project would not cause significant intersection impacts under cumulative plus Project conditions.

**TABLE 5.10-30

Source: Stantec 2017 (Table 4-19)

## Off-Site Impacts

The proposed off-site wells and utility connections would cause essentially no increase in traffic. It is anticipated that one daily visit to each well location would be necessary for maintenance and monitoring purposes. This level of traffic would be nominal relative to the anticipated daily trips associated with the Project. The proposed off-site roadway improvements (e.g., deceleration lanes, acceleration lanes, turn pockets, and signalized traffic lights on SR-138) would be constructed within Caltrans rights-of-way to allow for safe ingress/egress to and from the site. These improvements would have beneficial impacts on traffic and are evaluated in the discussion of On-Site Impacts above. Aqueduct crossings, while off-site, would be part of the internal circulation system and are also evaluated in the discussion of On-Site Impacts above. Improvements to SR-138 and I-5 are subject to the environmental review process of Caltrans and are not part of the Project. Proposed off-site improvements would have no impact related to traffic congestion and no mitigation is required.

***Impact Summary:*** The on-site roadway network has been designed to accommodate projected traffic from proposed land uses. Impacts on the internal roadway system would be less than significant after mitigation. If improvements at Project access points on SR-138 are not constructed, impacts would be significant and unavoidable. Project buildout would result in significant traffic impacts on off-site roadways and freeways, including SR-138, I-5 mainline segments and interchange ramps, and arterial roadway intersections (see Table 5.10-30 below). Mitigation measures have been identified to reduce all significant Project impacts, as listed in Table 5.10-31, Mitigation Summary. In addition, MM 10-23 would protect the right-of-way needed to widen and realign SR-138.

Although mitigation measures identified for Caltrans facilities would reduce Project impacts, it is outside the control of the County of Los Angeles to implement these measures. The CTIP or the Project Applicant's fair share contribution requirements in MM 10-3 and MMs 10-6 through 10-28 and MMs 10-31 through 10-45 will provide funding for the planning, design, and construction of certain improvements. MM 10-4 requires the Project Applicant to work to establish a funding program to collect fair share contributions from other projects for the required improvements. Compliance with these mitigation measures would reduce traffic impacts to a less than significant level. Potential Project impacts would be significant and unavoidable, however, if the improvements are not constructed by Caltrans because the County (as the Lead Agency) lacks jurisdiction and control over State highway facilities and cannot mandate the construction of improvements to these facilities.

**TABLE 5.10-32  
PROJECT IMPACT SUMMARY**

<b>Location</b>	<b>Impacts</b>
SR-138	Based on the existing SR-138 facility, significant impacts would occur at the following segments:  SR-138 between I-5 and SR-14 (Existing Plus Project and Cumulative)  Intersections along SR-138 from westerly access of the Specific Plan area to SR-14 NB Ramps (Existing Plus Project and 2035 Cumulative)
I-5	Based on the existing I-5 facility, significant impacts would occur at the following segments:  Between Grapevine and Fort Tejon Road (Cumulative) Between SR-138 and Parker Road (Cumulative)
I-5/SR-138 Interchange	Based on the existing I-5/SR-138 Interchange, significant impacts would occur at the following connector ramps:  WB SR-138 to SB I-5 Connector (Existing Plus Project and Cumulative) NB I-5 Connector to EB SR-138 (Cumulative) NB SR-14 Off Ramp to SR-138 (Cumulative) SB SR-14 On Ramp from SR-138 (Cumulative)
Freeway Interchange Intersections	Based on existing lane configurations, significant impacts would occur at the following intersections:  SR-14 NB Ramps and SR-138 (Cumulative ) SR-14 SB Ramps and SR-138 (Cumulative) I-5 NB Ramps and Lake Hughes (Cumulative) I-5 SB Ramps and Sedona/The Old Road (Existing Plus Project and Cumulative) I-5 SB Ramps and Magic Mountain (Cumulative) I-5 NB Ramps and Magic Mountain (Cumulative) I-5 SB Ramps and Valencia (Cumulative) I-5 NB Ramps and Valencia (Cumulative) I-5 SB Ramps and McBean (Cumulative) I-5 SB Ramps and Calgrove (Cumulative) I-5 NB Ramps and Calgrove (Cumulative)

**Threshold 10-2**     **Would the project conflict with an applicable congestion management program (CMP), including, but not limited to, level of service standards and travel demand measures, or other standards established by the CMP for designated roads or highways?**

The Los Angeles County CMP includes a Land Use Analysis Program, which requires that the impacts of land use decisions on the regional transportation system be evaluated for projects preparing an EIR. Impacts are evaluated by monitoring level of service performance standards for highway segments and key roadway intersections on the CMP highway network. The CMP Land Use Analysis Program also requires a Transit System Impact Analysis, which monitors project impacts on the regional transit system and provides the planning framework to make the most effective use of transit services.

**On-Site Impacts**

The CMP highway network, which is evaluated in the impact analysis, consists of all state highways (both freeways and arterials) and principal arterials that meet the criteria established by Metro. The Project site is largely undeveloped and does not have roadways that are part of the CMP highway network. Also, there is no transit system on or near the site. Thus, no on-site impacts would occur.

**Off-Site Impacts**

***Transportation Impact Analysis***

A Transportation Impact Analysis (TIA) is required as part of the CMP Land Use Analysis Program for CEQA documentation. (Development projects requiring subsequent approvals do not need to repeat this process as long as no significant changes are made to the Project.)

The study area of the CMP TIA is defined by a focused set of criteria used only to satisfy CMP requirements. In many cases, the study area used in the Project's traffic analysis may differ from the study area used for the CMP TIA. The study area for the CMP TIA is defined by the following criteria:

1. CMP intersections where the proposed Project will add 50 or more trips during the AM or PM weekday peak hours (of adjacent street traffic).
2. Mainline freeway locations where the Project will add 150 or more trips, in either direction, during either the AM or PM weekday peak hours.

Table 5.10-32 lists the freeway and intersection locations affected by the Project that meet the CMP criteria. As specified in the CMP guidelines, the criteria for determining significant impacts for arterial intersections and freeway monitoring stations is defined by an ICU or V/C increase of two percent or more ( $V/C \geq .02$ ) which causes or worsens LOS "F" ( $V/C > 1.00$ ). Evaluation of Project impacts for CMP locations is based on peak hour volumes.

**TABLE 5.10-34  
CMP ANALYSIS LOCATIONS**

Location	Meet Criteria?	ProjectTraffic	
		AM Peak Hour	PM Peak Hour
<b>Freeways</b>			
I-5 n/o Jct SR-126 NB	Yes	0	1,180
I-5 n/o Jct SR-126 SB	Yes	1,340	280
I-5 n/o Jct SR-14 NB	Yes	0	170
I-5 n/o Jct SR-14 SB	Yes	190	0
SR-14 s/o Jct SR-138/Ave D NB	No	40	140
SR-14 s/o Jct SR-138/Ave D SB	No	120	0
SR-14 n/o Jct I-5 NB	No	30	0
SR-14 n/o Jct I-5 SB	No	0	0
<b>Intersections</b>			
Lancaster Rd (SR-138) and 300 <sup>th</sup> St West	Yes	4,950	5,390
Ave D (SR-138) and 60 <sup>th</sup> St West	Yes	1,540	1,700
I: Interstate; n/o: north of; SR: State Route; NB: northbound; SB: southbound; s/o: south of Source: Stantec 2017 (Table 5-1).			

The long-range analysis presented under Threshold 10-1 above shows that based on the current freeway and arterial configurations, the Project would cause a significant impact at the following CMP monitoring stations:

- I-5 north of SR-126
- SR-138 at 300<sup>th</sup> Street West
- SR-138 at 60<sup>th</sup> Street West

The analysis above under Threshold 10-1 shows that with the proposed mitigation measures at these facilities, Project impacts would be fully mitigated.

### ***Countywide Deficiency Plan***

The CMP statute requires the preparation of deficiency plans when portions of the CMP highway system do not meet the established level of service standard. The deficiency plan is linked to the Land Use Analysis Program because it provides jurisdictions the opportunity to plan for mitigation before impacts occur due to new development.

The CMP allows each jurisdiction to mitigate impacts created by new development with an appropriate amount of improvements and/or land use strategies based on a point system. Under this point system, new development generates debit points which represent the jurisdiction's mitigation goal. Credit points are awarded based on the construction of improvements and/or a number of land use strategies. These credits serve as the basis by which the jurisdictions meet mitigation goals. The CMP allows mitigation in the form of credits to not be directly associated with a specific deficiency, thereby giving local

jurisdictions the flexibility to prioritize improvements based on local needs and also to partner with other jurisdictions to resolve regional issues.

While the CMP requires an assessment of Project impacts through the TIA, deficiency plan debits and credits will be assigned when building permits are issued, or when land use strategies are implemented and/or transportation improvements are made. Therefore, this analysis shows the gross impact on the CMP system and provides an estimate of the relative balance of mitigation contained in the plan. Actual debits and credits will be determined in the future and documented through an Annual Monitoring Activity Report based on the CMP guidelines and prepared in consultation with Metro. The specific value of individual development and improvement projects within the Centennial Specific Plan area will be determined at that time.

### ***Transit System Impact Analysis***

The CMP Land Use Analysis Program also requires a Transit System Impact Analysis, which monitors project impacts on the regional transit system and provides the planning framework to make the most effective use of transit services. The CMP has a transit monitoring network which consists of bus and rail routes that are within the corridors of the Congested Corridor Progress Report and provide service parallel to the CMP highway system for five miles or greater.

The CMP TIA requires a review of transit impacts that include evidence that transit operators received the Notice of Preparation, identification of existing transit services near the Project (none for this area), estimation of the number of Project trips assigned to transit, information on facilities and/or programs that will encourage public transit use, and an analysis of Project impacts on transit service.

The proposed Project is forecasted to generate approximately 216,400 ADT. The conversion to person trips is accomplished by using Metro guidelines (multiplying the ADT by an occupancy factor of 1.4) which results in a total of 302,960 average daily person trips. Applying Metro's factor for converting total person trips to transit trips (.035) results in approximately 10,600 total daily transit trips and approximately 1,660 peak hour AM plus PM transit trips. The estimated transit trips are summarized in Table 5.10-33.

**TABLE 5.10-35  
TRANSIT TRIP SUMMARY**

Description	Time Period		
	Daily	AM Peak Hour	PM Peak Hour
Vehicle Trips	216,400	16,440	17,370
Person Trips*	302,960	23,020	24,310
Factor to Transit Trips	3.5%	3.5%	3.5%
Total Transit Trips	10,604	810	850
* Person Trips = Vehicle Trips x 1.4 (from Congestion Management Program for Los Angeles County, 2002, 2004, and 2010)			
Source: Stantec 2017 (Table 5-2).			

The transit demand created by the Project will occur in increments as the Project develops. As required by MM 10-2, transit services will be evaluated at the tentative tract map level and the vehicle trip reduction measures and transit friendly design standards contained in the Specific Plan (PDFs 10-1 to 10-4), and transit operator assessment of the capacity and demand for transit services, will occur as the Project is developed.

### ***Kern County CMP***

The Congestion Management Program for Kern County (Kern County CMP) is a section of the County's Regional Transportation Plan. The purpose of the CMP is to help ensure that a balanced transportation system is developed that relates population growth, traffic growth and land use decisions to transportation system LOS performance standards and air quality improvement.

The Kern County CMP contains six elements and places the requirements of these elements on the local agencies (City and County governments) and on the Kern Council of Governments. No specific requirements are not placed on private developments. The Centennial Project is consistent with the goals of the CMP based on its consistency with each element of the CMP, as discussed below.

**Land Use Impact Analysis:** The impacts of the Project are evaluated for the roadways within Kern County. The analysis demonstrates that the Project would not result in a significant impact to the Kern County transportation system.

**Multi-Modal Performance Standards:** The Project has been evaluated based on the performance standards of Caltrans and the County of Kern, which equal or exceed the performance standards of the Kern County CMP. Since the Project is located in Los Angeles County, bus/transit service is being coordinated with operators based in Los Angeles County.

**Regional Traffic Model:** The traffic impact analysis utilizes the Kern COG traffic model for traffic volume forecasts for Kern County roadways. Kern COG modeling staff prepared special model runs of the Kern COG regional traffic model to account for the traffic generation of the Project. The analysis demonstrates that the Project would not result in a significant impact to the Kern County Congestion Management system.

**Transportation Demand Management:** The Project has been designed to promote alternatives to driving, such as walking, biking, transit, and the use of neighborhood electric vehicles. In addition, the Project will include formation of a Traffic Management Association to promote transit use and other alternatives to automobile use and to reduce vehicle trips from the Project.

**Capital Improvement Program:** The Project Applicant worked with the local agencies to ensure that needed roadway improvements are programmed into the appropriate plans of those agencies, and will be contributing its fair share of funding for improvements at locations significantly impacted by the Project. Also, the analysis shows that the Project would not result in a significant impact to the Kern County roadway system.

**Deficiency Plan:** Where significant traffic impacts have been determined, the Project would implement mitigation measures for these impacts. Also, the analysis shows that the Project would not result in a significant impact to the Kern County roadway system.

**Impact Summary:** The Project would not conflict with the Los Angeles County and Kern County CMPs. Impacts would be less than significant, and no mitigation is required beyond those previously identified (MMs 10-23 through 10-28 and MMs 10-31 through 10-45). However, if Caltrans does not implement the needed improvements identified under Threshold 10-1 above, impacts on freeways, arterial roadways, and intersections on the CMP highway network would be significant and unavoidable.

**Threshold 10-3**      **Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?**

### **On-Site Impacts**

The Quail Lake Skypark Airport, a small, single-strip, general aviation (i.e., non-jet) private airport, is the closest airport to the Project site and is located east of Quail Lake and south of the Project site. Because the Quail Lake Skypark is privately owned and only has six locally based aircraft, the number and frequency of flights is expected to be minimal. Development of the Project would not increase the flights in or out of this airport as it would still be privately owned. As such, there would be no changes to air traffic patterns, nor would there be increased safety risks as a result. Impacts would be less than significant. Please see Section 5.3, Hazards and Fire Safety, for more information about impacts as a result of the Quail Lake Skypark Airport.

### **Off-Site Impacts**

Construction of off-site roadway and utility improvements would not change air traffic patterns or levels at the Quail Lake Skypark Airport, nor would it result in increased safety risks. There would be no impact, and no mitigation is required. As determined for the Centennial Project above, exposure to hazards created by aircraft operations at the Quail Lake Skypark Airport would not have a significant impact on the proposed wells, utility connections, and roadway improvements due to the small scale of airport operations. Also, the off-site Project features would not result in glare, emit smoke, or otherwise affect air traffic. Therefore, impacts would be considered less than significant and no mitigation is required.

**Impact Summary:** The Project would not change air traffic patterns; create an increase in air traffic levels; or create substantial safety risks from air traffic. Impacts would be less than significant, and no mitigation is required.

**Threshold 10-4**      **Will the project substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?**

**Threshold 10-5 Will the project result in inadequate emergency access?**

**On-Site Impacts**

The Circulation Plan for the Project was designed to accommodate the projected traffic volumes that would be generated by on-site development. The Project's Mobility Plan (PDF 10-1/MMs 10-29 and 10-30) has been designed to reduce vehicle trip generation and provide adequate roadway capacity. A capacity verification of the on-site circulation system was made using long-range traffic forecast data from the CTM.

The Project roadways would be built to County of Los Angeles Department of Public Works standards as contained in County design manuals, the AVAP and the *Centennial Specific Plan*. The roadways will be designed to ensure that there is proper access for emergency ingress and egress for evacuation and for access by emergency vehicles. In addition, the conceptual alignment of the roadways for the Project area has been designed to accommodate general design speeds in accordance with County standards.

National Cement Plant Road is planned to be realigned to the west to provide a shorter route of access for the cement trucks to the I-5 and separate cement truck traffic from Project-generated vehicle trips. The Project also includes the construction of off-site roadway improvements under MMs 10-23 and 10-7 through 10-20 (e.g., deceleration lanes, acceleration lanes, turn pockets, and signalized traffic lights on SR-138) to allow for safe ingress/egress to and from the site. Thus, no traffic hazards or inadequate emergency access would occur as a result of the Project.

**Off-Site Impacts**

The proposed wells would not involve modifications to existing roadways, nor would they require new roadways. The proposed well locations would be accessed via the existing dirt or decomposed granite roads serving the Tejon Ranch Company Water Bank or via West Avenue B. Therefore, the off-site wells would not affect traffic circulation or otherwise affect emergency access in any way. The proposed wells would not increase traffic hazards or result in inadequate emergency response.

The proposed utility connections would be underground and would not affect traffic flow or emergency access. In addition, the proposed roadway improvements would provide safe and efficient access to and from the site. The proposed off-site roadway improvements (e.g., deceleration lanes, acceleration lanes, turn pockets, and signalized traffic lights on SR-138 and Aqueduct crossings) would improve traffic safety.

There are no off-site Project features being proposed that will impede traffic flow or restrict emergency access to or from the Project site or create a hazardous situation; therefore there will be no impacts to or from off-site Project features.

Construction of the proposed off-site Project features would lead to temporary obstruction of roadways where utility lines connections and roadway improvements are planned but this impact would be temporary and would occur at scattered locations. Compliance with the Greenbook and Graybook and implementation of traffic management plans during

construction (MM 10-5) would prevent traffic and emergency access obstruction. Impacts would be less than significant.

***Impact Summary:*** There are no known traffic hazards, nor are there existing or planned Project components that may create hazards that will impact the Project or surrounding area. There will be less than significant impacts to emergency access with implementation of the proposed roadway improvements at intersections with SR-138 and compliance with existing regulations and implementation of MMs 10-7 through 10-20, MMs 10-29, 10-30, 10-23, and 10-5.

**Threshold 10-6** **Would the project conflict with adopted policies, plans or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?**

## **On-Site Impacts**

### ***Intersections, Streets, Highways and Freeways***

Please see the discussion under Threshold 10-1 for the impact analysis regarding intersections, streets, highways, and freeways. Please see Section 5.8, Land Use, Entitlements, and Planning, for a consistency analysis with the SCAG Regional Comprehensive Plan (RCP) and RTP/SCS, the County of Los Angeles General Plan, and the Antelope Valley Area Plan (AVAP).

### ***Pedestrian and Bicycle Paths***

Please see Section 5.8, Land Use, Entitlements, and Planning, for a consistency analysis with goals and policies related to pedestrian and bicycle paths, as contained in the SCAG RCP and RTP/SCS, the County of Los Angeles General Plan, and the AVAP.

### ***Transit***

As part of the Project's overall transportation demand management (TDM) strategy to reduce the dependence on the private automobile, which would result in a consequential reduction in overall volume of Project-generated trips off site, the Project Applicant will participate in or form a Transportation Management Association (TMA) to serve the residents and employees of businesses within the Project area or will be organized in conjunction with an existing organization in the Antelope Valley or Santa Clarita area. If the former, the Centennial TMA will specifically develop strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize transit efficiencies and services. Such coordination will also help match ride sharers and provide information on transit options. The TMA's purpose will be to coordinate and facilitate transit and rideshare usage to serve as many riders as possible. Commuter buses that may be utilized by Project residents to travel to and from the Santa Clarita Valley, Antelope Valley and the Tejon Ranch Commerce Center are expected to lead to 100 less vehicle trips to and from the Santa Clarita Valley and 50 less vehicle trips to and from the Antelope Valley during peak hours on weekdays.

Rideshare programs are also expected to lead to a net reduction of 100 single occupancy vehicle trips to (AM) and from (PM) the Santa Clarita Valley and a net reduction of 60 single occupancy vehicle trips from (AM) and to (PM) the Antelope Valley. A total of 200 vehicle trips to and from the Santa Clarita Valley and 110 trips to and from the Antelope Valley would be reduced by commuter buses and rideshare programs.

Under MM 10-30, TDM measures such as the transit and rideshare program will be implemented at the onset of Project development, although conceivably on a smaller scale and expanded as demand increases through buildout.

### ***Policy Compliance***

In a regional context, SCAG policies have been assessed in Table 5.8-4, SCAG Regional Comprehensive Plan Consistency, and Table 5.8-2, Consistency with SCAG RTP/SCS Goals and Policies, in Section 5.8, Land Use, Entitlements, and Planning. There are six policies in SCAG's RTP/SCS that are applicable to the Project. They are listed below with a discussion of how the Centennial Project complies with each policy.

- **Policy 1:** Transportation investments shall be based on SCAG's adopted Regional Performance Indicators.

The RTP Performance Criteria, as noted in Table 5.10-1, depict the following Performance Indicators: Location Efficiency, Mobility and Accessibility, Safety and Health, Environmental Quality, Economic Well Being, Investment Effectiveness, and System Sustainability. Location Efficiency is met by the site's location on SR-138 and near the I-5, a major regional transportation corridor, where improvements have been planned for both Caltrans facilities. Mobility is addressed through mitigation measures that enhance capacity and flow of the transportation network. Accessibility is provided through a comprehensive plan of on-site roadways, greenway trails, and community trails. Safety and health is met by building a circulation system in accordance with County safety standards. Environmental quality is promoted by Project features and mitigation measures that provide alternatives to vehicle use and minimize vehicle emissions and road runoff generated by on-site uses. Economic well-being is met by development of a new community where residents can work and obtain goods and services within the site and employees can live near their place of work in the Centennial community. Investment effectiveness is increased through Project investment in roadway and infrastructure improvements in the area and funding mechanisms to ensure the improvements are maintained. Lastly, the Project's Green Development Program incorporates sustainability measures through planned infrastructure and the fossil fuel reduction that would occur with ADT reduction as a result of balanced growth on-site and development in accordance with the AVAP.

- **Policy 2:** Ensuring safety, adequate maintenance, and efficiency of operations on the existing multimodal transportation system should be the highest RTP/SCS priorities for any incremental funding in the region

The Project includes a Green Development Program, which would serve to improve the efficiency of the transportation network. Among the policies of the Green Development Program, the Project would result in the construction of streets and parking lot aisles to the

minimum widths in accordance with the *Centennial Specific Plan*, in compliance with regulations for the Americans with Disabilities Act, and in accordance with safety requirements for fire and emergency vehicle access. Additionally, as identified above, safety would be met via building improvements in accordance with County safety standards. The Project's TMA would also coordinate with public transportation providers to provide transit service, special charter operations, and other similar types of transit to reduce vehicle trips.

- **Policy 3:** RTP/SCS land use and growth strategies in the RTP/SCS will respect local input and advance smart growth initiatives

Developed via interagency coordination, the Project is included in demographic analyses with respect to anticipated population, housing, and employment growth assumed in the 2012 RTP/SCS. The Project was developed to utilize smart growth strategies, including the development of walkable neighborhoods with a range of housing choices in close proximity to schools, parks and commercial uses in village centers, and non-residential uses to accommodate employment for local residents.

- **Policy 4:** Transportation demand management (TDM) and non-motorized transportation will be focus areas, subject to Policy 1

The Project includes an on-site network of sidewalks, greenway trails, and community trails that contribute to TDM measures; participation in a TMA that promotes the use of transit, ridesharing, carpools and/or vanpools; and a community intranet for public education and information sharing.

- **Policy 5:** HOV gap closures that significantly increase transit and rideshare usage will be supported and encouraged, subject to Policy 1

To mitigate impacts to the I-5 mainline, the Project will contribute its fair share to the planned I-5 improvement Project, which consists of adding one auxiliary lane in each direction between Lake Hughes and Parker and adding one HOT lane in each direction between Parker Road and SR-14.

- **Policy 6:** Monitoring progress on all aspects of the Plan, including the timely implementation of projects, programs, and strategies, will be an important and integral component of the Plan

The Project includes a detailed Mitigation Monitoring and Reporting Plan (MMRP) to ensure that the mitigation measures are implemented to reduce or avoid significant environmental impacts. Specifically, the proposed Project includes design elements called project design features (PDFs) and mitigation measures (MMs). PDFs are design features that the Project Applicant incorporates into a project to minimize impacts. The MMs serve to address potential significant impacts related to Project implementation. Because PDFs have been incorporated into the Project, they do not constitute mitigation measures as defined by CEQA; however, PDFs will be included in the MMRP to ensure that they are implemented as part of the Project and monitored as required.

### ***Trip Balance Between Residential and Non-residential***

The Centennial Project has been designed to balance residential and non-residential uses and to balance the number of on-site jobs with on-site housing units to encourage local trips. Because of the balanced land use plan, all jobs could be filled by workers in the community and all service needs could be met by on-site retail and other service land uses. Non-work activities such as schools, parks, library facilities, and retail have also been planned on the Project site in an effort to reduce the need to access such services by making trips external to the Project. As discussed in Threshold 10-1, a proportion of Project residential work and service or amenity transit can be expected to consist of external trips to or from the site, and a proportion of residents and workers outside of the site can be expected to commute to the Project. Overall, about 65 percent of all daily trips, measured by trip ends, will be internal to the Project. The estimated proportion of Project internal (on site) and external (off site) trip ends and trips is summarized in Table 5.10-18 and Table 5.10-19.

### **Off-Site Impacts**

The proposed off-site wells and well infrastructure, utility connections, and roadway improvements would not cause an increase in traffic. The only traffic would be generated by the anticipated daily visit to each well location for maintenance and monitoring. Therefore, the proposed off-site improvements would not conflict with any measures for performance of the circulation system. There would be no interference with existing or proposed alternative transportation facilities. There would be no impact and no mitigation is required.

***Impact Summary:*** The Project will promote the use of alternatives to the automobile and will comply with applicable transportation plans, policies, and regulations. The bicycle and pedestrian facilities proposed for the Project will be built for safe performance, consistent with regional and County plans. In addition, the proposed Transportation Management Association would promote transit use and reduce vehicle trips. There will be no impact on alternative transportation systems as a result of Project implementation.

## **5.10.7 MITIGATION MEASURES**

**MM 10-1** The Project shall provide internet infrastructure and a community intranet with access for homeowners associations; interest groups; local event scheduling; schools, library, carpool and transit services; and other on-site entertainment and amenities for residential land uses. The internet and intranet will reduce the need for people to use automobile travel to obtain the information that is provided by both. The intranet shall also provide education about greenhouse gas (GHG) emissions; GHG reduction opportunities; energy and water conservation opportunities; financial incentives (e.g., rebates and low-interest loans) for energy-efficiency improvements; and energy-efficiency technology systems, including those suitable for large commercial and industrial users.

- MM 10-2** The Project Applicant/Developer shall submit a traffic study that addresses site access and local circulation in accordance with the County of Los Angeles Department of Public Works Traffic Impact Analysis Report Guidelines. The Project Applicant/Developer shall retain a Traffic Engineer or Civil Engineer licensed in the State of California to perform the traffic study to the satisfaction of the County.
- MM 10-3** The Project Applicant/Developer shall seek to enter into a Centennial Transportation Improvement Program (CTIP) for Land Development Impacts to California State Transportation Facilities with Caltrans and shall comply with the terms the CTIP agreement if approved and implemented. Compliance with the CTIP shall constitute compliance with the mitigation measures for the Project's traffic impacts on the State highway system. Any required improvements that result from direct Project impacts (i.e., not from cumulative impacts), and are required on Caltrans-owned facilities, shall be implemented through a CTIP. Any required improvements that result from cumulative traffic impacts may be implemented through payment of fair share fees.
- MM 10-4** The Project Applicant/Developer will work with the County and/or Caltrans to establish a Traffic Mitigation Fee Program or an assessment district (an example of such is the Bridge and Thoroughfare District pursuant to *California Government Code*, Sections 66484 et seq.) or other equivalent program. Such a program or assessment district will mitigate vehicular trips related to new development accessing the SR-138 corridor between I-5 and SR-14 by establishing a fair share contribution from such new development to ensure the SR-138 needed improvements are fully funded. These fees shall be used for the needed improvements and may include the cost of engineering, soils analysis, right-of-way acquisition, demolition, relocation, construction, inspection, and other related expenses.
- MM 10-5** The Project Applicant/Developer shall submit Traffic Management Plans to the County for review and approval. The Traffic Management Plans shall describe traffic-control measures that shall be implemented to maintain traffic flow in all directions, including where utilities and other improvements are being implemented in existing roadways. The Traffic Management Plans shall identify the following: construction haul routes; duration and location of lane closures; location of parking for the public and construction workers during construction phases; use of flag persons; and any pedestrian-related impacts to sidewalks and intersection crossings. The Traffic Management Plan shall be implemented during all stages of Project construction that generate traffic impacts.
- MM 10-6** (*Traffic Study MM-1*) To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP to improve SR-138 to a four lane expressway from I-5 to 190<sup>th</sup> Street West, with right-of-way reserved for a six-lane expressway between I-5 and 300<sup>th</sup> Street West, or

comparable improvements consistent with the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-7** *(Traffic Study MM-2)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for the following intersection improvements at Specific Plan Westerly Access and SR-138:

- Widen SR-138 to a four-lane highway from westerly project entrance to 290th Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.
- Construct intersection to include: two NB left-turn lanes, three NB through lanes and one NB right-turn lane.
- In the SB direction, construct two left turn lanes, three through lanes and one free-flow right-turn lane.
- In the EB direction, construct three left-turn lanes and one right-turn lane.
- In the WB direction, construct two left-turn lanes and a free-flow right-turn lane.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-8** *(Traffic Study MM-3)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at Specific Plan Central Access and SR-138:

- Widen SR-138 to a four-lane highway from westerly project entrance to 290<sup>th</sup> Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.
- In the NB and SB directions, construct two left-turn lanes, three through lanes and one right-turn lane.
- In the EB direction, construct two left-turn lanes and one right-turn lane.
- In the WB direction, construct two left-turn lanes and a free-flow right-turn lane.
- Install traffic signal and include SB and NB right-turn overlap phasing.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-9** *(Traffic Study MM-4)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 300<sup>th</sup> Street West and SR-138:

- Widen SR-138 to a four-lane highway from westerly project entrance to 290<sup>th</sup> Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.
- Construct two left-turn lanes and one right-turn lane in the EB direction and two left-turn lanes and dual right-turn lanes in the WB direction.
- In the NB direction, construct two left-turn lanes, three through lanes, and one right-turn lane.
- In the SB direction, construct two left turn lanes, three through lanes and one free-flow right-turn lane.
- Install traffic signal and include WB right-turn overlap phasing.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-10** *(Traffic Study MM-5)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 290<sup>th</sup> Street West and SR-138:

- Widen SR-138 to a four-lane highway from westerly project entrance to 290<sup>th</sup> Street West, with auxiliary lanes between intersections, resulting in three through lanes in the WB and EB directions.
- Additional intersection improvements include: two EB left turn lanes, one WB right-turn lane, two SB left turn and two SB right-turn lanes.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-11** *(Traffic Study MM-6)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at Margalo Drive and SR-138:

- Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.
- Additional intersection improvements include: one EB left turn lane and one WB right-turn lane.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-12** *(Traffic Study MM-7)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at Three Points and SR-138:

- Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.
- Additional improvements include adding one NB left-turn lane and one SB left turn lane.

Or contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-13** *(Traffic Study MM-8)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 245<sup>th</sup> Street West and SR-138:

- Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.
- Additional improvements include adding one NB left-turn lane and one SB left turn lane and one dedicated EB right-turn lane.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-14** *(Traffic Study MM-9)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 230<sup>th</sup> Street West and SR-138:

- Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West.
- Additional improvements include one SB left-turn lane, one SB right-turn lane and one EB left-turn lane.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-15** *(Traffic Study MM-10)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 190<sup>th</sup> Street West and SR-138:

- Widen SR-138 to a four-lane highway from 290th Street West to 190th Street West with roadway augmentation at intersection, approximately ¼ mile in length for the west and east legs resulting in three through lanes in the WB and EB directions.
- Additional improvements include adding one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left turn lane and one dedicated EB right-turn lane.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-16** *(Traffic Study MM-11)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 170<sup>th</sup> Street West and SR-138:

- Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.
- Additional improvements include one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-17** *(Traffic Study MM-12)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 110<sup>th</sup> Street West and SR-138:

- Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.
- Additional improvements include: one EB left-turn lane, one WB left-turn lane, two NB left-turn lanes, one SB left-turn lane and two SB right-turn lanes.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-18** *(Traffic Study MM-13)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 90th Street West and SR-138:

- Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.
- Additional improvements include: one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-19** *(Traffic Study MM-14)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 60th Street West and SR-138:

- Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.
- Additional improvements include: one EB left-turn lane, one WB left-turn lane, one NB left-turn lane and one SB left-turn lane.
- Install traffic signal.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-20** *(Traffic Study MM-15)* To mitigate the Project's impacts to SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for implementation of the following intersection improvements at 30th Street West and SR-138:

- Roadway augmentation at intersection, approximately ¼ mile in length for the east and west legs, resulting in 2 through lanes in the WB and EB directions at the intersection.
- Additional improvements include adding one EB left-turn lane and one WB left-turn lane.

Or, contribute fair share to intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-21** *(Traffic Study MM-16)* To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:

- Addition of one auxiliary lane at the connector ramp from westbound SR-138 to southbound I-5 for existing plus Project conditions

**MM 10-22** *(Traffic Study MM-17 and MM-34)* To provide adequate capacity at The Old Road at I-5 SB Ramps/Sedona intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the addition of a second southbound left-turn lane from The Old Road to the I-5 Southbound On-Ramp.

**MM 10-23** *(Traffic Study MM-18)* To mitigate the increase of side-street delay for the existing adjacent off-site areas and for planned on-site side streets along SR-138, the Project Applicant/Developer shall either (1) comply with the terms of the Centennial Transportation Improvement Program (CTIP) or (2) dedicate right-of-way within the project site at each site access location to accommodate the ultimate intersection or interchange configuration to be determined by the Northwest Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative) at the following SR-138 intersections:

- Westerly Access
- Central Access
- 300<sup>th</sup> Street West

- 290<sup>th</sup> Street West

**MM 10-24** *(Traffic Study MM-19)* To provide adequate on- and off-site capacity, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the widening of SR-138, including:

- Addition of an auxiliary lane in each direction (six lanes total) from I-5 to 300<sup>th</sup> Street West

**MM 10-25** *(Traffic Study MM-20)* To provide adequate on- and off-site capacity, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the widening of SR-138, including:

- Addition of an auxiliary lane in each direction (six lanes total) from 300<sup>th</sup> Street West to 245<sup>th</sup> Street West

**MM 10-26** *(Traffic Study MM-21 and MM-26)* To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding towards RTP/SCS improvement projects on SR-58 between I-5 in Kern County and I-15 in San Bernardino County, as verified by the County in consultation with the Kern COG and Caltrans. Improvements could include development of a high capacity goods movement facility along the SR-58 and/or E-220 corridors.

**MM 10-27** *(Traffic Study MM-22)* To provide adequate capacity on SR-138, the Project Applicant/Developer shall comply with the terms of the CTIP for the SR-138 improvements to a limited access facility with grade-separated interchanges, consistent with the County's analysis of the AVAP, or fair share participation and/or contribution to the SR-138 improvements (freeway/expressway or expressway/limited access conventional highway) being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).

**MM 10-28** *(Traffic Study MM-23)* To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding towards the following planned improvements to I-5:

- I-5 between Fort Tejon and Grapevine Road and between SR-138 and Lake Hughes Road interchanges: Strengthening and widening the inside and outside shoulders of I-5.

**MM 10-29** *(Traffic Study MM-24)* The Project Applicant/Developer shall implement the Mobility Plan, included as Section 3.2 of the Specific Plan, which provides an extensive system of sidewalks, greenway trails, community trails, and two transit hubs to serve as alternative means of transportation on the Project site. The Mobility Plan also requires creation and ongoing operation of a

Transportation Management Association (TMA) to implement ongoing transportation improvements and programs.

The Project Applicant/Developer, through the required implementation of the Mobility Plan, shall:

- Reinforce and serve the Land Use Plan;
- Provide residents and employees with multiple modes of accessibility for internal and external trips by future residents and visitors;
- Provide options to reduce vehicle trips and emissions by linking effective travel demand management with transportation systems and parking policies;
- Provide residents and employees on the Project site with multiple modes of transportation;
- Provides for 80 percent on average, but no less than 50 percent of residential units to be located within one-half mile of a Village center that includes retail and service uses;
- Provide parks within a 5-minute walk (0.25 mile) of 80 percent of all residential units;
- Require TMA implementation of combination of transit and transportation measures to reduce on-site single-occupancy automobile use by 30 percent in relation to standard ITE-generation rates for the overall Project; and
- Require TMA implementation of a combination of measures to reduce off-site peak hour commutes to and from the Project site in single-occupancy automobiles by 20 percent.
- Require TMA implementation of a program to coordinate with automotive dealers on the Project site to promote CNG, electric, and hybrid electric vehicles.
- Require TMA oversight of requirement for service fleet vehicles for agencies or businesses located on-site to be alternative fuel vehicles to the maximum extent feasible, as determine by the Project Applicant/Developer.

The Circulation Plan sets forth requirements for roadway classifications; intersection controls; and traffic calming measures. Where approved by the California Department of Transportation (Caltrans) and the County and where maintenance and durability costs are comparable to traditional materials, use “cool” pavement materials, which reduce heat island effect.

**MM 10-30** *(Traffic Study MM-24)* Each component of the Mobility Plan incorporates Transportation Demand Management (TDM) features to reduce dependence

on the automobile, provide for a more efficient use of transportation resources among Project occupants, and thereby reduce pollutant emissions. Related to this is the creation and ongoing operation of a Transportation Management Association (TMA) to fund and manage the operation of ongoing transportation programs, including but not limited to transit and on-demand services.

The key TDM elements that are inherent in the overall Mobility Plan are:

- Sidewalks, greenway trails, and community trails that link residential, schools, shopping, and employment areas;
- Small- to medium-sized streets and blocks that allow for shorter walking distances to retail, parks, schools, and other destinations;
- Pedestrian environments incorporated with public streets;
- Parking behind buildings to encourage walking in retail areas along street frontage; and
- Parks within 0.25 mile of 80 percent of all residential units

**MM 10-31** *(Traffic Study MM-25)* To provide adequate capacity to the I-5 mainline freeway, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding towards the following planned improvements to I-5:

- I-5 between Lake Hughes and Parker: Addition of one auxiliary lane in each direction.
- I-5 between Parker Road and SR-14: Addition of one HOV or HOT lane in each direction.

**MM 10-32** *(Traffic Study MM-27)* To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:

- Addition of two auxiliary lanes at the connector ramp from westbound SR-138 to southbound I-5 for Year 2035 cumulative buildout conditions.

**MM 10-33** *(Traffic Study MM-28)* To provide adequate capacity at the I-5/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at I-5/SR-138:

- Addition of two auxiliary lanes at the connector ramp mainline before the northbound I-5 to eastbound SR-138 connector ramp.

- MM 10-34** *(Traffic Study MM-29)* To provide adequate capacity at the SR-14/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at SR-14/SR-138:
- Construction of one auxiliary lane and a second off-ramp lane for the SR-14 northbound off ramp to SR-138.
- MM 10-35** *(Traffic Study MM-30)* To provide adequate capacity at the SR-14/SR-138 interchange, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the following ramp improvement at SR-14/SR-138:
- Construction of a second lane on the SR-14 southbound on-ramp from SR-138.
- MM 10-36** *(Traffic Study MM-31)* To provide adequate capacity at the SR-14 SB Ramps and SR-138 interchange, the Project Applicant/Developer shall (1) comply with the terms of the CTIP for the reconfiguration of the interchange to include two eastbound through lanes and three westbound through lanes. In the southbound direction, add a second right-turn lane; and install a traffic signal and include right-turn overlap phasing or (2) contribute fair share funding for intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).
- MM 10-37** *(Traffic Study MM-32)* To provide adequate capacity at SR-14 NB Ramps and SR-138 interchange, the Project Applicant/Developer shall (1) comply with the terms of the CTIP for the reconfiguration of the interchange to include two eastbound through lanes and two westbound through lanes and, in the northbound direction, add two left-turn lanes and a traffic signal or (2) contribute fair share funding for intersection improvements being advanced by Caltrans in the Northwest 138 Corridor Improvement Project (specific improvements pending Caltrans selection of a preferred alternative).
- MM 10-38** *(Traffic Study MM-33)* To provide adequate capacity at Lake Hughes Road at I-NB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the CTIP or (2) contribute fair share funding towards planned improvements to I-5 for the addition of one lane to the northbound off-ramp and restripe the configuration to include one left-turn, one shared left/right-turn lane, and one dedicated right-turn lane.
- MM 10-39** *(Traffic Study MM-35)* To provide adequate capacity at the Magic Mountain Parkway at I-5 SB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the CTIP or (2) contribute fair share funding towards planned improvements to I-5 for the restriping of the southbound off-ramp to provide two left-turn lanes, one shared left-turn/through lane, and one right-turn lane.

- MM 10-40** *(Traffic Study MM-36)* To provide adequate capacity at the Magic Mountain Parkway at I-5 NB Ramps intersection, the Project Applicant/Developer shall (1) comply with the terms of the CTIP or (2) contribute fair share funding towards planned improvements to I-5 for the conversion of the shared through/right-turn lane to a shared left/through/right-turn lane.
- MM 10-41** *(Traffic Study MM-37)* To provide adequate capacity at the Valencia Road at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the striping of a third westbound through lane.
- MM 10-42** *(Traffic Study MM-38)* To provide adequate capacity at the Valencia Road at I-5 NB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the traffic signal modification to add a northbound right-turn overlap phase.
- MM 10-43** *(Traffic Study MM-39)* To provide adequate capacity at the McBean Parkway at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward the restriping of the dedicated westbound right-turn lane to a shared through/right-turn lane.
- MM 10-44** *(Traffic Study MM-40)* To provide adequate capacity at the Calgrove Road at I-5 SB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward adding a second eastbound through lane and a de-facto right-turn lane and a second through lane in the westbound direction.
- MM 10-45** *(Traffic Study MM-41)* To provide adequate capacity at the Calgrove Road at I-5 NB Ramps intersection, the Project Applicant/Developer shall either (1) comply with the terms of the CTIP or (2) contribute fair share funding toward restriping to add a westbound de facto right-turn lane.

Since Caltrans has deferred the selection of a preferred build alternative for the Northwest 138 Corridor Improvement Project and has also reserved the right to determine the specific types of intersection controls at the time the improvements occur and MMs 10-6 through 10-27 and MMs 10-31 through 10-35 would mitigate the Project's impacts and cumulative impacts on the SR-138, these mitigation measures are subject to change pending Caltrans determination of the preferred 138 Corridor alternative. Therefore, the Centennial Project will contribute its fair share and/or contribute towards the cost of the Northwest 138 Corridor Improvement Project for the alternative ultimately selected by Caltrans and Metro. Refer to the Traffic Study (Appendix 5.10-A) for additional detail on the traffic mitigation.

Under MM 10-29, the Project is required to reduce use of automobiles by implementing PDFs and TDM measures to be administered and monitored by a Transportation Management Association. These mandatory mitigation measures require the reduction of single-occupancy automobile use for off-site commutes by 20 percent, and require the reduction of

single occupancy automobile use within the Project site by 30 percent. The traffic analysis above conservatively assumes full trip (i.e., single occupancy automobile) volumes on- and off-site, and thus, is conservative and actual traffic volumes from the Project are anticipated to be lower.

### **5.10.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION**

Mitigation measures have been established to reduce the Project's significant impacts on traffic access and circulation. However, these mitigation measures call for improvements to Caltrans facilities, which are outside the control of the County of Los Angeles and the Project Applicant. Implementation of the CTIP or fair share contributions by the Project Applicant in accordance with MM 10-3, MMs 10-6 through 10-28, and MMs 10-31 through 10-45 will ensure that the Project provides fair share funding required to mitigate potential Project impacts. Implementation of a traffic mitigation fee program (MM 10-4) would provide a mechanism for providing fair share contributions from other projects and future activity affecting State facilities.

Accordingly, pursuant to Section 21081 of CEQA, the County determines that:

- (a) Changes or alterations have been requested or incorporated into the Project which mitigate the traffic effects to a less than significant level, and
- (b) The mitigations are within the responsibility and jurisdiction of Caltrans and can and should be adopted by Caltrans.

It is recognized that if Caltrans does not implement the improvements outlined in the mitigation measures above in the manner or within the time frame needed to serve the Project, significant and unavoidable impacts to traffic circulation may result.

## 5.11 AIR RESOURCES

### 5.11.1 INTRODUCTION

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that air quality issues be evaluated as part of the environmental documentation process. The Project's air quality impacts are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0 of this EIR, respectively.

#### Summary

This section analyzes the temporary/construction-related and long-term/operational-related regional air quality emissions, local pollutant concentrations, and exposure of sensitive receptors to pollutants resulting from implementation of the Project. Analyses of health risks to sensitive receptors from toxic air contaminant emissions generated by stationary sources, minor sources, and by vehicles on State Route (SR) 138 are provided. Odor impacts and consistency with air quality management plans are also analyzed.

The northern 91 percent of the Project site lies within the boundaries of the Antelope Valley Air Quality Management District (AVAQMD), while the remaining 9 percent lies within the South Coast Air Quality Management District (SCAQMD).

The Project's construction emissions would exceed AVAQMD annual mass emissions thresholds for nitrogen oxides (NO<sub>x</sub>) and SCAQMD daily mass emissions thresholds for volatile organic compounds (VOC) and NO<sub>x</sub>.

Implementation of mitigation measures (MMs) 11-2 and 11-3 would substantially reduce construction-related NO<sub>x</sub> and would also reduce VOC emissions, but the impact would remain significant and unavoidable after mitigation. Construction mass emissions of inhalable particulate matter with a diameter of 10 microns or less (PM<sub>10</sub>), fine particulate matter with a diameter of 2.5 microns or less (PM<sub>2.5</sub>), carbon monoxide (CO), and sulfur oxides (SO<sub>x</sub>) would be less than significant. During later phases of construction, concentrations of PM<sub>10</sub> and PM<sub>2.5</sub> from construction activities could exceed ambient air quality standards and potentially expose sensitive receptors in the completed area of the development to substantial pollutant concentrations. This impact would be significant and unavoidable.

At buildout of the Project, in 2035, long-term operational emissions of VOC, NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub> would exceed AVAQMD and SCAQMD CEQA significance thresholds. The primary source of long-term emissions would be from vehicle operations. MM 11-4, MM 11-5, and MM 11-6 would be implemented to reduce operational emissions; however, the impact would remain significant and unavoidable. It should be noted that the Project's proposed residential and non-residential uses have been planned for a balance between the number of jobs available and the number of on-site housing units in an effort to encourage local trip

making. The Centennial Traffic Study located in Appendix 5.10-A of this EIR forecasts that around 48 percent of the daily trip generation will be internal to the Project site, while 52 percent will be external trips. The Project would require the establishment of a Transportation Management Association (TMA) that develops strategic linkages with other Antelope Valley/Santa Clarita Valley TMAs or like organizations in order to maximize transit efficiencies and services. The TMA would reduce dependence on the automobile and provide for a more efficient use of transportation resources among Project occupants, thereby reducing pollutant emissions.

The Project's stationary sources (natural gas-fired boilers, emergency generators, broilers, and small source particulate matter generators) would be limited in size and number by MM 11-1, which requires implementation of PDF 11-1. With these limits, stationary source emissions would not exceed ambient air quality standards or health risk (cancer and non-carcinogenic) standards, and the impacts would be less than significant.

The Project would not contribute to off-site traffic conditions that would violate ambient CO standards; therefore, this impact would be less than significant.

MM 11-10 requires the implementation of PDF 11-6, which specifies that residences or other sensitive land uses shall not be built within 150 feet of SR-138. The analysis demonstrates that the incremental cancer risk and chronic non-cancer health risk to sensitive receptors beyond the 150-foot buffer would be less than significant. The analysis also indicates that health risks to existing residents adjacent to SR-138 in the Project vicinity would be less than significant with incorporation of MM 11-10.

There would be less than significant impacts related to potential offensive odors generated by the wastewater reclamation facilities (WRFs) or the Materials Recovery Facility/Transfer Station (MRF/TS), which would allow for mulching/composting operations.

The Project would not conflict with AVAQMD and SCAQMD air quality management plans (AQMP) because the land uses, population, and vehicle travel elements of the Project are anticipated in the Southern California Association of Governments (SCAG) *2012-2035 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS) and the SCAG 2016-2040 RTP/SCS, which is the basis for AQMP development. The impact would be less than significant.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce the impacts; and level of significance after mitigation. This information is presented

in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - Air Pollutants
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## **Air Pollutants**

### ***Criteria Pollutants***

The U.S. Environmental Protection Agency (USEPA) and the California Air Resources Board (CARB) have established national ambient air quality standards (NAAQS) and California ambient air quality standards (CAAQS) for seven major pollutants (ozone [O<sub>3</sub>], PM<sub>10</sub>, PM<sub>2.5</sub>, CO, nitrogen dioxide [NO<sub>2</sub>], sulfur dioxide [SO<sub>2</sub>], and lead), often referred to as criteria pollutants. CARB has also developed CAAQS for four additional pollutants: visibility reducing particles, sulfates, hydrogen sulfide, and vinyl chloride. Table 5.11-1, California and National Ambient Air Quality Standards, presents the State and national ambient air quality standards. A brief explanation of each criteria pollutant and their health effects is presented below.

Emissions are discussed in terms of mobile, area, energy, and stationary sources. Mobile sources refer to motor vehicles, engines, and equipment that moves or can be moved from place to place, and include vehicles that operate on roads and highways (“on-road” or “highway” vehicles), as well as off-road vehicles, engines, and equipment. Off-road vehicles include construction equipment. Area sources refer to dispersed sources of pollution that emit pollutants from a specified area; these include consumer products, fireplaces, landscaping maintenance equipment, and other sources associated with a particular land use. Energy sources are natural gas uses, typically for building heat and hot water. Stationary sources refer to any fixed emitter of air pollutants, such as fossil fuel-burning power plants, petroleum refineries, petrochemical plants, food processing plants, gas stations, emergency

generators, central boilers, and other industrial and commercial sources. Stationary sources are typically required to obtain permits to operate from air pollution agencies.

**TABLE 5.11-1  
CALIFORNIA AND NATIONAL AMBIENT AIR QUALITY STANDARDS**

Pollutant	Averaging Time	California Standards	Federal Standards	
			Primary <sup>a</sup>	Secondary <sup>b</sup>
O <sub>3</sub> <sup>c</sup>	1 Hour	0.09 ppm (180 µg/m <sup>3</sup> )	-	-
	8 Hour	0.070 ppm (137 µg/m <sup>3</sup> )	0.070 ppm (137 µg/m <sup>3</sup> )	Same as Primary
PM <sub>10</sub>	24 Hour	50 µg/m <sup>3</sup>	150 µg/m <sup>3</sup>	Same as Primary
	AAM	20 µg/m <sup>3</sup>	-	Same as Primary
PM <sub>2.5</sub>	24 Hour	-	35 µg/m <sup>3</sup>	Same as Primary
	AAM	12 µg/m <sup>3</sup>	12.0 µg/m <sup>3</sup>	15.0 µg/m <sup>3</sup>
CO	1 Hour	20 ppm (23 mg/m <sup>3</sup> )	35 ppm (40 mg/m <sup>3</sup> )	-
	8 Hour	9.0 ppm (10 mg/m <sup>3</sup> )	9 ppm (10 mg/m <sup>3</sup> )	-
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m <sup>3</sup> )	-	-
NO <sub>2</sub>	AAM	0.030 ppm (57 µg/m <sup>3</sup> )	0.053 ppm (100 µg/m <sup>3</sup> )	Same as Primary
	1 Hour	0.18 ppm (339 µg/m <sup>3</sup> )	0.100 ppm (188 µg/m <sup>3</sup> )	-
SO <sub>2</sub>	24 Hour	0.04 ppm (105 µg/m <sup>3</sup> )	-	-
	3 Hour	-	-	0.5 ppm (1,300 µg/m <sup>3</sup> )
	1 Hour	0.25 ppm (655 µg/m <sup>3</sup> )	0.075 ppm (196 µg/m <sup>3</sup> )	-
Lead	30-day Avg.	1.5 µg/m <sup>3</sup>	-	-
	Calendar Quarter	-	1.5 µg/m <sup>3</sup>	Same as Primary
	Rolling 3-month Avg.	-	0.15 µg/m <sup>3</sup>	
Visibility Reducing Particles	8 hour	Extinction coefficient of 0.23 per km – visibility ≥ 10 miles ( 0.07 per km – ≥30 miles for Lake Tahoe)	<b>No Federal Standards</b>	
Sulfates	24 Hour	25 µg/m <sup>3</sup>		
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m <sup>3</sup> )		
Vinyl Chloride	24 Hour	0.01 ppm (26 µg/m <sup>3</sup> )		
<p>O<sub>3</sub>: ozone, ppm: parts per million, µg/m<sup>3</sup>: micrograms per cubic meter, -: No Standard; PM<sub>10</sub>: respirable particulate matter with a diameter of 10 microns or less, AAM: Annual Arithmetic Mean, PM<sub>2.5</sub>: fine particulate matter with a diameter of 2.5 microns or less, CO: carbon monoxide, mg/m<sup>3</sup>: milligrams per cubic meter, NO<sub>2</sub>: nitrogen dioxide, SO<sub>2</sub>: sulfur dioxide, km: kilometer.</p> <p><sup>a</sup> <i>National Primary Standards</i>: The levels of air quality necessary, within an adequate margin of safety, to protect the public health.</p> <p><sup>b</sup> <i>National Secondary Standards</i>: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.</p> <p>Note: More detailed information in the data presented in this table can be found at the CARB website (<a href="http://www.arb.ca.gov">www.arb.ca.gov</a>).</p> <p>Source: CARB 2016a.</p>				

### Ozone (O<sub>3</sub>)

O<sub>3</sub> is a secondary pollutant; it is not directly emitted. O<sub>3</sub> is formed by chemical reactions between VOCs (also referred to as reactive organic gases [ROGs]) and NO<sub>x</sub>, which occur only in the presence of bright sunlight. VOC/ROG emissions are generally unburned hydrocarbons that are a result of motor vehicle travel and other combustion sources. Nitrogen oxides are also a result of the combustion process, most notably due to the operation of motor vehicles. Sunlight and hot weather cause ground-level O<sub>3</sub> to form. (Not to be confused with the “ozone layer” which occurs very high in the atmosphere and shields the planet from some ultraviolet [UV] rays.) As a result, O<sub>3</sub> is known as a summertime air pollutant. Ground-level ozone is the primary constituent of smog. Because ground-level ozone is formed in the atmosphere, high concentrations can occur in areas well away from sources of its constituent pollutants.

People with lung disease, children, older adults, and people who are active are the most sensitive when O<sub>3</sub> levels are unhealthy. Numerous scientific studies have linked ground-level O<sub>3</sub> exposure to a variety of health problems, including:

- lung irritation that can cause inflammation much like a sunburn;
- wheezing, coughing, pain when taking a deep breath, and breathing difficulties during exercise or outdoor activities;
- permanent lung damage to those with repeated exposure to O<sub>3</sub> pollution; and
- aggravated asthma, reduced lung capacity, and increased susceptibility to respiratory illnesses like pneumonia and bronchitis.

Ground-level O<sub>3</sub> can also have detrimental effects on plants and ecosystems. These effects include:

- interfering with the ability of sensitive plants to produce and store food, making them more susceptible to certain diseases, insects, other pollutants, competition, and harsh weather;
- damaging the leaves of trees and other plants, negatively impacting the appearance of urban vegetation, national parks, and recreation areas; and
- reducing crop yields and forest growth, potentially impacting species diversity in ecosystems.

Currently, the South Coast Air Basin (SoCAB) and Mojave Desert Air Basin (MDAB) are designated as “Nonattainment Areas” for the State and federal O<sub>3</sub> standards.

### Particulate Matter (PM<sub>10</sub>, PM<sub>2.5</sub>, and UFP)

Particulate matter includes both aerosols and solid particles of a wide range of size and composition. Of particular concern are inhalable particulate matter, which are those particles equal to or smaller than 10 microns in size (PM<sub>10</sub>); fine particulate matter, which are particles smaller than or equal to 2.5 microns (PM<sub>2.5</sub>); and ultrafine particulate matter (UFP), which are particles less than 0.1 micron. The size of the particulate matter refers to

the aerodynamic diameter of the particulate. Smaller particulates are of greater concern because they can penetrate deeper into the lungs than large particles. PM<sub>2.5</sub> is directly emitted in combustion exhaust and fugitive dust and is formed from atmospheric reactions between various gaseous pollutants, including NO<sub>x</sub>, SO<sub>x</sub>, and VOCs. PM<sub>10</sub> is directly emitted as a result of mechanical processes that crush or grind larger particles or from the re-suspension of dusts most typically through construction activities and vehicular travels. PM<sub>2.5</sub> and PM<sub>10</sub> can remain suspended in the atmosphere for days and/or weeks and can be transported long distances. Ultrafine particles are the smallest particles and are good indicators of any kind of fuel burning, from diesel engines to refinery operations.

The principal health effects of airborne particulate matter are on the respiratory and cardiac systems. According to the USEPA, some people are more sensitive than others to breathing fine particles (USEPA 2017). People with influenza, chronic respiratory and cardiovascular diseases, and the elderly may suffer worsening illness and premature death due to breathing these fine particles. People with bronchitis can expect aggravated symptoms from breathing in fine particles. Children may experience decline in lung function due to breathing in PM<sub>10</sub> and PM<sub>2.5</sub>. Other groups considered sensitive are smokers and people who cannot breathe well through their noses. Exercising athletes are also considered sensitive, because many breathe through their mouths. However, all people exposed to elevated levels of particulate matter may experience temporary health effects (USEPA 2016a).

Short-term exposure to high PM<sub>2.5</sub> levels is associated with premature mortality and increased hospital admissions and emergency room visits. Long-term exposure to high PM<sub>2.5</sub> levels is associated with premature mortality and development of chronic respiratory disease. Short-term exposure to high PM<sub>10</sub> levels is associated with hospital admissions for cardiopulmonary diseases, increased respiratory symptoms, and possible premature mortality. There are national and State 24-hour PM<sub>10</sub> standards, but there is no annual long-term standard. With respect to long-term PM<sub>10</sub> health effects, the USEPA concluded in a 2006 standards review that analysis of air quality data showed that the 24-hour PM<sub>10</sub> standard generally resulted in annual average PM<sub>10</sub> levels at or below the annual standard of 50 µg/m<sup>3</sup> and that available evidence did not suggest an association between long-term exposure to PM<sub>10</sub> at 2006 ambient levels and health problems. Based on this conclusion, the national PM<sub>10</sub> annual standard was revoked (USEPA 2006). However, California maintains an annual PM<sub>10</sub> standard.

Particulate matter in the AVAQMD tends to be primarily fugitive dust. This dust appears to be generated by both local sources and by region-wide dust during moderate to high wind episodes. These regional episodes tend to be multi-district and sometimes interstate in scope. The AVAQMD has identified the local sources of fugitive dust to be primarily unpaved road travel; construction and local disturbed areas of soil concentrated in the urban populated areas in the district; and seasonal agricultural operations (AVAQMD 2005).

No federal or State standards have been established for UFP. Currently, PM<sub>10</sub> levels in the SoCAB and MDAB are designated as “Nonattainment areas” for State standards and “Attainment/Maintenance areas” for federal standards. PM<sub>2.5</sub> levels in the SoCAB are designated as “Nonattainment areas” for State and federal standards; the MDAB is

designated as Unclassified/attainment for the PM<sub>2.5</sub> federal standard and Unclassified for the PM<sub>2.5</sub> State standard.

### Carbon Monoxide (CO)

CO is a colorless and odorless gas which, in the urban environment, is associated primarily with the incomplete combustion of fossil fuels in motor vehicles. CO combines with hemoglobin in the bloodstream and reduces the amount of oxygen that can be circulated through the body. High CO concentrations can lead to headaches, aggravation of cardiovascular disease, and impairment of central nervous system functions. Carbon monoxide concentrations can vary greatly over comparatively short distances. Relatively high concentrations are typically found near crowded intersections; along heavily used roadways carrying slow moving traffic; and at or near ground level. Even under the most severe meteorological and traffic conditions, high CO concentrations are limited to locations within a relatively short distance (i.e., up to 600 feet or 185 meters) of heavily traveled roadways. Overall, CO emissions are decreasing as a result of the Federal Motor Vehicle Control Program, which has mandated increasingly lower emission levels for vehicles manufactured since 1973.

Currently, CO levels in the SoCAB and MDAB are in attainment for State and federal one-hour and eight-hour standards.

### Nitrogen Dioxide (NO<sub>2</sub>)

Nitrogen gas, normally relatively inert (unreactive), comprises about 80 percent of the air. At high temperatures (i.e., in the combustion process) and under certain other conditions it can combine with oxygen to form several different gaseous compounds collectively called nitrogen oxides (NO<sub>x</sub>). NO is converted to NO<sub>2</sub>, a red-brown pungent gas, in the atmosphere. Motor vehicle emissions are the main source of NO<sub>x</sub> in urban areas.

NO<sub>2</sub> is toxic to various animals and to humans. Its toxicity relates to its ability to form nitric acid with water in the eye, lung, mucus membrane, and skin. In animals, long-term exposure to NO<sub>x</sub> increases susceptibility to respiratory infections lowering their resistance to such diseases as pneumonia and influenza. Laboratory studies show susceptible humans, such as asthmatics, exposed to high concentrations of NO<sub>2</sub> can suffer lung irritation and, potentially, lung damage. Epidemiological studies have also shown associations between NO<sub>2</sub> concentrations and daily mortality from respiratory and cardiovascular causes and with hospital admissions for respiratory conditions.

NO<sub>x</sub> is primarily a combination of NO and NO<sub>2</sub>. While the NAAQS and CAAQS only address NO<sub>2</sub>, the total group of nitrogen oxides is of concern. NO and NO<sub>2</sub> are both precursors in the formation of O<sub>3</sub> and PM<sub>2.5</sub>. Because of this and the fact that NO emissions largely convert to NO<sub>2</sub>, NO<sub>x</sub> emissions are typically examined when assessing potential air quality impacts. Currently, NO<sub>2</sub> levels in the SoCAB and MDAB are in attainment for State and federal standards.

### Sulfur Dioxide (SO<sub>2</sub>)

Sulfur oxides (SO<sub>x</sub>) constitute a class of compounds of which SO<sub>2</sub> and sulfur trioxide (SO<sub>3</sub>) are included. Ninety-five percent of pollution-related SO<sub>x</sub> emissions are in the form of SO<sub>2</sub>. SO<sub>x</sub> emissions are typically examined when assessing potential air quality impacts of SO<sub>2</sub>. Combustion of fossil fuels for generation of electric power is the primary contributor of SO<sub>x</sub> emissions. Industrial processes, such as nonferrous metal smelting, also contribute to SO<sub>x</sub> emissions. SO<sub>x</sub> is also formed during combustion of motor fuels. However, most of the sulfur has been removed from fuels, greatly reducing SO<sub>x</sub> emissions from vehicles.

SO<sub>2</sub> combines easily with water vapor, forming aerosols of sulfurous acid (H<sub>2</sub>SO<sub>3</sub>), a colorless, mildly corrosive liquid. This liquid may then combine with oxygen in the air, forming the even more irritating and corrosive sulfuric acid (H<sub>2</sub>SO<sub>4</sub>). Peak levels of SO<sub>2</sub> in the air can cause temporary breathing difficulty for people with asthma who are active outdoors. Longer-term exposures to high levels of SO<sub>2</sub> gas and particles cause respiratory illness and aggravate existing heart disease. SO<sub>2</sub> reacts with other chemicals in the air to form tiny sulfate particles which are measured as PM<sub>2.5</sub>. SO<sub>2</sub> is monitored at several sites in the SoCAB and MDAB, and both the SoCAB and the MDAB are in attainment for the State and federal SO<sub>2</sub> standards.

### Lead

Lead is a stable compound, which persists and accumulates both in the environment and in animals. In humans, it affects the blood-forming (or hematopoietic), the nervous, and the renal systems. In addition, lead has been shown to affect the normal functions of the reproductive, endocrine, hepatic, cardiovascular, immunological, and gastrointestinal systems, although there is significant individual variability in response to lead exposure. Since 1975, lead emissions have been in decline due in part to the introduction of catalyst-equipped vehicles and the decline in production of leaded gasoline. In general, an analysis of lead is limited to projects that emit significant quantities of the pollutant (e.g., lead smelters, battery manufacturers, and battery recyclers) and are not undertaken for transportation, residential, or commercial development projects. Both the SoCAB and MDAB are in attainment for the State lead standard. The Los Angeles County portion of the SoCAB is classified nonattainment for the federal lead standard.

### Visibility Reducing Particles

Visibility reducing particles consist of suspended particulate matter, which is a complex mixture of tiny particles that consist of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt. The State standard is intended to limit the frequency and severity of visibility impairment due to regional haze. Both the SoCAB and the MDAB are “unclassified” for this pollutant. There are no federal standards for visibility reducing particulates.

### Sulfates (SO<sub>4</sub>)

Sulfates (SO<sub>4</sub>) are the fully oxidized ionic form of sulfur. SO<sub>4</sub> occurs in combination with metal and/or hydrogen ions. In California, emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (e.g., gasoline and diesel fuel) that contain sulfur. This sulfur is oxidized to SO<sub>2</sub> during the combustion process and subsequently converted to sulfate compounds in the atmosphere. The conversion of SO<sub>2</sub> to SO<sub>4</sub> takes place comparatively rapidly and completely in California urban areas due to regional meteorological features.

The CARB's SO<sub>4</sub> standard is designed to prevent aggravation of respiratory symptoms. Effects of SO<sub>4</sub> exposure at levels above the standard include a decrease in respiratory function; aggravation of asthmatic symptoms; and an increased risk of cardiopulmonary disease. SO<sub>4</sub> is particularly effective in degrading visibility and, due to fact that it is usually acidic, can harm ecosystems and damage materials and property. Both the SoCAB and MDAB are in attainment for the State SO<sub>4</sub> standard.

### Hydrogen Sulfide (H<sub>2</sub>S)

H<sub>2</sub>S is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. It can also be present in sewer gas and some natural gas, and it can be emitted as the result of geothermal energy exploitation. Breathing H<sub>2</sub>S at levels above the standard will result in exposure to a very disagreeable odor. In 1984, a CARB committee concluded that the ambient standard for H<sub>2</sub>S is adequate to protect public health and to significantly reduce odor annoyance (CARB 2009). Both the SoCAB and the MDAB are "unclassified" for this pollutant.

### Vinyl Chloride (Chloroethene)

Vinyl chloride (chloroethene), a chlorinated hydrocarbon, is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents.

Short-term exposure to high levels of vinyl chloride in air causes central nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure to vinyl chloride through inhalation and oral exposure causes liver damage. Cancer is a major concern from exposure to vinyl chloride via inhalation. Vinyl chloride exposure has been shown to increase the risk of angiosarcoma, a rare form of liver cancer in humans. Vinyl chloride is not routinely measured in the SoCAB or MDAB. California has a vinyl chloride standard, but there is no corresponding federal standard.

### ***Toxic Air Contaminants***

In addition to criteria air pollutants, toxic air contaminants (TACs) emitted from mobile and stationary sources must be taken into consideration for projects proposing new sources of TAC emissions. TACs are those pollutants that are known or suspected to cause cancer or other serious health effects (e.g., reproductive effects or birth defects) or adverse environmental effects.

Installation and operation of stationary equipment that emit TACs generally require permits from the applicable air district, and a Health Risk Assessment (an HRA) of TAC emissions may be a requirement under the permitting process. Land uses that would result in a long-term increase in mobile TAC emissions (e.g., distribution centers with diesel emissions from delivery trucks) also may require the preparation of an HRA. The HRA evaluates the risks posed to sensitive receptors (e.g., residents, schools, hospitals, and parks) in the vicinity of proposed TAC source(s) and must not exceed significance thresholds. Significance thresholds have been established in terms of cancer risk and hazard index.

Carcinogenic risks (i.e., cancer risks) are estimated as the incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens. The estimated risk is expressed as a probability (e.g., 10 in 1 million). Hazard indices (HIs) express the potential for chemicals to result in non-cancer health impacts, and non-carcinogenic chemicals should not be present at levels expected to cause adverse health effects (i.e., HI greater than one). HIs are expressed using decimal notation (e.g., 0.001). If there is a reference exposure level of greater than 1, then impacts would be considered potentially significant. The National Contingency Plan (NCP, in accordance with *Code of Federal Regulations* [CFR], Title 40, Part 300) is commonly cited as the basis for target risk and hazard levels. According to the NCP, lifetime incremental cancer risks posed by a site should not exceed the range of between 1 in 1 million and 100 in 1 million. Pursuant to SCAQMD Rule 1401(d)(1) and AVAQMD Rule 1401(E)(3)(e), the risks associated with potential exposure to emissions from a source equipped with the best available control technology for toxics (T-BACT) and from all emissions sources included in a “project” are acceptable if the incremental cancer risk is less than ten in one million, and is less than one in one million for sources not equipped with T-BACT. A brief explanation of diesel particulate matter and its potential health effects is presented below. Additional TACs are discussed in Appendix 5.11-D.

### Diesel Particulate Matter

Diesel particulate matter (diesel PM) is part of a complex mixture that makes up diesel exhaust emitted from a broad range of diesel engines, including on-road diesel engines of trucks, buses, and cars and the off-road road diesel engines that include locomotives, marine vessels, and heavy-duty equipment. Diesel exhaust is composed of gas and particles. The gas phase is composed of many urban hazardous air pollutants, such as acetaldehyde, benzene, and formaldehyde. The particle phase includes categories of fine and ultra-fine particles that, when inhaled, can cause immunological effects including lung inflammation and cellular changes in the lung. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings. In 1998, the California Office of Environmental Health Hazards (OEHHA) listed diesel PM as a TAC based on its potential to cause cancer and other adverse health effects. Under California regulatory guidelines, diesel exhaust, as a mixture, is identified as a known carcinogen. .

### 5.11.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

#### Federal

##### *U.S. Environmental Protection Agency*

The USEPA's air quality mandates are drawn primarily from the Clean Air Act (CAA), which was enacted in 1970. The most recent major amendments made by Congress were in 1990. The USEPA is responsible for setting and enforcing the NAAQS for criteria pollutants, which are discussed above in Section 5.11.1, Introduction and shown in Table 5.11-1, California and National Ambient Air Quality Standards. Regional air quality is defined by whether the area has attained or not attained State and federal standards, as determined by monitoring. As part of its enforcement responsibilities, the USEPA requires each State with federal nonattainment areas to prepare and submit a State Implementation Plan (SIP) that demonstrates the means to attain and maintain the federal standards. The SIP must integrate federal, State, and local plan components and regulations to identify specific measures to reduce pollution by using a combination of performance standards and market-based programs within the SIP-identified timeframe.

#### State

##### *California Clean Air Act (CCAA)*

The California Clean Air Act of 1988 provides the basis for air quality planning and regulation independent of federal regulations. A major element of the Act is the requirement that local air districts in violation of the CAAQS must prepare attainment plans that identify air quality problems, causes, trends and actions to be taken to attain and maintain California's air quality standards by the earliest practicable date (CARB 2016b).

##### *California Air Resources Board (CARB)*

CARB, a part of the California Environmental Protection Agency (CalEPA), is responsible for coordinating and administering both the federal and State air pollution control programs in

California. In this capacity, CARB conducts research; sets the California Ambient Air Quality Standards (CAAQS), as shown in Table 5.11-1; compiles emission inventories; develops suggested control measures; oversees local programs; and prepares the SIP. For regions that do not attain the CAAQS, CARB requires the air districts to prepare plans for attaining the standards. These plans are then integrated into the State SIP. CARB establishes emissions standards for (1) motor vehicles sold in California; (2) consumer products (e.g., hair spray, aerosol paints, barbecue lighter fluid); and (3) various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

### ***Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling***

The California Code of Regulations (CCR, specifically, Title 13, Section 2485) places restrictions on vehicular idling. It requires that on or after February 1, 2005, any person that owns, operates, or causes to operate any diesel-fueled commercial motor vehicle with gross vehicular weight ratings of greater than 10,000 pounds must prohibit vehicle idling for more than five consecutive minutes at any location. Additionally, diesel-fueled internal combustion engine auxiliary power systems (APS) must be prohibited from operating for greater than 5 minutes at any location when within 100 feet of any property zoned for individual or multi-family housing units, schools, hotels, motels, hospitals, senior care facilities or child care facilities.

### ***Title 24 Energy Efficiency Standards***

The Energy Efficiency Standards for Residential and Nonresidential Buildings (24 CCR 6) were established in 1978 in response to a legislative mandate to reduce California's energy consumption. The current applicable standards are the 2013 Standards, effective July 1, 2014. The 2016 Code was published on July 1, 2016, and will go into effect on January 1, 2017 (CBSC 2016). The 2016 code is estimated to be at least 28 percent more efficient for than the 2013 Code for residential buildings and 5 percent more efficient for nonresidential buildings (CEC 2015a, 2015b). The requirements of the energy efficiency standards result in the reduction of natural gas and electricity consumption. Since natural gas use produces criteria pollutant emissions, a reduction in natural gas consumption results in a related reduction in air quality emissions.<sup>1</sup> Additional discussion of the Title 24 energy efficiency standards is included in Section 5.21, Greenhouse Gas Emissions.

### ***Title 24 Green Building Standards***

The 2013 California Green Building Standards Code (24 CCR 11), also known as the CALGreen code, contains mandatory requirements for new residential and nonresidential buildings (including buildings for retail, office, public schools and hospitals) throughout California (CBSC 2016). The 2016 CALGreen Code was effective January 1, 2017 (CBSC 2016b). The development of the CALGreen Code is intended to (1) cause a reduction in greenhouse gas (GHG) emissions from buildings; (2) promote environmentally responsible, cost effective, healthier places to live and work; (3) reduce energy and water consumption; and (4) respond to the directives by the Governor. In short, the code is established to reduce

---

<sup>1</sup> Because electricity is not generated on site, the emissions associated with electricity generation are not included in the emissions calculations.

construction waste; make buildings more efficient in the use of materials and energy; and reduce environmental impact during and after construction.

The CALGreen Code contains requirements for construction site selection, storm water control during construction, construction waste reduction, indoor water use reduction, material selection, natural resource conservation, site irrigation conservation, and more. The code provides for design options allowing the designer to determine how best to achieve compliance for a given site or building condition. The code also requires building commissioning, which is a process for the verification that all building systems, such as heating and cooling equipment and lighting systems, are functioning at their maximum efficiency.

The CALGreen Code provides mandatory requirements for bicycle parking, carpool/vanpool/electric vehicle spaces, light and glare reduction, grading and paving, energy efficient appliances, renewable energy, graywater systems, water efficient plumbing fixtures, recycling and recycled materials, pollutant controls (including moisture control and indoor air quality), acoustical controls, storm water management, building design, insulation, flooring, and framing, among others.

Beyond the mandatory requirements, optional Tier 1 status can be achieved by complying with voluntary measures for energy and water efficiency, material conservation, and other design features. Examples of Tier 1 requirements are 15 percent less energy use in residential construction than required by existing regulations and 12 percent less indoor water use in non-residential construction. Tier 2 status can be achieved by complying with additional voluntary measures; example requirements are 30 percent less energy use in residential construction and 20 percent less indoor water use in non-residential construction.

## **Regional**

### ***Air Quality Management Districts***

Air quality management districts are the air pollution control agencies that are responsible for attaining and maintaining State and federal ambient air quality standards in their respective air basin(s). California has been divided into 15 air basins based on similar meteorological and topographical features; these basins are managed by 35 different air quality management districts. As discussed above, each air district maintains a plan, or plans, that detail how State and federal air quality standards shall be met for nonattainment pollutants. Additionally, each air district monitors the air quality in its jurisdiction; issues and enforces permits for sources of pollutants to be constructed and operated; and establishes rules and regulations that govern sources of pollutants.

The Project site lies in two different air districts and two different air basins. The northern 91 percent of the site lies within the boundaries of the AVAQMD, while the remaining 9 percent lies within SCAQMD's boundaries. Since the Project lies within two air quality districts, the guidelines and significance thresholds from both the AVAQMD and SCAQMD are included in the air quality report. Exhibit 5.11-1, Air District and Basin Boundaries,

D:\Projects\3CEN\Centennial\XDR\EX\air\_disticts\_20150827.mxd

**Air District and Basin Boundaries**  
*Centennial Project*

**Exhibit 5.11-1**

illustrates the boundaries of these air districts and each air basin in relation to the Project site.

### Antelope Valley Air Quality Management District

The AVAQMD was formed in 1997 when the Antelope Valley separated from the jurisdiction of the SCAQMD. The AVAQMD is bound by the Kern County-Los Angeles County border to the north, the Los Angeles County-San Bernardino County border to the east, and the SCAQMD border to the south and southwest. The portion of the site under the jurisdiction of the AVAQMD lies within the Mojave Desert Air Basin (MDAB).

The AVAQMD's current air quality planning documentation, pursuant to SIP and the CCAA requirements applicable at the Project site, includes the following separate documents: the *AVAQMD 2004 Ozone Attainment Plan (State and Federal)*; the *AVAQMD List and Implementation Schedule for District Measures to Reduce PM Pursuant to Health & Safety Code §39614(d)*; the *8-Hour Reasonably Available Control Technology – State Implementation Plan Analysis*; the *2014 8-Hour Ozone Reasonably Available Control Technology (RACT) State Implementation Plan (SIP) Analysis – Supplemental Analysis*; and the *AVAQMD Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Non-attainment Area)*. The AVAQMD adopted the 2004 Ozone Plan in response to the designation of the western portions of the MDAB, including the Antelope Valley, as nonattainment areas for the O<sub>3</sub>NAAQS and CAAQS and in accordance with the Federal CAA requirement to prepare plans demonstrating attainment. The overall control strategy for the 2004 Ozone Plan is to implement all federal Reasonable Available Control Technology (RACT) rules to reduce O<sub>3</sub> precursors in the Antelope Valley (AVAQMD 2015a, AVAQMD 2015b).

The Antelope Valley has not yet demonstrated attainment status for O<sub>3</sub>, largely due to the transport of pollutants from the Los Angeles Basin and San Joaquin Valley. In 2008, the AVAQMD prepared the *Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Non-attainment Area)* to replace or update all previously submitted federal ozone plans for the Antelope Valley. The plan (1) demonstrates that the AVAQMD will meet the primary required federal O<sub>3</sub> planning milestones and will attain the 1997 8-hour O<sub>3</sub> NAAQS by June 2021; (2) presents the progress the AVAQMD will make towards meeting all required O<sub>3</sub>planning milestones; and (3) discusses the 2008 0.075 part per million (ppm) 8-hour O<sub>3</sub>NAAQS, preparatory to an expected nonattainment designation for the new NAAQS.<sup>2</sup> The AVAQMD is not proposing to adopt any additional control measures for direct O<sub>3</sub>precursor reduction purposes. However, the AVAQMD is committed to having all applicable Federal RACT rules as specified in the *Federal 8-Hour Ozone Attainment Plan*, and is currently performing analyses on the feasibility of adopting additional rules under the State of California “all feasible measures” mandate, which requires air districts to adopt rules that achieve the maximum degree of O<sub>3</sub>precursor emissions reduction, taking into account technology considerations and economic impacts. In addition, the AVAQMD will experience additional future emission reductions from existing and proposed federal and State control measures that affect mobile and area sources. In June 2008, the CARB approved a SIP revision for the Western Mojave Desert Ozone Nonattainment Area; the SIP revision includes the *AVAQMD*

---

<sup>2</sup> On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

*Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Non-attainment Area)*. The SIP revision was submitted to the USEPA in July 2008. As of the preparation of this EIR, the SIP revision has not been approved.

The AVAQMD adopted the *List and Implementation Schedule for District Measures to Reduce PM Pursuant to Health & Safety Code §39614(d)* on August 16, 2005. The list was prepared in response to the code which requires CARB, in consultation with local air pollution management districts, to develop and adopt a list of the most readily available, feasible, and cost-effective control measures that could be employed by CARB and the air districts to reduce PM10 and PM2.5.

#### South Coast Air Quality Management District

Approximately 9 percent of the Project site is under the jurisdiction of the SCAQMD and lies within the SoCAB. The SCAQMD was established in 1977 by merging the individual air pollution control districts of the four counties within the SoCAB: Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The SoCAB is bound on the west by the Pacific Ocean, on the north by the San Gabriel Mountains, on the north and east by the San Bernardino Mountains, on the southeast by the San Jacinto Mountains, and on the south the Santa Ana Mountains. The SoCAB occupies a low plain and the surrounding mountains channel and confine air flow, which traps air pollutants.

The Federal CAA requires the preparation of plans to demonstrate attainment of the NAAQS for which an area is designated as being in nonattainment. Furthermore, the CCAA requires the revision of these plans every three years to address reducing pollutant concentrations that exceed the CAAQS. The SCAQMD and SCAG, in coordination with local governments and the private sector, develop the Air Quality Management Plan (AQMP) for the SoCAB to satisfy these requirements. The AQMP is the most important air management document for the SoCAB because it provides the blueprint for meeting State and federal ambient air quality standards.

On November 28, 2007, CARB submitted a State Implementation Plan (SIP) revision to the USEPA for O<sub>3</sub>, PM2.5 (1997 Standard), CO, and NO<sub>2</sub> in the SoCAB. This revision is identified as the “2007 South Coast SIP”. The 2007 South Coast SIP demonstrates attainment of the federal PM2.5 standard in the SoCAB by 2014 and attainment of the federal 8-hour O<sub>3</sub> standard by 2023. This SIP also includes a request to reclassify the O<sub>3</sub> attainment designation from “severe” to “extreme”. The USEPA approved the redesignation effective June 4, 2010. The “extreme” designation requires the attainment of the 8-hour O<sub>3</sub> standard in the SoCAB by June 2024. CARB approved PM2.5 SIP revisions in April 2011 and the O<sub>3</sub> SIP revisions in July 2011. The USEPA approved the PM2.5 SIP on September 25, 2013, and has approved 47 of the 62 1997 8-hour O<sub>3</sub> SIP requirements (USEPA 2016b). On November 30, 2014, the USEPA proposed a finding that the SoCAB has attained the 1997 PM2.5 standards (USEPA 2014). The comment period closed on January 22, 2015; no subsequent action has been taken.

On September 30, 2015, the USEPA proposed to approve elements of the South Coast 2012 PM2.5 Plan and 2015 Supplement, which addresses Clean Air Act requirements for the 2006 PM2.5 NAAQS, and proposed to reclassify the area as a ‘serious’ nonattainment area for the

2006 PM<sub>2.5</sub> standard. The reclassification is based on the determination that the area cannot practicably attain the 2006 PM<sub>2.5</sub> NAAQS by the moderate area attainment date (December 31, 2015). On December 22, 2015, the EPA reclassified the South Coast area as a "Serious" nonattainment area for the 2006 PM<sub>2.5</sub> standard. The final reclassification requires the State to submit a "serious area" plan that provides for attainment of the 2006 PM<sub>2.5</sub> NAAQS as expeditiously as practicable as and no later than December 31, 2019 (USEPA 2016d).

On December 7, 2012, the SCAQMD adopted the 2012 AQMP, which is a regional and multi-agency effort (SCAQMD, CARB, SCAG, and USEPA). The 2012 AQMP incorporates the latest scientific and technical information and planning assumptions, including SCAG's 2012 *2012–2035 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS); updated emission inventory methods for various source categories; and SCAG's latest growth forecasts. The primary purposes of the 2012 AQMP are to demonstrate attainment of the federal 24-hour PM<sub>2.5</sub> standard by 2014 and to update the USEPA-approved 8-hour Ozone Control Plan. On December 20, 2012, the 2012 AQMP was submitted to CARB and the USEPA for concurrent review and approval for inclusion in the SIP (SCAQMD 2013). The 2012 AQMP was approved by the CARB on January 25, 2013.

The SCAQMD is currently developing the 2016 AQMP. The population projections for this plan include the proposed Project. The Final 2016 AQMP was adopted by the SCAQMD Governing Board on March 3, 2017 (SCAQMD 2017). The 2016 AQMP will develop integrated strategies and measures to meet the following NAAQS (SCAQMD 2016a):

- 8-hour O<sub>3</sub> (75 parts per billion [ppb]) by 2031<sup>3</sup>
- Annual PM<sub>2.5</sub> (12 micrograms per cubic meter [µg/m<sup>3</sup>]) by 2025
- 8-hour O<sub>3</sub> (80 ppb) by 2023
- 1-hour O<sub>3</sub> (120 ppb) by 2022
- 24-hour PM<sub>2.5</sub> (35 µg/m<sup>3</sup>) by 2019

### ***Southern California Association of Governments***

SCAG is a council of governments for Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties. As a regional planning agency, SCAG serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SCAG also serves as the regional clearinghouse for projects requiring environmental documentation under federal and State law. In this role, SCAG reviews projects to analyze their impacts to its regional planning efforts.

Although SCAG is not an air quality management agency, it is responsible for several air quality planning issues. As the designated Metropolitan Planning Organization (MPO) for the Southern California region, SCAG partners with local air districts by providing information and/or oversight of air quality planning documentation. Specifically, SCAG provides

---

<sup>3</sup> On October 1, 2015, the USEPA lowered the 8-hour O<sub>3</sub> standard to 0.070 ppm (70 ppb). The SIP (or AQMP) for the 70 ppb standard will be due 4 years after the attainment/non-attainment designations are issued by the USEPA, which is expected next year in 2017. Thus, meeting the 70 ppb standard will be addressed in a 2021 AQMP.

demographic projections as well as integrated land use, housing, employment and transportation programs, measures, and strategies for portions of the South Coast AQMP, which applies to a portion of the Project site. The local air districts develop and enforce regulations for non-vehicular sources of air pollution and coordinate with SCAG to develop and implement Transportation Control Measures (TCMs) to reduce and otherwise improve vehicular travel and associated pollutant emissions.

On April 4, 2012, the SCAG Regional Council adopted the 2012–2035 RTP/SCS, which includes a strong commitment to reduce emissions from transportation sources in order to improve public health; to meet the NAAQS as set forth by the Federal CAA; and to comply with Senate Bill (SB) 375 (SCAG 2012). New to the 2012RTP, SB 375 states that RTPs must include an SCS that reduces greenhouse gas (GHG) emissions from passenger vehicles by 8 percent per capita by 2020 and 13 percent per capita by 2035 compared to 2005 emissions levels. The measures to reduce GHG emissions would also cause reductions in criteria pollutant emissions.

On April 7, 2016, the SCAG Regional Council adopted the 2016–2040 RTP/SCS. The RTP/SCS combines the need for mobility with a “sustainable future” through a reduction in the amount of emissions produced from transportation sources. This would be made through the operation of low or no emission transportation systems by 2040. The 2016 RTP/SCS, like the 2012 RTP/SCS, includes population and housing projections in Traffic Analysis Zone (TAZ) maps for the Project that are consistent with the size and location of the Project, and both the 2012 and 2016 RTP/SCS include corresponding figures that are consistent with the Project.

## County

### *General Plans*

#### Los Angeles County General Plan and Antelope Valley Area Plan

The *County of Los Angeles 2035 General Plan* and *Antelope Valley Area Plan* address air quality issues that affect the County. A consistency analysis of the Project’s specific goals and policies with the County’s relevant plans, policies and regulations is provided in the Land Use, Entitlements, and Planning Section (Section 5.8) of this document. The AVAP goal and policies applicable to the analysis of air quality with Project implementation are listed below.

#### **Air Quality Goal COS 9:** Improved air quality in the Antelope Valley.

**Policy COS 9.1:** Implement land use patterns that reduce the number of vehicle trips, reducing potential air pollution, as directed in the policies of the Land Use Element.

**Policy COS 9.2:** Develop multi-modal transportation systems that offer alternatives to automobile travel to reduce the number of vehicle trips, including regional transportation, local transit, bicycle routes, trails, and pedestrian networks, as directed in the policies of the Mobility Element.

**Policy COS 9.3:** In evaluating new development proposals, consider requiring trip reduction measures to relieve congestion and reduce air pollution from vehicle emissions.

**Policy COS 9.4:** Promote recycling and composting throughout the Antelope Valley to reduce air quality impacts from waste disposal activities and landfill operations.

**Policy COS 9.5:** Encourage the use of alternative fuel vehicles throughout the Antelope Valley.

### 5.11.3 METHODOLOGY

#### Construction and Operational Emissions

Construction and operational emissions were calculated by using the California Emissions Estimator Model (CalEEMod) Version 2016.3.1. CalEEMod is a computer program that is used to calculate anticipated emissions associated with land development projects in California. CalEEMod uses pollutant emission rates from the CARB's Emission FACTor model (EMFAC 2014) for on-road vehicles; CARB's OFFROAD 2014 for construction and material handling equipment; and USEPA formulas for non-vehicular emissions. Where appropriate, emission factors, trip distance, and other data in the model are specific to a county or air basin. The Los Angeles County – Mojave Desert data were used for the Project. The model calculates emissions of the following criteria pollutants: VOC, NO<sub>x</sub>, CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>.

Specific inputs to CalEEMod for both construction and operations include land uses and acreages associated with the Project. Construction input data include but are not limited to the start and finish dates of construction phases; inventories of construction equipment to be used during each phase; volumes of structures to be demolished; volumes of materials to be imported to and exported from the site; areas to be paved; and areas to be painted. Output emissions data are provided for off-road equipment, on-road vehicles, fugitive dust from grading, and VOCs from asphalt off-gas and architectural coatings.

For the purposes of the air quality modeling assumptions, the Project construction is assumed to begin in 2016, with buildout complete in 2035, although the actual start of construction and buildout are likely to occur later than 2016 and 2035, respectively. The 2035 buildout date is consistent with the Project's Traffic Study (see Section 5.10, Traffic, Access, and Circulation) and also with the CalEEMod model, which does not include operational emissions beyond 2035. For both construction and operational emissions, this is a very conservative approach because both the construction equipment fleet and on-road vehicles are assumed to be "cleaner", that is, to generate less unit emissions, with each future year. As such, assuming development of the Project site occurs sooner than is likely to occur provides a more conservative assessment of both construction and operational emissions.

Operational inputs include the year of analysis and vehicle trip generation rates. Output operational emissions data categories include area, energy, and mobile sources. Area sources are landscape maintenance equipment, consumer products, and architectural coatings used for routine maintenance. Energy emissions are from natural gas consumption. For vehicle

use emissions, traffic data was obtained from the Traffic Study prepared by Stantec (Appendix 5.10-A). The year of analysis for Project buildout is 2035. Average daily trip (ADT) generation rates from the traffic study were entered into the appropriate land use categories in CalEEMod to determine total vehicle trips, vehicle miles traveled, and associated emissions by land use unit type. The Project would generate an estimated 146,154 daily trips at Buildout, with approximately 48 percent (70,246 trips) being internal trips (Stantec 2016). The total estimated weekday Project-generated vehicles miles traveled (VMT) at buildout is 3,438,632 based on the Project-specific internal-external trip proportions (trip types) and average trip distances for the internal and external trips (Stantec 2016). However, the total weekday increase in regional VMT would be 1,921,599 due to changes in regional commuting patterns. The VMT data was used to adjust the CalEEMod trip lengths for consistent VMT results.

The CalEEMod model also includes data to calculate emissions reductions resulting from the implementation of PDFs and mitigation measures (MMs). The methodology for most emissions reductions is based on the August 2010 CAPCOA publication, *Quantifying Greenhouse Gas Mitigation Measures, A Resource for Local Government to Assess Emission Reductions from Greenhouse Gas Mitigation Measures* (CAPCOA 2010). CAPCOA measure LUT-6, documents that trip generation is less for below market rate (affordable) housing. This adjustment to project operational mobile emissions is based on a minimum of 10 percent of the housing being affordable, as stated in PDF 11-5, which is required to be implemented by MM 21-16 of Section 5.21, Climate Change, the Centennial Affordable Housing Implementation Plan.

### ***Ambient Air Quality Standards – Localized Significance Thresholds***

The SCAQMD developed a method to assess the localized impacts of criteria pollutant emissions from project sites in close proximity to sensitive receptors. This Localized Significance Threshold (LST) method addresses the thresholds (as listed in Table 5.11-7) for Ambient Air Quality for Criteria Pollutants. There are no corresponding significance thresholds in the AVAQMD's California Environmental Quality Act and Federal Conformity Guidelines (AVAQMD 2016b).

In general, the LST method is a table look-up procedure recommended for projects up to five acres in size. For larger projects, project-specific dispersion modeling is recommended to determine project impacts on surrounding sensitive land uses. Therefore, ENVIRON International Corporation (ENVIRON) conducted a screening-level air dispersion modeling evaluation to estimate ambient air concentrations of criteria pollutants at sensitive receptor locations and compared these estimated concentrations with the CAAQS and NAAQS. The USEPA's Industrial Source Complex, Short Term Version 3 (ISCST3) model with USEPA default settings was used to model air emissions transport.

The SCAQMD recommends selecting the closest site expected to have representative data for meteorological input. Due to its proximity to the proposed development and similar topographic characteristics (Centennial and the chosen site are in the valley formed to the east by the Tehachapi Mountains and San Andreas Rift Zone), the meteorological data from SCAQMD recorded at the Lancaster, California Monitoring Station was assumed appropriate

for this analysis. Selection of model parameters, such as terrain and rural/urban coefficients is discussed in the ENVIRON report included in Appendix 5.11-C of this EIR.

NO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> were evaluated and compared to the CAAQS, the NAAQS, and the SCAQMD's LSTs. NO<sub>x</sub> emissions were modeled and gradual conversion of emitted NO to NO<sub>2</sub> was assumed (per LST Guidelines). As a conservative assumption for this analysis, 50 percent of NO<sub>x</sub> were assumed to convert to NO<sub>2</sub> (this approximates a travel distance of 1,000 meters [3,280 feet] downwind according to LST Guidelines). VOC emissions were not modeled as there is no State or federal ambient air quality standard for VOCs. CO was not modeled, as CO impacts tend to be highest for traffic at intersections. Pollutant emission rates for on-site emissions were taken from the calculated daily emissions data for construction activity. Calculation of chemical concentrations requires the selection of appropriate concentration averaging times for comparison to the CAAQS and NAAQS. The maximum 1-hour and annual NO<sub>x</sub> concentrations were modeled, as well as the maximum 24-hour average and annual PM<sub>10</sub> and PM<sub>2.5</sub> concentrations. These concentrations, estimated at sensitive receptor locations, were placed every 50 meters (164 feet) along the closest residential, commercial, and institutional boundaries to the construction area.

### ***Carbon Monoxide Hotspot***

For localized CO impacts from mobile sources at congested intersections, an appropriate screening procedure is provided in the procedures and guidelines contained in *Transportation Project-Level Carbon Monoxide Protocol* (the Protocol) to determine whether a project poses the potential for a CO hotspot (UCD ITS 1997). If it is determined that a quantitative analysis is required, the Protocol methods are not used because of emission factors that are outdated. Potential local CO impacts were evaluated by comparing projected traffic conditions with the CO analysis in the SCAQMD's 2003 AQMP.

### ***Exposure to Toxic Air Contaminant Emissions***

At this time, neither the AVAQMD nor the SCAQMD has adopted a quantitative methodology for analyzing short-term construction-related emissions of TACs and/or the exposure thereof. Therefore, Project-generated, construction-related emissions of TACs were assessed in a qualitative manner.

### **Stationary Sources**

The total mass emissions of VOC, NO<sub>x</sub>, PM, and CO generated by potential stationary sources were calculated by ENVIRON based on the limitations on such sources imposed in MM 11-1 (which requires the implementation of PDF 11-1). The stationary sources addressed in the analysis include boilers, emergency generators, spray booths, restaurant broilers, gasoline service stations, solvent storage tanks, small source PM-generators, and dry cleaners. These constitute and/or represent the majority of stationary sources for the wide variety of land uses allowed by the Project. The VOC emissions from proposed wastewater reclamation facilities were also addressed. A detailed description of the methods applied in the stationary source air quality analysis is provided in the ENVIRON Report included in Appendix 5.11-B of this EIR.

### Toxic Air Contaminants

The ENVIRON Stationary Sources Report (Appendix 5.11-B) evaluates the Project's anticipated business park stationary source emissions of TACs to determine whether the incremental risks posed to sensitive receptors (e.g., residents, schools, hospitals, parks) by such stationary sources would exceed the applicable significance thresholds (i.e., has a cancer risk greater than or equal to 10 in 1 million for cancer risks and 1.0 for non-cancer chronic and acute HIs). Although the ENVIRON Stationary Sources Report analyzed TACs based on data from 2008, there have been no substantial changes to information related to TACs, and the analysis remains relevant. Because it is possible that two stationary sources that are located in proximity to each other may result in incremental risks greater than these thresholds, a Project-wide analysis of TAC emissions was completed.

The TAC analysis includes a multi-step risk characterization to quantify the potential for adverse health effects as a result of site-specific exposures to emissions and an evaluation of TACs in commercial, institutional, and residential areas to confirm, with the designation of appropriate buffer areas, that the aggregate incremental cancer and non-cancer health risks from these TAC-emitting sources would be below significance thresholds. A description of the methodology for these analyses is provided in the Appendix 5.11-B.

For TAC-emitting sources in commercial, institutional and residential areas, modeling was conducted to confirm that limitations on equipment types and sizes imposed by MM 11-1 will ensure that the incremental long-term risks posed by each individual source would be less than significant at the maximum point of impact. To account for the possibility of impacts at one receptor from more than one source, the limitations for each individual source are based on a standard at one-tenth of the applicable standard. This is described in more detail in Appendix 5.11-B. In addition, a screening health risk assessment for the wastewater reclamation facilities (WRFs) was conducted using ISCST3 to evaluate the air concentration at the nearest sensitive receptors and the incremental cancer and non-cancer health risks at the maximally exposed receptor location.

### Diesel Particulate Matter

ENVIRON conducted a screening evaluation to estimate the health risk to sensitive receptors associated with diesel PM emissions within 500 feet of SR-138 (based on recommended default separation distances) when locating new sensitive land uses near sources of TACs, including freeways (Appendix 5.11-C). The CARB guidance manual provides recommended buffers between freeways and sensitive receptors of 500 feet, indicating that further analyses may be in order if the proposed sensitive land use is located within this recommended buffer. According to the CARB, sensitive receptors include residences, schools, day care centers, playgrounds (e.g., parks or community areas), and medical facilities.

ENVIRON used CAL3QHCR, a steady-state Gaussian dispersion model, to estimate diesel PM concentrations at sensitive receptors (e.g., existing and planned future residences and locations which could contain schools or hospitals according to the proposed land use plan) located in proximity to SR-138. Diesel PM concentrations were calculated for "With Project" and "Without Project" scenarios.

Two configurations of SR-138 were evaluated: (1) the current configuration, assuming it will not change if the Project is not completed and (2) a realigned and expanded configuration, consistent with the proposed Northwest 138 Corridor Improvement Project. In addition to the locations of potential future sensitive receptors within 500 feet of the freeway, 3 existing residences were identified and were evaluated as discrete receptors.

Cancer risks were calculated for the modeled sensitive receptors assuming Office of Environmental Health Hazard Assessment-recommended (OEHHA-recommended) exposure parameters and toxicity using a 30-year exposure duration, which represents a high-end residency period. Additionally, a 70-year exposure scenario was estimated per OEHHA parameters under their Air Toxics Hot Spots Program (Assembly Bill 2588) to represent a maximum, lifetime exposure.

#### **5.11.4 ENVIRONMENTAL SETTING**

##### **Climate and Meteorological Conditions**

The climate in and around the Project area, as with all of Southern California, is controlled largely by the strength and position of the subtropical high pressure cell over the Pacific Ocean. It maintains moderate temperatures and comfortable humidity, and it limits precipitation to a few storms during the winter “wet” season. Temperatures are normally mild, except in the summer months, which commonly bring substantially higher temperatures.

The Project site is located in the southern foothills of the Tehachapi Range at its confluence with the Coast Range (west of the Project site) and Sierra Pelona Range (south of the Project site). From the area where these ranges join, a series of Coast Range mountains extend southeastward to California’s southern border. The Tehachapi and Coast ranges form a barrier separating the San Joaquin Valley to the north and the Mojave Desert to the east. Similarly, the Sierra Pelona range forms a barrier separating the Mojave Desert to the east from the Santa Clarita Valley and Los Angeles metropolitan area to the south. West of the Coast Range are coastal areas with a predominantly maritime climate, while to the east a continental desert regime prevails. The Project site is located within the transitional zone between these two climate regimes and is considered a temperate climate with cool temperatures and moderate precipitation during the winter and warm, dry summers.

In the winter, when the Pacific high moves south, cool, moist air moves through the region from the north and west. As the air mass is forced above the Tehachapi and Coast ranges, precipitation occurs in the form of rain and episodic hail and/or snow. In the summer, when the Pacific high moves north, most storms are deflected far to the north, and storms from the Gulf of Mexico dissipate before reaching the Project region. These conditions result in warm, dry summers. Temperatures in the area rarely exceed 100 degrees Fahrenheit (°F) in the summer or drop below 20°F in the winter. The average annual temperature measured on Tejon Ranch from 2012 through 2014 was 67°F (WRCC 2015). Average annual precipitation measured on the Tejon Ranch from 2012 through 2014 was 8.05 inches (WRCC 2015).

The San Joaquin Valley's topography has a dominating effect on wind patterns in the Tejon Pass and on the Tejon Ranch. Winds tend to blow from the north somewhat parallel to the valley and mountain range orientation, generally in the winter; however, in the summer when low-pressure systems in the Great Basin form and the Pacific high moves northward, strong winds out of the northwest will also occur.

## **Air Quality Attainment Designations**

Based on monitored air pollutant concentrations, the USEPA and the CARB designate an area's status in attaining the NAAQS and CAAQS, respectively, for the criteria pollutants identified in Table 5.11-1. The Federal CAA specifies dates for achieving compliance with the NAAQS and mandates that States develop SIPs to manage the attainment, maintenance, and enforcement of the NAAQS. Similarly, the CARB requires air districts to prepare plans showing how the area would meet the CAAQS by its attainment dates for all areas designated as being in nonattainment, and these plans become part of California's SIP. The attainment status for the AVAQMD portion of the MDAB and the SoCAB are summarized below. The CARB has not published attainment designations for vinyl chloride.

### ***Antelope Valley Air Quality Management District Attainment Designations***

Table 5.11-2, Designations of Criteria Pollutants in The Antelope Valley Portion of The Mojave Desert Air Basin, lists the current attainment designations for the MDAB. The USEPA designates an area as "unclassifiable" if, based on available information, it cannot be classified as either meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant. For the CARB, an "unclassified" designation indicates that the air quality data for the area are incomplete and do not support a designation of attainment or nonattainment.

Table 5.11-2 shows that the USEPA has designated the AVAQMD portion of MDAB as being in "severe-15 nonattainment" for ambient O<sub>3</sub> concentrations. Pursuant to the approved *2008 Federal Ozone Attainment Plan* and given the "severe-15 nonattainment" designation, the AVAQMD has 15 years from the 2004 plan approval (year 2019) to achieve attainment. To be designated as an "attainment" area by the State, the AVAQMD portion of the MDAB will need to achieve both the one-hour and eight-hour O<sub>3</sub> standards.

The USEPA has designated the AVAQMD portion of the MDAB as being an "unclassifiable" area for PM<sub>10</sub>. The State has designated the AVAQMD portion of the MDAB as being in "nonattainment" for the State PM<sub>10</sub> standard.

**TABLE 5.11-2  
DESIGNATIONS OF CRITERIA POLLUTANTS IN THE ANTELOPE VALLEY  
PORTION OF THE MOJAVE DESERT AIR BASIN**

Pollutant	Attainment Status	
	State	Federal
O <sub>3</sub> (1 hour)	Nonattainment; classified Extreme	No standard
O <sub>3</sub> (8 hour)		Nonattainment; classified Severe-15
PM10	Nonattainment	Unclassifiable/Attainment <sup>a</sup>
PM2.5	Unclassified	Unclassifiable/Attainment
CO	Attainment	Attainment
NO <sub>2</sub>	Attainment	Unclassifiable/Attainment
SO <sub>2</sub>	Attainment	Unclassifiable/Attainment
Lead	Attainment	Unclassifiable/Attainment
Particulate Sulfate	Unclassified	No federal standard
Hydrogen Sulfide	Unclassified	
Visibility Reducing Particles	Unclassified	

O<sub>3</sub>: ozone; PM10: respirable particulate matter with a diameter of 10 microns or less in diameter; PM2.5: fine particulate matter with a diameter of 2.5 microns or less in diameter; CO: carbon monoxide; NO<sub>2</sub>: nitrogen dioxide; SO<sub>2</sub>: sulfur dioxide.

<sup>a</sup> If the air quality in a geographic area meets or is cleaner than the national standard, it is called an attainment area (designated "unclassifiable/attainment"); areas that don't meet the national standard are called nonattainment areas. In some cases, EPA is not able to determine an area's status after evaluating the available information. Those areas are designated "unclassifiable."

Source: AVAQMD 2016b; USEPA 2016c.

### ***South Coast Air Quality Management District Attainment Designations***

Table 5.11-3, Designations of Criteria Pollutants in the South Coast Air Basin, lists the current attainment designations for the SoCAB. As shown, the SoCAB is a nonattainment area for PM10 (State), PM2.5 (State and Federal), and O<sub>3</sub> (State and Federal).

Table 5.11-3 shows that the USEPA has designated the SoCAB as an "extreme nonattainment" area for O<sub>3</sub>, a "nonattainment" area for PM10, a "moderate nonattainment" area for PM2.5, and an "attainment/maintenance" area for CO and NO<sub>2</sub>; the Los Angeles County portion of the SoCAB is designated as a "nonattainment" area for lead. For the federal designations, the qualifiers (i.e., "extreme" and "moderate") affect the required attainment dates as the federal regulations have different requirements for areas that exceed the standards by greater amounts at the time of the attainment/nonattainment designation. The State has designated the SoCAB as being in "nonattainment for" O<sub>3</sub>, PM10, and PM2.5.

**TABLE 5.11-3  
DESIGNATIONS OF CRITERIA POLLUTANTS IN  
THE SOUTH COAST AIR BASIN**

<b>Pollutant</b>	<b>State</b>	<b>Federal</b>
O <sub>3</sub> (1 hour)	Nonattainment	No standard
O <sub>3</sub> (8 hour)		Nonattainment - Extreme
PM <sub>10</sub>	Nonattainment	Attainment/Maintenance
PM <sub>2.5</sub>	Nonattainment	Nonattainment - Moderate <sup>a</sup>
CO	Attainment	Attainment/Maintenance
NO <sub>2</sub>	Attainment	Attainment/Maintenance
SO <sub>2</sub>	Attainment	Attainment
Lead	Attainment	Attainment/Nonattainment <sup>b, c</sup>
Particulate Sulfate	Unclassified	No federal standard
Hydrogen Sulfide	Unclassified	
Visibility Reducing Particles	Unclassified	
<p>O<sub>3</sub>: ozone; PM<sub>10</sub>: respirable particulate matter 10 microns or less in diameter; PM<sub>2.5</sub>: fine particulate matter 2.5 microns or less in diameter; CO: carbon monoxide; NO<sub>2</sub>: nitrogen dioxide; SO<sub>2</sub>: sulfur dioxide; USEPA: U.S. Environmental Protection Agency; SoCAB: South Coast Air Basin; CARB: California Air Resources Board.</p> <p><sup>a</sup> On November 30, 2014, the USEPA proposed a finding that the SoCAB has attained the 1997 PM<sub>2.5</sub> standards. If approved, the SoCAB would remain a nonattainment area for the 2006 PM<sub>2.5</sub> standard. On September 30, 2015 the USEPA proposed a reclassification from Moderate to Serious for the 2006 PM<sub>2.5</sub> standard.</p> <p><sup>b</sup> Los Angeles County is classified as "nonattainment" for lead; the remainder of the SoCAB is in attainment of the federal standard.</p> <p>Source: CARB 2015, 2014; USEPA 2016c.</p>		

The SoCAB is designated as being in attainment of the federal SO<sub>2</sub> and lead NAAQS (except Los Angeles County) as well as the State CO, SO<sub>2</sub>, lead (except Los Angeles County), hydrogen sulfide, and vinyl chloride CAAQS.

## Monitored Air Quality

Air quality at any site is dependent upon regional air quality and local pollutant sources. Regional air quality is determined by the release of pollutants throughout the air basin and transport of pollutants from other air basins.

Air quality data for the Project region was collected at the Lancaster and Santa Clarita Monitoring Stations. The Lancaster Monitoring Station is approximately 33 miles east of the Project site, located at 43301 Division Street in Lancaster. The Santa Clarita Monitoring Station is approximately 29 miles southeast of the Project site, located at 22224 Placerita Canyon Road in Santa Clarita. Both stations were included for this analysis because, although the Santa Clarita Monitoring Station is closer in proximity to the Project site, the Lancaster

Monitoring Station is more representative of data from the Mojave Desert Air Basin, which is where most of the Project site is located.

As shown in Table 5.11-4, Air Quality Levels Measured at the Lancaster and Santa Clarita Monitoring Stations, the Lancaster monitoring data show that O<sub>3</sub> is the air pollutant of primary concern in the Project area. At the Lancaster Monitoring Station, the State 1-hour O<sub>3</sub> standard was exceeded 9 days in 2013, 3 days in 2014, and 26 days in 2015. The State 8-hour O<sub>3</sub> standard was exceeded 50 days in 2013, 35 days in 2014, and 80 days in 2015. The federal O<sub>3</sub> 8-hour standard was exceeded 34 days in 2013, 17 days in 2014, and 53 days in 2015. O<sub>3</sub> is a secondary pollutant and is not directly emitted from a source; it occurs as the result of chemical reactions between other pollutants, most importantly VOCs and NO<sub>2</sub>, which occur only in the presence of bright sunlight. Pollutants emitted from upwind cities react during transport downwind to produce the oxidant concentrations experienced in the area. Because NO<sub>2</sub> is a primary constituent of O<sub>3</sub>, the very low measured concentrations of NO<sub>2</sub> indicate that existing high O<sub>3</sub> levels are primarily the result of transport of O<sub>3</sub> that is formed outside the Antelope Valley.

Particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>) is another air pollutant of concern in the area. The State 24-hour PM<sub>10</sub> standard was exceeded for 2 days in 2013 at the Lancaster Monitoring Station. The federal 24-hour PM<sub>2.5</sub> standard was exceeded for 1 day in 2014. No other PM<sub>10</sub> or PM<sub>2.5</sub> standards were exceeded from 2013 to 2015. Particulate levels in the area are due to natural sources (such as wind), grading operations, and motor vehicles.

**TABLE 5.11-4  
AIR QUALITY LEVELS MEASURED AT THE LANCASTER  
AND SANTA CLARITA MONITORING STATIONS**

Pollutant	California Standard	National Standard	Year	Max. Level <sup>a</sup>	Days State Standard Exceeded <sup>b</sup>	Days National Standard Exceeded <sup>b, c</sup>
PM2.5 (AAM)	12 µg/m <sup>3</sup>	15 µg/m <sup>3</sup>	2015	-	-	-
			2014	-	-	-
			2013	-	-	-
<p>O<sub>3</sub>: ozone; ppm: parts per million; PM10: respirable particulate matter with a diameter of 10 microns or less; µg/m<sup>3</sup>: micrograms per cubic meter; AAM: annual arithmetic mean; NO<sub>2</sub>: nitrogen dioxide; CO: carbon monoxide; PM2.5: fine particulate matter with a diameter of 2.5 microns or less</p> <p>"-" indicates that the data are not reported or there is insufficient data available to determine the value. N/A indicates that there is no applicable standard.</p> <p><sup>a</sup> California maximum levels were used.</p> <p><sup>b</sup> For annual averaging times, a "Yes" or "No" response is given if the annual average concentration exceeded the applicable standard.</p> <p><sup>c</sup> PM is measured once every 6 days. Where 2 values are shown for PM10 and PM2.5, the first is for the measured value, and the second is the estimated value if monitored every day.</p> <p>Source: CARB 2017</p>						

The air pollutants measured at the Santa Clarita Monitoring Station include O<sub>3</sub>, PM10, NO<sub>2</sub>, CO, and PM2.5. The Santa Clarita monitoring data show that O<sub>3</sub> is the air pollutant of primary concern in the Project area. At the Santa Clarita Monitoring Station, the State 1-hour O<sub>3</sub> standard was exceeded 30 days in 2013, 32 days in 2014, and 23 days in 2015. The State 8-hour O<sub>3</sub> standard was exceeded 57 days in 2013, 64 days in 2014, and 52 days in 2015. The federal O<sub>3</sub> 8-hour standard was exceeded 40 days in 2013, 45 days in 2014, and 37 days in 2015.

No State or federal standards were exceeded for the remaining criteria pollutants monitored. Furthermore, because NO<sub>2</sub> is a primary constituent of O<sub>3</sub>, the very low measured concentrations of NO<sub>2</sub> indicate that existing high O<sub>3</sub> levels are primarily the result of transport of O<sub>3</sub> that is formed outside the Antelope Valley.

## Valley Fever

Valley Fever is the common name (formally known as *Coccidioidomycosis*) for a fungal disease caused by inhalation of *Coccidioides immitis* spores that are carried in dust. In California, the highest incidence of Valley Fever occurs in the San Joaquin (Central) Valley, with over 75 percent of reported cases (CDPH 2016). Valley Fever tends to occur in areas with dry dirt and desert-like weather conditions that can allow the fungus to grow. The fungus is found throughout Los Angeles County, with the highest rates in the San Fernando Valley and Antelope Valley (LADPH 2015). The fungus can become airborne when soil that contains *C. immitis* spores is disturbed, either by natural or anthropogenic (man-made) means, including wind, farming, and construction. Valley Fever is diagnosed by a blood test, a chest x-ray, and other tests, and can be treated with anti-fungal medications. Approximately 60 percent of people exposed to Valley Fever spores develop no symptoms.

If symptoms develop, those individuals generally develop a mild respiratory illness with flu-like symptoms that can last a month or more. Rarely, individuals develop a severe illness such as pneumonia, meningitis, or dissemination when the fungus spreads to other parts of the body. African Americans, Filipinos, pregnant women, children under 5 years of age, the elderly, and immunocompromised individuals are at higher risk for severe disease (LADPH 2016). At highest risk for exposure to Valley Fever are farmers, construction workers, military personnel, archaeologists, and others who are likely to engage in activities that actively disturb soils in areas where Valley Fever may be present.

A more thorough discussion of Valley Fever, including applicable PDFs and MMs is discussed in Section 5.3, Hazards and Fire Safety.

### **Toxic Air Contaminants**

As described in Section 2.0, Environmental Setting, the Project site and surrounding areas remain in a relatively rural and undeveloped condition. As such, there are very few existing sources of TACs. The National Cement Company of California's (NCCC) Lebec Cement Kiln, located more than one mile north of the Project site, was identified as a potential stationary source of TACs in the vicinity of the Project site. Additionally, freeways in the vicinity of the Project site, including SR-138 and Interstate (I) 5, experience daily vehicle traffic that includes diesel trucks and buses considered mobile sources of diesel particulate matter. Both existing and proposed sources of toxic air contaminants have been considered in the air quality analysis below.

### **Sensitive Receptors**

Certain groups of people are more sensitive to airborne pollutants, such as the elderly, children, and persons with respiratory illnesses or impaired lung function because of other illnesses. Sensitive receptors are land uses that provide facilities and/or structures where these sensitive persons live or spend considerable amounts of time. These land uses include, but are not limited to, schools, school yards, day care facilities, hospitals, rest homes, long-term medical facilities, and parks/playgrounds. Residences are also considered to be sensitive receptors because of their potential to contain children and the elderly.

The nearest existing sensitive receptors to the Project site are residential properties near the Project site boundaries on 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue. Additional nearby residences include one located offsite on the south side of SR-138 west of Cement Plant Road and homes between the Quail Lake Sky Park runway and SR-138. The residences, schools, and parks to be built as part of the Project would also be sensitive receptors. Both existing and proposed sensitive receptors on and around the Project site have been considered in the air quality analysis below.

### 5.11.5 PROJECT DESIGN FEATURES

The emission savings from the Project Design Features (PDFs) listed below are quantifiable, and these emissions reductions have been estimated and are described in the analyses below where feasible. Each PDF listed below has a corresponding MM to ensure implementation since there are quantifiable reductions in emissions associated with each PDF.

- PDF 11-1** The Project requires stationary sources to comply with ambient air quality standards and the toxic air contaminant (TAC) emissions thresholds by requiring compliance with the parameters stated in Table 5.11-5, Stationary Source Types, Size Limits, and Quantity Estimates. Should there be a need or request for a stationary source exceeding the prescribed limits, a source-specific air quality analysis in accordance with the applicable Antelope Valley Air Quality Management District (AVAQMD) or South Coast Air Quality Management District (SCAQMD) Rules would be required.
- PDF 11-2** The Green Development Program requires compliance with the California Green Building Standards (CALGreen) Code voluntary measure A5.203.1.2.1 for non-residential buildings. Therefore, the energy efficiency of nonresidential, hotel, and high-rise residential buildings would exceed 2016 Title 24 requirements by 10 percent.
- PDF 11-3** The Green Development Program requires compliance with CALGreen voluntary measure A4.203.1.2.1 for low-rise residential buildings. Therefore, the energy efficiency of these buildings would exceed 2016 Title 24 requirements by 15 percent.
- PDF 11-4** The Project prohibits wood-burning fireplaces. The elimination of wood burning avoids the potential emissions of substantial quantities of respirable particulate matter with a diameter of 10 microns or less (PM<sub>10</sub>), fine particulate matter with a diameter of 2.5 microns or less (PM<sub>2.5</sub>), nitrogen oxides (NO<sub>x</sub>), and volatile organic compounds (VOCs). This PDF extends SCAQMD Rule 445, Wood-Burning Devices, to the entire Project area and to developments at 3,000 or more feet above mean sea level, and applies the requirements and exemptions of SCAQMD Rule 445, with the exception that the exemption for locations at 3,000 or more feet above mean sea level is not applicable. The maximum number of non-wood burning fireplaces will be 13,954, the equivalent of 1 fireplace for each single-family residence.
- PDF 11-5** The Centennial Affordable Housing Implementation Plan (see Appendix 3-H of the *Centennial Specific Plan*, which is in Appendix 4.0-A of this EIR) will be adopted in conjunction with the Project, which includes dedication of a minimum of ten percent of the residential units as affordable housing. A range of employment opportunities will be created within the community; therefore, a range of housing needs will be provided to reduce the number of vehicle trips (particularly long trips outside the Project).

**PDF 11-6** The Project prohibits residences, schools, day care centers or other land uses involving public congregation from being built within 150 feet of the near edge of the State Route (SR) 138 traffic lanes. This requirement will ensure that the risk of exposure to diesel particulate matter (diesel PM) is less than what is allowed by AVAQMD and SCAQMD guidelines.

**TABLE 5.11-5  
STATIONARY SOURCE TYPES, SIZE LIMITS,  
AND QUANTITY ESTIMATES**

Source Type	Description	Maximum Single Source Size/ Configuration <sup>a</sup>	Project-wide Representative Estimate <sup>b</sup>	Assumed Average Size of Single Source	Number of Sources <sup>c</sup>	Notes
Boiler	Includes general purpose heating for schools, hospitals, commercial buildings, light industrial uses.  Does not include industries such as large scale chemical or pharmaceutical manufacturing, large scale agricultural processing plants or breweries (i.e., heat-intensive processes).	58 mmbtu/hr per boiler	700 mmbtu/hr	25 mmbtu/hr	28	A 25 mmbtu/hr boiler is typical for a large hospital and is larger than approximately 70% of the boilers permitted in the SJVAPCD; the Project-wide estimate is based on 28 boilers at average size.
Emergency Generator	Used for emergency back-up power at schools, hospitals, commercial buildings, light industrial uses, cell phone towers, etc.	1,000 hp per generator (Tier 4 Final engine)	12,800 hp	200 hp	64	In the SJVAPCD, the median generator size is 200 hp, and 92% of permitted generators are smaller than 1000 hp (1999); the Project-wide estimate is based on 64 generators of average size. A Tier 4 Final engine is not required to meet the threshold provided the total emissions are lower than those from 1000 hp Tier 4 Final engine operating for 9 hours per year.

**TABLE 5.11-5  
STATIONARY SOURCE TYPES, SIZE LIMITS,  
AND QUANTITY ESTIMATES**

Source Type	Description	Maximum Single Source Size/ Configuration <sup>a</sup>	Project-wide Representative Estimate <sup>b</sup>	Assumed Average Size of Single Source	Number of Sources <sup>c</sup>	Notes
Restaurant with Charbroilers	Includes fast food restaurants such as McDonalds and Wendy's; steakhouses and other restaurants with charbroilers, such as Applebees or TGIFriday's; and school cafeterias.  Does not include cafés, small sandwich shops, and fine dining restaurants without charbroilers.	775 lbs of meat throughput per day per restaurant	13,750 lbs of meat per day	250 lbs of meat per day	55	SCAQMD indicates average beef usage of 233 lbs per day; the Project-wide estimate is based on 55 restaurants of assumed average size.
Spray Booths	Includes small-scale auto detailing, furniture repair and refinishing, antique refurbishing, and other small scale painting activities.  Does not include industries such as vehicle manufacturing, dye production, composite manufacturing, industrial drum refurbishing (i.e., large-scale solvent or paint use).	VOC emissions up to 667 lbs per month per spray booth	VOC emissions up to 13,340 lbs per month	VOC emissions up to 667 lbs per month per spray booth	20	Typical small-scale permit based on SCAQMD permits in Santa Clarita; the Project-wide estimate is based on 20 units of this size.
Gas Stations	Includes all fuel-dispensing facilities.	CARB specifies setback distances	Project-wide throughput of 28.4 MG per year	2.4 MG per year throughput	Project-wide throughput of 28.4 MG per year	CARB reports that 96% of gas stations in California are smaller than 2.4 MG per year throughput. A large gas station (e.g., Costco) has a throughput around 9 MG per year. The Project-wide estimate is based on the assumption that Centennial will have 65,000 drivers logging national average vehicle miles traveled in cars with national average fuel efficiency.

**TABLE 5.11-5  
STATIONARY SOURCE TYPES, SIZE LIMITS,  
AND QUANTITY ESTIMATES**

Source Type	Description	Maximum Single Source Size/ Configuration <sup>a</sup>	Project-wide Representative Estimate <sup>b</sup>	Assumed Average Size of Single Source	Number of Sources <sup>c</sup>	Notes
Storage Tanks (non-fuel dispensing)	Includes most light-industrial uses such as small-scale personal-care product manufacturing and other small users.  Does not include storage tanks for gasoline-dispensing facilities (included above) or oil production equipment and refineries.	<20,000 gallons per storage tank	560,000-gallon capacity	10,000 gallons	56	A survey of SCAQMD permits for Santa Clarita indicated that no permitted tank (for all uses, including fuel distribution) was larger than 20,000 gallons. The Project-wide estimate is based on 56 non-gasoline dispensing tanks that are all the average size of 10,000 gallons.
Other VOC-emitting sources	Includes film-processing facilities; oil-water separators at auto repair facilities; and soil and groundwater remediation systems.	VOC emissions up to 4 tons per year per VOC source	VOC emissions up to 80 tons per year	VOC emissions up to 4 tons per year per VOC source	20	This is the assumed estimate for miscellaneous sources. The Project-wide estimate is based on 20 miscellaneous sources.
Small Source PM-emitting sources	Includes auto repair, metal fabrication and finishing, swimming pool supply, and repair shops.	PM emissions up to 1 lb per day per PM source. The source shall be no closer than 25 feet from the property boundary.	PM emissions up to 23 lbs per day	PM emissions up to 1 lb per day per PM source	23	This is the assumed estimate for miscellaneous sources. The Project-wide estimate is based on 23 miscellaneous sources.
On-site Petroleum Solvent Dry Cleaning	Includes on-site dry cleaning of clothing.  Does not include store-front dry cleaning shops with no on-site cleaning (i.e., cleaning sent to another location).	N/A	2,400 gallons of solvent usage per year	100 gallons of solvent usage per year	24	The average usage for petroleum-based drycleaner is 89 gallons of solvent consumed per year. The Project-wide estimate is based on an average use estimate of 100 gallons and 24 dry cleaners in Centennial.

The Project incorporates important characteristics or elements that are quantified and accounted for in the modeling for the Traffic Study, and that would minimize air quality impacts, as summarized in Section 5.10, Traffic, Access and Circulation. The location of the Project and the proposed residential and non-residential uses have been planned for a balance between the number of jobs available and the number of on-site housing units in an effort to encourage local trips. The approximate 10.1 million square feet (sf) of commercial office, shopping center, and industrial land uses will provide approximately 20,809 jobs, many of which are anticipated to be filled by future Centennial residents and would result in trips that are “internal” to the Project site.

Some Centennial residents will be commuting to jobs outside the community and some residents from surrounding areas will commute to Centennial for employment. The Centennial Traffic Study forecasts that around 48 percent of the average daily trips will be internal (Stantec 2016). This is a substantially greater amount of internal trips than would be anticipated in a development with less residential/non-residential balance. The result is a reduction in vehicle miles traveled (VMT) and the associated air pollutant emissions. This internal capture of trips is quantified in the Traffic Study, which is used as a component of the operational emissions calculated by CalEEMod Version 2016.3.1.

#### **5.11.6 THRESHOLD CRITERIA**

Air quality impacts are usually classified as short term and/or long term. Short-term (or temporary) impacts are usually the result of construction or grading operations. Long-term impacts are associated with a project’s emissions from the proposed land uses in their built-out condition. This analysis addresses “criteria” pollutants (the contaminants for which ambient air quality standards have been established) and TACs.

Ambient concentrations of criteria pollutants are monitored throughout the state and nation to determine the general acceptability of the air environment. When ambient air quality standards are exceeded, measures (which are often regional in nature) are implemented to reduce concentrations. Based primarily on measured ambient concentrations, emissions inventories, and projected emissions activities, air quality management districts determine maximum emissions values, applicable to all projects, that would not likely cause or contribute to a new violation of air quality standards; increase the frequency or severity of existing violation(s); and/or delay attainment of an air quality standard or other requirement of the federal attainment plan.

At the local level, pollutant concentrations may be analyzed to ensure that sensitive receptors (e.g., residences, schools, hospitals, and parks) are not subjected to ambient concentrations in excess of State or federal standards as a result of a project’s construction or operation. A pollutant emissions inventory and dispersion modeling effort is often required for larger projects to determine project-specific effects on ambient concentrations in surrounding areas with sensitive receptors.

An analysis of TACs is intended to characterize the potential incremental health risks (both cancer and non-cancer) associated with anticipated long-term ambient concentrations resulting from site-specific exposure to emissions sources. TAC analyses use the results from the dispersion modeling to determine expected incremental exposure and dosage of toxic

contaminants for each receptor. The toxicity information for each TAC is then combined with the expected dosages of respective TACs to determine the potential incremental health risk at a particular location.

### **California Environmental Quality Act Thresholds**

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

- Threshold 11-1** Violate any air quality standard or contribute substantially to an existing or projected air quality violation.
- Threshold 11-2** Expose sensitive receptors to substantial pollutant concentrations.
- Threshold 11-3** Conflict with or obstruct implementation of applicable air quality plans of either the South Coast AQMD (SCAQMD) or the Antelope Valley AQMD (AVAQMD).
- Threshold 11-4** Create objectionable odors affecting a substantial number of people.
- Threshold 11-5** Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).

The AVAQMD and the SCAQMD have established CEQA significance thresholds for use by lead agencies in air quality impact analysis as detailed below.

### ***Antelope Valley Air Quality Management District Thresholds***

The AVAQMD's CEQA and Federal Conformity Guidelines (2016) establishes significance thresholds to assess the regional impact of project-related air pollutant emissions in the AVAQMD. Table 5.11-6, Antelope Valley Air Quality Management District Criteria Pollutant Significance Thresholds, summarizes the AVAQMD's mass emissions thresholds, which are presented as both daily and annual values. The AVAQMD guidelines state that a project with "phases shorter than one year can be compared to the daily value" (AVAQMD 2016b). However, the Project, as analyzed, would not have construction or operational phases shorter than one year, and the AVAQMD daily thresholds are not used. A project with emission rates below these thresholds is considered to have a less than significant effect on regional air quality throughout the AVAQMD portion of the MDAB.

**TABLE 5.11-6  
ANTELOPE VALLEY AIR QUALITY MANAGEMENT DISTRICT  
CRITERIA POLLUTANT SIGNIFICANCE THRESHOLDS**

<b>Criteria Pollutant</b>	<b>Annual Threshold (tons)</b>	<b>Daily Threshold (lbs)</b>
Greenhouse Gases (CO <sub>2</sub> e)	100,000	548,000
Carbon Monoxide (CO)	100	548
Oxides of Nitrogen (NO <sub>x</sub> )	25	137
Volatile Organic Compounds (VOC)	25	137
Oxides of Sulfur (SO <sub>x</sub> )	25	137
Particulate Matter (PM <sub>10</sub> )	15	82
Particulate Matter (PM <sub>2.5</sub> )	12	65
Hydrogen Sulfide (H <sub>2</sub> S)	10	54
Lead	0.6	3
lbs: pounds; CO <sub>2</sub> e: carbon dioxide equivalent, Source: AVAQMD 2016b.		

### Toxic Air Contaminants

The AVAQMD's CEQA and Federal Conformity Guidelines establish the significant risk thresholds at 10 in 1 million for cancer risks and 1.0 for non-cancer chronic and acute HIs.

### ***South Coast Air Quality Management District Thresholds***

The SCAQMD has established significance thresholds to assess the regional and localized impacts of Project-related air pollutant emissions. The significance thresholds are updated as needed to appropriately represent the most current technical information and attainment status in the SoCAB. Table 5.11-7, South Coast Air Quality Management District Thresholds of Significance, presents the current significance thresholds. A project with daily emission rates, risk values, or concentrations below these thresholds is generally considered to have a less than significant effect on air quality.

**TABLE 5.11-7

## 5.11.7 ENVIRONMENTAL IMPACTS

**Threshold 11-1** Would the proposed project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

### On-Site Impacts

#### *Mass Daily and Annual Emissions Standards*

##### Construction-Related Impacts

Temporary impacts would result from Project construction activities. Air pollutants would be emitted by construction equipment and fugitive dust generated during grading of the Project site. Other construction activities that emit pollutants include painting, surface coating, and asphalt paving operations. For this analysis, construction has been divided into four phases: grading, building, application of architectural coatings, and paving. Project emissions were calculated using CalEEMod version 2016.3.1 as described in the Methodology section.

Emissions are evaluated on annual rate (tons per year) in accordance with the AVAQMD criteria pollutant thresholds (Table 5.11-6) and on a daily rate (pounds per day) in accordance with SCAQMD thresholds of significance (Table 5.11-7).

Once construction begins (in Year 1), it will proceed continuously for approximately 20 years, with full buildout completed after 20 years. Construction emissions are calculated for the following construction activities: grading, building, paving, and architectural coating (painting).<sup>4</sup> The rate of construction would vary with a variety of factors including, but not limited to market demand, weather, and as-found site conditions. The estimation of the quantities of grading, building, paving, and painting on a year-by-year basis for a 20-year project would be highly speculative. Therefore, the construction effort is initially evaluated assuming that each construction activity would be spread equally over the applicable years. Additionally, as further explained below, construction emissions are evaluated for a peak grading year.

**Average Year Assumptions.** Grading would occur from Year 1 through Year 18. Preliminary grading engineering design indicates that approximately 127 million cubic yards (mcy) of earth would be moved for the total Project. Based on the preliminary grading estimates, the average daily grading quantity over the 18 years of grading would be approximately 26,500 to 36,500 cubic yards (cy), depending on the number of days of grading. For a conservative estimate, it is assumed that grading would be limited by weather and other factors to 200 days per year, and the average daily grading quantity would be 36,500 cy. Cut and fill would be balanced on the Project site and no off-site export or import is anticipated. Soil movement

---

<sup>4</sup> Emissions modeling often includes demolition and site preparation (clearing and grubbing) activities. Demolition required for the proposed Project would be negligible. Clearing and grubbing would be predominantly grassland, and would occur concurrently with grading.

within the site would be by scraper. Equipment used for the average year grading analysis is shown in Table 5.11-8.

**TABLE 5.11-8

Compressors	4

The Project Applicant/Developer is required to implement dust-control measures as prescribed in AVAQMD Rule 403, Fugitive Dust, and SCAQMD Rule 403, Fugitive Dust. AVAQMD Rule 403 and SCAQMD Rule 403 require that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source.

Two options are presented in SCAQMD Rule 403: monitoring of particulate concentrations or active control. The exact method would be determined at the time of the preparation of the Dust Control Plan. Monitoring involves a sampling network around the Project site with no additional control measures unless specified concentrations are exceeded. The active control option does not require any monitoring, but requires that a list of measures be implemented starting with the first day of construction. Basic measures include pre-watering of grading sites, watering during grading, and watering or chemical treatment of stockpiles. Compliance with these rules will result in reducing short-term particulate pollutant emissions.

SCAQMD Rule 403 requires that “Large Operations” implement additional measures. A Large Operation is defined as “any active operations on a property that contain 50 or more acres

of disturbed surface area or any earth-moving operation with a daily earth-moving or throughput volume of 3,850 cubic meters (5,000 cubic yards) or more 3 times during the most recent 365 day period” (SCAQMD 1976b). Grading of the Project would be considered a Large Project under Rule 403. Therefore, the Project shall be required to implement the applicable actions specified in Table 2 of the Rule, which is included in EIR Appendix 5.11-D. As a Large Operation, the Project shall also be required to do the following:

- Submit a fully executed Large Operation Notification (SCAQMD Form 403N) to the SCAQMD Executive Officer within 7 days of qualifying as a large operation.
- Include, as part of the notification, the name(s), address(es), and phone number(s) of the person(s) responsible for the submittal, and a description of the operation(s), including a map depicting the location of the site.
- Maintain daily records to document the specific dust-control actions taken, maintain such records for a period of not less than three years, and make such records available to the Executive Officer upon request.
- Install and maintain Project signage with Project contact information that meets the minimum standards of the Rule 403 Implementation Handbook, prior to initiating any earth-moving activities.
- Identify a Dust-Control Supervisor that is employed by or contracted with the Property Owner/Developer; is on the site or available on site within 30 minutes during working hours; has the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule requirements; and has completed the AQMD Fugitive Dust Control Class and has been issued a valid Certificate of Completion for the class.
- Notify the SCAQMD Executive Officer in writing within 30 days after the site no longer qualifies as a large operation.

Further, SCAQMD Rule 403 requires that that the Project not “allow track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation” (SCAQMD 1976b). All track-out from an active operation is required to be removed at the conclusion of each workday or evening shift. Any active operation with a disturbed surface area of 5 or more acres or with a daily import or export of 100 cubic yards or more of bulk materials must utilize at least one of the measures listed in Table 3 of SCAQMD Rule 403 at each vehicle egress from the site to a paved public road.

Rule 403 measures include regular watering of active grading areas and unpaved roads, limiting vehicle speeds on unpaved surfaces, stabilizing stockpiled earth, and curtailing grading operations during high wind conditions. Watering of active grading areas is included in the CalEEMod emissions analysis and results in reduced PM10 and PM2.5 emissions. It should be noted that some Project requirements and features, such as watering grading areas, although required Project elements, are shown in the CalEEMod format as mitigation measures.

Building would occur from Year 2 through Year 20. Similar to grading, the intensity of building would vary from a low of approximately 400 residential dwelling units (du) in Year 2 to approximately 1,200 du, which would occur in many years. Conservatively, for emission estimation, the average residential construction is assumed to be 1,018 dwelling units per year. The average non-residential construction is assumed to be 531,400 square feet per year. For purposes of emissions estimation, it is assumed that utilities installation and paving, occur concurrently with building; architectural coating would begin six months after the start of building and continue through buildout.

The Project Applicant/Developer is required to use architectural coatings compliant with AVAQMD Rule 1113 and SCAQMD Rule 1113, which limit the VOC content of architectural coatings. Based on these rules, it was assumed that the average VOC content of architectural coatings would not exceed 50 grams per liter (g/L) for all interior surfaces, 100 g/L for residential exterior surfaces, and 150 g/L for non-residential exterior surfaces. It was also assumed that 50 percent of the non-residential exterior surface would be painted. Equipment used for the building, paving, and architectural coating analysis is shown in Table 5.11-8.

**Average Year Construction Emissions.** Average year construction emissions are the total of Project emissions from the scenario described above that assumes concurrent grading, building construction, architectural coatings, and asphalt paving activities. Table 5.11-9 shows the estimated annual emissions for each year from Year 1 through Year 20 for the average construction year, and emissions are compared to the AVAQMD thresholds. Table 5.11-10 shows the estimated daily emissions for each year from Year 1 through Year 20 for the average construction year, and emissions are compared to the SCAQMD thresholds. CalEEMod input and output data for these emissions are included in Appendix 5.11-A to this EIR.

Source: SCAQMD 2015 (thresholds). Emissions calculations can be found in Appendix 5.11-A.

As shown in Table 5.11-9, using average year assumptions, estimated construction NO<sub>x</sub> emissions would exceed the AVAQMD annual emissions thresholds from Year 2 through Year 14. The primary source of NO<sub>x</sub> emissions would be the exhaust emissions from diesel-engine equipment used for site grading. Beginning in Year 15, the estimated NO<sub>x</sub> emissions are less than the AVAQMD thresholds and substantially less than in previous years not because of any change in Project activity, but because of a change in the emission factors in the

CalEEMod database. The emission factors assume continuing reductions in NO<sub>x</sub> emissions due to increasing use of newer equipment with cleaner engines (Tier 3, Tier 4 Interim, Tier 4 Final) as required by USEPA regulations. The change is substantial in Year 15 because, prior to Year 10, the model has emission factors for each year and after 2025 the emission factors are in five-year increments. Estimated emissions of VOC, CO, SO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> would be less than the AVAQMD thresholds. The NO<sub>x</sub> emissions impact would be potentially significant.

As shown in Table 5.11-10, using average year assumptions, estimated construction NO<sub>x</sub> emissions would exceed the SCAQMD daily emissions thresholds from Year 1 through Year 18, the entire grading period. VOC emissions would exceed the daily emissions thresholds from Year 3 through Year 18, which are the years when grading, building, paving, and painting are concurrent activities. The primary sources of VOC emissions would be architectural coatings and exhaust emissions from grading equipment. Estimated emissions of CO, SO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> would be less than the SCAQMD thresholds. The VOC and NO<sub>x</sub> emissions impacts would be potentially significant.

**Peak Grading Year Assumptions.** Construction emissions, particularly NO<sub>x</sub> emissions, are dominated by the magnitude of grading effort and the emissions of scrapers, dozers, and similar equipment. Preliminary grading engineering design indicates that the peak year for grading would be approximately Year 11 and the grading quantity could be approximately 17 mcy, or an average of 86,000 cy/day. Equipment used for the average year grading analysis is shown in Table 5.11-11.

**TABLE 5.11-11

Graders	2

**Peak Grading Year Construction Emissions.** To evaluate the peak grading year scenario, calculations were made using the equipment required for the peak grading year in Table 5.11-11 combined with the average year equipment for building, painting, and paving activities (Table 5.11-8).

The results are in Tables 5.11-12 and 5.11-13, which show annual and daily emissions, respectively.

**Bold** indicates emissions exceeding threshold

Sources: SCAQMD 2015 (thresholds). Emissions calculations can be found in Appendix 5.11-A.

Estimated emissions for the peak grading year would be substantially greater than for an average year. Peak grading year annual emissions of VOC, CO, SO<sub>x</sub>, and PM2.5 would remain below AVAQMD thresholds; there would be potential significant impacts for annual NO<sub>x</sub>, and PM10 emissions. Peak grading year daily emissions of CO and SO<sub>x</sub> would remain below SCAQMD thresholds. There would be potential significant impacts for daily VOC, NO<sub>x</sub>, PM10, and PM2.5 emissions.

To reduce NO<sub>x</sub> and VOC emissions without reducing the quantity or operating hours of construction equipment, which would extend the duration of grading, equipment with newer, low-emissions engines should be used. MM 11-2 requires the use of construction

equipment with Tier 4 Final diesel engines and on-road trucks with 2010 or newer engines to the extent that the equipment is available.

Project emissions that could occur with the use of Tier 4 Final construction equipment, as required by MM 11-2, are shown in Table 5.11-14 and Table 5.11-15 for the average construction year and in Table 5.11-16 and Table 5.11-17 for the peak grading year.

Year 11	83	72	506	1	70	30
<b>SCAQMD Thresholds (Table 5.11-7)</b>	<b>75</b>	<b>100</b>	<b>550</b>	<b>150</b>	<b>150</b>	<b>55</b>
<b>Exceeds SCAQMD Thresholds?</b>	<b>Yes</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>
lbs/day: pounds per day; VOC: volatile organic compound; NOx: nitrogen oxides; CO: carbon monoxide; SOx: sulfur oxides; PM10: respirable particulate matter with a diameter of 10 microns or less; PM2.5: fine particulate matter with a diameter of 2.5 microns or less; SCAQMD: South Coast Air Quality Management District; CalEEMod: California Emissions Estimator Model <b>Bold</b> indicates emissions exceeding threshold Sources: SCAQMD 2015 (thresholds). Emissions calculations can be found in Appendix 5.11-A.						

As shown in Table 5.11-14 and Table 5.11-16, the use of all Tier 4 Final construction equipment would reduce annual NOx emissions for both average grading years and the peak grading year to less than the AVAQMD significance thresholds.

As shown in Table 5.11-15 and Table 5.11-17, the use of all Tier 4 Final construction equipment would reduce daily NOx emissions to less than the SCAQMD significance threshold for both the average grading years and the peak grading year. VOC emissions reductions resulting from the use of Tier 4 Final equipment would exceed the SCAQMD thresholds for both the average and peak grading years.

In summary, construction emissions of VOC would be significant and would be unavoidable because (1) it cannot be known if Tier 4 Final construction equipment could be feasibly and reasonably provided for enough construction equipment to result in emissions less than AVAQMD thresholds for all years and (2) even if Tier 4 Final construction equipment would be available, the SCAQMD daily VOC emissions threshold may be exceeded in some average years.

#### Operational Impacts – Buildout

Long-term operational criteria pollutant emissions are generated by area, energy, and mobile sources. Project regional area, energy, and mobile source emissions were calculated using CalEEMod, as described in the Methodology section above.

As previously described, but repeated here for continuity, area sources include landscape maintenance equipment, consumer products, and architectural coatings used for routine maintenance. Energy emissions are from natural gas consumption. The operational buildout analysis assumes the Project would include 13,954 single-family residences, 5,379 multi-family residences, 7.4 million square feet (sf) of business park uses, 1 million sf of commercial uses, 1.6 million sf of institutional/civic uses, elementary schools for 8,000 students, a high school for 3,500 students, and other land uses as described in Chapter 4.0, Project Description and the Project Traffic Study (Stantec 2016). Buildout is assumed to be complete in 2035. Land use details are included in the CalEEMod data included in Appendix 5.11-A.

The default natural gas use and resulting emissions calculations are modified by application of the 2016 State Energy Efficiency Standards for Residential and Nonresidential Buildings. As stated in PDF 11-2 which, through MM 21-2 of Section 5.21, Climate Change, is required to be implemented, the Green Development Program requires compliance with CALGreen voluntary measure A5.203.1.2.1 for non-residential buildings. As stated by PDF 11-3 and required by MM 21-3 of Section 5.21, Climate Change, the Project must comply with CALGreen voluntary Tier 1 measures to exceed the 2016 code for residential buildings. The combined effect is a 32.4 percent reduction from the CalEEMod base data for Title 24 natural gas uses.

Fireplace emissions are calculated in accordance with PDF 11-4, which is required by the implementation of MM 11-3, which assumes a maximum of 13,954 natural gas fireplaces and no wood-burning fireplaces.

Mobile source emissions are based on trip generation data from the Traffic Study. CalEEMod has input options to generate trip and vehicle miles traveled (VMT) reductions for mixed-use projects, increased density, neighborhood walkability, and similar features. For the Project, features related to the mixed-use character of the Project that would reduce trips and VMT have been included in the Traffic Study. The Traffic Study also includes regional traffic modeling results that indicate that implementation of the Project would result in an estimated 1,921,599 VMT weekday increase over existing conditions. The CalEEMod trip distances were modified to yield a VMT increase consistent with the Traffic Study. As described in Section 5.11.3, trip generation for affordable housing is less than for market rate

housing. This trip generation and corresponding emissions reduction is not included in the traffic analysis and is made manually due to defects in this element of CalEEMod (SCAQMD 2016b).

Estimated annual and maximum daily operational emissions at buildout are shown in Tables 5.11-18 and 5.11-19.

<b>Exceeds SCAQMD Thresholds?</b>	<b>Yes</b>	<b>Yes</b>	<b>Yes</b>	<b>No</b>	<b>Yes</b>	<b>Yes</b>
lbs/day: pounds per day, VOC: volatile organic compounds, NOx: nitrogen oxides, CO: carbon monoxide, SOx: sulfur oxides, PM10: respirable particulate matter with a diameter of 10 microns or less, PM2.5: fine particulate matter with a diameter of 2.5 microns or less, SCAQMD: South Coast Air Quality Management District. * Totals may not add due to rounding. <b>Bold</b> indicates emissions exceeding threshold Sources: SCAQMD 2015 (thresholds). Emissions calculations can be found in Appendix 5.11-A.						

As shown in Table 5.11-18 and Table 5.11-19, the estimated operational emissions would substantially exceed both the AVAQMD annual emissions thresholds and the SCAQMD daily emissions thresholds for VOC, NOx, CO, PM10, and PM2.5. The SOx thresholds would not be exceeded. Vehicle emissions would be the dominant source of NOx, CO, PM10, and PM2.5 emissions and a secondary source of VOC emissions. The dominant source of VOC emissions would be consumer products at 200 tons per year (tons/year) and 1,096 pounds per day (lbs/day). Operational emissions would be a significant impact.

As noted above, the primary area emissions sources are consumer products and landscape maintenance equipment. There are no feasible mitigation measures for consumer product VOC emission reductions. However, it should be noted that State consumer products regulations were updated in January 2015, requiring reduced VOC emissions. Therefore, the CalEEMod forecasts of consumer products VOC emissions may be assumed to be higher than would occur. With respect to landscape equipment, MM 11-5 would be incorporated into the Project, requiring that all multi-family residential buildings and all non-residential buildings

with adjacent landscaping be provided with exterior electrical receptacles to encourage the use of electric landscaping equipment instead of gasoline powered equipment.

As required by MM 10-1 from Section 5.10, Traffic, Access, and Circulation, the mixed-use character of the Project, the jobs-housing balance, and the Mobility Plan with Transportation Demand Management (TDM) features would provide a very transportation-efficient Project with an estimated 48 percent of the trip generation being short-distance internal trips. As part of the TDM strategy to reduce the dependence on the private automobile, the Project Applicant/Developer will create and operate an ongoing Transportation Management Association (TMA) to serve the residents and employees of businesses in the Project area or will be organized in conjunction with an existing organization in the Antelope Valley or Santa Clarita area. As further discussed in Section 5.10, it is anticipated that a total of 200 per weekday vehicle trips to and from the Santa Clarita Valley and 110 per weekday trips to and from the Antelope Valley would be reduced by commuter buses and rideshare programs.

However, in an effort to further reduce mobile emissions by encouraging alternative transportation modes, reducing single-occupant commuting, and electric-powered vehicles, MM 11-4, MM 11-5 and MM 11-6 would be incorporated into the Project. These three MMs require preferential parking for alternative-fueled vehicles and electric vehicle charging facilities for non-residential buildings, residential buildings, parking garages, and parking lots. MM 11-4 also requires preferential parking for carpool vehicles and charging facilities for some non-residential buildings. MM 11-5 and MM 11-6 also require bicycle parking for residential buildings and parking facilities.

The reductions that would result from implementation of MM 11-4 through MM 11-6 are not reasonably quantified. However, the reductions would not be of a magnitude to reduce the operational emissions to a less than significant level.

#### Combined Construction and Operational Emissions during Development

During Project development, the initial phases of the Project would be occupied while construction continues on future phases. In accordance with recent SCAQMD recommendations, a calculation of combined construction and operational emissions is provided for information. As a reasonable worst-case scenario, it is assumed that the Project would be 90 percent operational in Year 18 and consequently 90 percent of operational phase emissions were combined with construction emissions occurring in Year 18. The estimated Year 18 combined annual and daily emissions are shown in Table 5.11-20 and Table 5.11-21, respectively.

lbs/day: pounds per day; VOC: volatile organic compounds; NOx: nitrogen oxides; CO: carbon monoxide; SOx: sulfur oxides; PM10: respirable particulate matter with a diameter of 10 microns or less; PM2.5: fine particulate matter with a diameter of 2.5 microns or less. Note: Totals may not add due to rounding. <b>Bold</b> indicates emissions exceeding threshold Sources: SCAQMD 2015 (thresholds). Emissions calculations can be found in Appendix 5.11-A						

As shown in Table 5.11-20, Year 18 combined construction and operations annual emissions would exceed the operational emissions thresholds established by the AVAQMD. As shown in Table 5.11-21, Year 18 combined construction and operations daily emissions would exceed the SCAQMD significance thresholds for the operations phase. The exceedance of the significance thresholds for both of the air districts are due to the larger proportion of emissions generated during the operations phase. The finding of significant impacts for the combined construction and operations phases are consistent with the finding of significant impacts for emissions occurring for solely for the operations phase of the Project.

### Stationary Sources

An Air Quality Impact Analysis (AQIA) was prepared by ENVIRON International (now Ramboll Environ) in 2009 to assess the impacts of stationary sources of emissions that would be allowed and could locate on the Project site. Each substantial stationary source would be required to obtain a Permit to Construct and a Permit to Operate in accordance

with AVAQMD Regulation II, Permits, and included in Rules 201 through 226 or SCAQMD Regulation II, Permits, and included Rules 201 through 223. Based on the results of the AQIA, the stationary source size limits included in PDF 11-1 (Table 5.11-5) were established. The analysis of individual sources is described in Appendix 5.11-B. In addition to assessing individual sources, the aggregate total emissions from these anticipated sources were calculated, and are shown in Table 5.11-22, Aggregate Emissions from Stationary Sources. Natural gas fired boilers used for general purpose heating in facilities like schools, hospitals, commercial buildings, and light industrial uses account for all the estimated stationary source CO emissions, 99.4 percent of the NOx emissions, and 76 percent of the PM10 emissions. The other sources of PM10 emissions with more than ten percent of the total are charbroilers used in restaurants. The principal single stationary source type contributor of VOC emissions is spray booths, which account for approximately 36 percent of the emissions. The remaining VOC emissions would be generated by smaller sources including gas stations, boilers, dry cleaners, and light industrial processes. Stationary sources would be operated according to permits issued by AVAQMD or SCAQMD, and the District's permitting process for stationary sources requires offsetting emissions and compliance with emission reduction mandates for criteria pollutants to attain regional ambient air quality goals.

**TABLE 5.11-22  
AGGREGATE EMISSIONS FROM STATIONARY SOURCES**

Emissions Source	Pollutant Emissions			
	VOC	NO <sub>x</sub>	CO	PM <sub>10</sub>
<b>Annual Emissions (tons/year)</b>

Source: ENVIRON 2009a (Appendix 5.11-B).				

***Impact Summary: Mass Daily and Annual Thresholds.*** Based on the AVAQMD annual thresholds and SCAQMD mass daily thresholds, construction-related emissions of VOC and NO<sub>x</sub> would result in significant impacts. MM 11-1 and MM 11-2 would be implemented to reduce emissions; however, the impacts would remain significant and unavoidable and full implementation of MM 11-2 would result in a significant and unavoidable CO impact for the SCAQMD threshold. Long-term operational emissions of CO, VOCs, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> would result in significant impacts. MM 11-3 would be implemented to reduce emissions; however, the impacts would remain significant and unavoidable.

## Ambient Air Quality Standards

### ***Construction-Related Impacts***

As described in the Methodology section above, ENVIRON used ISCST3 (Version 02035) with the USEPA's default model settings to model the transport of NO<sub>x</sub> (which is converted to NO<sub>2</sub>), PM<sub>10</sub>, and PM<sub>2.5</sub> emissions to sensitive receptors. The impacts were evaluated and compared to the CAAQS, NAAQS, and SCAQMD Localized Significance Thresholds (LSTs) (see EIR Appendix 5.11-C).

It is assumed that construction of each phase would occur sequentially so that construction phases will not overlap and residents of occupied phases would not be exposed to emissions from more than one adjacent phase. In the ENVIRON analysis, the previous project was evaluated in four phases. Ambient air concentrations resulting from Phase Two construction emissions were evaluated at the boundary of Phase One. Emissions from Phase Three construction were evaluated at the boundaries of Phases One and Two, and emissions from Phase Four construction were evaluated at the boundaries of Phases One, Two, and Three. Additionally, a grid of receptors with 500-meter (1,640-foot) spacing was placed over the entire site.<sup>5</sup> Although the phasing for the Project differs from the phasing for the previous project, the concept of air quality impacts from a phase under construction to an occupied phase is the same. The input emissions data for the ambient air quality standard analysis is based on the construction emissions data. The NO<sub>x</sub> emissions data for the previous project and the currently proposed Project are generally the same. The PM<sub>10</sub> and PM<sub>2.5</sub> emissions for the Project are substantially less than for the previous project, thus making the PM<sub>10</sub> and PM<sub>2.5</sub> results very conservative<sup>6</sup>. The results are provided below in Table 5.11-23, Ambient Concentrations at Sensitive Receptors during Phase Two, Three, and Four Construction.

**TABLE 5.11-23  
AMBIENT CONCENTRATIONS AT SENSITIVE RECEPTORS  
DURING PHASE TWO, THREE, AND FOUR CONSTRUCTION**

Regulated Pollutant	Averaging Time	Federal Standard (µg/m <sup>3</sup> )	State Standard (µg/m <sup>3</sup> )	LST Background Concentration (µg/m <sup>3</sup> )	LST Threshold Concentration (µg/m <sup>3</sup> )	Maximum Estimated Concentration at Nearest Sensitive Receptor (µg/m <sup>3</sup> )*		
						Phase Two	Phase Three	Phase Four
NO <sub>2</sub>	AAM	100	56	-	56.0	0.5	0.8	0.8
	1hour	-	338	188	150.0	36	38	60

	24hour	150	50	-	10.4	<b>90</b>	<b>159</b>	<b>136</b>
PM <sub>2.5</sub>	AAM	15	12	-	12.0	1.3	2.5	1.5
	24hour	35	-	-	10.4	<b>19</b>	<b>34</b>	<b>29</b>

LST: Localized Significance Threshold; µg/m<sup>3</sup>: micrograms per cubic meter; NO<sub>2</sub>: nitrogen dioxide; AAM : annual arithmetic mean; - : no standard or LST value; PM<sub>10</sub>: respirable particulate matter with a diameter of 10 microns or less; PM<sub>2.5</sub>: fine particulate matter with a diameter of 2.5 microns or less

\* Values in excess of State, federal or SCAQMD standards are displayed in **bold text** in these columns.

Source: ENVIRON 2009b (Appendix 5.11 C)

<sup>5</sup> The construction phases and sensitive receptor locations are shown in Figure 2-1 of EIR Appendix 5.11-B.

<sup>6</sup> PM emissions for the previous project were calculated using the then-current Urbemis emissions model. Studies conducted for the now-current CalEEMod emissions model resulted in a revised methodology for PM emissions and substantially reduced emissions compared to Urbemis results. With respect to NO<sub>x</sub> emissions, although unmitigated emissions from the current project and the previous project are similar, the implementation of MM 11-2 would reduce Project NO<sub>x</sub> emissions substantially compared to the emissions used in the ENVIRON local impacts analysis.

As identified in Table 5.11-23 above, estimated NO<sub>2</sub> concentrations would be less than State, federal, and SCAQMD LST standards, but ambient concentrations at sensitive receptor locations may exceed the 24-hour standards for PM<sub>10</sub> and PM<sub>2.5</sub> during construction. It is noted that, if construction activities were localized to one or several planning areas within a construction phase that are near already-established sensitive receptors, the resultant concentrations could be higher. This would be a significant and unavoidable impact. AVAQMD Rule 403 requires a dust control plan to be prepared for any residential developments that result in a disturbed surface area of 10 acres or more or 5 acres or more for non-residential development. As such, the Project Applicant/Developer shall prepare a Supplementary Dust Control Plan for approval by the County to minimize PM<sub>10</sub> and PM<sub>2.5</sub> emissions and the transport of those emissions towards sensitive receptors. Measures in the Supplementary Dust Control Plan may include, but not be limited to additional watering of active grading areas and disturbed areas; stopping operations when winds exceeding ten miles per hour are in the direction from the grading towards the receptors; and/or other measures to minimize fugitive dust. With incorporation of Rule 403, impacts would remain significant and unavoidable because the dust suppression resulting from the Supplementary Dust Control Plan cannot be quantified at this time.

***Impact Summary: Ambient Air Quality Standards – Construction.*** Construction emissions could cause a potential temporary exceedance of federal, State, and SCAQMD PM<sub>10</sub> and PM<sub>2.5</sub> standards at Project residences that would be completed and occupied; with consideration of AVAQMD and SCAQMD dust control rules, this would be a significant and unavoidable impact.

### ***Operations***

The stationary sources analyzed above for mass emissions are limited by size and quantity as described in MM 11-1. The limitations are based on compliance with ambient air quality standards. In addition to the stationary sources, operational mobile and area sources would be dispersed throughout the Project area and would make contributions to local ambient pollutant concentrations. The ENVIRON AQIA for stationary sources, described above, includes an assumed background concentration that would account for the effects of mobile and area sources.

Of the eight stationary source types that are analyzed in the ENVIRON Report, only the natural gas fired boilers, restaurant broilers, emergency generators, and small source particular matter generators have the potential to impact ambient air quality standards. Boilers and emergency generators emit NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub>, all of which have short-term ambient air quality limits. Broilers only emit particulates and VOCs. All other sources, including the wastewater reclamation facilities (WRFs), emit only VOCs, for which there are no State or federal ambient air quality standards. While NO<sub>x</sub> and PM<sub>10</sub> also have annual limits, the short-term limits drive the ambient air quality standards' compliance, as demonstrated when applying USEPA factors for scaling concentrations over different averaging times. The AQIA accounts for the possibility of concurrent impacts at a receptor from more than one source by limiting the impact to one-quarter of the allowable increase in the ambient concentration. Additional details are in Appendix 5.11-B.

The stationary source limits of MM 11-1, which requires the implementation of PDF 11-1 and Table 5.11-5, are based on compliance with ambient air quality standards with conservative margins. Therefore, emissions from operational on-site sources would not exceed ambient air quality standards. The impact would be less than significant; no mitigation is required.

***Impact Summary: Ambient Air Quality Standards – Stationary Sources.*** The Project would involve the use of stationary sources (natural gas-fired boilers, emergency generators, broilers, and small source particulate matter generators) that emit NO<sub>x</sub>, CO, and PM<sub>10</sub>. Analysis of potential impacts concludes that this impact would be less than significant with the limitations on stationary sources included MM 11-1.

### ***Mobile Sources – Carbon Monoxide Hotspots***

The ambient air quality standard for CO is analyzed when there is a potential for severe traffic congestion at high-volume, signalized intersections. Localized areas where ambient concentrations exceed federal and/or State standards for CO are termed CO “hotspots”. According to the *Transportation Project-Level Carbon Monoxide Protocol* (the Protocol), projects may worsen air quality if they worsen traffic flow, defined for signalized intersections as increasing average delay at intersections operating at Level of Service (LOS) E or F or causing an intersection that would operate at LOS D or better without the Project, to operate at LOS E or F with the Project (UCD ITS 1997).

The Project Traffic Study lists two signalized intersections that would operate at LOS E or F with conditions that would worsen in the 2035 With Project Scenario when compared to the 2035 No Project Scenario (Stantec 2016):

- I-5 Southbound Ramps and SR-126 in the PM peak hour
- I-5 Southbound Ramps and Valencia Boulevard in the AM and PM peak hours

The SCAQMD’s analysis prepared for CO attainment in the SoCAB can be used to evaluate the potential for CO exceedances. CO attainment was thoroughly analyzed as part of the SCAQMD’s 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan) (SCAQMD 2003a). As discussed in the 1992 CO Plan, peak CO concentrations in the SoCAB are due to unusual meteorological and topographical conditions, and not due to the impact of particular intersections. Considering the region’s unique meteorological conditions and the increasingly stringent CO emissions standards, CO modeling was performed as part of 1992 CO Plan and subsequent plan updates and AQMPs. In the 1992 CO Plan, a CO hot spot analysis was conducted for four busy intersections in the SoCAB at the peak morning and afternoon time periods.

The intersections evaluated included Long Beach Boulevard and Imperial Highway (Lynwood); Wilshire Boulevard and Veteran Avenue (Westwood); Sunset Boulevard and Highland Avenue (Hollywood); and La Cienega Boulevard and Century Boulevard (Inglewood). These analyses did not predict a violation of CO standards. The busiest intersection evaluated in the 1992 CO Plan and subsequent 2003 AQMP was at Wilshire

Boulevard and Veteran Avenue, which had a daily traffic volume of approximately 100,000 vehicles per day. The 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 parts per million (ppm), which indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 400,000 vehicles per day. The maximum modeled 8-hour concentrations at this intersection were 5.8 ppm in 1997, decreasing to 2.8 ppm in 2005, compared with the 8-hour standard of 9 ppm. The Los Angeles County Metropolitan Transportation Authority evaluated the LOS in the vicinity of the Wilshire Boulevard/Veteran Avenue intersection and found it to be LOS E at peak morning traffic and LOS F at peak afternoon traffic.

Based on the data in the Project's Traffic Study, under 2035 With Project conditions, the average daily trips at the I-5 Southbound Ramps and SR-126 intersection is estimated at approximately 64,700 average daily trips (ADT) and the volume at the I-5 Southbound Ramps and Valencia intersection is estimated at approximately 61,700 ADT. These volumes are substantially below the daily traffic volumes that would be expected to generate CO exceedances as evaluated in the 2003 AQMP. There is no reason unique to the local meteorology or topography to conclude that the CO concentrations at these intersections would exceed the 1-hour CO standard if modeled in detail, as based on the studies undertaken for the 2003 AQMP. Moreover, vehicle standards have become increasingly more stringent since 1992 and background CO concentrations are less than in 1992; thus, this analysis is very conservative.

Therefore, the Project would not result in the creation of a CO hot spot and the impacts would be less than significant.

***Impact Summary: Ambient Air Quality Standards – Mobile Sources – CO Hotspots.*** The Project would not contribute to traffic conditions that would cause a CO hot spot. The impact would be less than significant.

## **Off-Site Impacts**

### ***Construction***

Construction of the off-site Project features described in Section 4.7 of the EIR (i.e., roadway improvements, water infrastructure, and utilities connections) would generate short-term mass emissions. These construction activities and their associated emissions would be a small part of the estimated on-site emissions, quantified above in Table 5.11-10 through Table 5.11-17. MM 11-2 would be applicable to off-site construction activities. Separately, these emissions would not exceed applicable standards. However, these activities would occur concurrently with on-site construction and would add a small increment to calculated annual and peak-day significant and unavoidable construction emissions impacts.

---

### ***Operational Impacts***

Upon completion of construction, the Project's off-site roadway, water infrastructure, and utility improvements would not generate criteria air pollutants. There would be no impact.

***Impact Summary: Off-Site Impacts.*** Off-site construction would add to concurrent on-site significant and unavoidable impacts. There would be no operational impact from off-site features.

### **Threshold 11-2      Would the proposed project expose sensitive receptors to substantial pollutant concentrations?**

As previously described, sensitive receptors include, but are not limited to, residences, schools, school yards, day care facilities, hospitals, rest homes, long-term medical facilities, and parks/playgrounds. The nearest existing sensitive receptors to the Project site are residential properties near the Project site boundaries on 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue. Additional nearby residences include one located offsite on the south side of SR-138 west of the Cement Plant Road and homes between the Quail Lake Sky Park runway and SR-138. The residences, schools, and parks to be built as part of the Project would be sensitive receptors.

The following impact categories are addressed: construction emissions; valley fever; criteria pollutant emissions from on-site stationary sources; CO Hotspots; toxic air contaminants from on-site stationary sources; toxic air contaminants from existing off-site sources; and diesel particulate matter exposure from vehicles on SR-138.

### **On-Site Impacts**

#### ***Construction Emissions***

The impacts of construction emissions of criteria pollutants to sensitive receptors are analyzed above under Threshold 11-1, Ambient Air Quality Standards – Construction. The analysis indicates that Project construction activities occurring subsequent to the completion and occupation of earlier Project phases could result in exceedance of federal, State, or SCAQMD LST ambient air quality standards for 24-hour concentrations of PM<sub>10</sub> and PM<sub>2.5</sub> at on-site receptors. Therefore, these receptors could be temporarily exposed to substantial concentrations of PM<sub>10</sub> or PM<sub>2.5</sub> during the later phases of construction. This would be a significant impact. Dust-control measures and Tier 4 Final construction equipment (MM 11-2) would reduce PM<sub>10</sub> and PM<sub>2.5</sub> emissions but it cannot be demonstrated that the reductions would reduce concentrations to less than the applicable standards. The short-term impact would be significant and unavoidable.

Diesel PM, a TAC, would be emitted during construction due to the operation of heavy equipment at the site. Because diesel PM is considered a carcinogen, long-term exposure to diesel exhaust emissions have the potential to result in adverse health impacts. Neither the AVAQMD nor the SCAQMD has adopted procedures for quantitative analysis of short-term construction-related TAC exposure. Although construction of the Project would occur over a period of many years, use of diesel-powered construction equipment in any single area

would likely occur for no more than a few months and would cease when construction is completed in that area. Further, there will be limited periods when construction would be near adjacent residences.

The dose to which the receptors are exposed is the primary factor used to determine health risk.<sup>7</sup> Dose is positively correlated with time, meaning that a longer exposure period would result in a higher exposure level for the Maximally Exposed Individual (MEI). The risks estimated for an MEI are higher if a fixed exposure occurs over a longer period. According to the OEHHA, health risk assessments, which determine the exposure of sensitive receptors to toxic emissions, should be based on a 70-year exposure period; however, such assessments should be limited to the period or duration of activities associated with a project. Therefore, if the duration of proposed construction activities near a sensitive receptor was 12 months, the exposure would be less than 1½ percent of the total exposure period used for health risk calculation (i.e., 70 years).

Based on the relatively short exposure time, diesel PM generated by Project construction would not create conditions where the probability for the MEI to contract cancer is greater than ten in one million, which is the threshold the AVAQMD and SCAQMD uses for cancer risk. Likewise, the probability of construction or operations to generate ground-level concentrations of non-carcinogenic TACs that exceed a Hazard Index greater than one for the MEI is very low. Additionally, with ongoing implementation of federal and State requirements for cleaner-burning fuels, diesel engine retrofits, and new low-emission diesel engine types, the diesel PM emissions of individual equipment would be substantially reduced over future years as Project construction is implemented. This impact would be less than significant; no mitigation is required.

***Impact Summary: Exposure to Construction Emissions.*** During construction of the Project, construction emissions of PM<sub>10</sub> and PM<sub>2.5</sub> could exceed the federal and State ambient air quality standards and SCAQMD-established local significance thresholds, exposing sensitive receptors to substantial pollutant concentrations. This impact would be significant and would be reduced with implementation of MM 11-2; however, they would not reduce impacts to a level considered less than significant. Exposure of sensitive receptors to diesel PM would be less than significant.

### ***Valley Fever***

As discussed above, Valley Fever spores have the potential to be found in soils in the Antelope Valley. The site is currently a large expanse of undeveloped land, which experiences periodic high winds and supports widespread grazing and some agricultural activity. These existing conditions result in (1) disturbance of existing soils on the site due to animal activity; (2) dust formation associated with this disturbance and high wind events; and (3) a resultant risk of Valley Fever for residents in the Project area. However, earth disturbing activities, including grading that would be required for site development, would have a more intensive

---

<sup>7</sup> "Dose" is a function of the concentration of a substance or substances in the environment and the extent of exposure that a person has with the substance.

surface disturbance and would increase the risk of Valley Fever exposure if spores are present on the Project site and become airborne in fugitive dust.

The Los Angeles County Department of Public Health (DPH) divides the County into Service Planning Areas (SPA) for the purposes of tracking and reporting trends of many diseases in Los Angeles County. The Antelope Valley is included within SPA1, which reported the highest incidence rate of reported cases of Valley Fever in Los Angeles County in 2014, at 26.2 cases per 100,000 people. The Centennial Project site is within the farthest western portion of SPA 1, and is adjacent to SPA 2 (San Fernando Valley), which had a lower incidence rate of 5.7 cases per 100,000 people (LADPH 2016).

For the purposes of this analysis, it is assumed that Valley Fever spores are located within soils on the Project site. Of all construction activities that would occur on the Project site, grading is the most likely to generate airborne dust, and is therefore the most likely phase of construction to potentially release Valley Fever spores into the air. Therefore, the Project's construction workers would be at the highest risk for Valley Fever exposure, and there would be an increased risk to the existing population in the immediate vicinity of the Project area.

The control of fugitive dust is the key to preventing exposure to Valley Fever spores during ground-disturbing construction activities. Fugitive dust control measures would be required and implemented on the Project pursuant to the AVAQMD Rule 403, Fugitive Dust, and SCAQMD Rule 403, Fugitive Dust. Both of these rules require that dust be controlled so as not to be visible beyond the property line, and are enforced by the AVAQMD and SCAQMD. AVAQMD Rule 403 and SCAQMD Rule 403 control measures include watering exposed surfaces and haul roads three times daily; replacing ground cover in disturbed areas quickly; covering stock piles with tarps; and limiting speeds on unpaved roads to 15 miles per hour. The rules include comprehensive sets of best available control measures that reduce fugitive dust generation and are required for all projects within the AVAQMD's and SCAQMD's jurisdictions. Additional discussion about AVAQMD Rule 403 and SCAQMD Rule 403 is included under Threshold 11-1.

SCAQMD Rule 403 also requires that each large project identify a Dust-Control Supervisor that is employed by or contracted with the Property Owner/Developer and is on the site or within 30 minutes of the site during working hours; has the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule 403 requirements; and has both completed the SCAQMD Fugitive Dust Control Class and been issued a valid Certificate of Completion for the class. In order to ensure implementation of Rule 403 requirements, MM 3-1, in Section 5.3 Hazards and Fire Safety requires that prior to beginning any on-site construction activity, a Dust-Control Supervisor be retained who will be on the site within 30 minutes of the start of work taking place each morning; will have the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule 403; and will have completed the SCAQMD Fugitive Dust Control Class and has been issued a valid Certificate of Completion for the class.

In order to further protect construction workers from infection from Valley Fever, MM 3-2 (in Section 5.3) requires the following measures:

- Hire workers from Los Angeles and/or Kern County populations, or other areas where Valley Fever is endemic, where possible, since it is more likely that they have been previously exposed to the fungus and are therefore immune.
- Prior to Project construction initiation, and for any personnel additions after initial Project construction initiation, the following California Department of Public Health (CDPH) materials on Valley Fever (or the most updated materials applicable to Los Angeles County) shall be distributed to worksite supervisors:
  - CDPH pamphlet entitled “Preventing Work-Related Coccidioidomycosis (Valley Fever)” available at:  
<http://www.cdph.ca.gov/programs/hesis/Documents/CocciFact.pdf>. (CDPH 2013a)
- Prior to Project construction initiation, and for any personnel additions after initial Project construction initiation, the following CDPH materials on Valley Fever (or the most updated materials applicable to Los Angeles County) shall be distributed to construction workers:
  - CDPH pamphlet entitled “Valley Fever Fact Sheet” available at:  
<http://www.cdph.ca.gov/HealthInfo/discond/Documents/VFGeneral.pdf>. (CDPH 2013b)
  - CDPH pamphlet entitled “Hoja de datos de la Fiebre del Valle (Valley Fever Fact Sheet in Spanish)” available at:  
<http://www.cdph.ca.gov/HealthInfo/discond/Documents/HojaDeDatosDeLaFiebreDelValle.pdf> (CDPH 2013c).
  - CDPH pamphlet entitled “Fact Sheet Valley Fever (Valley Fever Fact Sheet in Tagalog),” available at:  
<http://www.cdph.ca.gov/HealthInfo/discond/Documents/TagalogGeneralValleyFeverFactSheet.pdf> (CDPH 2013d).
- Require crews to use masks or respirators that are adequate to restrict inhalation of particulates during Project clearing, grading, and excavation operations in accordance with California Division of Occupational Safety and Health regulations.
- During rough grading and construction, the access way into the Project site from adjoining paved roadways shall be paved or treated with environmentally safe dust-control agents.

While construction workers would be at highest risk, on-site populations would also be at risk for exposure during interim phases of development, depending on the proximity to on-site construction activities. As described in PDF 3-1, as implemented through MM 3-3 (in Section 5.3, Hazards and Fire Safety), prior to sale, lease, or rental of any property, all

residents would be provided with a notice disclosing this potential risk and describing strategies to avoid potential exposure to Valley Fever spores during construction or other earth-moving activities. Additionally, as required by AVAQMD Rule 403, a Supplementary Dust Control Plan is required to minimize emissions of respirable particulate matter near sensitive receptors. Measures in the supplementary plan may include, but not be limited to additional watering of active grading areas and disturbed areas; stopping operations when winds exceeding ten miles per hour are in the direction from the grading towards the receptors; and/or other effective measures.

At the completion of construction activities, risks of exposure to Valley Fever would be reduced for those living on the Project site and adjacent to the Project site due to the replacement of undeveloped land with urban development, irrigated landscaping, and paved areas, that would have reduced risks of fugitive dust generation and the associated risk of Valley Fever. Valley Fever spores have a reduced chance of becoming airborne in areas that are irrigated, vegetated with groundcover, covered with hardscapes or pavement, or urbanized with relatively little undisturbed soil (KCPHSD2015). Therefore, once the Project is completed and the landscaping is established, residents and visitors on the Project site would not have an increased risk of exposure to Valley Fever when compared to the existing conditions.

Therefore, with implementation of PDF 3-1 (from Section 5.3, Hazards and Fire Safety), AVAQMD and SCAQMD Rule 403 requirements, MM 3-1, and MM 3-2 (from Section 5.3), the potential for exposure to Valley Fever spores from construction of the Project would be reduced to the maximum extent feasible and would be considered a less than significant impact.

***Impact Summary: Exposure to Valley Fever.*** During construction of the Project, implementation of AVAQMD and SCAQMD Rules for fugitive dust control, and MMs 3-1 and 3-2 (from Section 5.3, Hazards and Fire Safety) would result in a less than significant impact for exposure of construction workers, site occupants, and adjacent off-site persons to Valley Fever. Additionally, implementation of PDF 3-1, as implemented through MM 3-3, would result in a less than significant impact to future on-site residents.

## Operations

### ***Criteria Pollutant Emissions from On-Site Stationary Sources***

The potential for the Project's stationary sources during operations to exceed ambient air quality standards is analyzed above under Threshold 11-1 (see Operations, Ambient Air Quality Standards –Stationary Sources). The analysis concludes that, with the limitations on the number and size of Project stationary sources through MM 11-1, the emissions from these sources would not exceed established ambient air quality standards and therefore would result in a less than significant impact.

***Impact Summary: Criteria Pollutant Emissions from On-Site Stationary Sources.***

Stationary source sizes would be limited by MM 11-1. Emissions would not exceed applicable standards. Exposure of sensitive receptors to stationary source criteria pollutants would be less than significant.

***Mobile Sources – Carbon Monoxide Hotspots***

The potential for sensitive receptors to be exposed to substantial concentrations of vehicle-generated CO is analyzed above under Threshold 11-1, Ambient Air Quality Standards – Mobile Sources – CO Hotspots. The analyses conclude that there would be no potential CO hotspot.

***Impact Summary: Mobile Sources – CO Hotspots.*** The Project would not create or contribute to off-site traffic conditions that would cause a CO hotspot. Exposure of sensitive receptors to CO concentrations would be less than significant.

***Toxic Air Contaminant Emissions from On-site Stationary Sources***

This analysis of toxic air contaminants is based on the *Centennial Air Quality Analysis for Stationary Sources* prepared by ENVIRON (2009a) and is included as EIR Appendix 5.11-B. Carcinogenic risks (i.e., cancer risks) are estimated as the incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens. The estimated risk may be expressed as a unitless probability (e.g., 10 in 1 million or  $10^{-5}$ ), which is how they are expressed in this EIR discussion. By contrast, hazard indices (HIs) express the potential for chemicals to result in non-cancer health impacts, and non-carcinogenic chemicals should not be present at levels that may have the potential to cause adverse health effects (i.e., HI greater than one). HIs are expressed using decimal notation (e.g., 0.001) and express the fraction of the threshold concentration that may have the potential to cause adverse health effects.

Pursuant to SCAQMD Rule 1401(d)(1) and AVAQMD Rule 1401(E)(3)(e), the risks associated with potential exposure to emissions from a source equipped with the best available control technology for toxics (T-BACT) and from all emissions sources included within a “project” are acceptable if the incremental cancer risk is less than ten in one million, and one in one million for sources not equipped with T-BACT. Ten in one million is the limit stated in the AVAQMD and SCAQMD CEQA significance thresholds.

In the *Centennial Air Quality Analysis for Stationary Sources*, ENVIRON confirms that the *Centennial Specific Plan’s* limitations on Project TAC-emitting stationary sources would ensure that upper bound risks posed to sensitive receptors are not in excess of the significance thresholds.

**Evaluation of Toxic Air Contaminant Emissions in Business Parks**

The 2009 *Centennial Air Quality Analysis for Stationary Sources* includes an analysis of TAC emissions in the Project Business Park areas. The analysis is based on a previous design and plans for the Project; however, the changes in the Project site and design relative to this

analysis are minor and the analysis is sufficient to evaluate potential impacts. Land use designations from the previous Centennial Land Use Plan were used to identify the locations of proposed business parks and nearby residential and other sensitive receptors. In the previous Land Use Plan, buffer areas between business park locations and sensitive receptors were established. In order to determine the number of potential TAC emission sources, these business parks were subdivided into roughly three-acre sites. For this analysis, it was assumed that each three-acre site contained one air emission source located at the center of each site. Health impacts were evaluated at the property lines of any sensitive receptor land use designations adjacent to the business parks.

TAC emissions of 165 generic sources were scaled to the maximum emissions allowed by the limits in the Project to determine the aggregate cancer risk and non-cancer hazard index at each sensitive receptor. The modeling of composite emissions from all 165 TAC sources confirmed that none of the adjacent sensitive receptors would exceed a cancer risk of 10 in 1 million or have a chronic non-cancer hazard index of 1.0.

The modeling assumes that the buffer areas would not contain TAC emission sources or sensitive receptor uses. The modeling analysis demonstrates that this restriction ensures that the 10 in 1 million threshold for the aggregate sensitive receptor cancer risk and 1.0 threshold for chronic non-cancer risk are not exceeded at adjacent sensitive source receptor areas. In order to ensure that the Project's future tract maps incorporate this required buffer area, MM 11-7 requires the establishment of buffer areas in the Project equivalent to those used for the TAC modeling.

The establishment of buffer areas does not, however, preclude the use of these buffer zones for other commercial entities, provided they are not potential sources of TAC emissions. Additionally, there may be limitations on locations where schools or daycare centers could be located within the business parks, depending on the aggregate cancer risk and chronic non-cancer hazard index within the business park subdivision. Under a worst-case scenario, no schools or daycare centers should locate in any business park areas; however, since Centennial will likely build out with sources in the business park with lower emissions than those projected by this report, the Project does not, and need not contain an absolute ban. Rather, additional analyses are required before these uses can locate there so that the actual health risks can be assessed. MM 11-8 requires this analysis and identifies required performance standards to ensure that impacts are reduced to a less than significant level. Additionally, in order to comply with the CARB recommendation that distribution centers should be at least 1,000 feet from sensitive receptors, MM 11-9 requires Distribution Centers to be located within the business park areas south of State Route (SR) 138 and at least 1,000 feet from existing sensitive receptors and lands designated for sensitive land uses. Distribution centers would not be allowed in other areas within the Project site.

It should be noted that the ENVIRON analysis presents a conservative, worst-case assessment of the maximum expected cancer risk and chronic non-cancer risk due to business park TAC emissions at any sensitive receptor location. It assumes that each allowable location for TAC emissions would use toxic chemicals at the maximum allowable rate. It is likely that the chemical use at some of these locations would be below the maximum rate, and the resultant risks would also be lower.

---

### Evaluation of Toxic Air Contaminant Emissions in Commercial, Institutional, and Residential Areas

There are several discrete types of equipment with TAC emissions levels less than those described previously for stationary sources that would be permitted in the commercial and institutional areas on the Project site. These types of equipment include natural gas-fired boilers (a surrogate for any gas-fired equipment), emergency generators, gasoline service stations, spray booths, storage tanks, petroleum-solvent dry cleaners, small-source particulate matter (PM) generators, and wastewater reclamation facilities (WRFs). A modeling analysis was performed to confirm that the aggregate risk from these TAC-emitting sources remains below significance thresholds. In order to account for the possibility of a receptor being exposed to impacts from more than one source, individual units are limited in size by the Project to those that would result in risks less than one-tenth of the significance threshold (i.e., cancer risk of no more than 1 in 1 million and an HI of no more than 0.1) at its point of maximum impact (PMI). The methodology for conducting this analysis is described in Appendix 5.11-B.

If the Project were to include TAC emissions sources that do not meet the recommended sizes and operations, there would be a potential that the aggregate risk from these TAC-emitting sources would exceed identified significance thresholds. MM 11-1 requires compliance with these parameters which are included in Table 5.11-5. As stated in MM 11-1, should there be a need or request for a stationary source exceeding the prescribed limits, a source-specific air quality analysis in accordance with the applicable AVAQMD or SCAQMD Rules would be required.

Two WRFs would be constructed (one to the west and one to the east of the West Branch of the Aqueduct) to provide tertiary treated recycled water for community landscaping throughout the Project site. WRFs emit TACs; the types and relative quantities emitted depend on the chemical makeup of the influent wastewater sent to the treatment plant.

A screening health risk assessment was conducted to evaluate the air concentration at the nearest sensitive receptors to the WRFs. (The modeling methodology is described in Appendix 5.11-B.8) Because the future operating characteristics of the WRFs can be estimated (thus not requiring a safety factor to account for uncertainty) and because the plants would be located in institutional areas where there are not expected to be other TAC-emitting equipment contributing to composite risks, the relevant thresholds for the WRFs are 10 in 1 million for cancer risk and 1.0 for the chronic non-cancer HI. Cancer risk calculations were conservatively calculated for a maximum resident period of 70 years. The results of the screening analysis demonstrate that the estimated incremental cancer risk, chronic and acute health indexes from all WRFs would be less than the significance thresholds at the maximally exposed sensitive receptor location. Impacts from TAC emissions generated by the WRFs would be less than significant.

---

8 The location of the west WRF would be slightly different than the location shown in Appendix 5.11-B, but the TAC analysis is valid for either location.

---

## Off-Site Impacts

### *Construction*

Construction of the off-site Project features described in Section 4.7 of the EIR (i.e., roadway improvements, water infrastructure, and utilities connections) would generate short-term diesel PM TAC emissions. As described above for on-site construction, the duration of construction activities near any sensitive receptor would be small when compared to the exposure durations considered for a potential health risk. Off-site construction activities would be much less in magnitude and duration than on-site construction. Therefore, the TAC impact from off-site construction would be less than significant.

### *Operational Impacts*

Upon completion of construction, the Project's off-site roadway, water infrastructure, and utility improvements would not generate TACs. There would be no impact.

***Impact Summary: Toxic Air Contaminants.*** MM 11-1 prescribes limits on larger sources and all TAC sources are limited by AVAQMD Rule 1401 and SCAQMD Rule 1401. The analysis demonstrates that, with implementation of MM 11-7, MM 11-8, and MM 11-9, impacts of these sources would be less than the applicable incremental cancer risk and non-cancer health index thresholds. Exposure of sensitive receptors to TACs from on-site sources would be less than significant

### *Toxic Air Contaminant Emissions from Existing Off-Site Sources*

The National Cement Company's Lebec Plant was identified as the only stationary source in the Project vicinity with the potential to emit TACs. Due to the plant's proximity to the Centennial Project, it was deemed appropriate to assess any potential impact to the Project site associated with the Plant. In November 2005, ENVIRON prepared a technical memorandum entitled "Evaluation of Air Impacts for the National Cement Company of California's Lebec Kiln Permit Modification From a 25 percent Tire-Derived-Fuel Permit Limit to a 50% Limit" (see Appendix 5.11-C). As part of the evaluation, ENVIRON conducted a health risk analysis (HRA) to evaluate the human health impact from increasing the percentage of tire-derived-fuel (TDF) used at the NCCC facility at Lebec. In that HRA, ENVIRON used standard methods developed by the OEHHA (e.g., Hot Spots Analysis Reporting Program [HARP]) to evaluate cancer risks and non-cancer health hazards at the closest potential future Project residence, which is located at the northernmost point of the Project site (i.e., the portion of Centennial closest to the Plant).

Based on the results presented in the HRA, the estimated cancer risks and chronic and acute non-cancer HIs at the future Project residences and other sensitive uses (after Centennial Buildout) are below the AVAQMD's and SCAQMD's thresholds for significant risk (i.e., 10 in 1 million for cancer risk and 1.0 for HI). The cancer risk at the northernmost portion of the Project site was estimated to be 0.15 in 1 million; the chronic and acute non-cancer hazard indices estimated for this location were 0.01 and 0.12, respectively. Based on the results

presented in the HRA, the Plant at Lebec is not expected to cause unacceptable risks to future residents at Centennial (ENVIRON 2009b).

In December 2008, the OEHHA modified the acute and chronic non-cancer reference exposure levels (RELs) for formaldehyde and acrolein to reflect the current understanding of their non-cancer effects. Both RELs were increased, reflecting the fact that both compounds are considered to have lower non-cancer toxicity than previously believed. Since the HRA was last updated in December 2005, these revised RELs are not reflected in the HIs calculated in that HRA. If the analyses were updated with the new RELs, the resulting chronic and acute hazard indices (HIs) at the nearest residence will be less than the 0.01 and 0.12, respectively, which are the previous estimates. For the other chemicals identified in the HRA, ENVIRON determined that no OEHHA-published toxicity values have been modified since the HRA was issued (ENVIRON 2009b). Therefore, absent an increase in the emissions from the NCCC facility or a change in process that alters the emissions makeup, the health risks presented in the HRA would likely be lower and conclusions reached still continue to be valid.

***Impact Summary: Toxic Air Contaminants – Off-Site Sources.*** The TAC risks from the National Cement Plant at Lebec to the Project site would be less than the applicable AVAQMD and SCAQMD CEQA significance thresholds. The impact would be less than significant.

### ***Diesel Particulate Matter Exposure from Vehicles on State Route 138***

The CARB publication, *Air Quality and Land Use Handbook: A Community Perspective* recommends default separation distances when locating new sensitive land uses near sources of TACs, including freeways. The CARB guidance recommends 500-foot buffers between freeways and sensitive receptors, indicating that further analyses may be necessary if the proposed sensitive land use is located within this recommended buffer. The bases for this recommendation include epidemiological studies demonstrating additional cancer and non-cancer health risks associated with proximity to roadways, and attributing the risk to diesel PM. The CARB guidance manual states that the highest concentration of pollutants emitted from freeways dissipates rapidly within the first 300 feet of a freeway. According to CARB, California freeway studies also show an approximate 70 percent drop off in particulate pollution levels at 500 feet, and lifetime cancer risk from exposure to diesel PM is expected to be lowered proportionately. The guidance manual does not provide a quantitative acceptable threshold of risks from diesel PM from freeways in its recommendations of buffer distances between freeways or high traffic roadways and sensitive land uses, nor does it discuss the important factor of meteorology, which substantially affects pollutant concentrations if receptors are upwind or downwind of a freeway.

MM 11-10 requires the implementation of PDF 11-6, which prohibits the development of residences, schools, day care centers, or other land uses involving public congregation within 150 feet from the near edge of the traffic lanes of SR-138.

As discussed in the Methodology section and Appendix 5.11-C, ENVIRON conducted dispersion modeling to estimate diesel PM air concentrations at sensitive receptors (e.g., planned future residences and institutional locations that could contain schools or hospitals) located adjacent to SR-138. Concentrations were evaluated for two scenarios: “With Project” and “Without Project”. The With Project scenario includes a realigned and expanded SR-138 configuration, consistent with the proposed Northwest 138 Corridor Improvement Project (described in Section 4.5.5 of this EIR). The Northwest 138 Corridor Improvement Project evaluates operational improvements for SR-138 from I-5 to SR-14. Metro and Caltrans are preparing a Draft EIR/EIS for alternative improvements to this highway that would include a 6-lane freeway (with a curve correction) that includes a 22-foot median in the vicinity of the Project site (Metro 2015). The Without Project scenario would not change the current roadway configuration.

Because the Project would generate traffic on SR-138, the receptors evaluated included 3 existing residences within 500 feet of SR-138, as well as the proposed residential and institutional areas that could be located within 150 feet of the freeway. Cancer risks were calculated for the modeled sensitive receptors assuming a 30-year exposure duration, which represents a high-end residency period, and a 70-year exposure scenario, which represents a maximum, lifetime exposure. The health risks associated with non-carcinogenic effects were evaluated by comparing the maximum annual concentration to the OEHHA-established non-cancer chronic REL.

As discussed in greater detail in Appendix 5.11-C, *Centennial Supplemental Air Quality Analysis*, of this EIR, the analysis of diesel PM risks from SR-138 to future sensitive receptor areas shows incremental cancer risks for the 70-year exposure duration below 10 in 1 million at locations greater than 150 feet from the travel lanes. The estimated hazard index for all proposed sensitive receptors was less than one. As more stringent vehicular greenhouse gas emission and criteria air pollution standards take effect, the number of diesel powered vehicles on roadways as well as emissions from remaining newer diesel engines will further reduce diesel-related health risks. Therefore, the analysis confirms that the 150-foot buffer limitation established by MM 11-10 would ensure that diesel PM TAC impacts would be less than significant. In addition, MM 11-11 requires that prior to future tract map approvals, if any sensitive receptors (e.g. residential, day care, schools, hospitals) would be located within 500 feet of the SR-138, an additional dispersion modeling study must be conducted to estimate diesel PM air concentrations. If the study finds that diesel PM TAC emissions would be significant at the location of a proposed sensitive receptor, then effective construction measures must be implemented into the structures to mitigate for interior air quality, such as MERV13 filters or equivalent protections against TACs from vehicle emissions.

The results for the three existing residences are summarized in Table 5.11-24, Incremental Health Risks from Diesel PM to Existing Residences.

**TABLE 5.11-24  
INCREMENTAL HEALTH RISKS FROM DIESEL  
PARTICULATE MATTER TO EXISTING RESIDENCES**

Residence ID*	Incremental Cancer Risks (Per One Million)		Incremental Chronic Hazard Index
	30-Year	70-Year	
1	0.2	0.6	0.0003
2	-1.1	-2.5	-0.002
3	0.2	0.5	0.0003
* Residence locations are shown in Appendix 5.11-C. Source: Environ 2009b			

As shown in Table 5.11-24, the highest estimated cancer risk at any of the 3 existing residences is 0.6 in 1 million at Residence 1; the increase is for 70-year exposure. The risks to Residence 2 would decrease with the Project, as the new location of SR-138 would be slightly further from the residence than the current location.

***Impact Summary: Toxic Air Contaminants – Diesel PM from SR-138.*** The Project would include land use areas that could allow sensitive receptors to be located adjacent to SR-138. Vehicles on SR-138 emit diesel PM, which is a TAC. MM 11-10 prohibits the development of sensitive receptors within 150 feet of SR-138. MM 11-11 requires additional TAC study for sensitive receptors within 500 feet of the SR-138. With these measures, exposure of sensitive receptors to TACs from SR-138 would be less than significant.

**Threshold 11-3**      **Would the proposed project conflict with or obstruct implementation of the applicable air quality plan?**

### On-Site Impacts

Section 15125 of the State CEQA Guidelines requires an EIR to discuss any inconsistencies between the Project and applicable regional plans, which include air quality management plans and the State Implementation Plan (SIP). As discussed above, both the AVAQMD and SCAQMD have adopted air quality management plans that include strategies for reducing nonattainment criteria pollutant emissions to meet the NAAQS and CAAQS by a specified date. The AVAQMD *Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Non-Attainment Area)* and the SCAQMD 2012 AQMP are the most recent AQMPs for the respective Districts. Both documents rely on Southern California Association of Government (SCAG) growth forecasts to predict baseline inventories for mobile, area, and stationary sources. The analysis below discusses the Project's consistency with the assumptions and objectives of these applicable air quality plans and whether implementation of the Project would interfere with the AVAQMD's or SCAQMD's ability to comply with State and federal air quality standards.

The AVAQMD's CEQA and Federal Conformity Guidelines state "A project is deemed to not exceed this threshold, and hence not be significant, if it is consistent with the existing land use plan. Zoning changes, specific plans, general plan amendments and similar land use plan changes which do not increase dwelling unit density, do not increase vehicle trips, and do not increase vehicle miles traveled are also deemed to not exceed this threshold" (AVAQMD 2016b).

Population associated with the Project was not in the 2004 SCAG growth forecasts, upon which the basic AVAQMD *Federal 8-Hour Ozone Attainment Plan* was based. However, the 2008, 2012, and 2016 SCAG growth forecasts have accounted for the Project and emissions associated with the Project will be accounted for in future SCAQMD and AVAQMD AQMPs that are adopted prior to the buildout for the Project. AQMP revisions are required at least once every three years. Therefore, revised plans, which would include the Project's population and emissions forecasts, would be in place prior to the initial occupancy of Project facilities.

The SCAQMD guidelines also specify that, for consistency with the AQMP, a project will not result in an increase in the frequency or severity of existing air quality violations; will not cause or contribute to new violations; and will not delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP. Construction-related emissions are assumed to occur throughout the geographic region covered by the AQMP, and the AQMP is focused on operational emissions. As described under Threshold 11-1, the limitations for specific sources specified in MM 11-1 are sufficient to ensure that any individual source or a combination of adjacent sources would not result in a violation of an ambient air quality standard. Sources larger than the limitations set forth in the *Centennial Specific Plan* could be operated without exceeding air quality standards; however, the MM 11-1 requires an additional assessment of the potential impacts of that source prior to its operation. As discussed above, Project operational emissions are also consistent with the population, housing, and employment assumptions in the SCAG RTP/SCS, which is the criteria emission estimates included in the AQMP. Therefore, the Project would not conflict with the AQMP population projections at the time of Project implementation, operational impacts would be less than significant.

## Off-Site Impacts

Construction and operation of the off-site Project features are not population-generating land uses; therefore, these components would be consistent with the AVAQMD and SCAQMD AQMPs. There would be no impacts related to consistency of off-site Project features with the applicable air quality plans.

***Impact Summary:*** The Project and the associated population and emissions are in current SCAG growth forecasts, and will be included in future AQMPs. There would be no conflict with AQMPs and the impact would be less than significant.

---

**Threshold 11-4      Would the proposed project create objectionable odors affecting a substantial number of people?****On-Site Impacts*****Construction Phases***

Project construction would use equipment and activities that would generate odors typical during construction and not extraordinarily objectionable. Potential construction odors include on-site construction equipment's diesel exhaust emissions as well as roofing, painting, and paving operations. Because the Project is new development (as opposed to infill), it is likely that most construction activities will occur at some distance from occupied residences and businesses. However, there will be situations where construction activity odors will be noticed. These odors would be temporary and would dissipate rapidly from the source with an increase in distance. Therefore, the impacts would be short-term; would not affect a substantial number of people; and would be less than significant.

***Long-Term Impacts***

During long-term Project operations, some odors associated with residential uses would be expected to occur, such as from cooking and gardening. However, those odors are not considered significant on a local or regional scale. Local odors would be no different than in any other residential area with supporting services and would not be considered significant.

The most likely potential nuisance odors would be from the industrial or utility sources, including the WRFs and the Materials Recovery Facility/Transfer Station (MRF/TS). The two WRFs would be located along the northern edge of the Project site; see Exhibit 4-14, Centennial Project – Conceptual Wastewater System. The location of the MRF/TS, if constructed, has not been determined, but would be located within the Utility land use designation.

Anaerobic microbial decomposition of material in the wastewater and solid waste stream could generate emissions of hydrogen sulfide, which has a characteristic rotten egg odor, and other odorous compounds. Hydrogen sulfide is formed during bacterial decomposition of sulfur-containing organic substances. Also, it can be present in sewer gas and some natural gas, and can be emitted as the result of geothermal energy exploitation. Breathing hydrogen sulfide at levels above the State standard will result in exposure to a very disagreeable odor. In 1984, a CARB committee concluded that the ambient standard for hydrogen sulfide is adequate to protect public health and to significantly reduce odor annoyance. Decomposition of nitrogen compounds in wastewater can also generate emissions of ammonia, which has a pungent odor.

Prior to their construction and operation, the WRFs and the MRF/TS would be required to obtain construction and operation permits from the SCAQMD or AVAQMD, depending on the location of each facility, to ensure that their air quality and odor impacts would be less than significant. To minimize odors from these facilities to less than significant levels, state-of-the-art design and odor-control measures would be implemented where necessary. Examples of effective odor-control technologies include covering and/or enclosing odorous processes,

applying negative air pressure with blowers, and installing odor-control devices such as biofilters, chemical scrubbers, or activated carbon filters. Digester gas, which is primarily methane, can be either flared or used as an industrial fuel. Digester gas combustion would destroy odorous compounds. Both the SCAQMD and AVAQMD have regulations that prohibit off-site odors generated by any source. Any detectable odors outside the boundary of either the WRFs or the MRF/TS would be a violation of the air districts' rules and regulations.

## Off-Site Impacts

Project off-site roadway, water infrastructure, and utility improvements would not generate odors and would not require air quality permits for their operation. The off-site wells would not generate odors and would not require air quality permits for their operation. There would be no permanent population at the wells to be exposed to objectionable odors in the area. Construction of the proposed wells may result in short-term odors typical of construction, including diesel and paving odors in the immediate vicinity of the construction area. There would be no substantial populations nearby to be exposed to these odors. Therefore, there would be no impacts related to generating odors or to introducing a future population to nuisance odors or hazardous air emissions.

***Impact Summary:*** Construction activity odors would be temporary and would not be experienced by a substantial number of people. The WRFs and the MRF/TS would be facilities with the potential to emit objectionable odors. The Project must comply with review and permitting by the AVAQMD or SCAQMD, as applicable, with respect to odor impacts. Construction and operational on-site and off-site odor impacts would be less than significant.

**Threshold 11-5**      **Would the proposed project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?**

## On-Site and Off-Site Impacts

As previously identified in Table 5.11-2, the MDAB is in nonattainment for PM<sub>10</sub> and O<sub>3</sub>. As previously identified in Table 5.11-3, the Los Angeles County portion of the SoCAB is in nonattainment for PM<sub>10</sub>, PM<sub>2.5</sub>, lead, and O<sub>3</sub>. The Project would contribute PM<sub>10</sub>, PM<sub>2.5</sub>, and O<sub>3</sub> precursors (i.e., VOC and NO<sub>x</sub>) to the area during short-term construction and long-term operational activities. Lead emissions would be negligible. However, even with the inclusion of mitigation measures for direct impacts, the Project's emissions would be cumulatively considerable.

The AVAQMD CEQA guidelines state that "cumulative impacts are similar to direct and indirect impacts of the project, which the project contributes to" (AVAQMD 2016b). In the case of a subdivision project, a given project has a cumulative impact with all other subdivision projects, from the standpoint of each type of impact (e.g., cumulative

construction emissions, residential natural gas consumption, solvent use, transportation emissions, congestion).The SCAQMD considers the thresholds for project-specific impacts and cumulative impacts to be the same (SCAQMD 2003b).<sup>9</sup>

Construction annual emissions of NO<sub>x</sub>, an O<sub>3</sub> precursor, would be directly significant and therefore, cumulatively considerable and significant. Construction daily emissions of O<sub>3</sub> precursors VOC and NO<sub>x</sub>, would be directly significant and therefore, cumulatively considerable and significant. Even with the inclusion of mitigation measures for direct impacts, these Project emissions would be cumulatively considerable. Construction mass emissions of PM<sub>10</sub> and PM<sub>2.5</sub> would not be directly or cumulatively significant.

Even with the inclusion of mitigation measures, long-term operational emissions of PM<sub>10</sub>, PM<sub>2.5</sub>, and O<sub>3</sub> precursors VOC and NO<sub>x</sub>, would be directly significant and therefore, cumulatively considerable and significant.

### 5.11.8 MITIGATION MEASURES

**MM 11-1** The Project's plans and specifications shall require stationary sources to comply with the parameters stated in Stationary Source Types, Size Limits, and Quantity Estimates, which is included as Attachment A to the Project's Mitigation Monitoring and Reporting Program. Should there be a need for a stationary source exceeding the prescribed limits, the Project Applicant/Developer shall apply for source-specific permit from the Antelope Valley Air Quality Management District (AVAQMD) or South Coast Air Quality Management District (SCAQMD), as applicable.

**MM 11-2** The Project's plans and specifications shall include the following measures to minimize nitrogen oxide (NO<sub>x</sub>) and volatile organic compound (VOC) emissions during construction:

- All off-road diesel-powered construction equipment greater than 50 horsepower shall meet U.S. Environmental Protection Agency (USEPA) Tier 4 Final emission standards to the extent that the equipment is available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by the California Air Resources Board (CARB). Any emissions-control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. If Tier 4 Final equipment is not available, the Project Applicant/Developer shall provide the County with documentation showing the reasons for non-availability.
- Alternatively, construction equipment may be selected according to the Green Construction Policy used by the Los Angeles County Metropolitan Transportation Authority or the ports of Los

<sup>9</sup> The only exception is the hazard index significance threshold for toxic air contaminants.

Angeles/Long Beach. These policies include provisions to ‘step down’ from Tier 4 equipment to Tier 3 or Tier 2 if specified criteria are met.

- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export). If the Project Applicant/Developer determines that 2010 model year or newer diesel trucks cannot be obtained, trucks that meet USEPA 2007 model year NOx emissions requirements shall be required. If 2010 model year or newer diesel trucks are not available, the Project Applicant/Developer shall provide the County with documentation showing the reasons for non-availability.
- A copy of each unit’s certified tier specification, BACT documentation, and CARB or District operating permit shall be provided to the County at the first occurrence of mobilization of each applicable unit of equipment.
- Construction contractors shall ensure construction equipment is properly serviced and maintained to the manufacturer’s standards.
- Construction contractors shall limit non-essential idling of construction equipment to no more than five consecutive minutes.

**MM 11-3** The Project’s plans and specifications shall prohibit wood-burning fireplaces as required by SCAQMD Rule 445 in single-family residences throughout the entire Project site, including at residences that are 3,000 or more feet above mean sea level at which the SCAQMD prohibition would otherwise not apply. Natural gas fireplaces shall be limited to a total of 13,954.

**MM 11-4** The Project’s plans and specifications for non-residential buildings shall demonstrate that the following features have been incorporated into the building designs. Proof of compliance shall be provided to the County prior to the issuance of occupancy permits.

- For buildings with over 10 tenant-occupants, changing/shower facilities shall be provided as specified in Section A5.106.4.3, Nonresidential Voluntary Measures, of the CALGreen Code as follows: for 11 to 100 tenant-occupants, one unisex shower; for 101 to 200 tenant-occupants, one shower per gender; and for over 200 tenant-occupants, one shower per gender for each 200 additional tenant-occupants.
- Preferential parking for low-emitting, fuel-efficient, and carpool/van vehicles shall be provided as specified in Section A5.106.5.1, Nonresidential Voluntary Measures, of the CALGreen Code as follows: two for 10 to 15 spaces; four for 26 to 50 spaces; six for 51 to 75 spaces; nine for 76 to 100 spaces; eleven for 101 to 150 spaces; 18 for 151 to 200 spaces; and at least 10 percent of total for 201 and more spaces.

- Facilities shall be installed to support future electric vehicle charging at each non-residential building with 30 or more parking spaces. Installation shall be consistent with Section A5.106.5.3, Nonresidential Voluntary Measures (Tier 1), of the CALGreen Code. The facilities shall meet Section 406.9 (Electric Vehicle) of the *California Building Code* and as follows:

**Single charging space requirements.** When only a single charging space is required, install a listed raceway capable of accommodating a dedicated branch circuit. The raceway shall not be less than trade size 1. The raceway shall be securely fastened at the main service or subpanel and shall terminate in close proximity to the proposed location of the charging system into a listed cabinet, box or enclosure.

**Multiple charging spaces required.** When multiple charging spaces are required, plans shall include the location(s) and type of electrical vehicle supply equipment (EVSE), raceway method(s), wiring schematics and electrical calculations to verify that the electrical system has sufficient capacity to charge simultaneously all the electric vehicles (EV) at all designated EV charging spaces at their full rated amperage. Plan design shall be based on Level 2 EVSE at its maximum operating ampacity. Provide raceways from the electrical service panel to the designated parking areas which are required to be installed at the time of construction.

**MM 11-5** The Project's plans and specifications for residential buildings shall demonstrate that the following features have been incorporated.

- Visitor parking shall include preferentially located parking spaces for alternative-fueled vehicles.
- Exterior electrical receptacles and natural gas or propane hookups.
- Bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code, as follows:

**Short-term bicycle parking.** Provide permanently anchored bicycle racks within 100 feet of the visitor's entrance, readily visible to passers-by, for five percent of visitor motorized vehicle parking capacity within a minimum of one two-bike capacity rack.

**Long-term bicycle parking for multifamily buildings.** Provide on-site bicycle parking for at least one bicycle per every two dwelling units. Acceptable parking facilities shall be conveniently reached from the street and may include, but not limited to:

- Covered, lockable enclosures with permanently anchored racks for bicycles.
- Lockable bicycle rooms with permanently anchored racks.
- Lockable, permanently anchored bicycle lockers.

**Long-term bicycle parking for hotel and motel buildings.** Provide one on-site bicycle parking space for every 25,000 square feet, but not less than two. Acceptable parking facilities shall be conveniently reached from the street and may include, but not be limited to:

1. Covered, lockable enclosures with permanently anchored racks for bicycles.
2. Lockable bicycle rooms with permanently anchored racks.
3. Lockable, permanently anchored bicycle lockers.

**MM 11-6** The Project's plans and specifications for parking structures and parking lots with 20 or more parking spaces shall demonstrate that the following features have been incorporated into the parking facility.

- The parking facility shall include a minimum of five percent preferentially located parking spaces for alternative-fueled (electric, natural gas, or similar low-emitting technology) vehicles.
- The parking facility shall include at least one electric vehicle charging station. Electrical lines shall be designed and sized to add additional charging stations for up to three percent of the total parking spaces when a demand is demonstrated. The design and installation shall be consistent with Section A4.106.8.2, Residential Voluntary Measures, of the CALGreen Code as follows:

**Single charging space requirements.** When only a single charging space is required, install a listed raceway capable of accommodating a dedicated branch circuit. The raceway shall not be less than trade size 1 (nominal 1-inch inside diameter). The raceway shall be securely fastened at the main service or subpanel and shall terminate in close proximity to the proposed location of the charging system into a listed cabinet, box or enclosure.

**Multiple charging spaces required.** When multiple charging spaces are required, plans shall include the location(s) and type of electrical vehicle supply equipment (EVSE), raceway method(s), wiring schematics and electrical calculations to verify that the electrical system has sufficient capacity to charge simultaneously all the electric vehicles at all designated EV charging spaces at their full rated amperage. Plan design shall be based on Level 2 EVSE at its maximum operating ampacity. Only underground raceways and related underground equipment are required to be installed at the time of construction.

- For residential parking facilities, bicycle parking shall be provided as specified in Section A4.106.9, Residential Voluntary Measures, of the CALGreen Code.

- MM 11-7** The Project's plans and specifications for business park or water reclamation facility land uses shall demonstrate that buffer areas adjacent to proposed business parks in compliance with the Air Quality Analysis for Stationary Sources Allowed by the Centennial Specific Plan, (see Appendix 5.11-B of this EIR) have been incorporated into the design plans. The buffer areas shall prohibit uses that are potential sources of toxic air contaminants and shall prohibit uses that include sensitive receptors, except as allowed through written evidence that the sensitive use would not be exposed to Toxic Air Contaminants with pollutant concentrations resulting in a cancer risk greater than or equal to 10 in 1 million for health risks and 1.0 for non-cancer chronic and acute hazard indices (HIs).
- MM 11-8** Prior to approval of any tract map that includes an air quality sensitive use (e.g., school, hospital, daycare center) within a designated business park, the Project Applicant/Developer shall provide written evidence to the County that the sensitive use would not be exposed to Toxic Air Contaminants with pollutant concentrations resulting in a cancer risk greater than or equal to 10 in 1 million for health risks and 1.0 for non-cancer chronic and acute hazard indices (HIs).
- MM 11-9** The Project's plans and specifications shall demonstrate that all distribution centers are within the business park areas south of State Route (SR) 138 and are located at least 1,000 feet from existing sensitive receptors and lands designated for sensitive land uses. Distribution centers shall not be allowed in other areas within the Project site.
- MM 11-10** The Project's plans and specifications shall demonstrate that any land uses involving the public congregation of sensitive receptors (e.g. residential, schools, hospital, daycare center) are not within 150 feet of the near edge of the SR-138 traffic lanes.
- MM 11-11** Prior to the approval of any tract map that includes an air quality sensitive receptor (e.g. residential, day care, schools, hospital) located within 500 feet of the SR-138, the Project Applicant/Developer shall provide a dispersion analysis to calculate the health risks from vehicle emissions from SR-138. If the study concludes that health risks would be significant at the location of a proposed sensitive receptor, then effective design measures must be implemented into the structures to mitigate for interior air quality, such as ventilation systems that include MERV13 filters or equivalent protections against TACs from vehicle emissions. Confirmation of compliance shall be provided to the County prior to occupancy that include sensitive receptors within 500 feet of the SR-138.

### 5.11.9 LEVEL OF SIGNIFICANCE AFTER MITIGATION

With implementation of identified MMs, the following impacts would remain significant and unavoidable:

- Construction emissions would exceed the AVAQMD annual NO<sub>x</sub> emissions threshold and the daily SCAQMD VOC and NO<sub>x</sub> thresholds. VOC and NO<sub>x</sub> (both O<sub>3</sub> precursors) would be directly significant and therefore, cumulatively considerable and significant.
- Long-term operational emissions, including area, energy, and mobile sources, of CO, VOC, NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> would exceed AVAQMD mass annual emissions thresholds of significance and SCAQMD mass daily emissions thresholds of significance.
- Construction near previously completed and occupied residences could result in exceedance of ambient air quality standards and exposure of sensitive receptors to substantial local pollutant emissions of PM<sub>10</sub> and PM<sub>2.5</sub>.

## 5.12 NOISE

### 5.12.1 INTRODUCTION

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that noise issues be evaluated as part of the environmental documentation process. The noise impacts of the Project are analyzed at a Project-level of detail; direct and indirect impacts are addressed for each threshold criteria for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### Summary

The Project would generate an estimated 75,908 external daily trips at buildout; these vehicles would primarily use State Route (SR) 138, Interstate (I) 5, SR-14, and SR-99. The addition of Project traffic to existing traffic would increase the traffic volumes on these roadways and, therefore, the traffic noise at adjacent receptors. Traffic noise increases would exceed the 3 A-weighted decibels (dBA) Community Noise Equivalent Level (CNEL) criterion at identified receptors on SR-138, between Gorman Post Road and Old Ridge Route Road, resulting in a significant impact. The impact would be considered significant and unavoidable because feasible mitigation to reduce these impacts is not within County jurisdiction. Noise-reduction measures would involve alterations to private property and/or within California Department of Transportation (Caltrans) right-of-way, which are not in the County's or the Project Applicant's control. It should be noted that the forecasted noise increase is 3.3 dBA, and a noise increase of 3 dBA, when occurring instantaneously, is barely perceptible to most people. Project-generated traffic noise increases at Project buildout on other parts of SR-138 would not exceed 2.5 dBA CNEL. Project-generated traffic noise increases at Project buildout on I-5, SR-14, and SR-99 would be less than 1.0 dBA CNEL. Traffic noise increases due to the Project would occur gradually over the buildout period of approximately 20 years.

Project-generated traffic would potentially expose people at proposed residential, hotel, school, and religious facilities on the Project site to noise levels in excess of the applicable State and County standards. The impact would be less than significant with implementation of mitigation measure (MM) 12-1, which would require the completion of an acoustical analysis that address each proposed residential, hotel, school, and place of worship that may be significantly affected by traffic noise to verify that the facilities include the appropriate noise-reduction features to meet interior and exterior noise standards.

The Project would include a number of land uses where installed equipment or activities may generate noise levels that could result in a significant impact at areas adjacent to or within the Project site. Maximum noise levels for these noise sources are prescribed by the County Code (i.e., the Noise Ordinance). However, the land uses proposed as part of the Project are routinely constructed in Southern California and are able to meet the applicable noise standards through use of common, feasible methods and materials, including utilizing design features such as building setbacks from the sensitive receptors; noise barriers;

building orientation relative to the sensitive receptor; sound-rated windows; upgraded exterior wall and/or roof construction. The impact would be less than significant with implementation of MM 12-2, which would require the completion of an acoustical analysis for each proposed business park use, school, community use area, park and recreation area, transportation center, animal control facility, utility, commercial development, and manufacturing/industrial development to verify the facility has been properly designed to comply with the noise ordinance.

Construction of the Project and off-site Project features would increase the ambient noise levels in the Project vicinity above levels that exist without the Project. Noise levels at off-site receptors and future on-site receptors would fluctuate depending on the particular type, number, and duration of use of various pieces of construction equipment. Additionally, while the total construction period is approximately 20 years, an audible increase in the ambient noise level due to construction experienced at any individual receptor would be relatively short-term and temporary. Noise from mobile equipment would be loudest during site preparation and grading activities. Because of the large size of the Project site and distance between grading activities and sensitive receptors, mobile equipment noise levels would not exceed County standards and would be less than significant. There is a potential for stationary construction equipment (e.g. air compressors, generators, and cranes) to generate noise exceeding the noise ordinance limit. MM 12-3 would be incorporated into the Project and would require stationary equipment to operate at a distance of greater than 450 feet or to provide an enclosure or similar noise attenuation to limit the average hourly daytime noise level to 60 dBA or less. With the incorporation of MM 12-3, the temporary increase in ambient noise levels due to on-site construction stationary sources would be less than significant. Blasting may be required in portions of the Project site during the construction period, but the noise impact would be less than significant.

No pile driving is currently anticipated for the Project. However, if pile driving is required, there would be a potential significant impact. MM 12-4 would require a vibration analysis prior to any pile-driving activities to ensure that vibration impacts would not exceed County standards and would be less than significant. The County vibration standard could also be exceeded if vibratory rollers, scrapers, and bulldozers operate near occupied residences. MM 12-5 restricts the use of this equipment and impacts would be less than significant with mitigation.

The Project would not expose persons to significant noise impacts from aviation activities from public airports, military overflights, Quail Lake Skypark, or the Fire Station 77 heliport.

## **Section Format**

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and

Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

Although all references cited for preparation of this analysis are listed in Section 5.12.9, the primary technical references for this section are listed below.

1. Wieland Acoustics, Inc. 2011 (May). *Environmental Noise Study for the Proposed Centennial Specific Plan and Phase I Implementation in the County of Los Angeles*. Irvine, CA: Wieland Acoustics (Appendix 5.12-A).
2. Stantec Consulting Services, Inc. 2016 (April). *Centennial Specific Plan Traffic Study*. Irvine, CA: Stantec. (Appendix 5.10-A).

The Wieland Acoustics study was prepared between 2005 and 2011 to identify and assess potential noise and vibration impacts associated with construction and operation of the Project. Because many existing noise conditions have not substantially changed since 2011, currently relevant data from the Wieland Acoustics study has been retained for this EIR. BonTerra Psomas conducted noise monitoring at the Project site in 2015 to ascertain baseline noise levels, and this noise monitoring data can be found in Appendix 5.12-B.

### 5.12.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

#### Federal

No federal plans or policies have been identified that relate to noise.

## State

### ***California Noise Insulation Standards***

Title 24 of the *California Code of Regulations*, also known as the California Building Standards Code or, more commonly, as the California Building Code, requires that residential structures other than detached single-family dwellings be designed to prevent exterior noise intrusion so that the interior day-night average sound level ( $L_{dn}$ ) or CNEL attributable to exterior sources does not exceed 45 dBA in any habitable room with closed windows (CBSC 2015).

### ***California Code of Regulations for School Site Standards***

The *California Code of Regulations* (5 CCR 14010) includes standards for school site selection. These standards state that the site shall not be adjacent to a road or freeway that any site-related traffic and sound level studies have determined will have safety problems or sound levels that would adversely affect the educational program. It should be noted, however, that these regulations do not quantify an adverse sound level.

### ***California Noise/Land Use Compatibility Guidelines***

Noise compatibility guidelines from the State General Plan Guidelines, as included in the County of Los Angeles General Plan Environmental Impact Report (EIR) and Antelope Valley Area Plan (AVAP EIR) are shown below in Table 5.12-1, California Land Use Compatibility Guidelines (DRP 2014, 2015b). The noise compatibility guidelines are intended to be incorporated into land use planning decisions to reduce future noise and land use incompatibilities. For example, as shown below in Table 5.12-1, a CNEL at multiple-family homes that does not exceed 65 dBA is considered normally acceptable, while levels exceeding 75 dBA would be considered clearly unacceptable. These guidelines are primarily used to assess transportation noise impacts to new development.

**TABLE 5.12-1  
CALIFORNIA LAND USE COMPATIBILITY GUIDELINES**

Land Use Category	Community Noise Exposure						
	L <sub>dn</sub> or CNEL, dB						
	55	60	65	70	75	80	85
Residential (Low-Density Single-Family, Duplex, Mobile Homes)	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Residential (Multiple-Family Homes)	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Transient Lodging (Motels, Hotels)	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Schools, Libraries, Churches, Hospitals, Nursing Homes	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Auditoriums, Concert Halls, Amphitheaters	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Sports Arena, Outdoor Spectator Sports	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Playgrounds, Neighborhood Parks	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Golf Courses, Riding Stables, Water Recreation, Cemeteries	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Office Buildings, Business, Commercial and Professional	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
Industrial, Manufacturing, Utilities, Agriculture	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded	Shaded
	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable			
With no special noise reduction requirements assuming standard construction.	New construction or development should be undertaken only after a detailed analysis of the noise reduction requirement is made and needed noise insulation features included in the design.	New construction is discouraged. If new construction does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.	New construction or development should generally not be undertaken.

## County

### *Los Angeles County Code*

The County Code (Chapter 12.08, Noise Control) provides noise limits for stationary noise sources, construction, and vibration. It also establishes uniform minimum noise insulation performance standards to protect noise-sensitive receptors from traffic, rail, aircraft, and industrial noise sources (see Title 26, Building Code; Chapter 12, Interior Environment, Section 1207, Sound Transmission).

### Stationary Noise Sources

Section 12.08.390 of the County Code places limits on exterior noise levels emitted from stationary sources as experienced at various receptors. These limits are shown in Table 5.12-2, Los Angeles County Exterior Noise Standards for Stationary Noise Sources.

**TABLE 5.12-2  
LOS ANGELES COUNTY EXTERIOR NOISE STANDARDS  
FOR STATIONARY NOISE SOURCES**

Land Use of Receptor Property	Daytime Noise Level at Receptor (7:00 AM to 10:00 PM)	Nighttime Noise Level at Receptor (10:00 PM to 7:00 AM)
Noise-sensitive areas <sup>a</sup>	45 dBA	45 dBA
Residential properties	50 dBA	45 dBA
Commercial properties	60 dBA	55 dBA
Industrial properties	70 dBA	70 dBA
dBA: A-weighted decibel		
<sup>a</sup> "Noise-sensitive areas" are not specifically defined in the County Code. Typical noise-sensitive uses can include schools, day-care centers, hospitals, and other uses.		
Source: County of Los Angeles Code, Section 12.08		

The standards identified in Table 5.12-2 may not be exceeded for a cumulative period of more than 30 minutes in any hour (min/hr); however, higher noise levels are permitted for cumulative periods shorter than 30 minutes within an hour. Specifically, these standards are increased by 5 decibels (dB) for a cumulative period of no more than 15 minutes in any hour, by 10 dB for a cumulative period of no more than 5 minutes in any hour, and by 15 dB for a cumulative period of no more than 1 minute in any hour. At no time may the intruding noise exceed the exterior noise standards plus 20 dB. For instance, an intruding noise level (e.g., a pump or fan), when measured on a residential property, may not exceed 50 dBA for more than 30 minutes per hour (min/hr); 55 dBA for more than 15 min/hr; 60 dBA for more than 5 min/hr; more than 65 dBA for more than 1 min/hr; or 70 dBA for any length of time. For any source of sound that emits a pure tone or impulsive noise, the standards in Table 5.12-2 are reduced by 5 dB (*Los Angeles County Code*, Sections 12.08.390 and 12.08.410).

If the existing ambient noise level exceeds the noise standard, the existing ambient noise level then becomes the standard to which noise exceedances are compared. For measurement locations on the boundary of two different land use zones, the exterior noise standard is the arithmetic average of the noise standards for both zones. However, when an intruding noise source originates on an industrial property and is impacting another noise zone, the applicable exterior noise standard is the daytime (i.e., 7:00 AM to 10:00 PM) standard indicated in Table 5.12-2 for the receptor property (*Los Angeles County Code*, Section 12.08.390).

Section 12.08.450 of the County Code prohibits the operation of any forced-air blower in a tunnel car wash between the hours of 7:00 PM and 8:00 AM that exceeds 60 dBA at a residential property line or 65 dBA at a commercial/industrial property line.

Section 12.08.460 of the County Code prohibits the loading, unloading, opening, closing, or other handling of boxes, crates, containers, building materials, garbage cans, or similar objects between the hours of 10:00 PM and 6:00 AM in such a manner as to cause a noise disturbance.

Section 12.08.530 of the County Code prohibits the operation of any air conditioning or refrigeration equipment that exceeds 55 dBA at any point on a neighboring property; 50 dBA at the center of a neighboring patio; and 50 dBA outside the neighboring living area window nearest the equipment location.

Section 12.08.570 of the County Code specifically exempts many activities from the provisions of the noise ordinance, including the following: (1) activities conducted on public playgrounds and public or private school grounds, including but not limited to school athletic and school entertainment events and (2) all legal vehicles operating in a legal manner within the public right-of-way or on private property. Some activities, including construction and residential air conditioning equipment, are exempt from the exterior noise standards because they are regulated by specific County Code sections, as discussed below.

### Construction Noise

Construction noise limits are addressed in Section 12.08.440 of the County Code. This section prohibits daily construction work between the hours of 7:00 PM and 7:00 AM or at any time on Sundays or holidays when the sound would create a noise disturbance across a residential or commercial property line. In addition, the maximum construction noise level may not exceed the limits identified in Table 5.12-3, Los Angeles County Construction Noise Limits, when measured at the affected buildings.

**TABLE 5.12-3  
LOS ANGELES COUNTY CONSTRUCTION NOISE LIMITS**

	<b>Single-Family Residential</b>	<b>Multi-Family Residential</b>	<b>Semi-Residential and Commercial</b>	<b>Business Structures</b>
<b>Mobile Equipment</b>				
Daily, except Sundays and legal holidays, 7 AM to 8 PM	75 dBA	80 dBA	85 dBA	85 dBA
Daily, 8 PM to 7 AM and all day Sunday and legal holidays	60 dBA	64 dBA	70 dBA	85 dBA
<b>Stationary Equipment</b>

Daily, 8 PM to 7 AM and all day Sunday and legal holidays	50 dBA	55 dBA	60 dBA	N/A
dBA: A-weighted decibels; N/A: not applicable Source: County of Los Angeles Code, Section 12.08.				

### Interior Noise Levels

Section 1207.11.2 of the County Code states, “Interior noise levels attributable to exterior sources shall not exceed 45 dB in any habitable rooms, classrooms, and all rooms used in patient care and worship. The noise metric shall be either the day-night average sound level ( $L_{dn}$ ) or the community noise equivalent level (CNEL), consistent with the noise element of the local general plan”. Section 1207.12 describes the content of the acoustical analysis report required for evidence of compliance with the requirements of Section 1207.

### Vibration

In addition to the noise standards, the County Code also provides vibration standards. Section 12.08.560 of the County Code prohibits the operation of any device that creates vibration velocity levels of more than 0.01 inch per second (in/sec) over the frequency range of 1 to 100 Hertz (Hz) at or beyond the property boundary of the source if on private property, or at 150 feet from the source if on a public space or public right-of-way.

### ***County of Los Angeles General Plan***

The *County of Los Angeles General Plan* addresses noise issues that affect the County. Because the *Antelope Valley Area Plan* does not have policies that explicitly address noise, the policies from the *County of Los Angeles General Plan's* Noise Element are included below and a consistency analysis of the Project's specific goals and policies with the County's relevant plans, policies, and regulations is provided in the Land Use, Entitlements, and Planning section (Section 5.8) of this document.

**Policy N 1.1:** Utilize land uses to buffer noise-sensitive uses from sources of adverse noise impacts.

**Policy N 1.2:** Reduce exposure to noise impacts by promoting land use compatibility.

**Policy N 1.3:** Minimize impacts to noise-sensitive land uses by ensuring adequate site design, acoustical construction, and use of barriers, berms, or additional engineering controls through Best Available Technologies (BAT).

**Policy N 1.5:** Ensure compliance with the jurisdictions of State Noise Insulation Standards (Title 24, California Code of Regulations and Chapter 35 of the Uniform Building Code), such as noise insulation of new multifamily dwellings constructed within the 60 dB (CNEL or L<sub>dn</sub>) noise exposure contours.

**Policy N 1.6:** Ensure cumulative impacts related to noise do not exceed health-based safety margins.

**Policy N 1.9:** Require construction of suitable noise attenuation barriers on noise sensitive uses that would be exposed to exterior noise levels of 65 dBA CNEL and above, when unavoidable impacts are identified.

**Policy N 1.10:** Orient residential units away from major noise sources (in conjunction with applicable building codes).

**Policy N 1.11:** Maximize buffer distances and design and orient sensitive receptor structures (hospitals, residential, etc.) to prevent noise and vibration transfer from commercial/light industrial uses.

**Policy N 1.12:** Decisions on land adjacent to transportation facilities, such as the airports, freeways and other major highways, must consider both existing and future noise levels of these transportation facilities to assure the compatibility of proposed uses.

### 5.12.3 ENVIRONMENTAL SETTING

#### Terminology

Noise has been defined as unwanted sound, and it is known to have several adverse effects on people. From these known effects of noise, criteria have been established to help protect public health and safety and to prevent disruption of certain human activities. These criteria are based on known impacts of noise on people such as hearing loss, speech interference, sleep interference, physiological responses, and annoyance. Each of these potential noise effects is briefly discussed in the following descriptions.

- **Hearing loss** is not a concern in community noise situations such as residential developments. The potential for noise-induced hearing loss is more commonly associated with occupational noise exposures in heavy industry or very noisy work environments. Typical neighborhood noise levels, including very noisy airport environments, are not loud enough to cause hearing loss.

- **Speech interference** is one of the primary concerns in environmental noise problems. Normal conversational speech is in the range of 60 Dba to 65 dBA and any noise in this range or louder may interfere with speech. There are specific methods of describing speech interference as a function of distance among speaker, listener, and voice level.
- **Sleep interference** is a major noise concern for traffic noise. Sleep-disturbance studies have identified that interior noise levels have the potential to cause sleep disturbance. Sleep disturbance does not necessarily mean awakening from sleep, but can also refer to altering the pattern and stages of sleep.
- **Physiological responses** are those measurable effects of noise on people that are realized as changes in pulse rate, blood pressure, or other physical responses. While such effects can be induced and observed, the extent to which these physiological responses cause harm or are a sign of harm is not known.
- **Annoyance** is the most difficult of all noise responses to describe. Annoyance is a very subjective characteristic and can vary widely from person to person. What one person considers tolerable can be quite unbearable to another of equal hearing capability. In general, annoyance occurs when one person finds noise irritating over a period of time.

### ***Decibels***

Sound pressure levels are described in units called decibels (dB). In order to provide a finer resolution, each decibel is further subdivided by 10. Since decibels are logarithmic units, sound pressure levels cannot be added or subtracted by ordinary arithmetic means.

For example, if 1 automobile produces a sound pressure level of 70 dB when it passes an observer, 2 cars passing simultaneously would not produce 140 dB. In fact, they would combine to produce 73 dB. This same principle can be applied to other traffic quantities and/or noise sources as well. In other words, doubling the traffic volume on a street will increase the traffic noise level by 3 dB. Conversely, reducing the traffic volume by 50 percent will reduce the traffic noise level by 3 dB.

### ***A-Weighting***

Sound pressure level alone (i.e., decibels) is not a reliable indicator of loudness as perceived by human hearing. The frequency, or pitch, of a sound also has a substantial effect on how humans will respond to a noise level. Human hearing is limited not only to the range of audible frequencies, but also in the way it perceives the sound pressure level in that range. In general, the healthy human ear is most sensitive to sounds between 1,000 Hertz<sup>1</sup> (Hz) and 5,000 Hz, and perceives both higher and lower frequency sounds of the same magnitude with less intensity.

In order to approximate the frequency response of the human ear to a given sound pressure level, a series of sound pressure level adjustments, called A-weighting, is applied. The A-weighted noise scale approximates the frequency response of the average young ear when

---

<sup>1</sup> A hertz is a unit of frequency. The number of hertz equals the number of cycles per second.

listening to most ordinary everyday sounds. When people make relative judgments of the loudness or annoyance of a sound, their judgments correlate well with A-weighted sound levels. Noise levels using A-weighted measurements are written dB(A) or dBA. Table 5.12-4, Noise Levels for Common Activities, shows the relationship of various noise levels, in dBA, to commonly experienced indoor and outdoor activities.

**TABLE 5.12-4  
NOISE LEVELS FOR COMMON ACTIVITIES**

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
-	110	Rock Band
Jet Fly-over at 300 m (1,000 ft)	100	-
Gas Lawn Mower at 1 m (3 ft)	90	-
Diesel Truck at 15 m (50 ft) at 80 km/hr (50 mph)	80	Food Blender at 1 m (3 ft); Garbage Disposal at 1 m (3 ft)
Noisy Urban Area, Daytime Gas Lawn Mower at 30 m (100 ft)	70	Vacuum Cleaner at 3 m (10 ft)
Commercial Area, Heavy Traffic at 90 m (300 ft)	60	Normal Speech at 1 m (3 ft)
Quiet Urban Daytime	50	Large Business Office Dishwasher in Next Room
Quiet Urban Nighttime	40	Theater, Large Conference Room (Background)
Quiet Suburban Nighttime	30	Library
Quiet Rural Nighttime	20	Bedroom at Night, Concert Hall (Background)
-	10	Broadcast/Recording Studio
Lowest Threshold of Human Hearing	0	Lowest Threshold of Human Hearing

dBA: A-weighted decibels; m: meter; ft: feet; km/hr: kilometers per hour; mph: miles per hour  
Source: Caltrans 2013a.

The A-weighted sound level of traffic and other long-term noise-producing activities within and around a community varies considerably with time. Measurements of this varying noise level are accomplished by recording values of the A-weighted level during representative periods in a specified portion of the day.

### ***Equivalent Noise Level***

The equivalent noise level ( $L_{eq}$ ) is a steady-state sound level that contains the same total energy as a time-varying signal over a given sample period.  $L_{eq}$  is the “energy” average noise level during the time period of the sample and can be measured for any time period, but is typically measured for one hour. This one-hour noise level is the energy average of all the events and background noise levels that occur during that time period.  $L_{eq(24)}$ , for example, represents the average noise level over a 24-hour period.

---

### ***Community Noise Equivalent Level***

It is recognized that a given level of noise may be more or less tolerable depending on the duration or time of exposure experienced by an individual. There are numerous measures of noise exposure that consider not only the A-level variation of noise, but also the duration or time of the disturbance. For example, a passing fire engine with sirens will temporarily elevate ambient noise levels and may be annoying for only a short duration of time. The degree of disturbance from a passing fire engine may also depend on whether it occurs at 2:00 PM or 2:00 AM.

The State Department of Aeronautics and the California Commission on Housing and Community Development have adopted the CNEL. This measure weights the average noise levels for the evening hours (7:00 PM to 10:00 PM), increasing them by 5 dB, and weights the late evening and morning hour noise levels (10:00 PM to 7:00 AM) by 10 dB. The daytime noise levels are combined with these weighted levels and are averaged to obtain a CNEL value. Exhibit 5.12-1, Common CNEL Noise Exposure Levels at Various Locations, provides a frame of reference for outdoor CNELs at typical locations. Acceptable CNELs can vary based on the affected land use and adopted standards for a given area, as shown in Table 5.12-1.

### ***Single Noise Event Level***

The single noise event level (SEL) represents the cumulative (not average) sound exposure during a particular noise event, integrated into a one-second timeframe. This measurement is typically used to characterize impulse sounds that last less than two seconds.

## **Methodology**

This analysis assesses potential noise impacts from existing and Project-related traffic, stationary noise sources, and construction.

The study area for the traffic noise impact analysis was defined by the roadway segments identified in the *Centennial Specific Plan Traffic Study* (Stantec 2015) (see Appendix 5.10-A). Traffic noise levels were calculated using the Federal Highway Administration's (FHWA's) Highway Traffic Noise Prediction Model (RD-77-108). The FHWA model determines a predicted noise level through a series of adjustments to a reference sound level. These adjustments account for traffic flows, speed, truck mix, varying distances from the roadway, length of exposed roadway, and noise shielding. The calculations do not take into account the effect of any noise barriers or topography that may affect ambient noise levels.

For stationary and construction noise sources, the distance from the noise source to a receptor is a primary consideration in determining the actual noise level experienced at the receptor. Most reference noise levels are specified at a distance of 50 feet from the source. The calculation of noise from a point source (e.g., construction or heating, ventilation, and air conditioning [HVAC] equipment) at other distances uses the following equation:

Source: Wieland Associates, Inc. 2011

## Common CNEL Noise Exposure Levels at Various Locations Exhibit 5.12-1

*Centennial Project*

$$L_D = L_{50} - 20 \log (D/50), \text{ where}$$

$L_D$  is the noise level at a distance  $D$  from the noise source,

$L_{50}$  is the noise level at a distance of 50 feet from the source, and

20 is a factor used for a “hard” (i.e., non-absorptive) surface between the source and receptor.

This equation is the mathematical expression for a noise level being reduced by 6 dBA for each doubling of distance from the source. For “soft” (i.e., absorptive) surfaces such as grassland the 20 factor is replaced by 25, and the noise level is reduced by approximately 7.5 dBA for each doubling of distance. For very long distances, atmospheric absorption reduces noise at an approximate rate of 1 dBA per 1,000 feet.

Construction equipment can be considered to operate in two modes: stationary and mobile. Noise impacts from stationary equipment are assessed from the center of the equipment, while noise impacts for mobile construction equipment are assessed as emanating from the center of the equipment activity or construction site. For construction equipment, the average noise level ( $L_{eq}$ ) is related to the maximum noise level ( $L_{max}$ ) by the following equation:

$$L_{eq} = L_{max} + 10 \log (UF), \text{ where,}$$

$L_{eq}$  is the average noise level from a piece of construction equipment at 50 feet,

$L_{max}$  is the maximum noise level from a piece of construction equipment at 50 feet, and

UF is the acoustic utilization factor.

The  $L_{max}$  and UF data for construction equipment are tabulated in the impact analysis in Section 5.12.6.

## Sensitive Receptors

Certain land uses are particularly sensitive to noise and vibration. These uses include residential, schools, libraries, churches, nursing homes, hospitals, and open space/recreation areas where quiet environments are necessary for enjoyment, public health, and safety. Commercial and industrial uses are generally not considered noise- and vibration-sensitive uses, unless noise and vibration would interfere with their normal operations and business activities (DPR 2015).

The nearest existing sensitive receptors to the Project site are residential properties near the Project site boundaries on 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue. Additional nearby residences include one located off site on the south side of SR-138 (west of the Cement Plant Road) and homes between the Quail Lake Skypark runway and SR-138. The locations of these sensitive receptors are shown in Exhibit 5.12-2, Noise Measurement

---

Locations. Additional existing sensitive receptors that could be affected by Project-generated traffic noise are residences and other land uses near SR-138, I-5, SR-14, and SR-99.

The residences and schools to be built as part of the Project would be considered sensitive noise and vibration receptors.

Noise measurements were taken using a Larson Davis Laboratories Model 831 (LD 831) integrating sound level meter. The microphones were mounted approximately five feet above the ground and equipped with a windscreen during all measurements. The meter was calibrated before and after use with a Larson Davis Model CAL200 acoustical calibrator to ensure that the measurements would be accurate. The sound level meters were programmed to record noise levels in “slow” mode in A-weighted form. The duration of short-term measurements was determined by the variability of the noise source; noise was measured until the average noise level was relatively steady and representative of one hour of monitoring.

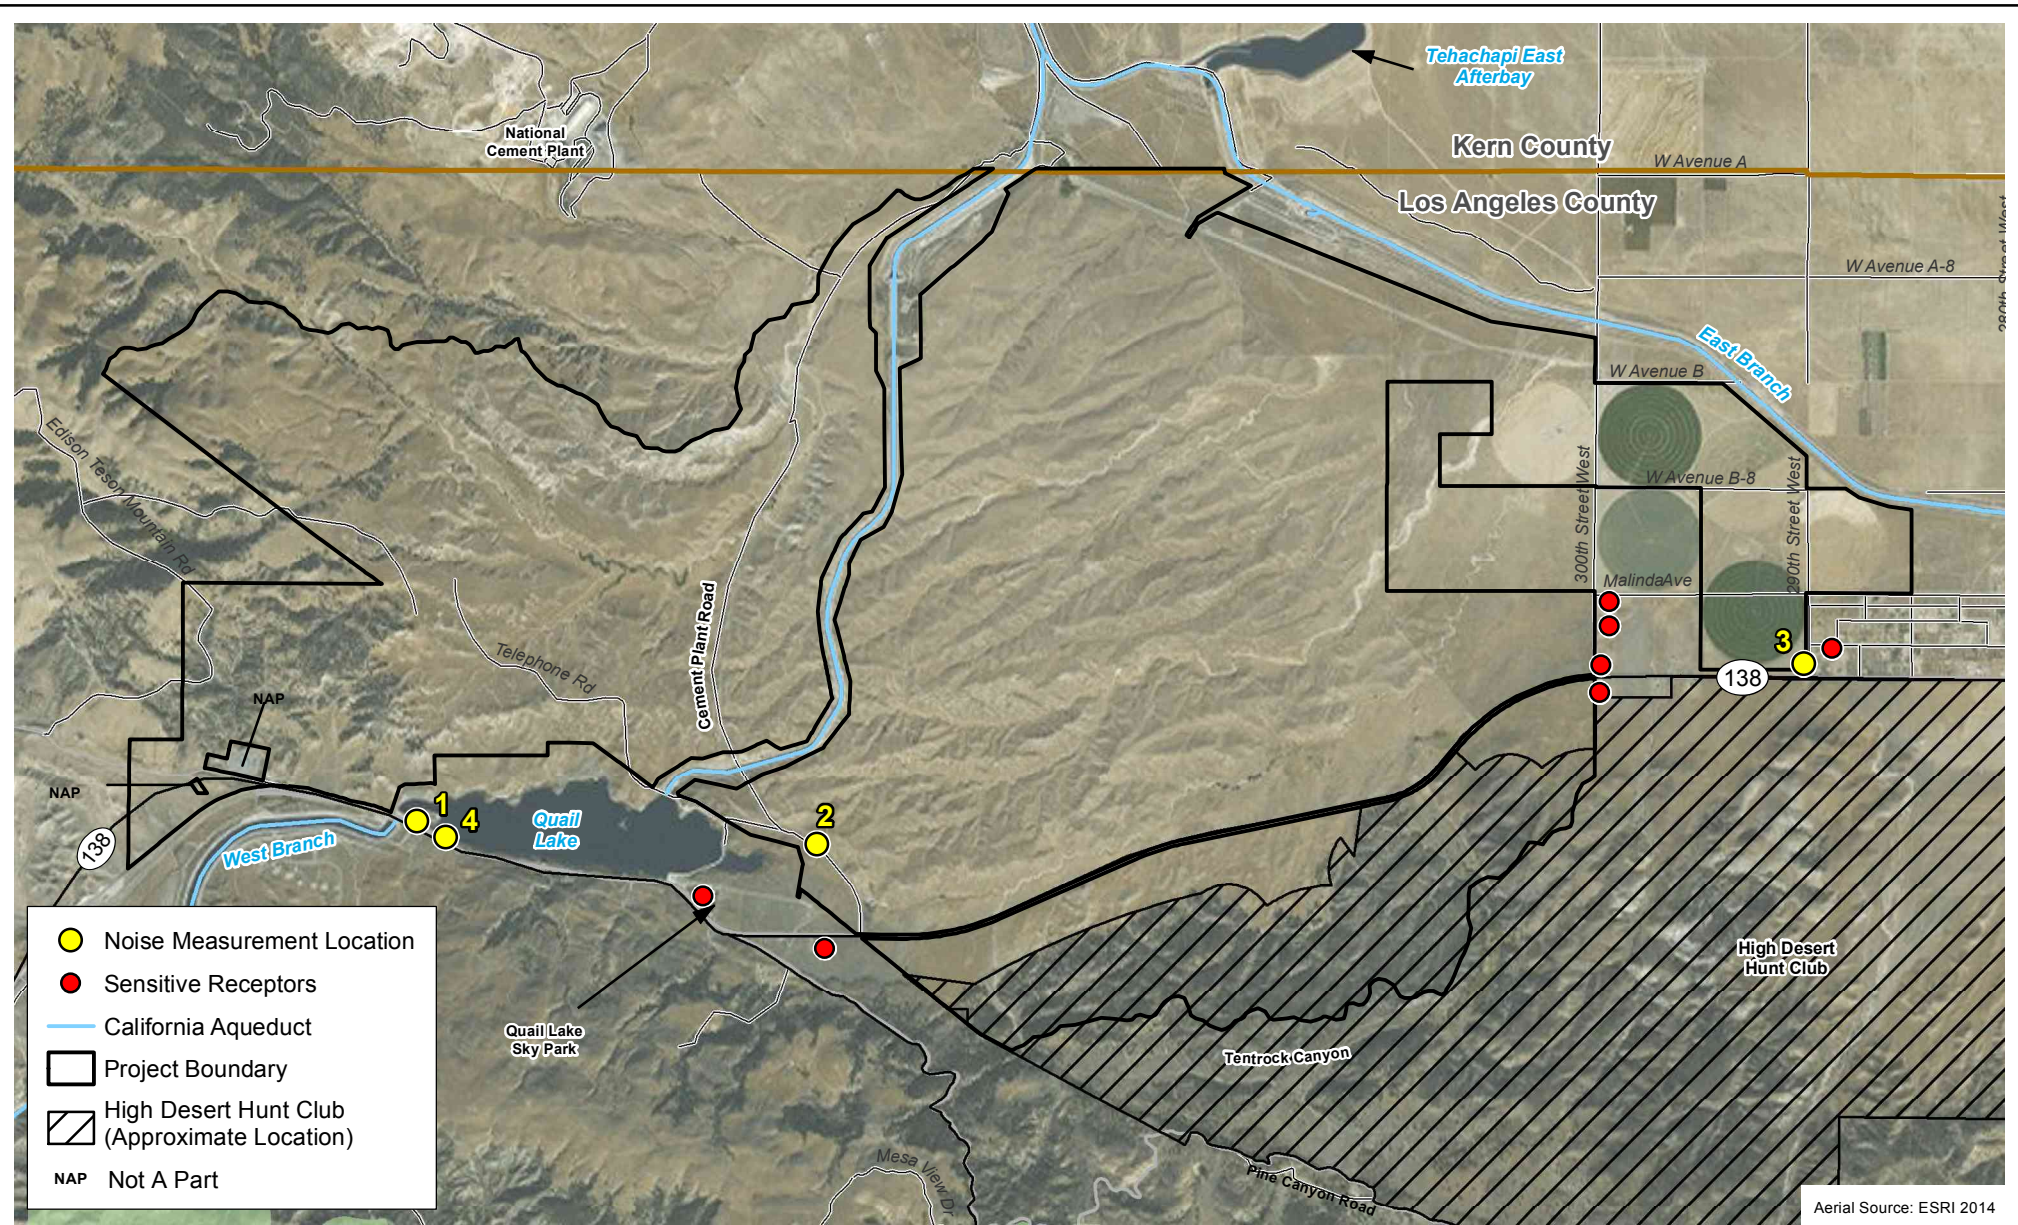

### **Existing Noise Sources**

Traffic on local streets and nearby highways is the predominant source of existing noise in the Project area. Other noise sources include activities at the Oso Pumping Station, the Alamo Power Plant, the Bailey Electric Substation, the National Cement Plant, the Quail Lake Skypark Airport, the High Desert Hunt Club, and military overflight activity. These noise sources are described below and their locations are depicted on Exhibits 3-2 and 5.20-1.

To characterize the existing noise environment, noise level measurements were taken on August 5, 2015 (short-term) and between August 5 and 7, 2015 (40-hour) using the LD 831 sound level meter as described above. Measurements were taken at four locations in the Project site study area, as shown in Exhibit 5.12-2, Noise Measurement Locations, and Table 5.12-5, Existing Measured Noise Levels.

### ***Traffic Noise Levels***

Existing traffic noise levels were estimated using an FHWA highway traffic noise model, as discussed above, adjacent to selected segments of the following roadways in the Project vicinity: I-5, SR-138, SR-14, and SR-99. The noise estimate is based on traffic volumes, speeds, truck mix, site conditions, and distance from the roadway to the receptor. Traffic volumes were derived from the traffic study prepared for the Project (Stantec 2015; see Appendix 5.10-A). The results of the traffic noise model are summarized in Table 5.12-6, Existing Traffic Noise Levels. This table describes the CNEL at the distance of the nearest noise-sensitive receptor (if any) from the centerline of the highway and the distances to the 60, 65, and 70 CNEL noise contours. The CNEL values described, although generally representative of existing traffic noise levels, do not consider any barrier effects that may be provided by topography, which would attenuate (reduce) actual noise levels.

**TABLE 5.12-6

### ***Oso Pumping Station and Alamo Power Plant***

Both the Oso Pumping Station and the Alamo Power Plant are located in the same general area at the northern end of the Project site (see Exhibit 5.20-1) adjacent to the California Aqueduct. During several site visits to the area by Psomas staff and Wieland Acoustics, neither facility produced audible noise levels at the fence lines.

### ***Bailey Electric Substation***

Bailey Substation is located in the southwestern portion of the site on a Not A Part (NAP) parcel owned by Southern California Edison (see Exhibit 5.20-1). Based on visits to the Bailey Electric Substation by Psomas and Wieland Acoustics on several occasions, the substation produces no audible noise levels at the fence line except for a low hum that was noticeable only when the background ambient noise level diminished. However, during a site visit on May 24, 2005, maintenance activity occurring at the substation produced measurable noise levels. The median noise level measured was about 45 dBA and the maximum noise level was about 59 dBA at the fence line (Wieland 2011).

---

### ***National Cement Plant***

The National Cement Plant is located over one mile north of the Project site behind the foothills of the Tehachapi Mountains (see Exhibit 3-2). During a site visit, Wieland Acoustics determined that activities at the facility were not audible at the fence line. In addition, although blasting at the National Cement Plant is understood to occur approximately twice a week, no blasting occurred during site visits as part of the noise assessment. Based on known average construction activity equipment levels (described in Table 5.12-8 in the analysis below), blasting is estimated to generate a noise level of approximately 94 dBA at a distance of 50 feet. More than 5,000 feet in distance and foothills separate the Project site and the National Cement Plant. Blasting noise levels are substantially attenuated by the presence of the intervening topography combined with distance. Therefore, the plant itself is not considered to be a significant noise source.

However, there is heavy truck traffic traveling on National Cement Plant Road and SR-138 in support of National Cement Plant operations. Measurements taken at Location 2 indicate that these trucks generate maximum noise levels of between 60 dBA and 74 dBA at a distance of 90 feet from the roadway center. During the noise measurement period taken in 2015, there was a truck passby approximately every three to five minutes. This frequency of trips is consistent with observations made by Wieland (2011).

### ***Quail Lake Skypark Airport***

The Quail Lake Skypark Airport is a privately owned facility that is used primarily for recreational activities (see Exhibit 3-2). There are five single-engine planes and one multi-engine plane based at the airport (AOPA 2015). Having one runway and no control tower, it does not support commercial aviation activities. As such, no operational data is available, and CNEL noise contours have not been developed for this airport. However, with its use of general aviation (non-jet) aircraft and its limited operations, it is highly unlikely that any noise contours above 55 dBA CNEL would extend much beyond the boundaries of the airport. Noise from aircraft overflights may occasionally be experienced in the study area, though none was experienced during numerous site visits as part of the noise assessment. As discussed in Section 4.0, Project Description, the California Department of Transportation (Caltrans) is preparing environmental clearance documents in support of improvements to the SR-138 in the Project area. The Quail Lake Skypark would be permanently closed in the event the SR-138 improvements are implemented.

### ***High Desert Hunt Club***

The High Desert Hunt Club (Hunt Club) is a private facility owned and operated by the Tejon Ranch Company (see Exhibit 3-2). It currently operates under Conditional Use Permit (CUP) No. R2013-01180-(5) issued by the Los Angeles County Department of Regional Planning in August 2015. The CUP defines numerous conditions whose purpose is to ensure that Hunt Club operations are compatible with the surrounding land uses as they were present at the time of CUP issuance (DRP 2015d). Many of these conditions relate to noise, and include provisions such as, but not limited to:

- Limiting the annual schedule (between September 1 of any year to April 30 and no hunting on Thanksgiving Day, Christmas Day, New Year's Day, and Easter Sunday).
- Limiting daily hours of hunting operations (between 8:00 AM and 4:00 PM).
- Instituting a safety/buffer zone of between 150 yards and 250 yards from the property boundary, public roads, and the Pacific Crest Trail for each hunting field within which no discharge of firearms will be permitted.
- Limiting the maximum number of hunters in the fields at any one time to 100 with the daily average number of hunters in the field not to exceed 60 over the entire hunting season.
- Requiring that firearms not be discharged in the general direction of any house, camp, place of human habitation, public highway, street, way (including the Pacific Crest Trail), park, or premises unless at least one-half mile from such place.

The facility is generally open Thursday through Monday between 8:00 AM and 4:00 PM in accordance with the CUP-conditioned dates for hunting (i.e., September 1 through April 30), but is open on Tuesday and Wednesday for guided valley quail hunts during the State valley quail season (mid-October through January).

The currently permitted Hunt Club boundaries overlap with the southern portion (that portion south of SR-138) of the Project site. The Project would dedicate this overlap as Open Space, which is located within a County-designated Significant Ecological Area (SEA). The overlap of the Hunt Club boundary would have no effect on Hunt Club operations, and the areas of hunting activities would remain unchanged if the Project were implemented. The primary noise source of concern related to the Hunt Club is shotgun fire (i.e., bird shot). However, the facility was closed during both BonTerra Psomas' and Wieland Acoustics' site visits, and noise measurements of actual Hunt Club activities could not be obtained.

### ***Military Overflights***

Based on the Military Overflight Noise Study prepared by Advanced Engineering Acoustics in September 2004, the CNEL for two military training flights per week passing over the Project site is estimated to range from less than 10 dBA to 53 dBA, depending on which military training route (MTR) is used and the flight path of the aircraft in each MTR (AEA 2004). The SEL for these flights is estimated to range between 53.0 dBA and 108.8 dBA (AEA 2004). During site visits in 2015 by BonTerra Psomas staff, occasional military overflights were readily audible and could be characterized as "loud".

## **5.12.4 PROJECT DESIGN FEATURES**

Refer to PDF 10-1 in Section 5.10, Traffic, Access, and Circulation

## **5.12.5 THRESHOLD CRITERIA**

The following threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

---

<b>Threshold 12-1</b>	Result in exposure of persons to, or generation of, noise in excess of standards established in the County General Plan or noise ordinance (Los Angeles County Code, Title 12, Chapter 12.08), or applicable standards of other agencies.
<b>Threshold 12-2</b>	Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels.
<b>Threshold 12-3</b>	Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project, including noise from parking areas.
<b>Threshold 12-4</b>	Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project, including noise from amplified sound systems.
<b>Threshold 12-5</b>	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels.
<b>Threshold 12-6</b>	For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.

### 5.12.6 ENVIRONMENTAL IMPACTS

<b>Threshold 12-1</b>	<b>Would the project result in exposure of persons to, or generation of, noise levels in excess of standards established in the County General Plan or noise ordinance (Los Angeles County Code, Title 12, Chapter 12.08), or applicable standards of other agencies?</b>
-----------------------	---

For purposes of this analysis, this impact would occur if:

- The exterior CNEL at proposed noise-sensitive land uses would exceed 65 dBA; or
- The interior CNEL would exceed 45 dBA in habitable rooms at proposed residences, hotels, schools, or places of worship (specified in the California State Building Code and County Building Code); or
- The noise levels generated by non-transportation (i.e., stationary) sources on the Project site would exceed the exterior limits specified in the County Code (shown in Table 5.12-2); or
- The construction activities generate noise levels in excess of the County Code standards (refer to Table 5.12-3).

### On-Site Impacts

Receptors on the Project site would be exposed to both internal and external long-term (operational) noise sources. Examples of internal sources include traffic on the Project

roadways and stationary sources such as school activities and commercial centers. Examples of external sources include activities at the Oso Pumping Station, the National Cement Plant, and the Bailey Electrical Substation, among others. On-site receptors would also be exposed to temporary construction noise.

**Traffic.** Traffic generated by the Project would be the internal noise source with the greatest impact on sensitive receptors on the Project site. Exhibit 5.12-3, On-Site Circulation System, Average Daily Traffic (ADT) Volumes, and Speeds, shows the road system on the Project site as well as the traffic volumes and posted speed limits for each road classification.

For proposed noise-sensitive land uses, a potential significant impact is identified where the exterior noise contour exceeds 65 dBA at that location. This criterion is stated in the AVAP EIR. Further, because current standard residential and hotel construction provide at least 20 dBA of noise reduction with windows and doors closed, where the exterior CNEL exceeds 65 dBA, the interior CNEL has the potential to exceed 45 dBA, which would exceed the California Building Code and County Building Code standards.

Using a typical residential traffic mix in the FHWA Traffic Noise Prediction Model, traffic noise levels of 65 dBA CNEL at a distance of 50 feet from the roadway centerline were calculated for collector (35 miles per hour) and limited secondary (40 miles per hour) roads. The limiting traffic volumes for collector and limited secondary roads are 10,000 and 6,500 ADT, respectively. With volumes exceeding these limits on these roads, and on all roads of higher classifications, significant traffic noise impacts may occur at adjacent residences, hotels, schools, and places of worship.

Mitigation Measure (MM) 12-1, included in Section 5.12.7 below, would require the completion of an acoustical analysis for each proposed residential, hotel, school, and place of worship that may be affected by significant noise levels from traffic to verify that the residential units and other receptors have been properly designed to comply with the 65 dBA exterior noise level limit and the 45 dBA  $L_{dn}$  or CNEL or less noise level for habitable interior living areas (residences and hotels), classrooms, and rooms used for patient care and worship.

The specific noise-reduction measures that would be applied at each potentially impacted land use cannot be defined until future tract maps have been prepared and the site-specific acoustical analysis (i.e., MM 12-1) is performed. However, the land uses proposed as part of the Project are routinely constructed in Southern California and are able to meet the applicable noise standards through use of common, feasible methods and materials.

In addition to standard construction designs and materials that reduce noise, other methods may be implemented in accordance with the requirements of MM 12-1, which may include strategic planting of street and front yard trees to buffer sensitive receptors; use of quieter busses and trucks, and/or designing and positioning the buildings on the lots to face away from noise sources. Therefore, implementation of MM 12-1 would reduce these impacts to a less than significant level.

# On-Site Circulation System, Average Daily Traffic (ADT) Volumes, and Speeds

## Exhibit 5.12-3

Centennial Project

---

**Stationary Source Noises – Internal Noise Sources**

The Project would include a number of land uses where installed equipment or activities may generate noise levels that could create a significant impact at areas adjacent to and on the Project site. These land uses include commercial/retail, business park, schools, community uses (e.g., fire station, library), community recreation areas, and utilities. It should be noted that outdoor activities conducted at parks and schools are not included in the following discussion; as discussed in Section 5.12.2, Section 12.08.570 of the County Code they are specifically excluded from the provisions of the Los Angeles County Noise Ordinance.

**Commercial/Retail Centers.** As shown in Exhibit 4-1, the Project's commercial uses would be within and adjacent to residential areas. The primary noise sources associated with commercial/retail areas include mechanical equipment (discussed above), loading dock activities, and menu board loudspeakers at fast food restaurants. In order to characterize the noise levels that may be generated by loading dock activities, measurements obtained at a Ralph's supermarket as part of a previous study by Wieland Acoustics (Reference 16 in Appendix 5.12-A) were used as the basis of potential noise levels within the Project. The measurement position was located about 210 feet in front of the loading dock at the approximate centerline of the bays. During the course of a 1 hour and 40 minute noise measurement during the busiest delivery period at the site, a number of trucks of various sizes were observed arriving, making deliveries, and leaving. Based on the measurement, loading docks generate an average noise level of 64 dBA. The noise study assumed that the level of loading dock activity and the measured  $L_{eq}$  at the measurement location are representative of that which would occur at the Project site.

As well as the activities in the loading docks, there would be noise associated with the arrival and departure of the delivery trucks themselves. As these trucks drive around the rear of the store, they may pass by neighboring properties. The large (i.e., 3 or more axles) and medium (i.e., 2-axle) trucks that would be used to make deliveries to the store typically generate maximum noise levels of 86 and 76 dBA, respectively, at a distance of 50 feet when operated by an experienced "reasonable" (not excessive) driver with typically applied accelerations. Higher noise levels may be generated by the excessive application of power. Lower levels may also be achieved, but would not be considered representative of an average truck operation.

In order to characterize the typical noise level that may be generated by vehicles in the drive-through lane of a fast food restaurant, measurements obtained as part of a previous Project by Wieland Acoustics at an existing fast food restaurant in Riverside were used as the basis of potential noise levels within the Project. These measurements were obtained at a position directly across from the menu board (a distance of ten feet from the vehicles). During the course of a 1-hour measurement, there were approximately 18 vehicles using the drive-through lane. This amount of activity produced an average noise level of about 56 dBA.

Based on the above discussion, activities at the commercial/retail centers on the Project site would have the potential to generate noise levels that would significantly impact neighboring properties prior to mitigation. Implementation of MM 12-2, in Section 5.12.7

below, would require the completion of an acoustical analysis for each commercial/retail use in order to verify that the Project has been properly designed to comply with the County of Los Angeles's noise ordinance standards at the nearby sensitive properties (both on and off site). However, the land uses proposed as part of the Project are routinely constructed in Southern California and are able to meet the applicable noise standards through use of common, feasible methods and materials, including incorporating design features such as building setbacks from the sensitive receptors; noise barriers; building orientation relative to the sensitive receptor; sound-rated windows; and upgraded exterior wall and/or roof construction. MM 12-2 would reduce these impacts to a less than significant level by requiring an acoustical analysis for each commercial/retail land use.

**Business Park.** As described in Section 4.5.4 and shown in Exhibit 4-1, the Project would develop business park uses. Typical noise sources in business parks include heating, ventilating, and air conditioning (HVAC) equipment, loading docks, and mechanical noise, such as tools and equipment used for light manufacturing and repair services. As shown in Exhibit 4-1, the business park land uses would be separated from noise-sensitive land uses by open space and/or SR-138. However, until future tract maps are designed, the potential remains for noise levels to exceed the noise standards in the County Code. To avoid significant noise impacts, MM 12-2 would be incorporated into the Project and would require the completion of an acoustical analysis for each business park use in order to verify that the Project has been properly designed to comply with the County of Los Angeles's noise ordinance standards at the nearby sensitive properties (both on and off site). The land uses proposed as part of the Project are routinely constructed in Southern California and are able to meet the applicable noise standards through use of common, feasible methods and materials. However, implementation of MM 12-2 would reduce these impacts to a less than significant level.

**Schools.** As previously noted, outdoor activities at schools are exempt from the provisions of Chapter 12.08 of the County Code. However, stationary sources at schools, such as HVAC equipment, has the potential to exceed the County Code noise limits. MM 12-2, in Section 5.12.7 below, would require the completion of an acoustical analysis for each school use in order to verify that the Project has been properly designed to comply with the County of Los Angeles' noise ordinance standards at the nearby sensitive properties (both on and off site). As stated before, the land uses proposed as part of the Project are routinely constructed in Southern California and are able to meet the applicable noise standards through use of common, feasible methods and materials. Regardless, implementation of MM 12-2 would reduce these impacts to a less than significant level.

**Community Use Areas.** The Project reserves and/or permits locations for schools, parks, a library, a sheriff station, and fire stations to serve future residents and employees as described in Section 4.5.13 of this EIR. Noise sources from community use facilities that would have the potential to affect adjacent land uses could include delivery trucks in loading/unloading docks at schools, trash pickup from dumpsters and compacting, occasional emergency generator use, and siren testing at fire stations. Table 5.12-7, Estimated Noise Levels from Community Use Area Activities, identifies the estimated noise levels at a distance of 100 feet for each of these types of community uses.

**TABLE 5.12-7  
ESTIMATED NOISE LEVELS FROM COMMUNITY USE AREA ACTIVITIES**

	<b>Fire Station</b>	<b>Library</b>	<b>Police Substation</b>
Operation of Medium Delivery Truck	–	52	–
Trash Pickup and Compacting	64	64	64
Emergency Generator	65	–	65
Siren (during testing)	66	–	–
<b>Combined Noise Level of All Sources</b>	<b>70</b>	<b>65</b>	<b>68</b>
Source: Wieland Acoustics 2011 (Appendix 5.12-A).			

Based on Table 5.12-7, noise levels generated by activities at the community use areas may create a significant impact at neighboring properties without mitigation.

Another noise source related to community use areas would be mechanical equipment, such as air conditioning or refrigeration units and their associated inlet and exhaust systems. Based on various manufacturers' published data and prediction algorithms, typical mechanical equipment noise levels are in the range of 41–58 dBA at a distance of 50 feet. Depending on where the equipment is located relative to the nearby properties, the unmitigated noise levels produced by the mechanical equipment may exceed County standards. Therefore, this impact is also potentially significant without mitigation.

MM 12-2, in Section 5.12.7 below, would require the completion of an acoustical analysis for each community use area in order to verify that the Project has been properly designed to comply with the County of Los Angeles' noise ordinance standards at the nearby sensitive properties (both on and off site). The land uses proposed as part of the Project are routinely constructed in Southern California and are able to meet the applicable noise standards through use of common, feasible methods and materials. Implementation of MM 12-2 would reduce these impacts to a less than significant level.

Additionally, the Project's design, as depicted in Exhibit 4-1, Conceptual Land Use Plan, incorporates compact, walkable and bikeable development pattern, which reduces trips and associated noise. The proposed well-connected street grid would disperse traffic rather than concentrating it, and narrower road lane widths and tighter curb radii would help slow cars down, reducing traffic noise.

**Parks and Recreation Areas.** Public and private park and recreation areas would be developed on the Project site as described in Section 4.5.6 of this EIR. The range of potential uses that could be developed represents a range of potential noise sources, such as dogs barking in kennels to crowds cheering at a baseball field. Because the type of land use(s) that would ultimately be developed is not yet defined, specific resulting noise levels cannot be estimated. However, for some activities and locations, such as private recreation areas that are not exempted by Section 12.08.570 of the County Code, the noise impact would have the potential to be significant without mitigation. Because the impact would depend on the use(s) selected for the proposed parks and recreation areas and their proximity to the

adjacent properties, implementation of MM 12-2, described below, would reduce these impacts to a less than significant level by requiring a land use-specific acoustical analysis to verify that each planned park and recreation area has been properly designed to comply with the County's noise ordinance standards.

**Transportation Demand Management.** The Project's Mobility Plan incorporates Transportation Demand Management (TDM) features to reduce dependence on the automobile and to provide for a more efficient use of transportation resources among Project occupants (PDF 10-1, in Section 5.10, Traffic, Access and Circulation). The Mobility Plan requires the formation and funding of a Transportation Management Agency (TMA) prior to the issuance of the first occupancy permit. The TMA is responsible for monitoring the form of travel, or transit modes, used by the people who live and work in Centennial, and enforcing that the Project meets its mobility objectives. Consistent with state and regional transportation, air quality and greenhouse gas planning objectives that focus on reducing the use of single occupancy vehicles (SOVs) for travel, the Project must meet the following mobility performance standards: (1) a minimum of 20 percent of total daily peak morning and afternoon external (e.g., commuting) trips must be completed by using non-SOV transit modes; and (2) a minimum of 30 percent of total daily internal (e.g., local) trips must be completed by using non-SOV transit modes. The TMA is responsible for conducting travel mode surveys and implementing TDM measures as required to verify the achievement with these mobility performance standards. These efforts to reduce single-occupancy vehicle use would also result in reduced traffic noise.

Dedicated areas for transfers between transit modes and for the staging of carpooling/ridesharing would be provided. A system of bikeways would allow for safe and efficient bicycle travel throughout the community. As part of land use planning, pedestrian amenities have been fully considered and a system of on-street and off-street facilities allow pedestrian access throughout the community. Finally, facilities for Neighborhood Electric Vehicles (NEV) are also proposed (Stantec 2015).

At park-and-ride areas and transit stations, cars and buses would generate noise. Using a computer model developed for the Federal Transit Administration (FTA) and assuming that, during the peak hour, 100 vehicles and 3 buses will access the facility, the level of activity would produce an average noise level of 58 dBA at a distance of 50 feet (Wieland 2011). This estimated noise level of 58 dBA would further attenuate (lessen) with distance to sensitive noise receptors in proposed development areas on the Project site. Regardless, the noise levels generated by vehicle movements at the transportation center are exempt from the provisions of the County's noise ordinance (Section 12.08.570). Impacts from park-and-ride areas and transit stations would be considered less than significant.

**Animal Control Facility.** An animal control facility would be constructed and operated when, in the judgement of the County, such a facility is required, as described in Section 4.5.13 of this EIR. The facility would include up to 54 dog kennels, a cat room (with up to 40 cages), and may include a facility to house farm animals and reptiles. The noise from barking dogs can especially be disturbing to nearby land uses and would be a potential significant noise impact. Implementation of MM 12-2 would reduce these impacts to a less than significant level by requiring an acoustical analysis for the animal control facility.

**Utilities.** Proposed water and wastewater facilities and proposed dry utilities are described in Sections 4.5.9 and 4.5.10 of this EIR, respectively. Utilities would include, but are not limited to, a water treatment plant, booster pump stations, wells, wastewater lift stations, and two wastewater reclamation facilities. The Project includes the option for a Materials Recovery Facility/Solid Waste Transfer Facility (MRF/SWTF) and green waste mulching and composting facility, as described in Section 4.5.15 of this EIR. Additionally, land for the maintenance yards for the Los Angeles County Department of Public Works and the Department of Parks and Recreation would be provided adjacent to the permanent wastewater reclamation facility site, as described in Section 4.0, Project Description.

The primary sources of noise at water treatment plants and wastewater reclamation facilities include pumps and blowers. Depending on their size, pumps can generate noise levels of up to 95 dBA at a distance 50 feet, while blowers can generate noise levels of 67 dBA or more at the same distance. Operational noise at an MRF would be generated by activities related to truck movements and the use of heavy equipment operating in the tipping rooms. Idling trucks at these locations produce an average noise level of about 73 dBA at a distance of 50 feet. Another source of noise associated with an MRF is from operations within the refuse room, specifically, those areas where trucks enter and leave this room.

Noise measurements obtained as part of a previous study by Wieland Acoustics indicate an average noise level of 77 dBA at a distance of 85 feet from the structure's opening, indicating average noise levels emanating from the facility at this distance. Operational noise at an electrical substation would be produced by transformers, which can produce noise levels of about 69 dBA at a distance of 50 feet. Therefore, activities at the utilities may generate noise levels that would create a significant impact at neighboring properties without mitigation. Implementation of MM 12-2, described in Section 5.12.7, would reduce these impacts to a less than significant level by requiring an acoustical analysis for each proposed utility facility.

### ***Stationary Source Noises – External Noise Sources***

**Oso Pumping Station and Alamo Power Plant.** As discussed above, during several site visits to the area, neither facility was producing audible noise levels at the fence lines. Therefore, the impact of these noise sources on the Project site is considered less than significant.

**Bailey Electric Substation.** Based on measurements obtained at this site, the median noise level generated by the substation is about 45 dBA and the maximum noise level is about 59 dBA, with the noise measured during a maintenance activity. Referring to the land use plan for the Project (Exhibit 4-1), the substation would be surrounded by open space and not near sensitive noise receptors. Therefore, there would be no potential for a significant noise impact.

**National Cement Plant.** As discussed above, the noise source of concern is truck traffic in support of National Cement Plant operations on National Cement Plant Road and on SR-138. National Cement Plant Road traverses the Project site in a north to south direction that roughly parallels the California Aqueduct. Trucks on National Cement Plant Road generate maximum noise levels of about 60 to 74 dBA as measured at a distance of 100 feet from the center of the roadway. The average measured single noise event level (SEL) was 85.

The actual number of trucks that access the National Cement Plant during a typical day could not be obtained; therefore, it is not possible to exactly calculate the CNEL generated by these vehicles. To provide a worst-case assessment, it was assumed that (1) 15 trucks per hour is typical of normal operations; (2) operations begin at 6:00 AM; and (3) operations continue for 8 hours. Based on these assumptions, it was estimated that the CNEL generated by the truck movements is 60 dBA at a distance of 44 feet from the center of the Cement Plant Road (Wieland 2011). Based on the realignment of National Cement Plant Road to connect to SR-138 on the west side of Quail Lake, as discussed in Section 4.5.5 of this EIR, the majority of the roadway traverses Open Space-designated areas. Segments of the realigned roadway would be adjacent to Very Low, Low, and Medium Density Residential land uses to the west of the Aqueduct. Assuming that standard residential construction provides 20 dBA of noise reduction with windows and doors closed, the interior CNEL will be about 40 dBA. This is less than the County Building Code standard of 45 dBA; therefore, the impact would be less than significant.

It is understood that blasting occurs at the National Cement Plant approximately twice a week. As shown in Table 5.12-8, Typical Maximum Construction Noise Levels (in the construction noise analysis below), blasting generates a typical noise level of about 94 dBA at a distance of 50 feet. Projecting this to the distance of the nearest portion of the Project site proposed for development (i.e., at least 7,500 feet from the east end of the Cement Plant property to the proposed residential on the east side of the Aqueduct) yields a noise level of less than 45 dBA. This level complies with the Los Angeles County exterior noise daytime standard of 45 dBA for noise-sensitive areas and 50 dBA for residential properties (Table 5.12-2); therefore, there would be a less than significant impact.

**Quail Lake Skypark Airport.** As discussed above, because the Quail Lake Skypark's facilities and operations are minimal (one runway and no control tower) and do not support commercial aviation activities, CNEL noise contours are not available for this facility. However, with its use of only small-scale general aviation (non-jet) private aircraft and its limited operations, it is unlikely that any noise contours for 55 dBA CNEL and above would extend much beyond the boundaries of the airport. Therefore, its impact on the overall noise environment at the Project site is considered to be less than significant.

**High Desert Hunt Club.** The Hunt Club has many designated hunting areas. Most of the hunting areas are ½ to 2 ½ miles from portions of the Project site planned for development. One relatively small hunting area, compared to the total amount of hunting area within the Hunt Club, is located approximately ½ mile south of the intersection of SR-138 and 300<sup>th</sup> Street West.

An estimate of gunshot noise from the Hunt Club to the nearest receptors at the Project site assumes that gunshots are fired from the closest hunting area. As previously discussed, the primary noise source from the Hunt Club is shotgun firing. For purposes of this noise estimate, a source noise level of 110 dBA at a distance of 110 feet is used. This source data is based on rifle firing data as shotgun fire is somewhat quieter than rifle fire (Wieland 2011). The closest proposed development to the northernmost hunting area would be Business Park, to be located at the southwest quadrant of SR-138 and 300<sup>th</sup> Street West, approximately 1,200 feet from the hunting area. Attenuation of noise over a hard surface

would reduce the gunshot noise to approximately 79 dBA. The intervening topography and soft terrain would likely reduce the gunshot noise level to less than 70 dBA at the Business Park area.

The closest proposed residential development to the northernmost hunting area would be north of SR-138 and west 300<sup>th</sup> Street West, approximately 3,000 feet from the hunting area. Attenuation of noise over a hard surface would reduce the gun shot noise to approximately 71 dBA. The intervening topography and soft terrain would likely reduce the gun shot noise level to less than 60 dBA at the closest residences.

Ambient noise at the southeast portion of the Project site that is closest to the Hunt Club would be dominated by traffic noise. However, the character of gunshot noise is different than traffic noise, and gunshot noise from the Hunt Club would be occasionally and intermittently heard at residences and businesses. Gunshot noise is considered an impulsive noise source due to the high magnitude short duration characteristic of this noise source. Though gunshot noise is audible, considering the expanse of hunting areas within the Hunt Club, the limited times for hunting (see the “Existing Noise Sources” section above), and the short duration of noise events, the addition of gunshot noise to the forecasted traffic noise CNEL would be negligible. The impact would be less than significant.

**Military Overflights.** Military Training Routes (MTRs) that would potentially affect the Project site originate from Edwards Air Force Base, China Lake Naval Air Warfare Center, Miramar Marine Base, and Lemoore Naval Air Station (see Section 5.3, Hazards and Fire Safety, for more information). As mentioned previously, a technical study was prepared to evaluate potential impacts related to military overflights in the Project vicinity. As discussed above, the CNEL for two military training flights per week passing over the Project site is estimated to range from less than 10 dBA to 53 dBA, depending on which MTR is used and the flight path of the aircraft in each MTR. The SEL for these flights is estimated to range between 53.0 dBA and 108.8 dBA.

While the existing and Projected military overflight activity is not estimated to exceed County CNEL standards and would not therefore result in a significant impact under the thresholds defined above, it does result in briefly higher noise levels (i.e., less than two seconds). How great a nuisance these periodic SELs are perceived to be is subjective and would vary from person to person. Additionally, the Project site is not unique in having MTRs and other types of military flight activity cross over or near its boundaries. Based on the most recent publicly available Digital Aeronautical Flight Information from the National Geospatial-Intelligence Agency, areas of military restriction (including both MTRs and military operating areas<sup>2</sup> [MOAs]) and other restricted areas overlie 44 percent of all land in California and 58 percent of the land in Southern California. Within the areas of military restriction, MTRs overlie 27 percent of the state and 36 percent of Southern California. While these corridors of military flight activity are distributed across most areas of the state, they do not overlie the most populous urban centers, such as San Francisco, Los Angeles, and the southwestern coastline to San Diego (NGIA 2004). However, many urban and suburban

---

<sup>2</sup> A military operations area (MOA) is airspace established outside Class A airspace to separate or segregate certain nonhazardous military activities. (FAR Part 1, Section 1.1).

areas across Southern California have existing routine military flight activity, including MTRs. The potential noise impact from MTR activity over the Project site is addressed below.

The MTR program is a joint venture by the Federal Aviation Administration (FAA) and the U.S. Department of Defense (DoD). The FAA has specific requirements regarding the altitude of MTR flights. Existing regulations prohibit military aircraft from flying lower than 500 feet above ground level (AGL) over sparsely populated areas and lower than 1,000 feet AGL over inhabited areas or lower than 1,000 feet over the tallest obstacle over any congested area of a city, town, or settlement (Federal Aviation Regulations [FAR], Section 91.119).

The Project Applicant has had discussions with military representatives concerning military flight routes in the vicinity of the Project site. Once development of the Project has progressed to the point where at least a portion of the site is considered to be inhabited, FAR Section 91.119 would prohibit aircraft flying at altitudes lower than 1,000 feet AGL. The principal military authority, after examining the actual Project plan, concluded that “we have come to a mutual understanding that the existence of DOD (Department of Defense) Military Training Routes [sic] (MTRs) over Tejon Ranch Company (TRC) development footprints for Centennial . . . should not preclude your planning efforts with regard to [this] area. The military services’ analysis of the information you have provided has not identified any threshold issues that would render Tejon Ranch’s development plans incompatible with DOD operations along MTRs in the vicinity” (Betancourt 2004). The military has indicated they would cooperate to minimize impacts to the Centennial site, though no formal agreement has been implemented to date. Therefore, while it is acknowledged that the Project site would be subject to periodic and brief SELs that may be considered a nuisance, for the reasons described above, it would be considered a less than significant impact on the Project site.

### ***Construction Noise***

Construction would be limited to the hours of 7:00 AM to 7:00 PM, Monday through Saturday, with no construction on Sundays or holidays in compliance with the County Code requirements.

Construction noise levels at off-site receptors and future on-site receptors would fluctuate depending on the particular type, number, and duration of use of various pieces of construction equipment. Additionally, while the total construction period is approximately 20 years, an audible increase in the ambient noise level due to construction experienced at any individual receptor would be relatively short-term and temporary.

Individual receptors would experience a period of construction noise that is typical of similar urban development (i.e., earth movement, building construction, infrastructure), regardless of the overall size of the Project and total construction period. Due to the effect of noise attenuation, noise-sensitive receptors would not experience a noise increase that exceeds the County standard during the entire construction period, but only during the period(s) when such activity is within close proximity to each receptor. Additionally, because of the large size of the site, the proportion of the total construction period when development would be occurring close enough to receptors to result in a construction noise increase exceeding County standards would be minimal.

Construction noise is related primarily to the use of heavy equipment. Typical maximum noise levels generated by representative pieces of construction equipment are listed in Table 5.12-8, Typical Maximum Construction Noise Levels.

**TABLE 5.12-8  
TYPICAL MAXIMUM CONSTRUCTION NOISE LEVELS**

<b>Equipment</b>	<b>Noise Level (dBA) at 50 ft</b>	<b>Acoustic Usage Factor</b>
Auger Drill Rig	85	20%
Backhoe	80	40%
Blasting	94	1%
Chain Saw	85	20%
Clam Shovel	93	20%
Compactor (ground)	80-82	20%
Compressor (air)	80	40%
Concrete Mixer Truck	85	40%
Concrete Pump	82	20%
Concrete Saw	90	20%
Crane (mobile or stationary)	85	20%
Dozer	85	40%
Dump Truck	84	40%
Excavator	85	40%
Front End Loader	80	40%
Generator (25 KVA or less)	70	50%
Generator (more than 25 KVA)	82	50%
Grader	85	40%
Hydra Break Ram	90	10%
In situ Soil Sampling Rig	84	20%
Jackhammer	85	20%
Mounted Impact Hammer (hoe ram)	90	20%
Paver	85	50%

Each phase of construction has a different equipment mix depending on the work to be accomplished during that phase. Each phase also has its own noise characteristics; some will have higher continuous noise levels than others, and some have high-impact noise levels. The noisiest phase of construction would be site preparation and grading. Based on the anticipated grading activity for the Project, the number and combination of equipment anticipated to be used, and the construction noise levels described above, the average combined construction noise levels for an average year of Project grading construction noise levels were estimated and are summarized in Table 5.12-9.

**TABLE 5.12-9  
ESTIMATED GRADING CONSTRUCTION NOISE LEVELS**

<b>Construction Phase and Equipment</b>	<b>Maximum Equipment Noise Level at 50 feet (dBA)<sup>a</sup></b>	<b>Usage Factor<sup>a</sup></b>	<b>Average Equipment Noise Level at 50 feet with Usage Factor (dBA)</b>
<b>Grading and Site Preparation – Average Year</b>			
10 scrapers	85	0.40	91.0
7 dozers	85	0.40	89.5
2 compactors	82	0.20	78.0
2 water trucks	84	0.40	83.0
1 grader	85	0.40	81.0
<b>Combined Noise Level</b>			<b>94.0</b>
dBA: A-weighted decibels			
<sup>a</sup> See Table 5.12-8.			
Source: Thalheimer 2000; FTA 2006			

As shown in Table 5.12-9, combined site preparation and grading noise levels would be 94 dBA  $L_{eq}$  at a distance of 50 feet for the calculation that assumes that all equipment is located at the centroid of a grading operation. Of course, in practice, the equipment would operate at some distance from the centroid in various directions. During an average year, with a noise level of 94 dBA at 50 feet (as calculated in Table 5.12-9), noise levels would be attenuated to the County standard of 75 dBA for mobile equipment at a distance of approximately 450 feet from the centroid of the grading operation. If the terrain between the grading work and a receptor would be acoustically “soft” or if the topography breaks the line of sight between the grading and the receptor, noise levels at 450 feet would be less than 75 dBA. During the anticipated peak year of grading, there could be as many as 26 scrapers and 18 dozers operating and the calculated noise level at 50 feet from the centroid would be 98.2 dBA. In this case, noise levels would be attenuated to the County standard of 75 dBA for mobile equipment at a distance of approximately 700 feet from the centroid of the grading operation.

Given the large size of the Project site, it is unlikely that site preparation and grading activities would occur in relatively small areas where the centroid of grading operations would be within 700 feet of off-site residences or other off-site sensitive receptors. Grading

noise would be audible above ambient noise levels at off-site receptors when individual pieces of equipment approach Project boundaries near the receptors, but noise levels at the receptors would not be expected to exceed 75 dBA  $L_{eq}$ . The impact would be less than significant.

Future occupants of homes, schools, or other noise-sensitive receptors on the site could be similarly exposed to construction noise from development on other parts of the site, until buildout of the Project is complete. Because of the large area of each phase of grading, the grading noise impact would be similar to the impacts described above for off-site receptors. The impact would be less than significant.

Upon completion of grading, construction activities, including trenching, foundation construction, building, and paving, would occur. These activities could occur near off-site sensitive receptors, particularly those near the Project boundaries at the southeast portion of the Project site, and future on-site sensitive receptors. Mobile equipment, such as backhoes and loaders, move around a construction site and work intermittently. Average noise levels would be substantially less than the maximum noise levels shown in Table 5.12-8 and would not be anticipated to exceed the 75 dBA noise ordinance limit.

Stationary noise sources associated with Project construction would include air compressors, generators, and cranes. As shown on Table 5.12-8, the maximum noise levels from operation of a generator at 50 feet are approximately 82 dBA with a load factor of 50 percent. The most restrictive County daytime stationary equipment noise standard is 60 dBA (Table 5.12-3). The noise level from a generator would not exceed 60 dBA  $L_{eq}$  at distances of 450 feet. As there is a potential for stationary equipment to be located within 450 feet of a sensitive receptor, the noise impact is potentially significant. MM 12-3 would be incorporated into the Project and would require stationary equipment to operate at a distance of greater than 450 feet or provide an enclosure or similar noise attenuation to limit the average hourly daytime noise level to 60 dBA or less. With the incorporation of MM 12-3, the temporary increase in ambient noise levels due to on-site construction stationary sources would be less than significant.

It is anticipated that limited blasting may be required in portions of the Project site during the construction period. As shown in Table 5.12-8, it is expected that blasting would generate a maximum noise level of about 94 dBA at a distance of 50 feet. As also shown in Table 5.12-8, the acoustic usage factor for blasting is 1 percent. Therefore, at a distance of 50 feet, blasting noise would be 74 dBA  $L_{eq}$ , which is less than the construction noise standard of 75 dBA. Based on safety considerations and reasonable planning, there would be no likelihood of blasting within 50 feet of a sensitive noise receptor. There would be a less than significant noise impact from blasting.

In summary, construction noise levels to existing receptors and future on-site residents would be less than significant. Although noise levels would be less than significant, MM 12-3, which incorporates best management practices for noise minimization, would be included in the Project. Additionally, with implementation of MM 12-6, the Project Applicant/Developer shall provide prospective purchasers or tenants on the Project site a notice and statement of acknowledgment that the Centennial property will be undergoing

continuing development which could result in noise impacts, dependent on the relative location from which construction activities may be heard.

## Off-Site Impacts

Long-term noise sources associated with off-site Project features would be limited to pumps at the wells to be installed at the Tejon Water Bank in Kern County north of the eastern part of the Project site. There are no sensitive noise receptors within ½ mile of the well sites. There would be no impact.

Construction of the off-site Project features described in Section 4.7 of the EIR would not require the mass grading activities described above for on-site development. However, construction of intersection improvements, utility connections, bridges, wells, and pipelines would require the use of similar construction equipment and would generate similar noise levels to those generated during the building and paving of on-site facilities. Where construction of off-site improvements would be near sensitive receptors, primarily residences near SR-138, noise impacts would be intermittent and temporary. The stationary source requirements and best management practices of MM 12-3 would apply to off-site construction activities. The impact would be less than significant.

***Impact Summary:*** Exterior and interior noise levels at existing and proposed noise-sensitive land uses would comply with State and County standards with the incorporation of MM 12-1. Noise generated by stationary sources associated with proposed land uses would comply with County standards with incorporation of MM 12-2. Construction noise would comply with County standards with incorporation of MM 12-3. With incorporation of these mitigation measures, impacts would be less than significant.

**Threshold 12-2**      **Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?**

## On-Site Impacts

Vibration impacts can result in structural damage and annoyance to persons. The County Code prohibits vibration activities that exceed the vibration perception threshold (annoyance) of 0.01 particle velocity (ppv) inch per second (in/sec). Compliance with this standard would eliminate the potential for structural damage, which, for most buildings range from 0.25 to 0.5 ppv in/sec, a much higher level than the County annoyance standard (Caltrans 2013b).

Typical sources of long-term operational groundborne vibration are trains and other transit systems. The Project site is not located near a train or transit system, nor would the Project install a train or transit system. There would be no long-term vibration impact from train or transit activity.

---

As previously discussed, it is understood that blasting occurs at the National Cement Plant approximately twice a week. Blasting can generate a vibration level of 0.1 in/sec at a distance of 50 feet. At a distance of 400 feet, the vibration level would be reduced to less than the County Code standard of 0.01 in/sec. The nearest proposed residence to the blasting area is at a distance of at least 8,000 feet. Therefore, there would be a less than significant impact.

Pile driving and blasting are generally the sources of the most severe vibration during construction. No pile driving is currently anticipated for the Project. However, if pile driving is required, there would be a potential significant impact. MM 12-4 would require a vibration analysis prior to any pile-driving activities.

It is anticipated that limited blasting may be required and that blasting would occur at large distances from existing or future receptors. However, MM 12-7 would be included to require a blasting plan if blasting is anticipated within 1,000 feet of a residence or similar sensitive land use. MM 12-7 would require that the Blasting Plan be approved by appropriate County authorities and public notification of affected residents.

Conventional heavy construction equipment would be used for mass grading. Table 5.12-10, Vibration Levels for Construction Equipment, summarizes typical vibration levels measured during construction activities for various vibration-inducing pieces of equipment at a distance of 25 feet. Table 5.12-10 also shows the calculated distance required to reduce vibration levels to the 0.01 ppv in/sec County Code limit. The closest sensitive receptors to areas where mass grading would occur are the homes on the east side of 300<sup>th</sup> Street West, the east side of 290<sup>th</sup> Street West, and the south of Malinda Avenue; some of these homes are 100 to 150 feet from the Project property line. Because vibratory rollers could be operated within 265 feet of sensitive receptors and large bulldozers and scrapers could be operated within 135 feet of sensitive receptors, the impact is potentially significant and mitigation is required. MM 12-5 restricts the use of vibratory rollers, scrapers, and bulldozers near occupied residences. MM 12-4 requires the limitation of vibration from caisson drilling, if anticipated near residences. With the implementation of MM 12-4 and MM 12-5, construction vibration impacts would be less than significant.

**TABLE 5.12-10  
VIBRATION LEVELS FOR CONSTRUCTION EQUIPMENT**

<b>Equipment</b>	<b>Vibration at 25 feet ppv (in/sec)</b>	<b>Distance to reduce to 0.01 ppv in/sec (feet)</b>
Vibratory roller	0.210	265
Large bulldozer	0.089	135
Caisson drilling	0.089	135
Loaded trucks	0.076	125
Jackhammer	0.035	80
Small bulldozer	0.003	9
ppv: peak particle velocity; ft: feet; in/sec: inches per second.		
Source: Caltrans 2013b; FTA 2006.		

## Off-Site Impacts

Construction of the off-site Project features described in Section 4.7 of the EIR would not require blasting or the use of large bulldozers, scrapers, or vibratory rollers. If pile driving or caisson drilling is required for bridge construction, and there are occupied buildings near the pile driving site, MM 12-4 would ensure that vibrations would not exceed the County Code standard. The impact would be less than significant.

***Impact Summary.*** Implementation of MM 12-4 and MM 12-5 would ensure that persons would not be exposed to construction vibration impacts exceeding County standards. Impacts would be less than significant with mitigation.

**Threshold 12-3**     **Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project, including noise from parking areas?**

For purposes of this analysis, this impact would occur if:

- Project-related traffic noise would increase the ambient noise level at noise-sensitive locations by 3 dBA or more and the ambient noise levels under With-Project conditions fall within the “Normally Unacceptable” or “Clearly Unacceptable” categories OR
- Project-related traffic noise increases the ambient noise level at noise-sensitive locations by 5 dBA or more.

It is noted that the County Code has no standards for a substantial permanent increase in ambient noise levels. The criteria above were used in the County General Plan EIR and AVAP EIR and are therefore used in this Centennial Project EIR noise analysis (DRP 2014, 2015b).

---

## On-Site impacts

Long-term, or permanent noise impacts would result from two types of sources, traffic and stationary sources.

### Traffic

The Project at buildout would generate an estimated 77,000 external daily trips (Stantec 2015); these vehicles would use roadways in the Project vicinity as identified in Section 5.10, Traffic, Access, and Circulation, of this Draft EIR. The addition of Project traffic to existing traffic would increase the traffic volumes on these roadways and therefore, the traffic noise at adjacent receptors. As previously described, a doubling of traffic volume would increase traffic noise levels by 3 dBA.

To estimate noise level increases and impacts due to development of the Project, noise level increases were calculated from the traffic volumes provided in the Project's Traffic Report (Stantec 2015). The traffic report provides analysis for Existing Year and Long Range scenarios.

- **Existing Year Without/With Project:** This scenario refers to traffic conditions for existing traffic volumes without and with the addition of the Project-generated buildout traffic, respectively. As noted in the traffic analysis, this scenario is hypothetical, as it presumes the existing background traffic conditions do not change (other than changes directly due to the Project) over the approximate 20-year time frame required to build the Project.
- **Long-Range (2035) Without/With Project:** This scenario refers to traffic conditions without and with the Project in the year 2035. According to the TIA, "In a regional context, there is no change to the amount of traffic being generated in the developed areas outside the immediate vicinity of the Project area with the Project versus without the Project, as they are simply distributed differently throughout the region. For example, as a result of Centennial, trips in areas such as Lancaster, Palmdale and the Santa Clarita Valley are redistributed under a with-Project 2035 condition. Workers in Lancaster and Palmdale have employment opportunities in Centennial, changing the commute patterns that would otherwise occur (e.g., reducing out-commuting on SR-14)" (Stantec 2015).

Table 5.12-11, Existing Plus Project Traffic Noise Levels, shows the Existing Plus Project traffic volumes; the calculated noise levels at the nearest sensitive receptor; and the noise increase due to Project-generated traffic for each road segment analyzed in the TIA.

<sup>a</sup> No receptor was identified near these segments.					
Source: Stantec 2015					

As shown in Table 5.12-11, the Existing Plus Project noise level at all of the nearest sensitive receptors, except two, would exceed 70 dBA CNEL and would be in the Normally Unacceptable category for Noise/land Use compatibility, as shown in Table 5.12-1. For these receptors in the Normally Unacceptable category, the significant impact criterion is a 3 dBA increase. The exception is residences adjacent to SR-138 between 190<sup>th</sup> Street West and 110<sup>th</sup> Street West where the Existing Plus Project noise level would be approximately 69 dBA CNEL and residences adjacent to SR-138 between 60<sup>th</sup> Street West and the junction with SR-14 where the Existing Plus Project noise level would be approximately 67 dBA CNEL. For these receptors, the significant noise increase impact criterion is a 5 dBA increase.

Under the Existing Plus Project scenario, there would be a significant noise impact from Project-generated traffic at receptors adjacent to SR-138 between Gorman Post Road and 190<sup>th</sup> Street West, where the noise increases are estimated to range from 5.5 to 7.0 dBA, and from 110<sup>th</sup> Street West to 60<sup>th</sup> Street West, where the noise increase is estimated to be 3.9 dBA. Project-generated traffic noise increases on I-5, SR-14, and SR-99 for this scenario would not exceed 1.4 dBA.

Table 5.12-12, 2035 Traffic Noise Levels, shows the 2035 Without Project and 2035 With Project traffic volumes; the calculated noise levels at the nearest sensitive receptor; and the noise increase due to Project-generated traffic for each road segment analyzed in the TIA.

Btw. W Jct SR-166 W and Jct I-5	72,000	75,000	No sensitive receptor <sup>a</sup>		

ADT: average daily trips; CNEL: Community Noise Equivalent Level; dBA: A-weighted decibel; SR: State Route; Btw.: between; Jct.: junction; I: Interstate; N: north; S: south; W: west; E: east.

<sup>a</sup> No receptor was identified near these segments.

Source: Stantec 2015

As shown in Table 5.12-12, the 2035 With Project noise level at all of the nearest sensitive receptors would exceed 70 dBA CNEL and would be in the Normally Unacceptable category for Noise/land Use compatibility, as shown in Table 5.12-1. For these receptors, the significant impact criterion is a 3 dBA increase.

Under the 2035 With Project scenario, there would be a significant noise impact from Project-generated traffic at receptors adjacent to SR-138 between Gorman Post Road and Old Ridge Route Road, where the noise increase would be 3.3 dBA. There is currently one residence adjacent to this road segment. No other Project-generated traffic noise increases would exceed 2.5 dBA.

Table 5.12-12 shows that Project implementation would result in reduced traffic volumes and reduced traffic noise levels on SR-14 between SR-138 and I-5. As previously discussed, implementation of the Project would result in a redistribution of regional trips because of employment opportunities in Centennial for residents of Lancaster and Palmdale. Similarly, workers in Centennial will fill jobs in the Santa Clarita Valley area that would otherwise be filled by commuters from other areas. Additionally, some workers from the Santa Clarita Valley will acquire jobs in Centennial that might otherwise commute south of the Santa Clarita Valley. Accordingly, under a cumulative setting, the Project will result in a net increase in traffic volume for some areas, or a net decrease in traffic in other areas, all of which is dependent on the change in traffic patterns that are a result of the Project (Stantec 2015.) Additional discussion of traffic distribution is included in the traffic study prepared for the Project (Stantec 2015; Appendix 5.10-A).

Feasible mitigation measures for the 2035 With Project impact sensitive noise receptors between Gorman Post Road and Old Ridge Route Road would include construction of a noise barrier at affected receptors or resurfacing the roadway with rubberized asphalt pavement.

Typical roadside noise barriers provide a noise reduction of at least 5 dBA; rubberized asphalt pavement is accepted as providing a noise reduction of approximately 4 dBA. Either of these mitigations would reduce the forecasted 2035 With Project traffic noise impact of 3.3 dBA to a less than significant level. However, these mitigations would involve alterations to private property and/or within Caltrans' right-of-way, which are not in the County's or the Project Applicant's control. Therefore, the impact would be significant and unavoidable.

## Off-Site Impacts

Long-term noise generation associated with proposed off-site features would be limited to noise from the wells to be installed at the Tejon Water Bank in Kern County north of the eastern part of the Project site. There are no sensitive noise receptors within ½ mile of the well sites. There would be no impact.

***Impact Summary.*** Increases in the ambient noise environment adjacent to SR-138 between Gorman Post Road and Old Ridge Route Road would exceed the applicable significance criterion at identified receptors. Feasible mitigation measures are not within the jurisdiction of the County. Impacts would be significant and unavoidable.

**Threshold 12-4** **Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project, including noise from amplified sound systems?**

For purposes of this analysis, this impact would occur if Construction of the proposed Project generates noise levels in excess of the Los Angeles County standards (refer to Table 5.12-2).

It is noted that the County Code has no standards for a substantial temporary increase in ambient noise levels, nor were any standards selected for analysis in the County General Plan EIR and AVAP EIR (DRP 2014, 2015b). Therefore, exceedance of the County standards is considered a substantial noise increase.

## On-Site Impacts

As discussed under Threshold 12-1, temporary noise impacts would occur during construction of the Project. With the implementation of MM 12-3, construction noise impacts relative to the County Code would be less than significant. Therefore, although construction activities would temporarily increase ambient noise levels above levels existing without the Project, the increases would not be substantial and the impact would be less than significant.

## Off-Site Impacts

As discussed under Threshold 12-1, temporary noise impacts would occur during construction of off-site Project features. With the implementation of MM 12-3, construction noise impacts relative to the County Code would be less than significant. Therefore, although construction activities would temporarily increase ambient noise levels above levels existing

without the Project, the increases would not be substantial and the impact would be less than significant.

**Impact Summary.** Temporary increases in noise due to construction activity would not be substantial with incorporation of MM 12-3. Impacts would be less than significant after mitigation.

**Threshold 12-5** For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

### On-Site and Off-Site Impacts

The Centennial Project is not located within an airport land use plan, and there are no public airports or public use airports within two miles of the Project site. Therefore, there is no impact on persons residing or working in the Project area.

**Impact Summary.** The Project site is not located within an airport land use plan, and there are no public airports or public use airports within two miles of the Project site. There would be no impact.

**Threshold 12-6** For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

### On-Site Impacts

The Project site is adjacent to the Quail Lake Skypark Airport, which is a privately owned facility used primarily for recreational activities. As described in “Existing Noise Sources”, above, it has one runway and no control tower, and it does not support commercial aviation activities. No operational data is available, and CNEL noise contours have not been developed for this airport. However, because the Quail Lake Skypark is privately owned and only has six locally based aircraft, the number and frequency of flights is expected to be minimal. Any additional flights or activity at the airport would be subject to the approval of the airport owner because the facility is not available to the general public.

With its use of only small-scale, general aviation (non-jet), private aircraft and its limited operations, it is unlikely that any noise contours for 55 dBA CNEL and above would extend much beyond the boundaries of the airport. Caltrans Division of Aeronautics reports the facility operates under a Special-Use Airport Permit that was issued in November 2002. Airports that are permitted as “Special-Use” are not open to the general public and access to the airport is at the discretion of the owner. While the permit does not specify a maximum number of daily flights, the Skypark is permitted to operate during daylight hours only. Also, the permit requires application for an Amended/Corrected Airport Permit prior to making physical or operational changes at the airport. Caltrans’ Aviation Safety Officer for Los Angeles and Riverside Counties was consulted regarding the potential for expansion of

activities at the Quail Lake Skypark; based on permit conditions and limited airport infrastructure, it was concluded to be “very unlikely that there would be any significant increase in flight activity in the future” (Miles 2016). Also, Quail Lake Skypark would be permanently closed in the event the SR-138 improvements are implemented. Therefore, its impact on the overall noise environment at the Project site is considered to be less than significant.

It should also be noted that, although the Project site is not located within the vicinity of a military overflight airstrip, military overflights are a contributing noise factor at the Project site, as discussed under Threshold 12-1. However, based on the reasoning presented under Threshold 12-1, the impact of military overflights would be considered a less than significant impact on the Project site.

The existing heliport located at the site for the existing Fire Station 77 (in Gorman) will continue to be located at the site and remain operational, as discussed in the Section 4.0, Project Description. However, the heliport will only be used for fire-related emergencies, and therefore, it is considered a less than significant impact on the Project site.

***Impact Summary.*** Persons would not be exposed to excessive noise levels from residing and working in the Project area within the vicinity of a private airstrip. Impacts would be less than significant.

### 5.12.7 MITIGATION MEASURES

**MM 12-1** For residences, hotels and motels, schools, and places of worship adjacent to a collector road with a buildout forecast of 10,000 average daily trips (ADT) or greater, a limited secondary road with a buildout forecast of 6,500 ADT or greater, or any higher classification road, the Project Applicant/Developer shall submit to the County an Acoustical Study prepared in accordance with Section 1207.12 of the County Building Code. The Acoustical Study shall demonstrate that exterior noise levels at areas where residents would reasonably be expected to spend more than one hour (e.g., backyards) would not exceed 65 A-weighted decibels (dBA) Community Noise Equivalent Level (CNEL). The Acoustical Study shall also verify, including during construction and before Certificate of Occupancy (CofO) issuance, that the buildings have been properly designed to comply with a CNEL requirement of 45 dBA for habitable interior living areas, classrooms, and rooms used for patient care and worship. The design features required to achieve the noise standard shall include one or more of the following elements, as verified by the Acoustical Study: building setbacks from the roadway; noise barriers; building orientation relative to the roadway; interior living space (bedroom, common area) orientation; sound-rated windows; upgraded exterior wall and/or roof construction; insulation batts; and forced air ventilation.

**MM 12-2** For each business park use, school, community use area, park and recreation area, animal control facility, utility, County maintenance facility, commercial development, or manufacturing/industrial development, the Project

Applicant/Developer shall submit an Acoustical Study verify that the Project has been properly designed to comply with the County of Los Angeles's Noise Ordinance standards at the nearby sensitive properties (both on and off site). The design features required to achieve the noise standard shall include one or more of the following elements, as verified by the Acoustical Study: building setbacks from the sensitive receptors; noise barriers; building orientation relative to the sensitive receptor; sound-rated windows; and upgraded exterior wall and/or roof construction.

**MM 12-3** To ensure that construction noise is minimized, in addition to meeting all requirements of Section 12.08 of the *County of Los Angeles Code*, the following measures shall be implemented during construction:

- All construction equipment, including internal combustion engines and stationary equipment (used for construction purposes) shall be equipped with noise-reducing features such as, but not limited to, improved mufflers, intake silencers, ducts, engine enclosures, and acoustical shields or shrouds.
- Stationary equipment (e.g., generators, air compressors, concrete pumps) located within 450 feet of residences or schools shall have noise abatement (e.g., engine enclosures or equipment placed behind barriers) to limit the noise level at the sensitive receptor to an average sound level ( $L_{eq}$ ) of 60 dBA or less.
- Equipment and material staging areas and equipment maintenance areas shall be located at least 500 feet from sensitive noise receivers, if feasible.

**MM 12-4** The Project Applicant/Developer shall submit a vibration analysis to the County demonstrating that the pile installation has been designed to limit vibrations to 0.01 peak particle velocity (ppv) inch per second (in/sec) or less at occupied buildings. Design features may include alternate methods of installation that result in reduced vibrations such as pile driving cushions or jetting instead of drilling.

**MM 12-5** For the Project site areas adjacent to 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue, the Project Applicant/Developer shall provide information to County demonstrating that plans and specifications require that (1) vibratory rollers shall not be used within 300 feet of occupied residences or that vibratory rollers used within 300 feet of occupied residences shall be operated in the static mode and (2) large bulldozers and scrapers shall not be operated within 150 feet of occupied residences. Alternatively, the Project Applicant/Developer shall provide information to County demonstrating that plans and specifications require that vibratory rollers, large bulldozers, large scrapers, and similar heavy equipment shall be operated to comply with the requirements of Section 12.08.560 of the County Code and that vibrations at residential properties would not exceed 0.01 inch per second (in/sec).

**MM 12-6** The Project Applicant/Developer shall provide to each prospective purchaser or tenant with a notice and statement of acknowledgment that shall be executed by the prospective purchaser, lessee, or tenant that the Centennial property will be undergoing continuing development and, depending on relative location, noise from construction activities may be heard. The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the County. Subsequent to Project buildout, this mitigation measure would no longer apply.

**MM 12-7** In the event that blasting is necessary in order to fracture non-rippable rock, the Project Applicant/Developer shall prepare a Blasting Plan to be submitted and approved by the County of Los Angeles Fire Department in order to obtain a blasting permit; evidence of this approval shall be submitted to the County of Los Angeles Department of Regional Planning in order to obtain an Explosives Permit. The Blasting Plan shall be prepared in accordance with the United States Department of Interior, Office of Surface Mining (USOSM) standards and shall include, but not be limited to, the following:

- a. A pre-blast survey.
- b. The site and location of planned blasting and hours of operation (blasting to be conducted during the daylight hours only).
- c. Notification of blasting activities to all property owners within one-half mile of the blasting area. This notification shall describe the expected period and frequency that the blasting shall occur and give a contact phone number for any questions or complaints. All complaints shall be responded to in a method deemed satisfactory to the County of Los Angeles Department of Regional Planning.
- d. The types and amounts of explosives.
- e. Warning system information.
- f. Methods of transportation and handling of explosives.
- g. Minimum acceptable weather conditions.
- h. Procedures for handling, setting, wiring, and firing explosives.
- i. Procedures for clearing and controlling access to blast danger.
- j. Procedures for handling misfires and other unusual occurrences.
- k. An Emergency Action Plan.
- l. Material safety data sheet for all explosives or other hazardous materials expected to be used.
- m. Procedures to ensure compliance with local, State and federal laws.
- n. Requirements and procedures for vibration monitoring near existing structures during blasting events.

## 5.12.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

As discussed above, impacts to off-site noise-sensitive receptors in the vicinity of identified segments of SR-138 from traffic-related ambient noise level (CNEL) increases would be significant and unavoidable because, although feasible mitigation to reduce these impacts is possible, it is not within County jurisdiction to implement it. Noise-reduction measures would involve alterations to private property and/or within Caltrans' right-of-way, which are not in the County's or the Project Applicant's control.

## 5.13 VISUAL RESOURCES

### 5.13.1 INTRODUCTION

#### Purpose

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that aesthetic issues be evaluated as part of the environmental documentation process. The impacts of the Project are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### Summary

The Project would result in significant and unavoidable impacts related to a change in visual character of the Project site, as experienced by viewers at public vantage points (primarily existing transportation thoroughfares including State Route [SR] 138 and 300<sup>th</sup> Street West). The Project proposes to preserve many existing features to minimize the visual alteration of the site, as listed in PDFs 13-1 through 13-6, as required for implementation through Mitigation Measures (MMs) 7-13 from Section 5.7, Biological Resources, and MMs 13-1 through 13-3. These include retention of rock outcroppings visible from off-site areas; use of landform/contour grading; use of landscaping designs that are similar to the natural topography; preservation of open space; use of native and regionally appropriate plant species in public landscape areas; provision of development setbacks from natural areas; and inclusion of aesthetically pleasing and consistent Project signing and monumentation both internally and externally. However, even with these features, the overall change to the site resulting from grading and development of the Project would be a substantial visual impact that may be perceived by some as an impact for which no additional feasible mitigation exists, and would therefore remain significant and unavoidable.

Views from existing public regional trails and bikeways would be limited due to both the distance and the intervening topography between these routes and the Project site, and would result in a less than significant impact. The United States Forest Service (USFS), Pacific Crest Trail Association (PCTA), Tejon Ranch Conservancy (Conservancy) and the Applicant have discussed the relocation of one segment of the Pacific Crest National Scenic Trail (PCT) that is currently located approximately 1.75 miles to the east-southeast at the nearest point from the site, so that it is generally aligned along 300<sup>th</sup> Street West between SR-138 and the northeastern corner of the Project site. The USFS and PCTA's acceptance of the conceptual future alignment in concert with the Project indicates their concurrence that this is an acceptable and preferable location over the existing alignment. It is anticipated that any structures that are proposed along PCT would be screened by a wall along the rear of the residences (see MM 13-4); additionally, a wide, landscaped setback containing the conceptual PCT realignment would ensure that the urban uses in the foreground would have

limited visibility and would therefore result in a less than significant impact with implementation of MM 13-4.

There are no State-designated scenic highways within 20 miles of the Project boundaries; SR-138 is not a State scenic highway, nor is it eligible for listing (Caltrans 2011). Thus, while there are features on and around the Project site that would be considered scenic by many, because these components of the overall visual character are not within the viewshed of a State-designated scenic highway, the proposed changes to the Project site would not result in impacts related to damaging scenic resources along a scenic highway.

The *Los Angeles County General Plan* does not identify any scenic highway near the site (DRP 2015a); however, the Antelope Valley Area Plan (AVAP) identifies Scenic Drives. Interstate (I)5, Gorman Post Road, SR-138, Old Ridge Road (Highway N-2), and Three Points Road are designated in the AVAP as Scenic Drives on and near the site. However, the site is also within the West Economic Opportunity Area and a Future Rural Town Area (DRP 2015b). A listing of applicable AVAP goals and policies is listed below in Section 5.13.3.

As the area is a rural environment with few existing land uses that emit ambient light, the Project site and surrounding areas do not contain bright or uniquely noticeable lighting, with the exception of the National Cement Plant, which has lighting at the facility and along the access road (i.e., National Cement Plant Road). The Project would introduce new light sources as part of future development. The Project would include preparation of an Exterior Lighting (photometric) Plan, also referred to as “the Dark Sky Plan”, to require outdoor lighting that minimizes glare and prevents light spillover beyond the Project site boundaries by using various techniques—which may include hooded street lights, directing light downward, and timers or sensors on lights—while maintaining consistency with County lighting and safety standards (MM 13-6). However, due to the existing low nighttime ambient light levels in the area, implementation of the Project would result in a significant and unavoidable impact by contributing a substantial new source of nighttime light and glare. In addition, because the Project site is currently undeveloped, new sources of daytime glare would be introduced and potential glare impacts would be greater than existing conditions; this would be considered a significant and unavoidable impact.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of these topics):

- Introduction
  - Purpose
  - Summary

- Section Format
- References
- Viewsheds and Visual Distance Zones
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

All references cited for preparation of this analysis are listed in Section 5.13.10.

### 5.13.2 VIEWSHEDS AND VISUAL DISTANCE ZONES

This section describes the aesthetic character and landform features of the Project site and immediate vicinity and discusses potential visual impacts that could result from implementation of the Project by identifying (1) corridors from which the Project site can be seen; (2) “viewsheds” where the development area is most visible from public vantage points; (3) “prominent visual features”; and (4) typical examples of commercial and residential land uses that demonstrate potential changes in the visual character of the Project site.

A “viewpoint” is defined as a specific location from which a view perspective is taken. A “viewshed” is defined as a broader perspective of a geographic area and incorporates both close-range and long-range elements. “Prominent visual features”, as used in this section, are features that are unique to the west Antelope Valley and/or are prominent in relation to their relative surroundings. The “development area” is the portion of the Project site that will be developed.

To provide a standard frame of reference for the reader, the visual character within each of the viewsheds is described in terms of foreground, middleground, and background views. Each represents a portion of the total view, based on distance from the viewing location or “viewpoint”. The different view zones are described below.

- **Foreground Zone.** Visual elements in this zone can be seen at a close distance and typically dominate the entire view. View impacts on this zone are often considered to be substantial because they are visually prominent.

- **Middleground Zone.** Visual elements in this zone can be seen at a moderate distance and partially dominate the view.
- **Background Zone.** Visual elements in this zone can be seen at a long distance and typically do not dominate the view, but are part of the overall visual composition of the viewshed.

The delineation between one viewing range and the next is largely based on prominent transitions in landscape character and the reduction in visibility of the landscape features as distance increases; however, it should be noted that the judgments of such transitions are subjective.

### 5.13.3 RELEVANT PLANS, POLICIES, AND REGULATIONS

#### Federal

No federal plans and policies have been identified related to visual resources.

#### State

##### *California Department of Transportation State Scenic Highway Program*

Through the California Scenic Highway Program, the California Department of Transportation (Caltrans) classifies highways meeting specific criteria as “scenic” throughout California. The purpose of the program is to preserve and protect scenic highway corridors from changes that would diminish the aesthetic value of lands adjacent to highways. According to Caltrans, “a highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler’s enjoyment of the view” (Caltrans 2015).

#### County

##### *Los Angeles County General Plan and Antelope Valley Area Plan*

The *Los Angeles County General Plan* and the *Antelope Valley Area Plan (AVAP)*, which is part of the County General Plan, include goals and policies that address aesthetic issues in the unincorporated County area. Goals and policies in the AVAP that are relevant to the Project’s visual resources include those listed below.

#### Land Use Element

**Goal LU 1:** A land use pattern that maintains and enhances the rural character of the unincorporated Antelope Valley.

- **Policy LU 1.1:** Direct the majority of the unincorporated Antelope Valley’s future growth to rural town center areas and identified economic opportunity areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

- **Policy LU 1.2:** Limit the amount of potential development in rural preserve areas, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.
- **Policy LU 2.2:** Limit the amount of potential development within Scenic Resource Areas, including water features, significant ridgelines, and Hillside Management Areas, through appropriate land use designations, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

### Conservation and Open Space Element

**Goal COS 5:** The Antelope Valley's scenic resources, including scenic drives, water features, significant ridgelines, buttes, and Hillside Management Areas, are enjoyed by future generations.

- **Policy COS 5.2:** Except within economic opportunity areas, limit the amount of potential development in Scenic Resource Areas through appropriate land use designations with very low densities in order to minimize negative impacts from future development.
- **Policy COS 5.3:** Require new development in Hillside Management Areas to comply with applicable Zoning Code requirements, ensuring that development occurs on the most environmentally suitable portions of the land.
- **Policy COS 5.4:** Require appropriate development standards in Hillside Management Areas that minimize grading and alteration of the land's natural contours, ensure that development pads mimic natural contours, and ensure that individual structures are appropriately designed to minimize visual impacts.
- **Policy COS 5.7:** Ensure that incompatible development is discouraged in designated Scenic Drives by developing and implementing development standards and guidelines for development within identified viewsheds of these routes (Map 4.2: Antelope Valley Scenic Drives).

**Goal COS 14:** Energy infrastructure that is sensitive to the scenic qualities of the Antelope Valley and minimizes potential environmental impacts.

- **Policy COS 14.1:** Require that new transmission lines be placed underground whenever physically feasible.
- **Policy COS 14.2:** If new transmission lines cannot feasibly be placed underground due to physical constraints, require that they be collocated with existing transmission lines, or along existing transmission corridors, whenever physically feasible.
- **Policy COS 14.3:** If new transmission lines cannot feasibly be placed underground or feasibly collocated with existing transmission lines or along existing transmission corridors due to physical constraints, direct new transmission lines to locations where environmental and visual impacts will be minimized.
- **Policy COS 14.5:** Discourage the placement of new transmission lines through existing communities or through properties with existing residential uses.

- **Policy COS 14.7:** Require that electrical power lines in new residential developments be placed underground.

**Goal COS 15:** Humans and wildlife enjoy beautiful dark Antelope Valley skies unimpeded by light pollution.

- **Policy COS 15.1:** Ensure that outdoor lighting, including street lighting, is provided at the lowest possible level while maintaining safety.
- **Policy COS 15.2:** Prohibit continuous all-night outdoor lighting in rural areas, unless required for land uses with unique security concerns, such as fire stations, hospitals, and prisons.
- **Policy COS 15.4:** Require compliance with the provisions of the Rural Outdoor Lighting District throughout the unincorporated Antelope Valley.

**Goal COS 18:** Permanently preserved open space areas throughout the Antelope Valley.

- **Policy COS 18.3:** Maintain permanently preserved open space areas to ensure attractiveness and safety.

**Goal COS 19:** New development meets open space objectives while maintaining rural character.

- **Policy COS 19.1:** When new development is required to preserve open space, require designs with large contiguous open space areas that maximize protection of environmental and scenic resources.
- **Policy COS 19.3:** Pursue innovative strategies for open space acquisition and preservation through the land development process, such as Transfers of Development Rights, Land Banking, and Mitigation Banking, provided that such strategies preserve rural character.

#### Economic Development Element

- **Policy ED 1.16:** Preserve the scenic resources of the Antelope Valley, including Scenic Drives, Significant Ridgelines and Significant Ecological Areas, in such a way that can contribute to the economic activities in the area.

A consistency analysis of the Project with specific goals and policies in the County's relevant plans, policies, and regulations is provided in the Land Use, Entitlements, and Planning section (Section 5.8) of this document.

#### ***Rural Outdoor Lighting District Ordinance***

As adopted into Title 22 of the Los Angeles County Code, the County of Los Angeles created the Rural Outdoor Lighting District that includes the unincorporated areas of the Antelope Valley, the Santa Monica Mountains, Santa Catalina Island, the Angeles National Forest, Oat Mountain, and the portion of the Los Padres National Forest in Los Angeles County. This district is subject to guidelines for outdoor lighting that save energy; prevent light spillover;

and reduce sky glow from private developments, street lighting, outdoor recreation facilities, and signs.

## 5.13.4 ENVIRONMENTAL SETTING

### Scenic Highways and Drives

There are no Officially Designated/Adopted or Eligible Scenic Highways pursuant to the State Scenic Highway Program in the Project vicinity. The nearest Officially Designated/Adopted Scenic Highway is SR-2, which is located approximately 50 miles to the southeast of the Project site. The nearest Eligible Scenic Highway, a portion of SR-126, is located approximately 25 miles to the south (Caltrans 2011).

The County of Los Angeles, as part of its General Plan, has created a Scenic Highway Plan that conforms to the State Scenic Highway Program and does not identify any scenic highway near the site (DRP2015a). The AVAP, part of the General Plan, identifies Scenic Drives in the Antelope Valley, several of which are located on or near the site, including the following:

- I-5 from Castaic to the Kern County Line (west of the site).
- Gorman Post Road from SR-138 to Gorman (southwest and west of the site).
- SR-138 from Gorman Post Road to 245<sup>th</sup> Street West (south of and through the site).
- Old Ridge Road (Highway N-2) from SR-138 to Pine Canyon Road (south of the site).
- Pine Canyon Road from Old Ridge Road (Highway N-2) to Three Points Road (south of the site).
- Three Points Road from SR-138 to Pine Canyon Road (southeast of the site).

### Existing Visual Characteristics

#### *Topography and Aesthetic Characteristics*

The approximate 12,323-acre Project site is largely undeveloped and uninhabited. The vast majority of the Project site consists of open grasslands that are used for cattle grazing. Sizeable areas of oak woodland are located in the southern and western portions of the Project site that will be preserved as open space. Approximately 1,000 acres in the eastern portion of the Project site are under crop cultivation by the Tejon Ranch Company. Several unpaved and paved roads exist on the Project site, including the National Cement Plant Road that travels from the SR-138 to the off-site National Cement Plant; a portion of 300<sup>th</sup> Street West; and dirt roads that traverse the Project site. One residential home is located in the northern portion of the Project site adjacent to the eastern side of the West Branch of the California Aqueduct. An aerial depiction of the Project site and surrounding features are illustrated on Exhibits 3-3, Aerial Photograph and Project Boundary.

The rolling hills and varied topography on the Project site provide an aesthetically interesting backdrop. Unique natural aesthetic features on the Project site include seasonal wildflower fields throughout the grassland areas; oak woodlands in the western portion of

the site; and rock outcroppings and visually interesting boulders that occur throughout the site. The foothills of the Tehachapi Mountains make up the middleground and background views, with local hillsides dominating the foreground views throughout the valley floor. The Tehachapi Mountains that border the northern and western perimeter of the Project site, the San Gabriel Mountains to the south of the Project site, and Quail Lake to the south of the southwestern portion of the Project site constitute the most defining aesthetic features in the immediate area.

The Tehachapi Mountains reach an elevation of 4,800 feet above mean sea level (msl) to the northwest of the Project site. Moving southeast towards the Project site, the elevation of the Tehachapi Mountains gradually diminishes over a distance of 3 to 5 miles before reaching the valley floor, where elevations are approximately 3,000 feet above msl but rise again south of the Project site as the San Gabriel foothills are approached.

According to the United States Geological Survey's La Liebre Ranch 7.5-minute quadrangle map, the Project site is located in the northwestern portion of the Antelope Valley, with elevations that range from 3,000 to 4,250 feet above msl. The lowest portions of the Project site are located at the northeastern corner with an elevation of approximately 3,000 feet above msl, and along the eastern perimeter of the Project site with elevations ranging from approximately 2,980 to 3,025 feet above msl.

### ***Project Site Views***

The Project site is primarily visible from public roadways along the southern (SR-138) and eastern (300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue) Project perimeters. Various locations along SR-138 provide the most publicly accessible views, and several adjacent off-site residences have observation points along SR-138, 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue. There are also intermittent views from the Pacific Crest National Scenic Trail (PCT), which are discussed further below. Because public access to the Project site is presently restricted, the Project site cannot be observed by the public from on-site locations.

SR-138 bisects the southern portion of the Project site in an east-west direction, reaching its lowest point at its intersection with 290<sup>th</sup> Street West. At this intersection, which is at the eastern boundary of the Project site, the elevation is approximately 3,025 feet above msl. As the SR-138 runs westerly toward its connection with Interstate 5 (I-5), the elevation gradually increases to approximately 3,360 feet above msl just past the western side of Quail Lake. Views from east of Quail Lake include the majority of the western Antelope Valley floor, including portions of the Project site, which are partially obscured by local hillsides. Views of the Project site from west of Quail Lake, are less visible and largely obscured by hillsides and topography.

The nearest local communities include Neenach and Three Points. Neenach is located approximately 2.5 miles east of the eastern boundary of the Project site, while Three Points is located approximately 4.0 miles southeast of the intersection of SR-138 and 290<sup>th</sup> Street West. Due to distance, views of the Project site are limited from residences in the Neenach community, except for residential properties directly adjacent to the eastern edge of the

Project site. Due to distance and intervening topography, views of the Project site are extremely limited from the residences in the Three Points community.

### ***Representative Public Views (Visual Simulation Views)***

Photographs of the existing conditions at each of the five representative public viewpoints, described below, are included alongside the visual simulations, which are discussed in the impact analysis later in this section. For ease of reference, these exhibits are first referenced in the discussion below and referenced again in the impact analysis. The “before” photograph associated with each simulation provides documentation of the baseline conditions and extent of Project site’s visibility from key public vantage points.

- **Viewpoint 1 – View from SR-138, approximately 1 mile east of the westernmost Project boundary, looking northeast.** Viewpoint 1, illustrated in Exhibit 5.13-1, Viewpoint 1 – Cement Plant Road Realignment Simulation, is the view from SR-138 looking northeast at the southern portion of the site to the west of the California Aqueduct. The most common observers from this vantage point would be passing motorists travelling east on SR-138. Foreground views show gently sloping, vacant land on the Project site (which is characteristic of the surrounding valley) and SR-138 with wire ranch fencing along the north side of the road. Middleground views show the local foothills, also typical of the immediate area. These foothills are approximately 150 to 200 feet above the valley floor as viewed from SR-138. The prominent visual features of this viewshed are the local foothills and the vegetation.
- **Viewpoint 2 –View from SR-138, approximately 3½ miles east of the westernmost Project boundary, looking northwest.** Viewpoint 2, illustrated in Exhibit 5.13-2, Viewpoint 2 – Project Entrance Simulation, is the view from SR-138 looking northwest at the National Cement Road as it travels through the site. The most common observers from this vantage point would be passing motorists on SR-138 and nearby residences along SR-138. Foreground views show National Cement Road and adjacent flat, vacant land on the Project site, which is characteristic of the surrounding valley. Middleground views show a line of power poles with transmission lines within the local foothills. The Tehachapi Mountains are visible in the background view. The local foothills and the Tehachapi Mountains constitute the prominent visual features in this viewshed.
- **Viewpoint 3 – View from SR-138, approximately 5½ miles east of the westernmost Project boundary, looking north-northwest.** Viewpoint 3, illustrated in Exhibit 5.13-3, Viewpoint 3 – Town Center Entrance Simulation, is the view from SR-138 looking north-northwest at the southern portion of the site to the east of the California Aqueduct. The most common observers from this vantage point would be passing motorists traveling along SR-138. Foreground views show gently sloping, vacant land on the Project site and SR-138 and a line of wire fencing along the north side of the road. Middleground views show the local foothills on the Project site, and the Tehachapi Mountains are visible in the background view. The local foothills and the Tehachapi Mountains constitute the prominent visual features in this viewshed.

### Viewpoint 3 – Town Center Entrance Simulation

*Centennial Project*

Exhibit 5.13-3

- **Viewpoint 4–View from SR-138, approximately 5¾ miles east of the westernmost Project boundary, looking south.** Viewpoint 4, illustrated in Exhibit 5.13-4, Viewpoint 4 – Business Park Simulation, is the view from SR-138 looking generally south from the southern end of proposed business park land uses. The most common observers from this vantage point would be passing motorists along SR-138. Foreground views show flat, vacant land on the Project site and SR-138 with wire ranch fencing along the south side of the road. Middleground views show the local foothills of the San Gabriel Mountains, covered with trees and other vegetation. These foothills are approximately 100 feet above the valley floor as viewed from SR-138. The prominent visual features of this viewshed are the local foothills.
- **Viewpoint 5– View from the intersection of SR-138 and 300<sup>th</sup> Street West, located near the eastern Project boundary, looking northwest.** Viewpoint 5, illustrated in Exhibit 5.13-5, Viewpoint 5 – 300<sup>th</sup> Street West Simulation, is the view from the intersection of SR-138 and 300<sup>th</sup> Street West looking northwest at the southeast portion Project site. The most common observer from this vantage point would be passing motorists traveling along either SR-138 or 300<sup>th</sup> Street West, and residences in the vicinity of this intersection. This viewpoint provides a broad view of the Project site situated east of the California Aqueduct. Foreground views show that SR-138 and 300<sup>th</sup> Street West are both lined by power poles and wire ranch fencing that extend into the middleground. Middleground views show the flat, vacant land on the Project site transitioning to foothills. The land in the northeast corner of the intersection is not part of the Project site. The Tehachapi Mountains are visible in the background. The prominent visual features of this viewshed are the local foothills and the Tehachapi Mountains.

### Views from the Pacific Crest National Scenic Trail

The PCT is the most notable trail in the western United States, extending from Mexico to Canada. Locally, the PCT extends through the Angeles National Forest (ANF) and provides views of the Antelope Valley, including rural/agricultural and suburban land development, varied terrain, vegetation, wilderness, and both the Tehachapi and San Gabriel Mountains, depending on location. The existing alignment of the portion of the PCT which is nearest the Project site travels due north where it emerges from the ANF and aligns with 270<sup>th</sup> Street West and turns due east at the California Aqueduct for approximately one mile to the bridge at Three Points Road. From there, the PCT continues generally moving in a northeasterly direction into the Tehachapi Mountains.<sup>1</sup> Exhibit 5.14-2, Trails and Bikeways in the Project Vicinity, depicts the existing alignment of the PCT. Distant views of portions of the Project site are intermittently visible from segments of an approximate two-mile stretch of the trail that passes through the Three Points area. However, due to distance and/or intervening topography, views of the Project site from the existing PCT alignment are very limited and do not substantially contribute to the visual experience of users of the existing PCT alignment.

The PCT has an existing alternative alignment referred to as the “1973 Permanent Alignment”. The 1973 Permanent Alignment begins where the trail intersects SR-138 and

<sup>1</sup> The existing alignment described is based on the Google Earth .kmz layer provided by the USDA Forest Service.

*Centennial Project*

Exhibit 5.13-5

Pine Canyon Road. Across from this alignment of the trail is Oso Canyon, which is parallel to the West Branch of the California Aqueduct, which runs through the center of the Project site. However, approving the relocation of a public access trail near a major water facility in a “post-September 11, 2001”, era is unlikely.

The USFS, PCTA, Conservancy, and Tejon Ranch Company are in ongoing discussions regarding an alternative realignment for the PCT. Specifically, the USFS, PCTA, Conservancy, and Tejon Ranch Company are discussing the relocation of one segment of the PCT that currently crosses Lancaster Road at 270<sup>th</sup> Street West approximately 1.75 miles east-southeast of the Project site so that it is generally aligned along 300<sup>th</sup> Street West between SR-138 and the northeastern corner of the Project site. Where this conceptual realignment would cross the Project site, a portion of 300<sup>th</sup> Street West’s right-of-way has been reserved for the PCT alignment. At this time, the 300<sup>th</sup> Street West alignment described above is assumed to be the conceptual future realignment for PCT in this EIR. Views from the conceptual PCT future realignment along 300<sup>th</sup> Street West would also have direct views of portions of the Project site, the foothills, and the Tehachapi Mountains, as depicted in Exhibit 5.13-5 (Viewpoint 5). The existing alignment of this segment of the PCT has broad views of flat-lying areas developed with rural/agricultural and older suburban land uses. The conceptual realignment also has views of flat-lying areas of agricultural land and scattered rural residences. Refer to Section 5.14, Parks and Recreation, for additional information on the PCT.

## Light and Glare

The Project site is currently undeveloped, uninhabited, and located in a rural area. In the surrounding area, the predominant land uses include scattered, large lot homes and agricultural uses. These existing land uses and their associated activities, most notably vehicular traffic, generate very little light and glare in the surrounding area. Current lighting on the Project site is sporadic and is generated from (1) residences located to the east and south of the Project site and (2) security lighting at land uses located on and off the site (which include the National Cement Plant, the High Desert Hunt Club, existing residences along 300<sup>th</sup> Street West and 290<sup>th</sup> Street West, the Quail Lake Skypark Airport, and the Southern California Edison Bailey Substation facility). Existing light and glare sources (with the exception of the National Cement Plant) are considered to be typical of rural areas in the western Antelope Valley.

### 5.13.5 PROJECT DESIGN FEATURES

- PDF 13-1** The Project provides a plant palette that requires the use of native, drought-tolerant, and adopted species of trees, grasses, and flowers tailored to the unique environmental conditions of the Project site and prohibits use of invasive species. Native, drought-tolerant, and adopted plant species that can adapt to site conditions (dry summers) to reduce irrigation needs will be used.
- PDF 13-2** The Project’s Design Guidelines include a lighting design that responds to the requirements of a variety of land uses and environmental conditions created by the Project. Street, parking lot, and structural lighting fixtures shall provide

adequate illumination for safety and comfort of vehicular and pedestrian traffic while minimizing light spillover.

**PDF 13-3** The Project's Green Development Program requires the following measures:

- Site the highest density residential uses in areas adjacent to commercial centers and permit residential uses in commercial centers through the Mixed Use Overlay to place larger populations within key centers, encouraging pedestrian activity and a reduction in vehicle trips.
- Preserve oak woodlands, savannahs, and other sensitive habitat areas near Oso Canyon and at the foot of the San Gabriel Mountains southerly of SR-138.
- Exterior lighting shall not cause unacceptable light trespass and shall be fully shielded.
- Outdoor lighting shall be turned off using automatic control devices or systems between the hours of 10:00 PM and sunrise of the following day in commercial, business park, and mixed use areas, unless required by the County Building Code. If the property operates beyond 10:00 PM, then outdoor lighting shall be turned off one hour after the operation ends for the day.
- Outdoor lighting for safety and security reasons is allowed after 10:00 PM only if fully shielded motion sensors are used to turn on lighting after 10:00 PM and the sensors turn the lighting off automatically no more than 10 minutes after the area is vacated, or if at least 50 percent of the total lumen levels are reduced or 50 percent of the total outdoor light fixtures are turned off between 10:00 PM and sunrise.
- Outdoor lighting in residential and open space areas that are over 15 feet in height shall have an output no greater than 400 lumens.
- The maximum height of outdoor lighting fixtures shall be:
  - 20 feet in Residential and Open Space areas.
  - 30 feet in Commercial, Mixed Use, and Public areas.
  - 35 feet in Business Park areas.
- Prohibit the use of outdoor lighting that includes drop-down lenses; mercury vapor lights; ultraviolet lights; search lights; laser lights; and any outdoor lighting that flashes, blinks, alternates, or moves unless mandated for health and safety reasons by a public agency.
- Outdoor light fixtures in outdoor recreational areas shall be mounted, aimed, and fully shielded so that light beams fall onto activity areas and no unacceptable light trespass occurs on surrounding areas or properties. Outdoor lighting shall only provide the minimum necessary to illuminate recreational activity areas and shall be no more than 75 feet high.

Preferably, these fixtures shall also use high pressure sodium or metal halide lamps.

- Outdoor advertising signs, business signs, and roof and freestanding signs that are lighted shall be fully shielded. Externally mounted light fixtures shall be mounted on the top of the sign and shall be oriented downward. Externally mounted bulbs or lighting tubes for signs shall not be visible from adjoining properties or public rights-of-way, unless such bulbs or tubes are filled with neon, argon, krypton or other self-illuminating substance.

**PDF 13-4** Of the 12,323 acres on the Project site, approximately 5,624 acres would be included in the Open Space land use designation. Of the 5,624 acres of designated Open Space, approximately 5,116 acres (42 percent of the total Project site) are intended to (1) remain in their original natural condition; (2) be restored; and/or (3) be enhanced by weed abatement, fencing, and native species planting, among other means. Of this amount, approximately 3,866 acres are designated as Significant Ecological Area (SEA) 17 to be preserved within the Project site boundaries.

**PDF 13-5** Approximately 3,866 on-site acres and the 23,547 off-site acres would comprise the 27,413-acre Open Space Preserve to be protected in perpetuity. When considering the amount of on-site and off-site lands compared to the total disturbed/developed areas within the Project boundaries based on the Grading Plan, almost four times as much land would be conserved within Tejon-owned property as would be developed.

**PDF 13-6** A new on-site dry utility backbone system consisting of joint and sole electric, natural gas, telephone, and cable television facilities would be installed underground within the roadway rights-of-way. The existing off-site 66-kilovolt (kV) electric lines that extend along State Route (SR)138, which passes adjacent to Quail Lake, would be relocated south of the Business Park area and may be placed underground, if feasible.

### 5.13.6 THRESHOLD CRITERIA

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

**Threshold 13-1** Have a substantial adverse effect on a scenic vista.

**Threshold 13-2** Be visible from or will obstruct views from a regional riding or hiking trail.

**Threshold 13-3** Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

- Threshold 13-4** Substantially degrade the existing visual character or quality of the site and its surroundings because of height, bulk, pattern, scale, character, or other features.
- Threshold 13-5** Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

### 5.13.7 ENVIRONMENTAL IMPACTS

In this impact analysis, the thresholds are taken out of order to better group issues for analysis.

- Threshold 13-1** **Would the proposed project have a substantial adverse effect on a scenic vista?**
- Threshold 13-4** **Would the project substantially degrade the existing visual character or quality of the site and its surroundings because of height, bulk, pattern, scale, character, or other features?**

Typically, viewsheds are those areas most visible to three types of viewing audiences: (1) persons in vehicles, (2) permanent residents, and (3) public recreational audiences. However, the Project site is currently uninhabited and provides no public access onto the site. Consequently, SR-138 provides the primary Project viewshed corridor. 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue are also Project viewshed corridors, primarily used by the local population. The analysis of the change in the Project site's visual character focuses on views along SR-138 and 300<sup>th</sup> Street West.

### On-Site Impacts

#### *Construction Phases*

Project construction would occur in phases over an approximate 20-year period. Areas where the natural open space is proposed to be preserved would either remain untouched or, if disturbance is required, the open space would be restored to its pre-development condition. Roadways and utilities (such as water, wastewater, gas, electric, and cable) would be constructed prior to the development of the structures. The transition from open space to graded lots to framed structures to finished buildings with landscaping would occur in phases over each area, and would occur in a consistent sequence over time. As the structures are constructed and finished, the scale of the Project and changes to the visual character of the Project site would become more evident. Changes to the visual character of the Project site and surrounding areas would occur gradually over the course of the 20-year construction timeframe. Although views of construction activity and incremental development would be periodic and temporary, the resulting change in topography due to grading and development of land uses would be permanent. Construction of the Project would result in a significant and unavoidable impact to visual character and quality of the site and its surroundings as the Project site transitions from open space to developed land uses.

## ***Project Buildout and Occupation***

### Views of the Site

Project implementation would change the overall aesthetic nature of the Project site from an undeveloped, rural landscape to a developed urban community. The analysis of these thresholds focuses largely on what is and would be visible from the location of publicly accessible viewpoints, rather than a subjective determination (of what is or is not an impact) based on the inherent character and quality of the land uses proposed on the site; this is discussed further below.

To capture the existing visual characteristics of the site currently available to the public, photographs were taken from representative public vantage points surrounding the Project site, as discussed above. Five views were selected which, collectively, best represent public observation points along SR-138 and 300<sup>th</sup> Street West to document the existing visual characteristics of the area. To assess the visual impact of the Project, these five viewpoints (Viewpoints 1 through 5) were selected to compare the current visual characteristics of the Project site and surrounding area from public vantage points (i.e., the site's major transportation connection, SR-138, and the residences located east of the Project site) with those that would occur in the developed condition via visual simulations. These five viewpoints were selected to provide representative viewsheds of the Project site.

Computer-modeling techniques were employed to simulate post-development conditions on the Project site and to illustrate the possible placement of future development. This was done for the five representative public viewpoints in Exhibits 5.13-1 through 5.13-5. To simulate post-buildout views of the site, a three-step process was involved: (1) viewsheds were chosen on the basis of field surveys; (2) photographs were then taken of the chosen viewsheds; and (3) typical building heights, massing, setbacks, and open space areas were plotted based on the Project's Conceptual Land Use Plan (see Exhibit 4-1). In Exhibits 5.13-1 through 5.13-5, the "before" view is provided beside the simulation in order to allow the reader to compare the Project site's "before" to the "after" view that would result with Project implementation.

The building setbacks for the Project would be highly varied based on several intersecting factors, including the land use designation, where the setback would be provided (i.e., front yard, side yard, rear yard), and between what two land uses the setback would extend (i.e., front entry garage, covered porch, corner lot on public street). At buildout of the Project, it is anticipated that the full range of building architecture, colors, and roofing materials would be represented on the Project site. The ultimate building sizes and types of building materials and colors would be determined at the time individual elements of the Project are submitted for building permits. These buildings must be consistent with the Design Principles as outlined in Appendix 2-A of the Specific Plan. The following discussion evaluates the Project's impact on the "before" views from each of the five representative public viewpoints illustrated in Exhibits 5.13-1 through 5.13-5.

### *Viewpoint 1*

Exhibit 5.13-1, Viewpoint 1 – Cement Plant Road Realignment Simulation, shows the before and after views that a motorist traveling on SR-138 would have of the southwestern portion of the Project site. As shown in the “after” view, foreground views to the north of SR-138 would include large truck traffic traveling along the realigned road to and from the National Cement Plant. The majority of the foreground, middleground, and background views would not substantively change from their existing setting, with the exception of the hillside cut to accommodate of National Cement Plant Road realignment. Some new trees and vegetation would be planted near the intersection of the newly realigned Cement Plant Road and SR-138. The proposed very low, low, and medium density residential, parks, school, and small utility area would be located beyond the high point of the low hill in the middleground and just beyond the truck in the “after” view. Therefore, these lands uses would not be visible from SR-138 when traveling from the west. The low hills in this view and on-site lands to the west would remain undeveloped and would be designated as Open Space.

### *Viewpoint 2*

Exhibit 5.13-2, Viewpoint 2 – Project Entrance Simulation, shows the before and after views that a motorist traveling on SR-138 would have of the Project site’s primary Project entrance, which is situated at the existing National Cement Plant Road’s intersection with SR-138. As shown in the “after” view, foreground views to the northeast of SR-138 would consist of a widened and split roadway in the same general configuration as the existing roadway. The proposed Recreation/Entertainment overlay to the left of the entrance would be visible, here visualized as a vineyard, in the foreground. In the middleground, the proposed Residential (Low, Medium, and High Density), Mixed-Use Commercial, and Kindergarten (K) through 8<sup>th</sup> grade school land uses would be partially visible beyond the landscaped slopes transitioning from the roadway to developed areas. New landscaping would also be visible along the entrance roadway. As per PDF 13-1 (as implemented by MM 7-13 in Section 5.7, Biological Resources), the Project’s plant palette would be incorporated into the Project’s Landscaping Plan and would require use of non-invasive species that are adapted to the conditions found on the Project site and do not require high irrigation rates. The Landscaping Plan would also include a list of invasive plant species prohibited from being planted on the Project site. In addition, retail sales of these invasive plant species would be prohibited at any businesses (nurseries) located within the Project site.

The foothills would be graded to accommodate the proposed development. As shown, background views of the Tehachapi Mountains would be more visible with grading of the local foothills. However, the middleground views of the local foothills would be replaced with views of the proposed landscaping and development.

### *Viewpoint 3*

Exhibit 5.13-3, Viewpoint 3 – Town Center Entrance Simulation, shows the before and after views that a motorist traveling on SR-138 would have immediately east of the Town Center entrance, one of the main community entrances to the Project site. As shown in the “after” view, changes to the foreground views would involve replacing the wire ranch fencing with horizontal slat wooden fencing and installing landscaping along the SR-138 and the

proposed on-site roadway. As shown, preserved Open Space would transition to a landscaped slope and then to proposed High Density and Very High Density Residential land uses in the middleground view. As with Viewpoint 2, the foothills would be graded to accommodate the proposed development. As shown, background views of the Tehachapi Mountains would be more visible with the grading of the local foothills. However, the middleground views of the local foothills would be replaced with views of the proposed landscaping and development.

#### *Viewpoint 4*

Exhibit 5.13-4, Viewpoint 4 – Business Park Simulation, shows the before and after views that a motorist traveling on SR-138 would have of the proposed Business Park land uses situated on the south side of SR-138. As shown in the “after” view, changes to the foreground views would involve replacing the wire ranch fencing with horizontal slat wooden fencing and installation of landscaping along the SR-138. As shown, a slope would be built up and landscaped between the fence and the proposed Business Park land uses in the middleground view. Although screened by the mature landscaping in the foreground, the multi-story buildings associated with the Business Park land use designation would be partially visible. Views of the local foothills in the background view would be partly obstructed by the proposed structures.

#### *Viewpoint 5*

Exhibit 5.13-5, Viewpoint 5 – 300<sup>th</sup> Street West Simulation, shows the before and after views that a motorist traveling on SR-138 would have of the southeast portion of the Project site. As shown in the “after” view, foreground views would include the landscaped rights-of-way along SR-138 and 300<sup>th</sup> Street West and the Commercial land uses proposed at this corner. Beyond the commercial development, primarily Low and Medium Density Residential land uses and associated landscaping would be visible in the middleground. In the after view, a widened landscape setback is present along the west side of 300<sup>th</sup> Street West to accommodate the anticipated realignment of the PCT adjacent to the Project site. Views of the local foothills and/or the Tehachapi Mountains in the background view would be partly obstructed by proposed structures.

### Visual Character Analysis

The level of impact to the visual character from each of the five view locations is subjective and largely depends on the observer’s location and individual perception of his/her surroundings. In contrast, the analysis above has largely focused on the viewpoint’s location. This method is more impartial when compared to one that requires a subjective determination of what is or is not an impact based on the character and quality of the land uses proposed on site. The visual simulations illustrate that Project implementation would result in an impact that is largely dependent on (1) the location of the observer and (2) the existing rural nature of the western Antelope Valley. These two factors are discussed below.

### *Location of the Observer*

The closer the observer is to the land uses proposed on the Project site, the greater the potential that the middleground and background views of distant ridgelines (scenic vistas) would be obstructed. This effect is apparent in each of the visual simulation viewpoints (Viewpoints 1 through 5). As SR-138 is the main observational corridor under existing and proposed conditions, observers along this corridor would generally see only the structures that are proposed adjacent to the highway in the foreground, thus screening portions of the middleground and background views of the local foothills on and near the Project site and the distant mountains from view.

It is the Applicant's intent to minimize such impacts to the extent possible by having setback requirements and other development standards (such as building height, signage, and parking standards) for proposed land uses along the main public thoroughfares so that development is removed farther from the road where feasible. Certain grading and planting design requirements would be used to ensure that manufactured slopes transition smoothly to natural grades. There are existing rock outcroppings located within the hillsides on the Project site that could be significantly changed by Project development. However, MM 13-1 would require that, during grading and development of the Project, rock outcroppings that are visible from SR-138 would be preserved to the extent feasible. Rock outcroppings in the northwestern corner of the Project site in Oso Canyon are contained within designated Open Space areas and would be preserved.

As an observer moves farther away from the Project site, the middleground and background views of distant foothills and ridgelines would become more visible. For observers from off-site residences (along SR-138, 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, Malinda Avenue, and from the Neenach and Three Points communities), views of the Project site's developed areas would depend on their distance to the site and the presence of intervening landforms, vegetation, and structures. However, views of the most prominent and dramatic visual feature in the area, the Tehachapi Mountains, would not be obstructed from these locations. From the Quail Lake area, the foreground and background views would remain unchanged, with only a small portion of the land uses associated with the Project area visible in the middleground.

Overall, Project implementation would result in a significant change to the visual character of the Project site and its surrounding area by obstructing some views of the local foothills and the Tehachapi Mountains and by changing the Project site's condition from rural to urban. Because the overall change is in significant contrast to the existing rural and open qualities of the pre-Project conditions, the impact from the perspective of local observers is considered to be significant and unavoidable.

### *Rural Nature of Western Antelope Valley*

Currently, the western Antelope Valley is mostly vacant, relatively undeveloped, and rural in character. The development of 19,333 dwelling units and approximately 10.0 million square feet of non-residential land uses throughout the Project site would represent a significant change to the character of the surrounding western Antelope Valley. The visual simulations prepared for Viewpoint 1 (see Exhibit 5.13-1) and Viewpoint 5 (see Exhibit 5.13-5) together

best represent the overall size and context of the Project within the surrounding area, as these views encompass the majority of the site on the east side of the California Aqueduct. Development of the Project would change the character within the majority of the Project site from rural to urban. Approximately 56 percent of the Project site would be mass-graded and developed, which would result in recontouring natural slopes; introducing new residential, commercial, and industrial structures; and adding streets and other appurtenant development associated with a new urban community. Although the landform changes proposed to accommodate the Project would alter the existing condition, views of the background ridgelines located off site (which surround the Project site) would largely remain. Grading for the creation of building pads and manufactured slopes would preserve existing rock outcroppings that are visible from off-site locations (see MM 13-1). Curvilinear street design and other improvements have been incorporated into Project design to emulate the natural contours of the existing topography.

As previously indicated, the Project site consists of gently rolling hills and flatlands, much of which has been used for cattle grazing for many decades. The Project has been designed to cluster development on the flattest areas of the site. The proposed development pattern would be clustered to minimize impacts to dense stands of oak trees, steep slopes, and existing natural drainages (see MM 13-2). Of the 12,323 acres on the Project site, approximately 5,624 acres would be included in the Open Space land use designation (PDF 13-4). Of this amount, approximately 3,866 acres are designated as SEA 17 to be preserved within the Project site boundaries, in addition to 23,547 off-site acres, which would comprise the Open Space Preserve to be protected in perpetuity (PDF 13-5). Graded slope faces would be revegetated with native or naturalized plants and grasses that will blend with the surrounding terrain, where appropriate.

Implementation of the Project would convert the Project site from a rural to an urban condition and would partially to wholly obstruct existing views across the site; views of the local foothills; and/or distant views of the Tehachapi and San Gabriel Mountains. As there is no additional, feasible mitigation for these changes to visual character, this is considered a significant and unavoidable impact to the visual character of the Project site and the surrounding area.

## **Off-Site Impacts**

Off-site Project features are individually small in scale and most would be located underground or at grade (i.e., wet utility pipelines, dry utility extensions, and acceleration and deceleration lanes along the SR-138). Proposed improvements located in Caltrans' right-of-way are limited both in scale and geographic extent, and would not result in above-ground structures that could substantially affect the visual character of the area. In the context of the Project as a whole, these features would not be noticeable as a substantial change to the viewshed. The utility lines along SR-138 would require relocation within the immediate area (i.e., movement of poles and lines to a nearby position); however, in the context of the Project development, these features would not be a substantial change to the viewshed because overhead utility lines already exist along SR-138 and they would not, therefore, be a new visual element as a result of the Project. Additionally, per PDF 13-6, as implemented by MM 13-3, off-site electrical lines may be placed underground in the vicinity

of Quail Lake. However, because these features are necessary to fully implement the Project and because the undergrounding of utilities near SR-138 is not certain, they would contribute to the significant and unavoidable impact to the visual character of the Project area.

The existing off-site Tejon Water Bank and proposed well locations are currently comprised of open space at the edge of the low, rolling foothills of the Tehachapi Mountains, identified as a dominant aesthetic feature of the area. The well locations at the Water Bank would have a very low profile and would only be intermittently visible by motorists along 300<sup>th</sup> Street West and trail users on the PCT. The off-site wells and the portion of the pipeline traversing the East Branch of the Aqueduct, by themselves, would not substantially affect a scenic vista or degrade the visual quality of the sites or the surrounding areas due to (1) the small scale of the aboveground structures at the well locations; (2) pipeline alignment over the Aqueduct via an existing bridge structure; and (3) the scattered location of the proposed improvements.

The potential widening expansion of the existing bridge of the West Branch of the Aqueduct would have minimal visual impact because the incremental expansion would not be a visually prominent change to the existing condition. The newly proposed bridge crossing over the West Branch of the Aqueduct would be visible by viewers in the immediate area and would alter the visual character of the portion of the Aqueduct that bisects the Project site. Because these roadway and bridge improvements, off-site wells, and utility improvements are part of the larger development Project, they would contribute to the significant and unavoidable impact to the visual character of the Project area.

**Impact Summary:** The Project would result in significant and unavoidable impacts related to a change in visual character experienced from public vantage points (primarily transportation thoroughfares including SR-138, 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and Malinda Avenue). Visual character impacts related to grading and development of the Project would be reduced through implementation of PDF 13-4, PDF 13-5, MM 7-13, MM 13-1, MM 13-2, and MM 13-3; however, the change of the Project site from a rural to urban condition and the varying degrees of obstruction of existing views of local foothills and the Tehachapi Mountains would be considered a significant unavoidable impact, for which no additional feasible mitigation exists.

**Threshold 13-2**      **Would the project be visible from or obstruct views from a regional riding or hiking trail?**

## **On-Site Impacts**

As discussed above, the majority of Project site observers are either passing motorists and travelers on SR-138 or other surrounding roadways or residents and visitors of immediately adjacent, off-site properties. As discussed fully in Section 5.14, Parks and Recreation, there are a variety of federal, State, and County trails in the Project area; however, due to distance

and/or topography, there are limited views of the Project site from these trails. The following discussion describes views of the Project from trails and bikeways in the Project area, if any.

From the existing alignment of the PCT, the Tehachapi and San Gabriel Mountains are the prominent visual features in the background. Distant views of the Project site are available in some locations along the PCT, but are often blocked by the foothills. Project development would not block any views from the PCT's current alignment. Additionally, views from the PCT of the Project site's visual character changes would be infrequent due to intervening topography. Therefore, impacts to the current alignment of the PCT would be less than significant.

As a result of ongoing coordination, the USFS, PCTA, Conservancy, and Tejon Ranch Company are discussing the relocation of one segment of the PCT that currently crosses Lancaster Road at 270<sup>th</sup> Street West approximately 1.75 miles east of the Project site so that it is generally aligned along 300<sup>th</sup> Street West between SR-138 and the northeastern corner of the Project site. The USFS and PCTA's agreement on the conceptual future realignment in concert with the Project indicates their concurrence that this is an acceptable and preferable location over the existing alignment. Views from the conceptual realignment of the PCT, if approved, would be of development on the Project site, the adjacent foothills, and the distant Tehachapi Mountains. The conceptual realignment of this segment of the PCT has broad views of flat-lying areas developed with rural/agricultural and older suburban land uses. Development on the eastern section of the site would present trail users with views of residential, commercial, and business park structures along 300<sup>th</sup> Street West for a distance of approximately 1½ miles. MM 13-4 requires that structures proposed along the PCT alignment be screened by a block wall along the rear of the structures and a wide, landscaped setback that would contain the conceptual PCT realignment. These features would ensure that the on-site urban uses in the foreground of views from the trail, as it passes through the site, would have limited visibility. The location and design of the conceptual PCT realignment is intended to be a similar (i.e., some rural/agricultural uses and some land development) to comparatively better than views from the existing alignment. Therefore, views from the conceptual future realignment of the portion of the PCT along 300<sup>th</sup> Street West would be reduced to a less than significant level.

County of Los Angeles Trail Number 113 is a historic California Riding and Hiking Trail and is located approximately ten miles east of the Project site. Because of the distance and intervening topography, it would not have views of the Project site. Other County trails exist in the ANF, but are situated near Castaic Lake, approximately 15 miles to the south of the Project site. These trails include Cliffie Stone Trail, North Park Trail, and Hasley Canyon Trail. The ANF offers 557 miles of hiking and equestrian trails south of the site. Some local trails include Cienega Loop, Warm Springs Necktie Trail, Fish Canyon Trail, and Castaic Lake Trail in Castaic and Gillette Mine Trail in Lake Hughes. Views of the Project site from these trails are not available due to distance and intervening topography and vegetation.

In addition, it is noted that the Tejon Ranch property (where the Project site is located) extends northward into Kern County. Official Los Angeles County trails are non-existent in this area. Additionally, there is little-to-no trail connectivity between the Kern County trail

system and the Los Angeles County trail system, other than the PCT, which extends from Mexico to Canada.

As the views of the Project site from existing trails are currently blocked or infrequent due to distance and intervening topography and vegetation and because development associated with the Project would not block major views from these trails, less than significant visual impacts are expected.

There is no existing regional bikeway near the site, but the Los Angeles County Bicycle Master Plan shows a proposed Class 3 bike route on Old Ridge Road (Highway N-2), just south of SR-138. The Project site is visible from Old Ridge Road (Highway N-2) and views would change as the low hills on the site are replaced with urban development. This change in view would be confined to the developed portions of the site, but open space areas would remain around the site and views of the Tehachapi Mountains that dominate this view would not be obstructed. This site would also be visible only from the northern section of this bike route. This impact is considered less than significant.

## Off-Site Impacts

As discussed above, the proposed PCT alignment would have views of development on the Project site, the adjacent foothills, and the distant Tehachapi Mountains. Off-site Project features are individually small in scale and most would be located underground or at grade (i.e., wet utility pipelines, dry utility extensions, acceleration and deceleration lanes along the SR-138), and would not obstruct views from the PCT. The proposed wells and utility lines at the Water Bank would be visible to trail users on the PCT but would have a very low profile. The potential widening and expansion of the existing bridge on the West Branch of the Aqueduct would also have minimal visual impact because the incremental expansion would not be a visually prominent change to the existing condition. The newly proposed bridge crossing over the West Branch of the Aqueduct would be visible by viewers in the immediate area and would alter the visual character of the portion of the Aqueduct that bisects the Project site, but would be too distant to affect views from hikers along the PCT. In the context of the Project as a whole, these features would not be noticeable as a substantial change to the viewshed and would be less than significant.

***Impact Summary:*** Existing views from public regional trails and bikeways would have less than significant impacts due to both the distance and the intervening topography between these trails and the Project site.

The relocation of one segment of the PCT that currently crosses Lancaster Road at 270<sup>th</sup> Street West would potentially move approximately 1.75 miles east so that it is generally aligned along 300<sup>th</sup> Street West between SR-138 and the northeastern corner of the Project site. Views from the conceptual alignment of the PCT, if constructed, would be of the Project site, nearby foothills, and the distant Tehachapi Mountains. MM 13-4 requires that structures proposed along 300<sup>th</sup> Street West be screened by a block wall along the rear of the structures and a wide, landscaped setback containing the

conceptual PCT realignment. This would ensure that the urban uses on the site would have limited visibility from the trail, and would therefore result in a less than significant impact.

**Threshold 13-3      Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?**

## On-Site Impacts

### *Construction/Buildout and Occupation*

There are no State-designated scenic highways within 20 miles of the Project boundaries. SR-138 is not an officially designated State scenic highway, nor is it eligible for designation (Caltrans 2011). As discussed above, the *County of Los Angeles General Plan* has a Scenic Highways Plan that conforms to the State Scenic Highway Program, but it does not identify any scenic highways near the site. Therefore, no impact on a scenic highway would occur with the Project. However, the AVAP designates several Scenic Drives on and near the site. These Scenic Drives currently offer views of the expansive valley floor and low hills, surrounded by the Tehachapi and San Gabriel Mountains, as well as views of tree-covered areas on winding mountain roads.

There are features on and around the Project site that would be considered scenic by many; these include the surrounding mountain ranges in the background, existing rock outcroppings located within hillsides on the Project site, views of the low hills and largely undeveloped and expansive valley area, Quail Lake, and some existing structures on the Project site that have been evaluated as historical resources, although not determined to be historically significant (please refer to Section 5.6, Cultural Resources). These components of the overall visual character of the area are not within the viewshed of a designated scenic highway but are visible from the County's Scenic Drives.

The Project would not change views from I-5 since the majority of the western portion of the site would be preserved as open space and development north of Quail Lake would not be visible in the distance. Since mountain slopes line both sides of I-5 near its intersection with SR-138, development on the Project site will not be a component of the scenic quality of the views from I-5.

Although areas on both sides of Gorman Post Road would remain as open space, views from this road would slightly change where on-site development north of Quail Lake would be visible from the eastern end of this road. There are intervening low hills and vegetation that block views of the site from this road. Thus, changes in views from this road would be considered less than significant.

Scenic views on Old Ridge Road (Highway N-2) consist mainly of a tree-lined road as it rises into the ANF. However, Old Ridge Road (Highway N-2), south of SR-138 provides northerly views of the Project site through trees that line the northern segment of this road. This view would change as the site is developed and the view of low hills is replaced with urban

development. This change in view would be confined to the developed portions of the site, with open space areas remaining around the site. This view would also be visible only from select points on the northern section of this road. This impact is considered less than significant.

The site is not readily visible from Pine Canyon Road between Old Ridge Road (Highway N-2) and Three Points Road due to intervening mountain slopes, trees, and distance. Thus, development on the site would not affect the scenic views on this road. This impact is considered less than significant.

Three Points Road south of SR-138 has views of a relatively flat agricultural area and scattered rural residences as the road rises up into the mountains. Distant views to the northwest include the eastern portion of the site. Future development on the site would be visible in the distance from Three Points Road. There are intervening low hills, vegetation, and existing residences north of SR-138 that block views of the site from this road. Thus, changes in views from this road would be considered less than significant.

The greatest change in scenic views would occur on SR-138 as development occurs on both sides of this road, as it passes through the site. Existing views of undeveloped land and agricultural land would be replaced with business parks and commercial structures, as well as residential development that would be constructed onsite. While distant views of the mountains will remain, the view of passing motorists will consist of urban structures that would be different than the existing rural environment.

While the AVAP has designated SR-138 as a Scenic Drive, it has also designated the Project site as the West Economic Opportunity Area and Future Rural Town Area, where future development is planned and expected. Also, the Project site is not located in Rural Preserve Areas or Scenic Resource Areas, where the preservation of existing visual and scenic qualities is called for. Since the Project is consistent with the AVAP for development as a Rural Town Area and Economic Opportunity Area, the Project would represent the overall scenic qualities that the County anticipates for the site and along SR-138. This would be ensured through compliance with Policy COS 5.7, which requires implementing standards and guidelines for development within identified viewsheds of Scenic Drive routes. As such, the Design Principles as outlined in Appendix 2-A of the Specific Plan would ensure the overall aesthetics and compatibility of the Project with the surrounding Scenic Drives.

Because Policy COS 5.2 exempts EOAs from limits on development in scenic resource areas, and Policy COS 5.7 ensures that development standards and guidelines are established for development within the viewsheds of Scenic Drives, impacts on SR-138 as a Scenic Drive would be less than significant.

The proposed changes to the Project site would result in less than significant impacts under this threshold. The analysis of Thresholds 13-1 and 13-4 above discuss the changes to visual character and the scenic qualities of the site, regardless of highway designation.

## Off-Site Impacts

There are no scenic highways within 20 miles of the Project boundaries. Further, there are no features that would generally be considered scenic in the immediate area of proposed off-site features that are located within roadway rights-of-way. Also, view from designated County Scenic Drives would not change due to these roadway and bridge improvements, water wells, and utility connections. The Gorman Substation, located approximately 3.6 miles northwest of the site, would require the addition of one or more additional transformers and the reconstruction of existing overhead power lines along Gorman Post Road from the substation to the Project site. The reconstructed overhead lines along Gorman Post Road would be a temporary construction impact within the right-of-way/utility easement and would not impact the nearby scenic resources associated with the adjacent open space. Because of the slim profile of the poles and the fact that they would be replacing existing utility poles along the same alignment, the newer and potentially taller utility lines would not significantly affect views of the nearby or distant open spaces. The utility poles would not substantially degrade any scenic resources. Therefore, there would be less than significant impacts from implementation of off-site project features related to scenic resources along a scenic highway.

While there are features in the vicinity of the Tejon Water Bank well locations that would be considered scenic by many—in particular the surrounding mountain ranges in the background—because these components of the overall visual character are not within the viewshed of a designated scenic highway, the proposed off-site wells would not result in impacts under this threshold. Also, the designated County Scenic Drives are located on the southern portion and south of the site and do not have direct views of the well locations. Therefore, there would be less than significant impacts from implementation of off-site wells related to damaging scenic resources along a scenic highway.

***Impact Summary:*** There are no scenic highways in the Project site vicinity. Therefore, the Project would not result in significant impacts related to damaging scenic resources along a scenic highway. While the AVAP has designated Scenic Drives on and near the site, the Project site is not located in Rural Preserve Areas or Scenic Resource Areas, where the preservation of existing visual and scenic qualities is called for. The Design Principles as outlined in Appendix 2-A of the Specific Plan would ensure the overall aesthetics and compatibility of the Project with the surrounding Scenic Drives. Thus, no adverse impact on designated Scenic Drives would occur. The analysis of Thresholds 13-1 and 13-4 above discuss the changes to visual character and the scenic qualities of the site from public vantage points, regardless of highway designation.

**Threshold 13-5**      **Would the project create a new source of substantial light and/or glare which would adversely affect day or nighttime views in the area?**

To determine if light and glare would result in a significant impact with implementation of the Project, basic information regarding light and glare is first provided below.

## **Definition of Light and Glare Terms**

### ***Light Scales***

Illuminance is the amount of total light received from a source by a unit of surface area. Illumination is measured in foot-candles of light. One candlepower is approximately equal to the light emitted from one candle, and a foot-candle is the amount of light produced by this candle on one-square-foot of a spherical surface one foot from the light source.

### ***Glare***

Glare is defined as the sensation produced when the brightness of an object is greater than the brightness to which the eyes can adapt. Glare, a function of candlepower, may be caused directly by a lamp or indirectly from the reflection of surrounding surfaces within the field of view. The presence of glare is frequently a subjective issue. In such cases, the magnitude of glare may prove to be less important than its very presence. When glare is excessive, it can cause discomfort, reduction of visibility, and even momentary loss of vision.

## **On-Site Impacts**

### ***Construction Light and Glare***

Project development would create new sources of light and glare during construction activities due to security lighting in the construction equipment and building material staging areas. Motorists on SR-138 could be affected by light and glare from construction of the new structures adjacent to it, which would be a potential significant impact. However, compliance with MM 13-5 requires that security lighting at the construction equipment and building material staging areas be directed away from SR-138, 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, Malinda Avenue and existing residences east of 300<sup>th</sup> Street West and 290<sup>th</sup> Street West, and south of Malinda Avenue. Security lighting at construction staging areas shall be screened and directed away from adjacent on-site residences that are occupied, as each development phase is built. Any security lighting associated with construction equipment and building material staging areas along SR-138 and other on-site areas would be limited and temporary in nature. Therefore, with compliance with MM 13-5, impacts due to construction-generated light and glare would be considered less than significant.

### ***Long-Term Light and Glare***

The Project would introduce new light and glare sources into the Project site that would result in daytime glare, nighttime lighting and glare, and nighttime sky glow. These are described below. New light sources are anticipated to occur from the illumination of on-site structures, such as residential structures, industrial lots, and commercial uses; recreational uses (i.e., signage, interior and exterior lighting); and street and vehicle lights. New permanent light sources would be introduced with the Project where none currently exist. Lighting associated with the commercial, industrial, and other business uses would include

security lighting, exterior lighting, parking lot lighting, and lighted signs. Light “spills” occur when light shines beyond the intended area and illuminates an unintended area. Lighting associated with the Project would be confined to the Project boundaries and the proposed lighting would be shielded or directed downward to minimize light spillover (PDF 13-2 and PDF 13-3, as implemented by MM 13-2 and MM 13-6). The impacts of potential light and glare sources from operation of the Project are described below.

#### Daytime Glare

Project development would increase the amount of glare (indirect reflected light) generated on the Project site during the day. Daytime sources of glare would primarily be generated by human activities and from the sun’s reflection off glass windows and other reflective materials on structures, automobiles, and trucks. From observation points located along SR-138 and other local streets, daytime sources of glare generated by the Project would be partially screened through the use of landscaping along the perimeter of the highway and throughout the Project site. Since the Project site is currently undeveloped, sources of daytime glare that would be generated would be greater than existing conditions and would be considered a significant and unavoidable impact.

#### Nighttime Light and Glare

Implementation of the Project would create new sources of light and glare that are presently not found in the area. Nighttime sources of light would include streetlights, vehicle headlights, and lights used within and around buildings, parking lots, parks, and walking paths located throughout the Project site. Streetlights along the roadways throughout the Project site would be most visible to off-site viewers traveling along SR-138. Sources of light that would be generated on the Project site would also be partially obstructed from observation points along SR-138 and other local streets through the use of landscaping along parkways and setback areas and throughout the Project site. Lighting will be required to meet applicable County standards and would be required to be directed downward (see Section 2.2.8[P] of the Centennial Specific Plan in Appendix 4.0-A). MM 13-2 and MM 13-6 are proposed to reduce nighttime light and glare to the greatest degree possible. However, because the Project would introduce new light and glare into a largely undeveloped rural area, increases in lighting levels would be experienced by existing residents near the site and by passing motorists for which there is no additional, feasible mitigation. Therefore, this is considered a significant and unavoidable impact.

#### Light Pollution (Sky Glow)

Light pollution, also known as “sky glow”, is an adverse effect of manmade light. It is often used to denote urban sky glow (brightening of the night sky due to man-made lighting) but also includes glare (intense and blinding light), light trespass (light falling where it is not wanted or needed; spill light), visual clutter, and other adverse effects of lighting (IDA 2005). In many cases, sky glow is visible from great distances, particularly in the evenings when there is moisture in the air. Minute water droplets in the evening air also reflect and scatter light into the atmosphere. As discussed above, outdoor lighting sources would be used along roadways, parking lots, parks, walkways, and for security throughout the Project site. Because of the proposed 19,333 dwelling units and approximately 10.0 million square feet

of non-residential floor area, these new sources of lighting would contribute to increased sky glow in the area.

Mount Piños, located approximately 15 miles to the west of the Project site at an elevation of approximately 8,831 feet above msl, is a well-known location for stargazing and astronomy. In order to minimize the effects of light pollution, the Project would include preparation of an Exterior Lighting (photometric) Plan, also referred to as “the Dark Sky Plan”, to define proposed outdoor lighting that minimizes glare and light spillover beyond the Project site boundaries by using various techniques that include hooded street lights that would direct light downward and timers or sensors on lights; these would also be consistent with County lighting and safety standards. Although these light sources are not expected to extend beyond the physical limits of the Project site, they have the potential to create sky glow in an area that has few light sources, except for the existing lighting at the National Cement Plant. Measures outlined in the MM 13-2 and MM 13-6 would minimize the effects of night lighting and associated sky glow to the extent feasible. However, because the Project would introduce new sources of nighttime light and glare into a largely undeveloped rural area, increases in sky glow may occur for which there is no additional, feasible mitigation. Therefore, this is considered a significant and unavoidable impact.

### **Off-Site Impacts**

Off-site Project features would introduce minimal light and glare sources, if present at all. In some instances, aboveground utility structures may have nighttime security lighting. However, these Project components would not appreciably contribute to the light and glare anticipated from Project implementation and there would be less than significant impacts.

The well locations may include nighttime security lighting, but any light fixtures installed at the well locations would be consistent with County lighting and safety standards to reduce light spillover and glare (see MM 13-2 and MM 13-6). The off-site wells would not require nighttime vehicle trips to the well locations, except in the rare event of an emergency visit. Therefore, these off-site wells would not appreciably contribute to the light and glare anticipated from Project implementation. There would be less than significant impacts and no mitigation is required.

The aboveground structures, including bridges and roadway improvements, would be constructed of non-reflective materials, such as concrete, asphalt, or similar materials. Bridge crossings of the Aqueduct would contain street lighting or other lighting, as required by the County for vehicular safety and visibility. These light sources are not expected to extend beyond the physical limits of the bridge structures; however, they have the potential to contribute to sky glow in an area that has few light sources, except for the existing lighting at the National Cement Plant. This increased lighting would contribute to the overall Project-generated lighting and is considered a significant and unavoidable impact. Measures outlined in the MM 13-2 and MM 13-6 would minimize night lighting to the extent feasible. However, impacts would remain significant and unavoidable after mitigation.

***Impact Summary:*** Since the Project site is in an undeveloped area with few existing light sources, implementation of the Project would result in significant and unavoidable impacts by introducing new sources of daytime and nighttime light and glare into the area. Project implementation would also cause a significant and unavoidable impact regarding a new source of sky glow, even with implementation of MM13-2 and MM 13-6. However, compliance with MM 13-5 would reduce construction-generated light and glare impacts to less than significant.

### 5.13.8 MITIGATION MEASURES

**MM 13-1** The Project's plans and specifications shall demonstrate the implementation of measures to preserve existing rock outcroppings that are visible from off-site locations. In addition, the County of Los Angeles shall review all final development plans (e.g., landscape, lighting, architectural plans)—as provided by the Project Applicant/Developer—to ensure that the development standards for each land use have been implemented to minimize the visual alteration of the site and to create an aesthetically pleasing development.

**MM 13-2** The Project shall implement the following components of the Green Development Program to minimize potentially adverse visual impacts:

- Site the highest density residential uses in areas adjacent to commercial centers and permit residential uses in commercial centers through the Mixed Use Overlay to place larger populations within key centers, encouraging pedestrian activity and a reduction in vehicle trips.
- Preserve oak woodlands, savannahs, and other sensitive habitat areas near Oso Canyon and at the foot of the San Gabriel Mountains southerly of SR-138.
- Exterior lighting shall not cause unacceptable light trespass and shall be fully shielded.
- Outdoor lighting shall be turned off using automatic control devices or systems between the hours of 10:00 PM and sunrise of the following day in commercial, business park, and mixed use areas, unless required by the County Building Code. If the property operates beyond 10:00 PM, then outdoor lighting shall be turned off 1 hour after the operation ends for the day.
- Outdoor lighting for safety and security reasons is allowed after 10:00 PM only if fully shielded motion sensors are used to turn off lighting after 10:00 PM and the sensors turn the lighting off automatically no more than 10 minutes after the area is vacated or at least 50 percent of the total lumen levels are reduced or 50 percent of the total outdoor light fixtures are turned off between 10:00 PM and sunrise.

- Outdoor lighting in residential and open space areas that are over 15 feet in height shall have an output no greater than 400 lumens.
- The maximum height of outdoor lighting fixtures shall be:
  - 20 feet in Residential and Open Space areas
  - 30 feet in Commercial, Mixed Use, and Public areas
  - 35 feet in Business Park areas
- Prohibit the use of outdoor lighting that includes drop-down lenses, mercury vapor lights, ultraviolet lights, search lights, laser lights and any outdoor lighting that flashes, blinks, alternates or moves unless mandated for health and safety reasons by a public agency.
- Outdoor light fixtures in outdoor recreational areas shall be mounted, aimed, and fully shielded so that light beams fall onto activity areas and no unacceptable light trespass occurs on surrounding areas or properties. Outdoor lighting shall only provide the minimum necessary to illuminate recreational activities areas and shall be no more than 75 feet high. Preferably, these fixtures shall also use high pressure sodium or metal halide lamps.
- Outdoor advertising signs, business signs and roof and freestanding signs that are lighted shall be fully shielded. Externally mounted light fixtures shall be mounted on the top of the sign and shall be oriented downward. Externally mounted bulbs or lighting tubes for signs shall not be visible from adjoining properties or public rights-of-way, unless such bulbs or tubes are filled with neon, argon, krypton or other self-illuminating substance.

**MM 13-3** The existing off-site 66 kV electric lines that extend from SR-138 beginning at approximately the Old Ridge Route to 290<sup>th</sup> Street West, shall be relocated south of the Business Park area or may be placed underground.

**MM 13-4** Structures proposed along the Pacific Crest National Scenic Trail (PCT) shall be screened by a block wall along the rear of the structures abutting the trail and a 34-foot-wide landscaped setback shall be provided that would contain the conceptual PCT realignment.

**MM 13-5** Security lighting used for construction areas, equipment, and building materials staging areas shall be directed away from SR-138, 300<sup>th</sup> Street West, 290<sup>th</sup> Street West, and existing residences east of 300<sup>th</sup> Street West and east of 290<sup>th</sup> Street West and Malinda Avenue. Screening of construction security lighting at construction staging areas shall be implemented as feasible. Construction equipment and materials staging areas shall be located as far as feasible from surrounding adjacent residences and lights shall be directed away from adjacent on-site residences that are occupied, as each development phase is built.

**MM 13-6** An Exterior Lighting Plan shall be prepared in coordination with a qualified Biologist, be reviewed by an Electrical Engineer who is registered in the State of California, and then approved by the County prior to the submittal of each building permit. The Lighting Plan shall apply to all proposed structures and for development areas that border natural open space resources.

The Lighting Plan, also referred to as the Dark Sky Plan, shall be consistent with County lighting and safety standards and shall provide guidelines for the outdoor lighting to be used throughout the Project site. Final lighting orientation and design shall be approved by the County.

The Lighting Plan shall include, but not be limited to, the following:

- a. All lighting within 300 feet of natural open space areas shall only be implemented where needed for safety and shall be directed away from these areas and shielded so that light is not directed into open space and riparian areas. Where possible, these safety lights shall be motion sensor activated with infrared light sensors to prevent daytime lighting.
- b. Mercury vapor and halide lighting shall not be used on the perimeter of the developed areas or adjacent to designated open space.
- c. Illumination levels should be compatible with the character and use of surrounding development as determined by national lighting organizations. The Illuminating Engineering Society of North America publishes recommendations for the lighting industry that include illumination levels for outdoor lighting.
- d. Low-pressure sodium lighting fixtures or flashing lights shall not be used except in emergency situations.
- e. Exterior lighting standards and fixtures shall be located and designed to minimize direct glare beyond the site boundaries. Lighting shall be fully shielded and directed downwards to confine light spread solely within necessary locations. Illumination or glare from the exterior lighting system onto adjacent properties or streets should be minimized.
- f. Security lighting fixtures shall not project above the roof line of the building on which they are mounted.
- g. Where applicable, time-control devices shall be utilized on exterior lighting sources.
- h. Street, parking lot, and structural lighting fixtures shall provide adequate illumination for safety and comfort of vehicular and pedestrian traffic while minimizing light spillover.

Also, MM 7-13 from Section 5.7, Biological Resources, which calls for a plant palette, would reduce visual resource impacts.

### 5.13.9 LEVEL OF SIGNIFICANCE AFTER MITIGATION

As discussed above, impacts to state scenic highways are less than significant and no mitigation is needed.

Despite the implementation of PDFs 13-4 and 13-5, and implementation of MMs 13-1, 13-2, MM 13-3, and MM 7-13 from Section 5.7, Biological Resources, the Project would result in significant and unavoidable direct impacts to visual character.

With implementation of MM 13-4, the Project would result in less than significant impacts to views from regional riding or hiking trails.

Despite the implementation of MM 13-2, MM 13-5 and MM 13-6, the Project would result in significant and unavoidable direct impacts to nighttime light and glare/light pollution.

## 5.14 PARKS AND RECREATION

### 5.14.1 INTRODUCTION

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that parks and recreation issues be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively.

#### Summary

The Project would provide abundant and varied on-site recreational amenities in an area that currently has little local parkland, including public (i.e., State or federal owned or County-dedicated and maintained) and private (i.e., Homeowner's Association or other privately maintained) parks and other recreation amenities. The Project would include approximately 163 acres of Park Overlay, which includes neighborhood parks, community parks, and community regional parks that would be dedicated to the County of Los Angeles in a developed condition. For instance the 163 acres of Park Overlay and the approximate 46 acres of Recreation Centers, private pocket parks, County multi-use (hiking, equestrian, and mountain biking) trail equates to approximately 209 acres of recreation features that could be credited against the General Plan local parkland standard (approximately 195 acres) (see PDFs 14-1 through 14-4, MMs 14-1 and 14-2).

Regarding County parkland requirements, based on consultation with the County Department of Parks and Recreation (DPR), the types and amounts of recreation amenities proposed on the Project site would meet and exceed the preliminary Parkland Dedication Ordinance/Quimby Act requirement of approximately 147 acres and the preliminary General Plan standard of approximately 195 acres. Specifically, in compliance with the Parkland Dedication Ordinance, (1) the quantity of public parks shall be provided consistent with the conditions of approval defined by the County for each tract map and (2) parkland would be dedicated to the County in a developed condition (see MM 14-3), providing for acreage equivalency credit. In compliance with the General Plan, the Project shall provide public and private recreation amenities that meet the General Plan parkland standard's acreage requirements, and each tract map submitted for the County DPR's review and clearance shall have a table with a breakdown of acreage per lot for the categories of parkland to be credited against both the Parkland Dedication Ordinance/Quimby Act requirement and the General Plan standard (see MMs 14-4 and 14-5). There would be less than significant impacts related to provision of parkland pursuant to State and County standards.

Although the Project would be expected to increase visitation to off-site federal, State, and County recreational facilities and trails in the Project area, it is not expected that increased visitation at any single facility would result in substantial physical deterioration or would necessitate the construction or expansion of off-site recreation facilities. The physical

impacts of development of the on-site recreational facilities are considered throughout this EIR, as they are part of the overall impact footprint and construction plan for the Project. The Project would result in less than significant impacts related to recreational facilities built as part of the Project, and no construction or expansion of off-site federal, State, and County recreational facilities and trails are anticipated that would result in physical environmental impacts. Finally, the Project would not interfere with, but would facilitate regional open space connectivity.

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation. This information is presented in the following format (Please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Relevant Plans, Policies, and Regulations
- Environmental Setting
- Project Design Features
- Threshold Criteria
- Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
  - On-Site Impacts
  - Off-Site Impacts
- Mitigation Measures
- Level of Significance After Mitigation
- References

## References

All references cited for preparation of this analysis are listed in Section 5.14.8. Information in this section was derived from the Los Angeles County Department of Parks and Recreation as well as from local, State, and federal records of recreational facilities.

## 5.14.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

### Federal

#### *U.S. Forest Service*

The U.S. Forest Service (Forest Service) was established in 1905 and manages 193 million acres of public lands within National Forests and grasslands (USDA Forest Service 2015a). In April 2006, the Forest Service reissued the decisions on the revised Land Management Plans (Forest Plans) for all four Southern California National Forests: Angeles, Cleveland, Los Padres, and San Bernardino. The Forest Plans guide site-specific planning and decision making in the National Forests (USDA Forest Service 2015b). The Angeles and Los Padres Forest Plans include strategies that indirectly address adjacent areas and involve coordination with other jurisdictions. These strategies are related to invasive species, biological resources, trails and fire protection, but do not require compliance or action by local agencies and/or developers.

#### *Federal Lands Recreation Enhancement Act*

In 2004, Congress enacted the Federal Lands Recreation Enhancement Act, which replaced the Recreation Fee Demonstration Program enacted in 1996. The Recreation Enhancement Act provides long-term authority for federal land management agencies (e.g., Forest Service, National Park Service) to collect fees from recreation users. The purpose of the recreation fee is to help fund the operation and maintenance of federally managed recreation lands in response to increasing demand and to be able to deliver high-quality facilities and services to the public. In the Project area, use of certain recreation sites and facilities of the Angeles and Los Padres National Forests requires the purchase and display of a regional “Adventure Pass”, which are available as daily, annual, and second vehicle passes. A National “Interagency Pass” may also be used for access to these venues (USDA Forest Service 2008).

#### *National Trails System*

The National Trails System Act (*United States Code* [USC], Title 16, Sections 1241–1251) was enacted in 1968. This act established a network of scenic, historic, and recreational “National Trails” across the United States. Each of these three types of trails has individual criteria, and each of the 30 current National Trails is assigned a primary administering agency, although a trail may have segments passing over multiple jurisdictions. Administering agencies include the Bureau of Land Management (BLM), the Forest Service, and the Park Service. The nearest and only National Trail in the Project area is the Pacific Crest National Scenic Trail, also known as the Pacific Crest Trail (PCT), which was established in 1968 and is administered by the Forest Service (USDO I NPS 2016).

### State

#### *California State Parks*

The California Department of Parks and Recreation (also referred to as California State Parks) manages 279 park “units” in the California State Parks System. California State Parks owns a total of 1.6 million acres of public parkland that contains over 339 miles of coastline;

974 miles of lake and river frontages; approximately 15,000 campsites and other overnight facilities; and 4,556 miles of hiking, equestrian, and biking (non-motorized) trails (CDPR 2015a). State parks in the Project area are described in detail in Section 5.14.3, Environmental Setting, below.

Because of the breadth and diversity of the resources that California State Parks oversees, there are a wide variety of departments, policies, and publications that guide the management of the California State Parks System, such as the 2015 Statewide Comprehensive Outdoor Recreation Plan; the California Recreational Trails Plan; and General Plans for individual parks prepared pursuant to the Planning Handbook (CDPR 2015b).

California State Parks also implements a fee program at selected parks to assist in funding, operating, and maintaining the park system, including camping fees and various day use fees (e.g., parking, museum entrance, boat launch, swimming, and tour fees). Additionally, there are a variety of passes that can be purchased for repeated use, including a variety of Annual Day Use Parking Passes, an Annual Boat Use Pass, an Oversized Vehicle Pass, a Disabled Discount Pass, and a Golden Bear Pass.

### ***Quimby Act***

California allows a City or County to pass an ordinance that requires, as a condition of approval of a subdivision, either the dedication of land, the payment of a fee in lieu of dedication, or a combination of both for park or recreational purposes (*California Government Code*, Section 66477). This legislation, commonly called the “Quimby Act,” establishes a standard of 3 acres of parkland per 1,000 residents for new subdivision development unless the amount of existing neighborhood and community parkland exceeds that limit. In 2013, Assembly Bill (AB) 1359 was approved and amended the Quimby Act to allow the municipality to use fees for the purpose of developing or rehabilitating park or recreation facilities in the neighborhood other than that the subdivision neighborhood for which the fees were paid as a condition of map approval. The Project would be subject to this legislative mandate in accordance with the County-adopted ordinance as described below.

### **County**

The County DPR owns, operates, and maintains approximately 70,000 acres of facilities located in both unincorporated areas and in cities in Los Angeles County. The County DPR collects fees for use of many facilities, including golf course greens fees; entrance fees; camping and recreational vehicle (RV) overnight fees; reservation/use fees for developed picnic areas, swimming pools, sports fields/courts, halls/buildings, amphitheaters; and annual pass fees, among others (LACDPR 2015b). The revenue from these fees is separate from the revenue and/or value of parks and facilities provided to the County DPR via the Quimby Act, discussed below.

### ***County of Los Angeles Parkland Dedication Ordinance***

Consistent with, and as permitted by the Quimby Act, the County of Los Angeles adopted Sections 21.24.340 and 21.24.350 and Sections 21.28.120, 21.28.130 and 21.28.140 of the Los Angeles County Code (“Parkland Dedication Ordinance”). Specifically, the ordinance requires that the subdivider of a residential subdivision “provide local park space to serve the subdivision, pay a fee in lieu of the provisions of such park land . . . provide local park space containing less than the required obligation but developed with amenities equal in value to the park fee, or do a combination of the above” (Los Angeles County Code, Section 21.24.340 et seq.). For the purposes of the County’s Quimby Act Ordinance, the unincorporated areas are divided into 47 Park Planning Areas (PPAs), based on location and neighborhood characteristics. These, in turn, are grouped into 11 total Planning Areas.

The Project site is within PPA 48 – West Antelope Valley, and within the Antelope Valley Planning Area. Section 21.24.340 requires 3.0 acres of parkland per 1,000 persons; contains a formula for calculating the local parkland obligation; and provides a table of the average household sizes by PPA. The population to be served is based on the formula contained in Section 21.24.340 of the Parkland Dedication Ordinance. The County DPR calculates the park obligation (i.e., to be fulfilled by land dedication, fee payment, improvements, or a combination of these) for each residential subdivision prior to its tentative map approval. The current in lieu fee established for Park Planning Area 48 (West Antelope Valley), which includes the Project site, is based on a Representative Land Value of \$30,880 per acre (Los Angeles County Code, Section 21.28.140).<sup>1</sup> Additionally, the County of Los Angeles General Plan (2015) establishes a standard for the provision of parkland at 4 acres of local parkland per 1,000 residents of the population in unincorporated areas, and 6 acres of regional parkland per 1,000 residents of the total population of Los Angeles County.

Because of the need for usable public parkland for active recreation purposes, the County DPR rarely gives any Quimby Act credit for parkland exceeding a slope of three percent and instead gives credit for the “net” park acreage (maximum slope of three percent) the County receives. The County DPR does not accept undeveloped park sites from developers; this means that the developer is required to provide a developed park to the County on a “turn-key” basis and receives credit for the costs of developing the public park up to and against any remaining Quimby Act obligation, after accounting for the net acreage dedicated to the County (DRP 2015b).

### ***Los Angeles County General Plan and Antelope Valley Area Plan***

The *Los Angeles County General Plan* (County General Plan) and the *Antelope Valley Area Plan* (AVAP), part of the County General Plan, include goals and policies that address parks and recreation issues in the unincorporated County.

---

<sup>1</sup> This is the current in-lieu fee Representative Land Value per acre amount (effective July 1, 2016) and reflects the annual adjustment based on changes in the Consumer Price Index from the previous year’s value (from March 2015–March 2015) authorized by Section 21.28.140 (Subsection A1) of the Los Angeles Code.

### Los Angeles County General Plan

The Los Angeles County General Plan goals and policies applicable to the analysis of parks and recreation with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal P/R 1:** Enhance active and passive park and recreation opportunities for all users.

**Policy P/R 1.2:** Provide additional active and passive recreation opportunities based on a community's setting, and recreational needs and preferences.

**Policy P/R 1.4:** Promote efficiency by building on existing recreation programs.

**Policy P/R 1.10:** Ensure a balance of passive and recreational activities in the development of new park facilities.

**Policy P/R 1.11:** Provide access to parks by creating pedestrian and bicycle-friendly paths and signage regarding park locations and distances.

**Goal P/R 3:** Acquisition and development of additional parkland.

**Policy P/R 3.1:** Acquire and develop additional local and regional parkland to meet the following County standards: 4 acres of local parkland per 1,000 residents in the unincorporated areas and 6 acres of regional parkland per 1,000 residents of the total population of Los Angeles County.

**Policy P/R 3.2:** For projects that require zone change approvals, general plan amendments, specific plans, or development agreements, require developers to provide for local and regional parkland above and beyond their Quimby obligations as based on an appropriate nexus study.

**Policy P/R 3.9:** Site new parks near schools, libraries, senior centers and other community facilities where possible.

**Goal P/R 4:** Improved accessibility and connectivity to a comprehensive trail system including rivers, greenways, and community linkages.

**Policy P/R 4.1:** Create multi-use trails to accommodate all users.

**Policy P/R 4.5:** Collaborate with other public, non-profit, and private organizations in the development of a comprehensive trail system.

**Policy P/R 4.6:** Create new multi-use trails that link community destinations including parks, schools and libraries.

### Antelope Valley Area Plan

The AVAP goals and policies applicable to the analysis of parks and recreation with Project implementation are listed below. Section 5.8, Land Use, Entitlements, and Planning, presents a more in-depth analysis of the Project's consistency with relevant plans, policies and regulations.

**Goal M 10:** A unified and well-maintained multi-use (equestrian, hiking, and mountain bicycling) trail system that links destinations such as rural town centers and recreation areas throughout the Antelope Valley.

**Policy M 10.2:** Connect new development to existing population centers with trails, requiring trail dedication and construction through the development review and permitting process.

**Policy M 10.3:** Maximize fair and reasonable opportunities to secure additional trail routes (dedicated multi-use trail easements) from willing property owners.

**Policy M 10.4:** Ensure trail access by establishing trailheads with adequate parking and access to public transit, where appropriate and feasible.

**Policy M 10.5:** Locate and design trail routes to minimize impacts to sensitive environmental resources and ecosystems.

**Goal PS 8:** Antelope Valley residents enjoy access to parks and recreational facilities.

**Policy PS 8.3:** Provide new parks as additional development occurs or as the population grows, with a goal of four acres of parkland for every 1,000 residents.

**Policy PS 8.5:** Encourage the use of school playgrounds and sporting fields for community recreation ("joint use") when school is not in session.

**Policy PS 8.7:** Provide trails, bikeways, and bicycle routes for recreational purposes, as directed in the policies of the Mobility Element.

### ***County of Los Angeles Park Design Guidelines and Standards***

The Park Design Guidelines and Standards document is intended to give design professionals, County staff, and other agencies guidance on how to design and develop parks that meet County standards and expectations. It incorporates input from DPR staff, other County departments, as well as outside partners such as non-profit organizations and private developers, which have an interest in park design. This manual addresses topics such as: spatial organization; buildings; circulation; recreational facilities; landscaping; storm water management; utilities; preferred manufactured products to be used at the parks; and preferred plant lists for both potable and recycled water.

---

### ***Los Angeles Countywide Parks and Recreation Needs Assessment***

Adopted by the Board of Supervisors on July 5, 2016, the *Parks Needs Assessment* was a historic and significant undertaking to engage all communities within Los Angeles County in a collaborative process to gather data and input for future decision-making on parks and recreation. The primary goal of the *Parks Needs Assessment* was to quantify the magnitude of need for parks and recreational facilities, and determine the potential costs of meeting that need. This goal has been accomplished, as evidenced by the final report which uses a transparent, best-practices approach to evaluate park and recreation needs, and is the product of an engagement process that involved the public, cities, unincorporated communities, community-based organizations, and other stakeholders. Specifically, the *Parks Needs Assessment*:

- Uses a set of metrics to measure and document park needs for each study area;
- Establishes a framework to determine the overall level of park need for each study area;
- Offers a list of priority park projects for each study area;
- Details estimated costs for the priority park projects by study area;
- Builds a constituency of support and understanding of the park and recreational needs and opportunities; and
- Informs future decision-making regarding planning and funding for parks and recreation.

The Project site is located within the Unincorporated Northwest Antelope Valley Study Area, which currently does not contain any community or neighborhood parks operated by DPR.

### ***County of Los Angeles Trails Manual***

The County of Los Angeles Department of Parks and Recreation Trails Manual provides guidance on trail planning, design, development, and maintenance of hiking, equestrian, and mountain biking recreational trails, while addressing physical and social constraints and opportunities associated with the diverse topographic and social conditions that occur in the unincorporated territory of the County.

#### **5.14.1 ENVIRONMENTAL SETTING**

There are no existing parks or other recreational features on the Project site, as the site is privately owned. However, a variety of jurisdictions own and/or maintain open space areas, parks, and recreational facilities in the vicinity of the Project site. Exhibit 5.14-1, Existing Open Space and Recreation Areas, depicts the location of recreational areas in the vicinity of the Project site and Exhibit 5.14-2, Existing and Proposed Trails in the Project Vicinity and Exhibit 4-8, Conceptual Bicycle Plan, located in Section 4.0, Project Description, depicts the location of both existing and proposed trails and bikeways, respectively, on and near the site with Project implementation.

## Open Space and Recreation Areas

### *Federal*

#### Angeles and Los Padres National Forests

The Angeles National Forest (ANF), now including the San Gabriel Mountains National Monument, covers about 700,000 acres of land in the San Gabriel Mountains, which is about one-quarter of Los Angeles County. The lower elevations of the ANF are covered with chaparral, and oak, sycamore, and alder trees, and at elevations above 5,000 feet above mean sea level feature pine, cedar, and fir trees (USDA Forest Service 2016a). The Los Padres National Forest (LPNF) is located primarily in the northern section of Ventura County and encompasses almost two million acres and covers the coastal mountains of central California and the Transverse Ranges, extending from the western edge of Los Angeles County to the Big Sur Coast in Monterey County. In addition, the LPNF has 10 congressionally designated wilderness areas that comprise 875,000 acres (approximately 48 percent of the 1.75 million acres). The nearest designated wilderness area to the Project site (the Chumash Wilderness) is located to the west near the town of Frazier Park (USDA Forest Service 2016b).

The ANF is approximately one mile southeast of the Project at the site's southernmost boundary. The LPNF is approximately five miles southwest of the Project site at the nearest point (as measured from the Quail Lake vicinity); the northeastern edge of the LPNF is approximately four miles south of State Route (SR) 138. The Forest Service and the U.S. Department of Agriculture (USDA) are the ANF's and LPNF's administering agencies. The nearest ANF district office to the Project site, the Santa Clara/Mojave Rivers Ranger District, is located in Saugus, approximately 35 miles to the south. The nearest LPNF district office, the Mount Pinos Ranger District, is located in Frazier Park approximately ten miles to the northwest of the Project site, as measured from the Quail Lake vicinity.

### *State*

#### Quail Lake

Quail Lake, located adjacent to SR-138 in the western Antelope Valley and adjacent to the southwestern boundary of the Project site, is one of the State Water Project's (SWP) 29 storage facilities. Quail Lake is maintained and operated by the California Department of Water Resources (DWR) as part of the California Aqueduct to move water safely across the San Andreas Fault Zone. Quail Lake's 290 acres and 3 miles of shoreline offer limited recreational opportunities including shoreline fishing, hiking, and bird watching. Swimming and boating are not permitted, but picnic tables and restroom facilities are available in the parking lot. About 10,000 people fish at the lake annually (DWR 1997).

#### Pyramid Lake

Pyramid Lake is another of the SWP's 29 storage facilities; is situated within the ANF; and is located on Piru Creek (8 miles southwest of the Project site). Not only does it provide storage for water delivery, it is a source of energy for the Castaic Power Plant, which is owned and operated by the Los Angeles City Department of Water and Power. Pyramid Lake provides for water-related recreational opportunities, including boating, waterskiing, swimming, and

fishing. Pyramid Lake also offers picnicking opportunities along its 21 miles of shoreline and camping locations (DWR 2016).

#### Hungry Valley State Vehicular Recreation Area

The Hungry Valley State Vehicular Recreation Area (SVRA) is the second largest unit of California State Park's Off-Highway Motor Vehicle Recreation Division and is located approximately three miles west of the Project site, as measured from the Quail Lake vicinity. Hungry Valley offers 19,000 acres and over 130 miles of scenic trails for motorcycles, all-terrain vehicles (ATVs), dune buggies, and 4x4 vehicle recreation as well as hikers and bicyclists. Although primarily an off-highway vehicle (OHV) facility, there are additional trails and areas of the park that are only accessible to hikers and bicyclists. Elevations at Hungry Valley range from 3,000 feet above mean sea level (msl) to nearly 6,000 feet above msl (CDPR 2015c).

#### Antelope Valley California Poppy State Reserve

The Antelope Valley California Poppy Reserve was established to protect and perpetuate outstanding displays of native wildflowers, particularly the California poppy (*Eschscholzia californica*), which is the state flower. This 1,745-acre State Reserve, nestled in the Antelope Buttes, is approximately 20 miles east of the Project site at an elevation ranging from 2,600 feet above msl to 3,000 feet above msl; it is located on California's most consistent poppy-bearing public land. Other wildflowers in the reserve include owl's clover (*Castilleja exserta* ssp. *Exserta*), lupine (*Lupinus* sp.), goldfield (*Lasthenia californica*), cream cups (*Platystemon californicus*), and coreopsis (*Coreopsis lanceolata*). Eight miles of trails, including a paved section for wheelchair access, wind through the wildflower fields. The reserve is a natural area, where only day use (hiking and picnicking) is allowed. Activities include exhibits and programs, guided tours, hiking trails, and nature trails. Facilities include parking, picnic areas, restrooms, and a visitor center (CDPR 2015d).

#### Arthur B. Ripley Desert Woodland State Park

Added to the State Park system in 1988, the 566-acre Ripley Desert Woodland State Park is located approximately 5 miles west of the Antelope Valley California Poppy Reserve on Lancaster Road (an extension of West Avenue I) at 210<sup>th</sup> Street West, and approximately 15 miles southeast of the Project site. The park protects and preserves a large stand of native Joshua trees (*Yucca brevifolia*) and juniper trees (*Juniperus* sp.), which once grew in great abundance throughout the Antelope Valley. Today, only remnants of this woodland community remain in the valley. Facilities at the park primarily include hiking trails (CDPR 2015e).

#### Fort Tejon State Historic Park

Fort Tejon State Historic Park (SHP) is located off Interstate (I) 5 at the Fort Tejon exit near the top of Grapevine Canyon. Fort Tejon was originally built to protect and control the Native Americans who were living on the Sebastian Indian Reservation, and to protect both Native Americans as well as white settlers from raids by the Paiutes, Chemeheui, Mojave, and other native groups of the desert regions to the southeast. The park has many restored adobe structures that were part of the original Fort, and the park offers guided tours, exhibits,

interpretive programs, group campsites, picnic areas and a visitor center. The park's museum features exhibits from historic army life and local history (CDPR 2015f).

## **Regional and Local**

### ***Los Angeles County***

As of 2010, the Antelope Valley PPA (48), which includes the Project site, has approximately 50 acres of local parks and 3,870 acres of regional parks. Based on the 2010 population and the County's parkland acreage goals, the County reports a deficit of 244 acres of local parks and a surplus of 1,573 acres of regional parks in the Antelope Valley Planning Area (DRP 2015b).

As shown on Exhibit 5.14-1, PPA 48 encompasses the Project site and the western portion of the Antelope Valley. The eastern boundary of PPA 48 extends east to 170<sup>th</sup> Street West in Lancaster, west to the Los Angeles/Ventura County line, north to the Los Angeles/Kern County line, and south to the northern portion of Castaic Lake. The County General Plan's Figure 10.3: Community, Neighborhood and Pocket Park Service Radius Map, indicates that the northwestern portion of the County currently has no local park coverage (DRP 2015b). Because local parks are typically associated with existing urban environments and functioning communities and because they are intended to offer opportunities for daily recreation, local parks are sized according to the community's needs. According to the County General Plan, local parks can range in size from less than ¼ acre to 20 acres. The nearest County-owned local parks—not including wildlife sanctuaries, reserves, and natural areas—are located in the communities of Castaic (Del Valle Park, Hasley Canyon Park, and Hasley Canyon Equestrian Center), Quartz Hill (George Lane Park), Acton (Acton Park), and Valencia (West Creek Park and Tesoro Adobe Historic Park) (DPR 2015b). All these facilities are 20 miles or more from the Project site.

Two County regional/specialized facilities of note are the Castaic Sports Complex, which covers approximately 54 acres and is located at 31230 Castaic Road in the unincorporated community of Castaic, approximately 20 miles south of the Project site, and the approximately 54-acre Apollo Community Regional Park (Apollo Park), located approximately 25 miles from the Project site in the City of Lancaster. The sports complex includes baseball fields, picnic facilities, aquatics complex, children's play areas, and public restrooms as well as a proposed in-ground skate park. Apollo Park includes a fishing lake, children's play areas, restrooms, an outdoor amphitheater, maintenance building and office, and parking area (DPR 2015b).

### **Castaic Lake State Recreation Area**

The Castaic Lake State Recreation Area (CLSRA) is located approximately 20 miles south of the Project site, at 32132 Ridge Route Road, in the unincorporated community of Castaic. Castaic Lake is one of the State Water Project's (SWP's) largest reservoir facilities and offers 29 miles of shoreline and a main attraction is the 425-foot-tall Castaic Dam. The CLSRA is maintained and operated by the County of Los Angeles Department of Parks and Recreation. CLSRA has two bodies of water, the lower lake and upper lake. The lower lake is for non-power boating and canoeing, with a swimming season from mid-May to mid-September. The

upper lake is for sailing, power boating, water and jet skiing, and fishing, being stocked with bass, trout, and catfish. Boat rentals and a tackle bait shop are available for visitors. The CLSRA also provides hiking and biking trails, playgrounds, and picnic areas; rental group picnic areas are available for up to 600 persons (CDPR 2015g).

### ***Kern County***

Because of the Project site's proximity to the Kern County boundary, the location and accessibility of facilities at Kern County parks were investigated. The County of Kern Parks and Recreation Department manages 8 regional parks, 40 neighborhood parks, and 25 public buildings, and it supervises 3 golf courses. The nearest and most accessible park facility to the Project site is Frazier Mountain Park in Frazier Park, approximately ten miles northwest of the Project site (as measured from the Quail Lake vicinity). Other, more distant, parks in Kern County that are accessible from I-5 include the Buena Vista Aquatic Recreation Area (just outside Taft) and the Metropolitan Recreation Center in Bakersfield (see Exhibit 5.14-1, Existing Open Space and Recreation Areas). Both facilities are located more than 40 miles north of the Project site off I-5 and SR-99, respectively. Another Kern County facility is Tehachapi Mountain Park. Geographically, this Park is only about 25 miles northeast of the Project site. However, because there is no direct access to this facility through the Tehachapi Mountains, access to the park is possible via SR-138, SR-14, and ultimately, SR-58. Travel distance from the Park to the Project site is approximately 70 miles (KCPRD 2016).

### **Private Facilities**

#### ***Wind Wolves Preserve***

The Wildlands Conservancy (TWC) purchased more than 93,000 acres to create the Wind Wolves Preserve (Preserve), which is the largest nonprofit preserve on the West Coast (TWC 2015). Located in Kern County, it is west of the Tejon Industrial Complex and southwest of where SR-166 and I-5 intersect. The Preserve is located approximately ten miles northwest of the Project site.

The Preserve is home to the federally-listed Endangered and State-listed Threatened San Joaquin kit fox (*Vulpes macrotis mutica*) and the State- and federally-listed Endangered blunt-nosed leopard lizard (*Gambelia sila*), and includes one of the largest stands of the State-listed Endangered Bakersfield cactus (*Opuntia basilaris* var. *treleasei*). Vegetation types include grasslands, California blue oak, valley oak savanna, and extensive riparian wetlands. At higher elevations, juniper and pinyon forests are present that ascend to stands of big-cone spruce (*Pseudotsuga macrocarpa*) and ponderosa pine (*Pinus ponderosa*). TWC activities on the Preserve include guided outdoor education programs, such as hiking and vehicle tours, an annual Nature Festival, and movie/picnic evenings (TWC 2015).

### **Trails and Bikeways**

The region surrounding the Project site has an existing and proposed trail system, composed of paths under federal, State, and County jurisdictions. These trails are described further below. There are numerous existing unpaved roads on the Project site related to ranching operations and utility access; however, the Project site is private land and there are no public

access trails. Exhibit 5.14-2, Existing and Proposed Trails, and Exhibit 4-8, Existing and Proposed Bikeways, depicts the location of existing and proposed trails and bikeways, respectively, on and near the Project site.

### ***Angeles and Los Padres National Forest Trails***

The ANF offers 557 miles of hiking and equestrian trails, which include 73 miles of National Recreation Trails and 176 miles of the Pacific Crest National Scenic Trail (PCT), discussed further below (USDA Forest Service 2010). The LPNF contains 1,257 miles of maintained trails for both day-use and extended backpacking opportunities (USDA Forest Service 2016b).

### ***Pacific Crest Trail***

#### Existing Alignment

The PCT is a designated National Scenic Trail that traverses approximately 2,650 miles through 3 states (California, Oregon, and Washington); it begins at the Mexican border and reaches the Canadian border. It was established under the National Trails System Act of 1968. Only non-mechanized activities, including foot and horse travel, are permitted; bicycle use is prohibited. The U.S. Forest Service has the overall responsibility for the PCT, and, relevant to the California portion of the trail, has established a Pacific Crest Trail Program Manager in the Pacific Southwest Regional Office. However, responsibility for trail operations is shared by the National Park Service, the Bureau of Land Management, California State Parks, and the Pacific Crest Trail Association, as well as managers of the tribal, provincial, state, and county lands through which the trail passes (USDA Forest Service 2015c). A segment of the PCT extends for 160 miles through the Angeles National Forest.

The nearest existing point of the PCT to the Project site is approximately 1.75 miles to the east-southeast (measured from the most eastern area of the Project site). The existing alignment of that portion of the PCT which is nearest the Project site travels due north where it emerges from the Angeles National Forest and aligns with 270<sup>th</sup> Street West and turns due east at the California Aqueduct for approximately one mile to the bridge at Three Points Road. From there, the PCT continues generally moving in a northeasterly direction into the Tehachapi Mountains.<sup>2</sup> Exhibit 5.14-2 depicts the existing alignment of the PCT. The Pacific Crest Trail Association (PCTA), a non-profit public benefit organization, holds as its mission to “protect, preserve and promote the Pacific Crest National Scenic Trail so as to reflect its world-class significance for the enjoyment, education and adventure of hikers and equestrians” (PCTA 2007).

#### Proposed Alignment

The PCT has an existing alternative alignment referred to as the “1973 Permanent Alignment”. The 1973 Permanent Alignment begins where the trail intersects SR-138 and Pine Canyon Road/County Road N2. Across from the trail is Oso Canyon, which is parallel to the California Aqueduct and which runs through the center of the Project site. However,

---

<sup>2</sup> The existing alignment described is based on the Google Earth .kmz layer provided by the USDA Forest Service.

approving the relocation of a public access trail near a major water facility is unlikely, given public health and safety concerns. Additionally, the Project site is private land, despite the planned alignment of a public trail pathway across the site by another agency.

The Forest Service, the PCTA, the Conservancy, and the Tejon Ranch Company are in ongoing discussions regarding an alternative realignment for the PCT. Specifically, the Forest Service, the PCTA, the Conservancy, and the Tejon Ranch Company are discussing the relocation of the segment of the PCT, discussed above, that currently crosses Lancaster Road at 270<sup>th</sup> Street West approximately two miles east-southeast of the Project site so that it is generally aligned along 300<sup>th</sup> Street West between SR-138 and the northeastern corner of the Project site, as shown on Exhibit 5.14-2. A portion of the western right-of-way of 300<sup>th</sup> Street West has been reserved for the conceptual PCT realignment where this conceptual realignment is contiguous with a portion the Project site and where it bisects the northeastern corner of the site. An appropriate buffer would be a buffer between the easement and Project development in the easternmost areas of the site (see Exhibit 4-10a, Centennial Project – Recreation and Trails Plan).

However, the precise location of the conceptual new alignment has not been finalized and discussions are still underway. Although not finalized, the 300<sup>th</sup> Street West alignment described above is assumed to be the future proposed alignment in this EIR. It should be emphasized that, although the PCT realignment is being considered as part of Project site development so that its ultimate location is beneficial to both the Project site and the wider Project area, it is not proposed by the Applicant and is not part of the Project. When and if implemented, the PCT realignment would be a separate Project with a separate environmental permitting process.

### ***Los Angeles County Trails***

The County General Plan's Figure 10.1: Regional Trail System Map, as reflected on the AVAP's Map 3.2: Town and County Planning Area-Trails, does not indicate existing or proposed trails on or near the Project site. The nearest trails are proposed alignments overlapping or near the PCT in the Three Points area approximately two miles to the east of the site (DRP 2015a, 2015b).

Additionally, although the County's Regional Trail System Map does not indicate existing or proposed trails within the Project site, the Project shall provide a County multi-use (hiking, equestrian, and mountain biking) trail that would connect to other (or non-County) trails and greenways, the PCT, and proposed open space. All proposed County regional trails shall be planned, designed, and developed in accordance with the County's Trail Manual.

### ***Los Angeles County Bikeways***

The County General Plan's Bicycle Master Plan, a sub-element of the Mobility Element and adopted in March 2012, provides policy guidance for building a comprehensive bicycle network throughout the unincorporated areas. The Bicycle Master Plan identifies bikeways and transportation systems that are available for use by bicyclists (e.g., roadways with bike lanes or designated bike routes) and dedicated off-road bike paths (e.g., bike paths along the flood protection channels) (DRP 2015b). The Bicycle Master Plan indicates a proposed Class

III Bike Route, more than 15 miles from the Project site, following Pine Canyon Road/County Road N2 from its intersection with SR-138 near Quail Lake southeast to Lake Hughes Road (LACDPW 2012).

### ***Kern County Trails***

The private Tejon Ranch property extends northward from Los Angeles County into Kern County; there are no official Kern County trails in this area. Additionally, there is little to no trail connectivity between the Kern County trail system and the Los Angeles County trail system other than the PCT described above, as evidenced by the trails maps in the County General Plan and the AVAP (DRP 2015a, 2015b).

## **5.14.2 PROJECT DESIGN FEATURES**

**PDF 14-1** The Project shall provide an extensive system of community trails and greenways within the Project site. The Project shall provide a County multi-use (hiking, equestrian, and mountain biking) trail with connectivity to other (or non-County) proposed trails and greenways, the Pacific Crest Trail, and proposed open space. All proposed County regional trails shall be planned, designed, and developed in accordance with the County's Trails Manual and the County General Plan's Regional Trail System adopted in October 2015.

**PDF 14-2** The Green Development Program will require the implementation of measures to encourage an environmentally healthy environment. Following are required Green Program practices related to parks and recreation (please see Table 1-B-1 of Appendix 1-B in the Project, which is Appendix 4.0-A of this EIR):

- Provide an extensive system of community trails, greenway trails, and natural corridors to serve as recreational opportunities and as alternative means of transportation to reduce vehicular traffic.
- Provide "complete streets" throughout the community to provide alternative modes of transport (walking, biking, low-speed vehicles (LSVs) such as neighborhood electric scooters, bikes and other low-speed electric vehicles (NEVs).
- Incorporate sidewalks (separated by a parkway from streets) and trees to be the main street elements to create a walking environment, promoting pedestrian activity.
- Provide Class I – IV bike lanes throughout the Project to ensure a variety of alternative transportation options.
- Provide permanently anchored bicycle racks within 200 feet of visitors' entrance of nonresidential buildings, readily visible to passers-by, for 5 percent of new visitor motorized vehicle parking spaces being added, with a minimum of two-bike capacity rack.

- For new nonresidential buildings with over 10 tenant-occupants or for additions or alterations that add 10 or more tenant vehicular parking spaces, provide secure bicycle parking spaces at a rate of 5 percent of tenant parking being added, with a minimum of one space.
- For residential buildings, provide permanently anchored bicycle racks within 100 feet of the visitor's entrance, readily visible to passers-by, for 5 percent of visitor motorized vehicle parking capacity with a minimum of one two-bike capacity rack.
- Nonresidential buildings within the Business Park and Commercial areas with 75,000 or more square feet of gross floor area shall provide locker rooms and shower facilities.
- For multifamily buildings, provide on-site bicycle parking for at least one bicycle per every two dwelling units
- Include planned green space, which are integrated pockets of open space (including greenways, tree stands, hillsides, and community parks) with minimal developed amenities. Planned green space reduces evapotranspiration; allows natural percolation of runoff from adjacent lands; reduces the heat island effect; adds aesthetic value; and provides for or helps protect habitat values.

**PDF 14-3** The Project includes 163 acres of public Park Overlay, which includes acreage to meet the County's Parkland Dedication Ordinance requirement. In addition, the Applicant will fund the cost of constructing and equipping the public parks on the Project site, pursuant to a park development agreement; statutory development agreement pursuant to Section 65864 et seq. of the *California Government Code*; or other condition of approval.

**PDF 14-4** The Project includes private recreational facilities, including one or more community-wide recreation centers. The community recreation centers may include pools, sports courts, workout equipment, crafts, meeting rooms and ballrooms, among other amenities. No specific locations for the community-wide recreation centers have been identified. Other private recreational facilities could include clubhouses for active adult communities and small recreation centers for multi-family developments that could include amenities such as a pool, cabana, meeting room, and kitchen.

## Threshold Criteria

The following significance threshold criteria are derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

**Threshold 14-1** Increase the use of the existing neighborhood and regional parks or other recreational facilities such that a substantial physical deterioration of the facilities would occur or be accelerated.

- Threshold 14-2** Include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment.
- Threshold 14-3** Interfere with regional open space connectivity.
- Threshold 14-4** Create capacity or service level problems, or result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, in order to maintain acceptable service ratios, response times or other performance objectives for parks.

### 5.14.3 ENVIRONMENTAL IMPACTS

- Threshold 14-1** **Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?**

#### **On-Site Impacts**

##### ***On-Site Recreational Facilities and Trails***

As the Project site is privately owned, there are no existing public parks or other recreation facilities on the Project site. Therefore, Project implementation would not have an effect on any existing on-site recreational facilities.

##### ***Off-Site Recreational Facilities and Trails***

The Project would provide ample on-site recreational opportunities, including parks, playgrounds, hiking, biking, picnicking, and wildflower and wildlife viewing/bird watching areas (discussed under Threshold 14-2 below); however, the increase in population on the Project site of 57,150 persons would also create a demand for the use of existing off-site regional facilities.

Recreational opportunities at surrounding (off-site) federal, State, and County (Los Angeles and Kern) facilities include activities such as camping, fishing, target shooting, hunting, hang-gliding, rock-climbing, OHV use, boating and water sports, water play, and skiing that would not be available on the Project site. It is reasonable to assume that a portion of Project residents would take advantage of their proximity to these alternate recreational facilities, even with the availability of recreational amenities on the Project site. Future Centennial residents would potentially travel to National Forests as well as State recreational facilities farther to the north or elsewhere in the region for a portion of their recreational activities, especially given the Project site's location at the outskirts of northern Los Angeles County and convenience to I-5, the major Statewide highway, as well as the variety of parks available to Southern Californians.

A portion of the new Centennial residents are expected to relocate from the greater Los Angeles metropolitan area, including the Santa Clarita Valley, and would already be users of the recreational facilities throughout northwestern Los Angeles County and other facilities in the state. It is possible that future Project residents would be drawn to relocate to the Centennial Project because of its proximity to these recreational amenities. However, the Project is also anticipated to result in an overall increase in the residents and visitors to this portion of the County. Therefore, it would be expected that implementation of the Project would result in an increase in the number of visitors (i.e., Project residents) to these surrounding facilities.

With the abundant and varied park and recreational facilities available to Southern Californians and the particular abundance of such facilities in northern Los Angeles County, the visits to off-site recreational facilities by the future residents of the Centennial Project who would pursue such interests would be widely dispersed among these different facilities. With an increase in use at off-site recreational facilities, a corresponding increase in maintenance demands would occur. As described in Section 5.14.2, Relevant Plans, Policies, and Regulations, the federal, State, and County agencies that operate and maintain public recreational facilities have implemented various fee programs. Therefore, future visitors from the Project site at surrounding recreational facilities would contribute fees as established at each facility to supplement other funding, such as tax and other government revenue, for maintenance activities for all facilities of each agency. As such, an increase in visitation would correlate with a corresponding increase in park revenue to those agencies and facilities that have fee programs.

Therefore, although the Project would result in an increased use of regional parks and recreational facilities, it is anticipated that the majority of the Project's demand for recreation will be satisfied through on-site facilities (see Threshold 14-4). For those future residents that would also utilize nearby National Forests as well as State recreational facilities, the potential impact on recreational facilities would be accounted for through user fees and tax revenues. The Project would not result in a substantial physical deterioration of the off-site recreational facilities, and impacts would be less than significant.

Regarding trail usage, the Project would provide for on-site greenway trails in addition to community trails, bicycle paths, and other accessways that promote non-vehicular modes of travel throughout the Project site (see Threshold 14-2). A system of on-site recreational trails is proposed as part of the Project's non-vehicular circulation system and a subset of these trails would be able to accommodate bicyclists and is designed to link to the conceptual location of the adjacent, off-site bikeway extending from SR-138 near Quail Lake planned by the County pursuant to the Bikeway Master Plan. As such, the Project is consistent with the intent of the County General Plan for a network of bikeways.

In addition to on-site trail use, it is expected that a portion of future residents would seek out other nearby regional trails such as the PCT as well as the more distant off-site County, State, and federal trails in the western Antelope Valley. As previously mentioned, the Forest Service, the PCTA, the Conservancy, and the Tejon Ranch Company are in ongoing discussions regarding an alternative realignment for the PCT near 300<sup>th</sup> Street West. Overall, the number of users and frequency of use of off-site trails in the immediate area would likely

increase over time due to the increase in population associated with the Project. Project residents would also be expected to use the realigned PCT.

Public trails are usually designated for certain types of use. County and other trails are generally signed as to the allowed uses.

Because the Project would introduce a new population to nearby existing trails, some of which would restrict off-road bicycle use, there could be an increase in unauthorized off-road bicycle traffic on trails. As this is a unique and specific form of recreation among a given population, the percentage of Project-related mountain bike enthusiasts would be comparatively small, with an even smaller subset of people that would not adhere to posted trail restrictions. Although a small portion of Project residents may utilize off-site trails for unauthorized off-road biking, it is anticipated that this proportion would not be large enough to cause substantial deterioration of the existing off-site trails and impacts would be less than significant.

In summary, while an increase in use of existing recreational facilities (e.g., parks, forests, trails) is expected, for the reasons discussed above, implementation of the Project is not anticipated to require the construction or expansion of off-site recreational facilities and trails or otherwise cause substantial physical deterioration at any one of these facilities and trails. Therefore, the Project would have a less than significant impact on off-site recreation facilities.

## **Off-Site Impacts**

The off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, are not, by themselves, population-generating land uses. As such, the off-site features would have no impact on existing recreational facilities and no mitigation is required.

**Impact Summary:** There are no on-site recreational facilities that would be impacted by Project implementation. The Project would increase the local population that would be expected to increase visitation to off-site federal, State, and County recreational facilities and trails in the Project area. While implementation of the Project would increase visitation to regional recreational amenities, it is not expected that the increased visitation at any single facility or trail would result in substantial physical deterioration or would necessitate the construction or expansion of off-site recreation facilities or trails that could result in a physical environmental impact. The Project would result in less than significant impacts related to existing, off-site federal, State, and County recreational facilities and trails, such as the National Forests and PCT.

**Threshold 14-2**      **Would the project include recreational facilities or require the construction or expansion of recreational facilities that could have an adverse physical effect on the environment?**

## On-Site Impacts

### *On-Site Recreational Facilities and Trails*

The Project would provide a variety of parkland and recreational facilities within the Project site for use by these new residents as well as visitors to the area. The Project includes approximately 163 acres of public parks within the Park Overlay. This acreage would include neighborhood parks, community parks, and community regional parks (PDFs 14-1 through 14-4, MMs 14-1 through 14-5). The Project would provide parks and recreational facilities, including trails, consistent with the AVAP's Goal PS 8 and Policies PS 8.3, 8.5, and 8.7 in amount, amenities, and location, as discussed further under Threshold 14-4.

Per the Los Angeles County General Plan, pocket parks are less than three acres in size, and serve residential or business areas within a ¼-mile radius or within walking distance. Amenities for pocket parks can include both active and passive features, depending on the community's setting and need, such as children's play apparatus, picnic areas, fountains, and seating areas, and include squares and plazas associated with commercial and civic uses. Pocket parks within the Project would be privately owned and maintained, but open to the public.

Neighborhood parks are typically between 3 and 10 acres and are located to serve surrounding neighborhoods within a ½-mile radius. Amenities can include informal open play areas, children's play apparatus, picnic facilities and barbeques, and sports fields.

Community parks are typically 10 to 20 acres and serve several neighborhoods within a 1- to 2-mile radius; they are intended to provide a wide variety of active and passive recreational activities, including group activities that may not be feasible in a neighborhood park. Amenities can include those provided for neighborhood parks as well as group picnic areas with overhead shelters, lighted sports fields, basketball and tennis courts, concession buildings, maintenance buildings, on-site parking areas, and information kiosks.

Community regional parks are typically 20 to 100 acres and have a service radius of 20 miles. Amenities for community regional parks can include a jogging exercise course, informal open play areas, children's play apparatus, group picnic areas with overhead shelters, barbecues, lighted sports fields, basketball courts and tennis courts, information kiosks, public restrooms, concession buildings, recreation offices, maintenance buildings, and on-site parking areas. Community regional parks may also have one or more of the following features: multiple sports facilities, an aquatics center, a fishing lake, a community building and gymnasium, and scenic views and vistas.

The Project includes a County multi-use (hiking, equestrian, and mountain biking) trail and a system of community trails within the street right-of-way that can also be used as a bike path, as trails within the greenways (also considered bike paths), and as Class II Bicycle Lanes (PDFs 14-1 and 14-2, MM 14-1). The trail system would connect residential neighborhoods to commercial, employment, school, parks, civic, and institutional land uses. The trail system would connect through the use of underpasses beneath on-site roadways. By including a County multi-use (hiking, equestrian, and mountain biking) trail and a system

of community trails that reflect on-site mobility, connection to the regional trail system (i.e., PCT) and existing ecological resources, the Project is consistent with AVAP Goal M 10 and related Policies M 10.2 through 10.5. MM 14-1 would also require components of the Green Development Program to be implemented as part of the Project.

The physical impacts of the proposed recreational facilities are considered throughout this EIR as part of the overall impact footprint and construction plan for the Project. The development of these facilities, from preliminary earthwork and grading to construction to landscaping, would contribute to the environmental impacts of site development on the environment. As described through EIR Sections 5.1 through 5.21, the Project would result in environmental impacts that can be partially attributable to the creation of on-site recreational facilities. Some impacts would be less than significant, some would require mitigation, and some would be significant and unavoidable with the inclusion of mitigation.

### ***Off-Site Recreational Facilities and Trails***

As discussed under Threshold 14-1 above, the Project would not require the construction or expansion of off-site recreational facilities, and no environmental impacts would occur.

### **Off-Site Impacts**

The off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, are not, by themselves, population-generating land uses. As such, the off-site features would have no impact on existing or future recreational facilities and no mitigation is required.

***Impact Summary:*** The development of on-site recreational facilities, from preliminary earthwork and grading to construction to landscaping, would contribute to the environmental impacts described through EIR Sections 5.1 through 5.21. The Project would result in environmental impacts that can be partially attributable to the creation of on-site recreational facilities. Some impacts would be less than significant, some would require mitigation, and some would be significant and unavoidable with the inclusion of mitigation. As discussed under Threshold 14-1, less than significant impacts to off-site recreational facilities and trails are anticipated. As a result, no construction or expansion of off-site federal, State, and County recreational facilities and trails are anticipated. Impacts would be less than significant.

**Threshold 14-3      Would the project interfere with regional open space connectivity?**

### **On-Site Impacts**

Currently, there are no existing public parks or other recreation facilities on the Project site. However, several recreational facilities are proposed. As a result, the Project would facilitate regional open space connectivity.

The proposed on-site multi-use trail system is planned to link to the planned location of the County bikeway near the intersection of SR-138 and Quail Lake adjacent to the Project site. The County multi-use (hiking, equestrian, and mountain biking) trail would traverse the Project site just south of the SR-138 and connect with the proposed re-alignment of the PCT along 300<sup>th</sup> Street West (PDFs 14-1 and 14-2, MM 14-1), increasing regional trail connectivity. Regarding open space, of the 5,624 acres of designated Open Space, approximately 5,478 acres (44 percent of the total Project site) are intended to (1) remain in their original natural condition; (2) be restored; and/or (3) be enhanced by weed abatement, fencing, and native species planting, among other means. Of this amount, approximately 3,867 acres are designated as Los Angeles County Significant Ecological Area (SEA) 17 to be preserved within the Project site boundaries. Because the Project site is private property that did not previously result in recreational connectivity of open spaces, the presence of the proposed regional trail with equestrian access and facilities would also increase regional connectivity.

The open space areas that contain grasslands also have seasonal wildflower displays that would continue to be available for viewing from publicly accessible vantage points, including the proposed County multi-use (hiking, equestrian, and mountain biking) trail, and from within the Project site by future residents and visitors. Also, a Public Access Plan will be developed in connection with the development of the Ranch Wide Management Plan (RWMP) to ensure significant, but well-managed, public access into the Conservation Easement Area.

## Off-Site Impacts

The off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, are not, by themselves, population-generating land uses. As such, the off-site features would have no impact on existing recreational facilities and no mitigation is required.

***Impact Summary:*** Currently, there are no existing public parks or other recreational facilities on the Project site. The Project is not located on existing lands dedicated as regional open space. The Project does not physically bisect regional open space, nor is it located between two areas designated as regional open space. With inclusion of features like the multi-use trail, with the continuance of open space areas, and with implementation of the Public Access Plan, the Project would not interfere with regional open space connectivity. In fact, the Project would facilitate regional open space connectivity. Impacts would be less than significant regarding regional open space connectivity.

**Threshold 14-4** **Would the project create capacity or service level problems, or result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, in order to maintain acceptable service ratios, response times or other performance objectives for parks?**

## On-Site Impacts

As discussed in Section 5.14.2, Relevant Plans, Policies and Regulations, there are two County-level parkland standards applicable to the Project, the County Parkland Dedication Ordinance (i.e., Quimby Act) and the County General Plan local park standard. Both are included in the discussion of County parkland requirements. The County General Plan parkland standard is 4 acres of local parkland per 1,000 residents in the unincorporated areas, and 6 acres of regional parkland per 1,000 residents of the total population of Los Angeles County (incorporated and unincorporated). Preliminary parkland requirements for the Project have been calculated under the County Parkland Dedication Ordinance, as shown further below in Table 5.14-1, Quimby Act/Parkland Dedication Ordinance Requirement for the Centennial Project, representing full buildout; parkland standards have been calculated under the County's General Plan, as shown below in Table 5.14-2, General Plan Parkland Standard for the Centennial Project.

These parkland estimates are calculated using the County's park space obligation formula and associated average household sizes for PPA 48, defined in Section 21.24.340 of the County Code, which is adjusted annually on July 1<sup>st</sup>. Therefore, pursuant to the State CEQA Guidelines, the analysis of parkland obligation is based on the formula published in the County Code in effect at the time of Notice of Preparation (NOP) distribution (i.e., effective July 1, 2015) and subsequently updated July 1, 2016, rather than the estimated population calculated as part of the Project. As discussed further below, the parkland obligation, and the Project's credit against that obligation, would be determined for each future tract map based on the Parkland Dedication Ordinance formula in effect at that time.

Also, these are preliminary calculations of parkland requirements because tract maps have not yet been developed and therefore the number and balance of housing types (which drives the calculation of parkland requirements for the County) would be refined as tract maps are developed. However, the Applicant has consulted with County DPR, including the Director, regarding the Project's planned recreation features and their relationship with County parkland requirements under the Parkland Dedication Ordinance and the General Plan. As discussed further below, based on consultation with the County DPR, the types and amounts of recreation amenities proposed for the Project would meet and exceed Parkland Dedication Ordinance requirements and General Plan standards.

### ***Preliminary Parkland Dedication Ordinance Requirement***

As shown in Table 5.14-1, based on Quimby Act/County Parkland Dedication Ordinance requirements, the Project would have a preliminary parkland obligation of approximately 147 acres. The County's parkland obligation can be met several ways, including dedication of undeveloped land only; payment of in-lieu park fees based on the Representative Land Value (RLV) per acre defined in the Parkland Dedication Ordinance; dedicate a lesser acreage of parkland but developed with amenities of equal value to the park fee based on estimated park development costs; or do a combination of the above. The County provides Quimby Act/Parkland Dedication Ordinance "credit" for parkland based on the proposed use that is dedicated for public park purposes, and the development costs for public parks using the equivalent RLV acreage in effect when the tract map (including each park) is adopted. The

County makes a determination regarding both the acreage and condition (i.e., slope, cost of amenities) of public parkland considered acceptable as part of the tract map review process.

**TABLE 5.14-1  
QUIMBY ACT/PARKLAND DEDICATION ORDINANCE REQUIREMENT  
FOR THE CENTENNIAL PROJECT**

No. of Dwelling Units (U)	Average Household Size <sup>a</sup>	Estimated Population under Parkland Dedication Ordinance	Parkland Assessment Factor <sup>b</sup>	Obligation In Acres
14,098 Detached and Attached SF	2.52	35,527	0.003	106.58
2,643 MF (2 to 4 du/bldg)	3.80	10,043	0.003	30.13
2,592 MF (>5 du/bldg)	1.26	3,266	0.003	9.80
<b>19,333 Total Units</b>	<b>N/A</b>	<b>47,708</b>	<b>N/A</b>	<b>146.51</b>
SF: single family; MF: = multi-family; du: dwelling units; bldg: building Under the Quimby Act/County Parkland Dedication Ordinance, the County parkland obligation is calculated using the formula defined in the Parkland Dedication Ordinance ( $X = 0.003 [U \times P]$ ). The park space obligation (X) is calculated by multiplying 0.003 (mathematically equivalent to 3 acres per 1,000 persons) by the number of dwelling units (U) times the average household size for each type of household defined for each Park Planning Area (P). <sup>a</sup> Based on <i>Los Angeles County Code</i> , Section 21.24.340 <sup>b</sup> Equivalent to 3 acres per 1,000 persons Source: <i>County of Los Angeles Code</i> , Section 21.24.340.				

As described in PDF 14-3 and required through implementation of MM 14-3, the Project includes approximately 163 acres of Park Overlay, which would include neighborhood parks, community parks, and community regional parks. Also, each public (i.e., County-owned and operated) park would be developed in accordance with schematic designs recommended by the County DPR and/or as approved by the Regional Planning Commission and/or the County Board of Supervisors as part of approval of each tentative tract map. The exact acreage to be credited for the construction and equipping of parks would be refined through estimates prepared for each park for each future tract map and continued review by County DPR as each tract map moves through the County's planning process, subsequent to the CEQA process (MM 14-4). Therefore, the Project is anticipated to meet, and substantially exceed, the preliminary Parkland Dedication Ordinance/Quimby Act requirement of approximately 147 acres when considering the total amount of Park Overlay (163 acres) combined with the RLV acreage equivalent for the cost of development of each park, which generally runs into multi-million dollar figures.

In compliance with the Parkland Dedication Ordinance, (1) the quantity of public parks shall be provided consistent with the conditions of approval defined by the County for each tract map and (2) parkland would be dedicated to the County in a developed condition, providing for acreage equivalency credit. The conditions of approval for each tract map would stipulate the timing of construction and dedication of each public park based on the number of residential units proposed in each tract map. As With implementation of PDF 14-3, and MMs 14-2 through 14-4, there would be less than significant impacts related to the County Parkland Dedication Ordinance/Quimby Act requirements.

### **Preliminary County General Plan Parkland Standard**

As shown in Table 5.14-2 below, based on the County's General Plan standard of 4 acres of local parkland per 1,000 persons, the Project would have a preliminary requirement to provide approximately 195 acres of parkland. The County General Plan standard can be met with the same methods as the Parkland Dedication Ordinance, discussed above. In addition, the Project includes acreage for additional amenities beyond that which is required by the County General Plan standard (MM 14-5). There are proposed recreation amenities beyond public parks that could potentially be utilized to meet the General Plan standard. These include pocket parks (public and private); private commercial recreation facilities; private community recreation facilities (e.g., in multi-family complexes); and the County multi-use (hiking, equestrian, and mountain biking) trail.

**TABLE 5.14-2  
GENERAL PLAN PARKLAND STANDARD FOR THE CENTENNIAL PROJECT**

<b>No. of Dwelling Units (U)</b>	<b>Average Household Size<sup>a</sup></b>	<b>Estimated Population under Parkland Dedication Ordinance</b>	<b>Parkland Assessment Factor<sup>b</sup></b>	<b>Obligation In Acres</b>
14,098 Detached and Attached SF	2.52	35,527	0.004	142.11
2,643 MF (2 to 4 du/bldg)	3.80	10,043	0.004	40.17
2,592 MF (>5 du/bldg)	1.26	3,266	0.004	13.06
<b>19,333 Total Units</b>	<b>N/A</b>	<b>47,708</b>	<b>N/A</b>	<b>195.34</b>
SF: single family; MF: multi-family; du: dwelling units; bldg.: building The proposed General Plan County parkland obligation is also calculated using the formula defined in the Parkland Dedication Ordinance as in Table 5.14-2 above, with the requirement for 4 acres per 1,000 persons for local parkland. <sup>a</sup> Based on <i>Los Angeles County Code</i> , Section 21.24.340 <sup>b</sup> Equivalent to 4 acres per 1,000 persons Source: <i>County of Los Angeles Code</i> , Section 21.24.340.				

The General Plan local parkland standard (approximately 195 acres) would be met by the 163 acres of Park Overlay combined with the other recreation amenities to be provided on-site. While the precise acreage of recreational amenities beyond the public parks dedicated to the County would not be quantified until each tract map is being processed, for instance the 163 acres of Park Overlay and the approximate 46 acres of Recreation Centers, private pocket parks, and a Regional Trail equates to approximately 209 acres of recreation features that could be credited against the General Plan standard. Therefore, it is anticipated the Project would also meet and exceed the General Plan local parkland standard.

Regarding the County's regional park standard of 6 acres per 1,000 residents of Los Angeles County, the approximate 163-acre Park Overlay would include County-owned and operated community regional parks, among other public park types. As discussed in Section 5.14.2, Environmental Setting, the County General Plan reports a deficit of 244 acres of local parks and a surplus of 1,573 acres of regional parks in the Antelope Valley Planning Area (i.e. PPA 48) (LACDRP 2017). The estimated population shown in Table 5.14-2 (47,708 persons) equates to a regional parkland demand of approximately 286 acres, which could be met by PPA 48's existing surplus parkland (1,573) by more than five times. However, the Project

would include community regional parks that would be dedicated to the County of Los Angeles in a developed condition, which would contribute to the County's need for regional parks and recreational amenities commensurate with the population in the region. As discussed previously, based on consultation with the County DPR, the types and amounts of recreation amenities proposed in the Project would meet and exceed General Plan standards.

In summary, the Project will provide public and private recreational amenities that meet the acreage requirements of the General Plan parkland standard and each tract map submitted for the County DPR's review and clearance will have a table with a breakdown of acreage per lot for the categories of parkland to be credited against both the Parkland Dedication Ordinance/Quimby Act requirement and the General Plan standard. With implementation of PDFs 14-1 through 14-4, MMs 14-1 through 14-3, and MM 14-5, there would be a less than significant impact related to the County General Plan standard.

### **Off-Site Impacts**

The off-site Project features, including intersections with SR-138, utility connections, water wells, and California Aqueduct crossings, are not, by themselves, population-generating land uses and, as such would have no County parkland requirements. The off-site features would have no direct or indirect impacts to recreational facilities, nor would they include the construction of recreational facilities. There would be no impact related to the need for additional recreational facilities and no mitigation is required.

**Impact Summary:** The Project would provide abundant and varied on-site recreational amenities, including County parks, in an area that currently has little local parkland. The Project includes 163 acres of Park Overlay, which includes developed public (i.e., County-owned and operated) parks that would meet and exceed the County's Parkland Dedication Ordinance requirement of approximately 147 acres when considering both acreage and equivalent RVL acreage for construction and equipping of each park. The General Plan parkland standard would be met by the public parks combined with the other recreation amenities to be provided on site, including public and private pocket parks, private commercial recreation facilities, private community recreational facilities (e.g., in multi-family complexes), and the County multi-use (hiking, equestrian, and mountain biking) trail. The exact acreages to be credited towards the Parkland Dedication Ordinance/Quimby Act requirements and General Plan standards would be refined through continued review by County DPR as each tract map moves through the County's planning process, and after the CEQA process is completed. With implementation of PDFs 14-1 through 14-4 and MMs 14-1 through 14-5, there would be a less than significant impact.

## 5.14.4 MITIGATION MEASURES

**MM 14-1** The Project shall implement the following components of the Green Development Program to provide healthy outdoor parks and recreational resources on the Project site:

- Provide a functional system of community trails, greenway trails, and natural corridors to serve as recreational opportunities and as alternative means of transportation to reduce vehicular traffic.
- Provide “complete streets” throughout the community to provide alternative modes of transport (walking, biking, low-speed vehicles (LSVs) such as neighborhood electric scooters, bikes and other low-speed electric vehicles (NEVs).
- Incorporate sidewalks (separated by a parkway from streets) and trees to be the main street elements to create a walking environment, promoting pedestrian activity.
- Provide Class I – IV bike lanes throughout the Project to ensure a variety of alternative transportation options.
- Provide permanently anchored bicycle racks within 200 feet of visitors’ entrance of nonresidential buildings, for 5 percent of new visitor motorized vehicle parking spaces being added, with a minimum of two-bike capacity rack.
- For new nonresidential buildings with over 10 tenant-occupants or for additions or alterations that add 10 or more tenant vehicular parking spaces, provide secure bicycle parking spaces at a rate of 5 percent of tenant parking being added, with a minimum of one space.
- For residential buildings, provide permanently anchored bicycle racks within 100 feet of the visitor’s entrance, readily visible to passers-by, for 5 percent of visitor motorized vehicle parking capacity with a minimum of one two-bike capacity rack.
- Nonresidential buildings within the Business Park and Commercial areas with 75,000 or more square feet of gross floor area shall provide locker rooms and shower facilities.
- For multifamily buildings, provide on-site bicycle parking for at least one bicycle per every two dwelling units.
- Include planned green space, which are integrated pockets of open space (including greenways, tree stands, hillsides, and community parks) with minimal developed amenities. Planned green space reduces evapotranspiration; allows natural percolation of runoff from adjacent lands; reduces the heat island effect; and adds aesthetic value to a site. Planned green space can provide habitat as well as linkages to other habitat areas.

**MM 14-2** The Project Applicant/Developer shall implement the Parks and Recreation Plan as set forth in Chapter 3.12 of the *Centennial Specific Plan* to provide visually appropriate parks and recreational amenities to the Project site.

**MM 14-3** The Project Applicant/Developer shall construct 163 acres of parks consistent with the Park Overlay requirements of the *Centennial Specific Plan*, which includes acreage to meet the County's Parkland Dedication Ordinance requirements. In addition, the Project Applicant/Developer will fund the cost of constructing and equipping the public parks within the Project, pursuant to a park Development Agreement, a statutory Development Agreement pursuant to Section 65864 et seq. of the *California Government Code*, or other condition of approval.

For purposes of this measure, and as applied to all future Tentative Maps, the County shall deem all parks that are 3.0 acres or more in size as public parks, so long as each park site meets County standards for site suitability. The Project shall provide public parks to be developed in accordance with the schematic designs approved by the County.

Neighborhood and community parks shall contain various types of improvements that may include, but not be limited to, parking lot, walkways, plazas and other forms of hardscape, shade trellis, security lighting, trash enclosures, locking gates, fencing, open turf sports fields, basketball courts, multi-purpose ballfields, tennis courts, children's play areas, picnic areas (picnic tables with pads), shade structures/pavilions, restrooms with drinking fountains, recreation building, office and storage space/service yards, trees, landscaping (including plant material, grading, drainage, and irrigation), and park entry monuments.

**MM 14-4** The Project shall provide public parkland in compliance with the County of Los Angeles Parkland Dedication Ordinance/Quimby Act, with all acreage figures stated as "net" (three percent slope, maximum). Additionally, public parks shall be dedicated to the County in a developed condition, in accordance with the schematic designs recommended by the County and/or as approved by the Regional Planning Commission and/or the County Board of Supervisors as part of approval of each tract map as each phase of development occurs throughout the Project site with amenities consistent with County-approved plans. Developed public parks shall also be credited with an equivalency acreage correlating with the current Representative Land Value for the applicable Park Planning Area (currently Park Planning Area 48). All public parks must comply with County's Park Design Guidelines and Standards, Public Parks.

**MM 14-5** The Project shall provide public and private recreation amenities that equate to the acreage requirements of the County of Los Angeles General Plan local parkland standard (4 acres for every 1,000 persons in the unincorporated County). For purposes of monitoring compliance with the General Plan

standard, whenever either a Tentative Map or a Final Map is submitted for the County's review and clearance, those maps shall have a table that provides a breakdown of acreage per lot for the following categories: (1) Public Park acreage (maximum slope 3 percent or less), ; (2) Public Park Acreage Equivalency (which shall be based upon estimated Public Park Improvement Values derived from Total Project Cost Estimates required at the time of map clearance and the Parkland Dedication Ordinance/Quimby Ordinance in effect at the time the map is submitted); (3) Private Park acreage, including pocket parks; (4) Greenway and County multi-use (hiking, equestrian, and mountain biking) trail acreage; (5) Community Recreation Facility acreage; and (6) Private Recreation Facility acreage.

### 5.14.5 LEVEL OF SIGNIFICANCE AFTER MITIGATION

With incorporation of PDFs and MMs described above, the Project's impacts on parks and recreation would be less than significant.

## 5.15 EDUCATION

### 5.15.1 INTRODUCTION

#### Purpose

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that public service issues, including schools, be evaluated as part of the environmental documentation process. The Project's impacts on schools are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively. Other sections of this EIR evaluate the potential environmental impacts (e.g., traffic, air quality, utilities) associated with the development of the seven schools proposed on the Project site.

#### Summary

The Project would increase the resident population of the area and would therefore result in the generation of new students. These new students would be served by one of the three respective school districts that encompass the Project site. The Project includes locations for one Kindergarten through 5<sup>th</sup> grade (K-5) school; five Kindergarten through 8<sup>th</sup> grade (K-8) schools (mitigation measure [MM] 15-1); and one high school (MM 15-3). The designation of school sites allows the respective school districts to plan for the provision of school facilities to serve the Project as needed. In addition, the Project Applicant/Developer shall finalize and sign agreements with the school districts for a contribution to facilitate the financing, construction, and operation of new school facilities in the Project area, as an alternative to the payment of school impact fees and as allowed under Section 65996(b) of the *California Government Code*. The Project Applicant/Developer shall demonstrate to the County of Los Angeles Department of Regional Planning that they have complied with all applicable School Facilities and Funding Agreements with the school districts (MM 15-2). In addition, compliance with California Department of Education Title 5 requirements for school site selection and school design and construction would reduce impacts to public schools to a less than significant level.

Because school facilities would be centrally located within the planning areas on the Project site, a majority of the Project site would not require busing. It is anticipated that the first K-8 school (initially a K-12 facility) would be opened by the Gorman Joint School District at occupancy of the first residential units. The planned approach is to initially construct a K-12 campus in order to provide public school accommodations at all education levels at Project opening. As Project buildout occurs, this school would revert to a K-8 school when the high school is constructed. There would be no impacts related to school transportation and no mitigation would be required.

There would be no impacts to education services associated with the proposed off-site access roads, and utilities would not result in any uses or activities that would generate additional students or otherwise create an increased demand for schools.

---

## Section Format

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential Project effects and identification of significant impacts; identification of mitigation measures, if required, to reduce significant impacts; and level of significance after mitigation, if any. This information is presented in the following format (please refer to Section 2.0, Introduction, and Section 5.0, Environmental Setting, Impacts, and Mitigation, for descriptions of each of these topics):

- Introduction
  - Purpose

## 5.15.2 RELEVANT PLANS, POLICIES, AND REGULATIONS

### Federal

No federal plans and policies have been identified related to education.

### State

#### *School Facilities Construction*

Title 5 of the *California Code of Regulations* contains general standards for school site selection, site planning, and construction of school facilities in the State of California. Educational facilities planned by school districts are required to meet minimum standards, and districts must ensure that school sites provide safety and support learning as they relate to site location and size; school layout; building design and construction; playgrounds and field areas; classroom sizes and specialized areas/classrooms; and other standards that are used by the California Department of Education and the District Architect in the review and approval of school sites and school construction plans.

#### *Assembly Bill 2926*

The State has traditionally been responsible for funding local public schools. To assist in providing facilities to serve students generated by new development projects, the State passed Assembly Bill (AB) 2926 in 1986. This bill allows school districts to collect impact fees from developers of new residential and commercial/industrial building space to fund school construction and reconstruction. AB 2926 also established maximum fees (adjusted for inflation) which can be collected under this and any other school fee authorization.

#### *Senate Bill 50*

Senate Bill (SB) 50 (or “Leroy Greene School Facilities Act”) and Proposition 1A (both of which passed in 1998) provide a comprehensive school facilities financing and reform program by, among other methods, authorizing both a \$9.2 billion school facilities bond issue and school construction cost containment provisions. Specifically, the bond funds are to provide for new construction and for reconstruction/modernization needs. The provisions of SB 50 (1) prohibit local agencies from denying either legislative or adjudicative land use approvals on the basis that school facilities are inadequate and (2) reinstate the school facility fee cap for legislative actions (e.g., general plan amendments, specific plan adoption, zoning plan amendments). According to Section 65996 of the *California Government Code*, the development fees authorized by SB 50 are deemed to be “full and complete school facilities mitigation”. In January 2007, the State Allocation Board proposed to update the provisions of SB 50 to reflect adjustments to current cost of school construction and modernization. The action was approved on January 30, 2008. The State Allocation Board approved increases in 2012 and 2014. Subsequent biannual review by the State Allocation Board will evaluate future updates and changes to fee schedules. Currently, the maximum fees allowed under SB 50 are \$3.36 per square foot (sf) for new residential development and \$0.54 per sf for commercial/industrial development (California Allocation Board 2014).

SB 50 establishes three levels of developer fees that may be imposed upon new development by a school district's governing board. These fee levels depend upon certain conditions within a district. These three levels include:

**Level 1:** Level 1 fees are the base statutory fees. As of January 2014, Level 1 fees are \$3.36 per square foot (sf) for new residential development and \$0.54 per sf of chargeable, covered, and enclosed floor space for new commercial/industrial development. These amounts represent the maximum that can currently be legally imposed upon new development projects by a school district unless the district qualifies for a higher level of funding. Payment of this fee is deemed to constitute full, complete, and adequate mitigation of a project's impacts on school facilities.

**Level 2:** Level 2 fees allow the school district to impose developer fees above the statutory levels up to 50 percent of school construction costs under designated circumstances. The State provides grant amounts for new school construction, if funds are available.

**Level 3:** Level 3 fees apply if the State runs out of bond funds, allowing the school district to impose 100 percent of the cost of the school facility or mitigation on the developer minus any local dedicated school monies.

In order to qualify for Level 2 funding, the district must satisfy at least two of the four requirements stated below.

1. Multi-Track Year-Round Education (MTYRE) should be imposed with:
  - at least 30 percent of K-6 enrollment in the high school attendance area on MTYRE for unified and elementary school districts; or
  - at least 30 percent of high school district enrollment on MTYRE; or
  - at least 40 percent of K-12 enrollment on MTYRE within boundaries of the high school attendance area for which the district is applying for funding.
2. A local bond measure should have been placed on the ballot in the last four years that received at least 50 percent plus 1 of the votes.
3. Issued debt or incurred obligations for capital outlay are equal to a specified (under *California Government Code*, Section 65995.5[b][3][C]) percentage of its local bonding capacity.
4. At least 20 percent of teaching stations within the district are relocatable classrooms.

To accommodate students from new development projects, school districts may alternatively finance new schools through special school construction funding resolutions and/or agreements between developers, the affected school districts and, occasionally, other local governmental agencies. These special resolutions and agreements often allow school districts to realize school mitigation funds in excess of the developer fees allowed under SB 50.

The California Public Education Facilities Bond Initiative was approved in the November 2016 ballot. This measure would provide \$9 billion bonding authority for new school construction, renovation, and upgrades for elementary, secondary, and community college districts.

## County

### *County of Los Angeles General Plan and Antelope Valley Area General Plan*

The *County of Los Angeles General Plan* and *Antelope Valley Area Plan* address education issues that affect the County and the Antelope Valley. Relevant goals and policies in the Antelope Valley Area Plan include those listed below.

#### Mobility Element

**Goal M 11:** A continuous, integrated system of safe and attractive pedestrian routes linking residents to rural town center areas, schools, services, transit, parks, and open space areas.

**Policy M 11.5:** Implement traffic calming methods in areas with high pedestrian usage, such as school zones.

#### Conservation and Open Space Element

**Policy COS 6.6:** Provide educational resources to farmers.

**Policy COS 11.3:** Promote the use of renewable energy systems in public facilities, such as hospitals, libraries, and schools, to ensure access to power in the case of major disasters.

#### Public Safety, Services and Facilities Element

**Policy PS 8.5:** Encourage the use of school playgrounds and sporting fields for community recreation (“joint use”) when school is not in session.

**Goal PS 10:** A wide range of educational opportunities for Antelope Valley residents.

**Policy PS 10.1:** Coordinate with all Antelope Valley school districts to ensure that new schools are provided as additional development occurs or as the population grows.

**Policy PS 10.2:** Encourage new schools to locate in rural town center areas, rural town areas, and economic opportunity areas, where they will be accessible by pedestrian walkways, trails, bikeways, and bicycle routes.

**Policy PS 10.3:** Encourage new schools to locate near parks and recreational facilities.

**Policy PS 10.4:** Encourage the use of school playgrounds and sporting fields for community recreation (“joint use”) when school is not in session.

**Policy PS 10.5:** Promote the creation of a four-year public university in the Antelope Valley to provide opportunities for continuing education and workforce development.

---

## Economic Development Element

**Policy ED 1.19:** Promote the creation of a four-year public university in the Antelope Valley to provide opportunities for continuing education and workforce development.

A consistency analysis of the Project's specific goals and policies with the County's relevant plans, policies, and regulations is provided in the Land Use, Entitlements, and Planning section (Section 5.8) of this document.

### 5.15.3 ENVIRONMENTAL SETTING

The Project site is within the jurisdiction of two public elementary school districts and one public high school district.

- **Gorman Joint School District (Gorman District):** provides K–8 education (which includes elementary and junior/middle school grades) to the western and central sections of the site.
- **Westside Union Elementary School District (WUSD):** provides K–8 education (which includes elementary and junior/middle school grades) to the eastern section of the site.
- **Antelope Valley Union High School District (AVUHSD):** provides high school education (grades 9–12) to the Project site.

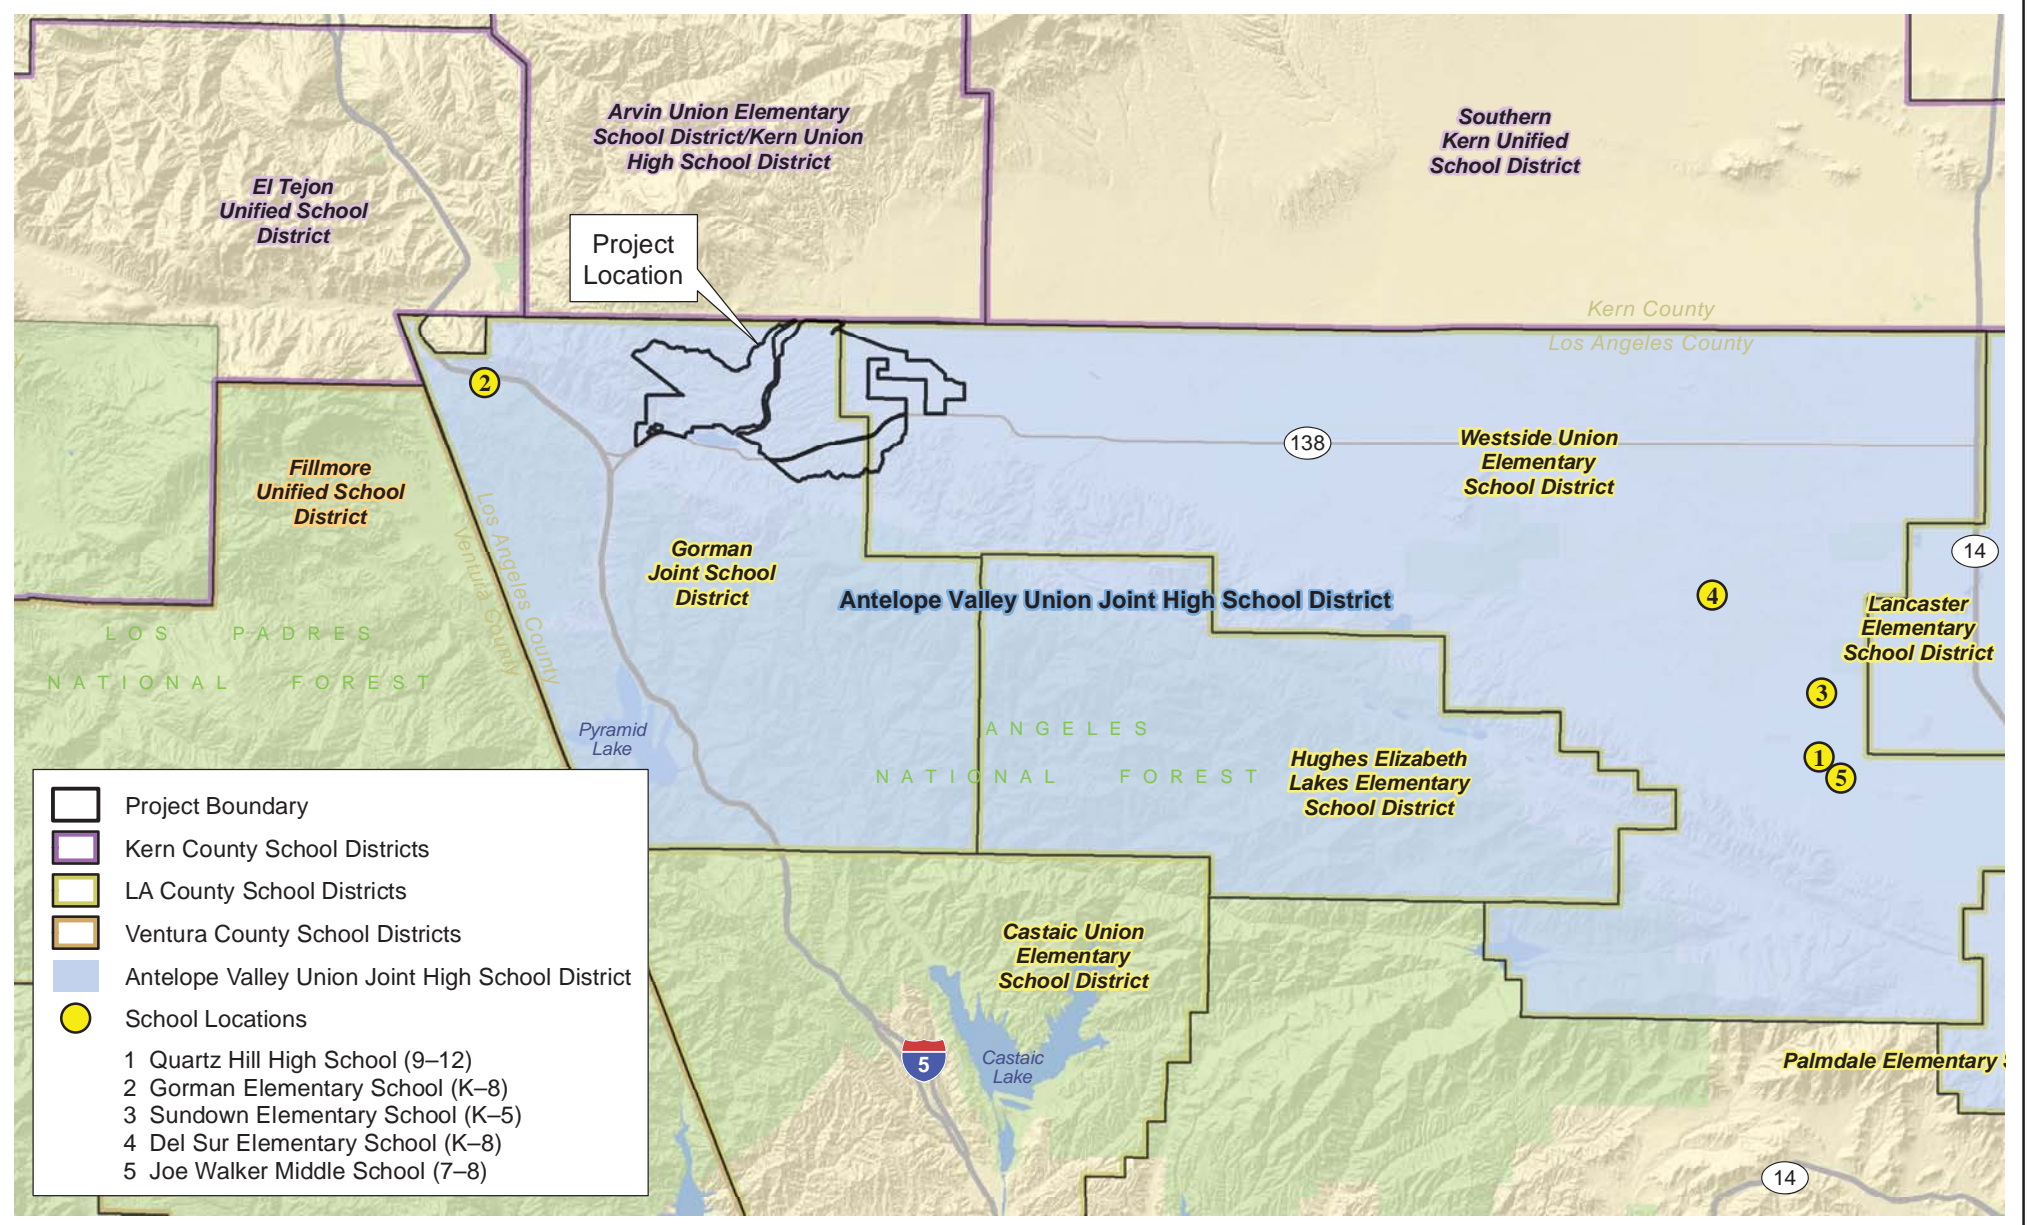

Exhibit 5.15-1, Local School Districts, identifies the local school districts in the Project area. There are no existing schools on the Project site. Within the school districts serving the site, the nearest elementary schools to the Project site are Gorman Elementary School (K–8), Sundown Elementary School (K–5), and Del Sur Elementary School (K–8). The nearest middle schools to the Project site is Joe Walker Middle School (7–8). The nearest high school of the AVUHSD to the Project site is Quartz Hill High School (9–12).

### **K–8 Schools**

As shown in Exhibit 5.15-1, the western portion of the Project site lies within the Gorman District. The Gorman District has one K–8 school, Gorman Elementary School, which is located at 49847 Gorman School Road in Gorman. This school served 103 students from the communities of Gorman, Frazier Park, Neenach, Lebec, and Lake of the Woods in the 2015–2016 school year (CDE 2017). It has five teachers in split level classes, two teacher aides, one accountant, one receptionist, one maintenance person, and one superintendent/principal (Gorman Joint School District 2015b, 2016).

In addition, the Gorman Learning Center, chartered by the Gorman District, serves grades K–12 at three resource centers and offices at 1826 Orange Tree Lane in Redlands, California. Charter schools are non-sectarian public schools of choice and can provide education in any

### Local School Districts

Centennial Project

### Exhibit 5.15-1

of the grades kindergarten through 12.<sup>1</sup> Gorman Learning Center had 2,236 K–12 students during the 2015–2016 school year. Table 5.15-1 provides district-wide enrollment in the Gorman District. For the 2015–2016 school year, the District had a total of 2,339 students (CDE 2017).

---

<sup>1</sup> A charter school is generally exempt from most laws governing school districts, except where specifically noted in the law. California public charter schools are required to participate in the statewide assessment test, STAR (Standardized Testing and Reporting). A charter school is usually created or organized by a group of teachers, parents, and community leaders or a community-based organization, and it is usually sponsored by an existing local public school board or county board of education. Specific goals and operating procedures for the charter school are detailed in an agreement (or “charter”) between the sponsoring board and charter organizers.

<sup>a</sup> CDE 2015.							
<sup>b</sup> CDE 2017.							
<sup>c</sup> School has no set capacity							
<sup>d</sup> GLC 2016.							

Gorman Elementary School serves both elementary and middle school students. It is located at 49847 Gorman School Road in Gorman, approximately 3.5 miles west of the Project site. As shown in Table 5.15-1, enrollment at Gorman Elementary School for the 2015–2016 school year is 103 students but the school has not set capacity (CDE 2017).

The Gorman Learning Center, chartered by the Gorman District, serves five counties (Kern, Los Angeles, Orange, San Bernardino, and Ventura Counties) and offers independent study/home schooling and special education studies. It has resource centers in the Cities of Lancaster, Santa Clarita and Redlands. As shown in Table 5.15-1, enrollment for the 2015–2016 school year is 2,236 students (CDE 2017). Due to the nature of independent studies, the Gorman Learning Center has unlimited capacity (GLC 2016).

As shown in Table 5.15-1, student enrollment at the Gorman District increased slightly in the school years from 2004–2005 to 2005–2006 and decreased in the school years from 2006–2007 to 2007–2008. The decrease in district-wide enrollment is due to a decrease in enrollment at the Gorman Learning Center. District-wide enrollment increased again in years 2007–2008 and 2014–2015. Enrollment at Gorman Elementary School decreased from 2004–2005 to 2006–2007 and increased from 2006–2007 to 2007–2008, decreased from 2007–2008 to 2008–2009 and was increasing from 2009 to 2014, but has recently decreased. Student enrollment in the Gorman District (K–8) does not exceed existing capacity on a district-wide basis. Again, student capacity is unlimited for the Gorman Learning Center (GLC 2016).

As shown in Exhibit 5.15-1, the eastern portion of the Project site falls within the boundary of the WUSD. The WUSD is responsible for serving K–8 grade levels, and currently serves the communities of West Lancaster, Quartz Hill, West Palmdale, and Leona Valley with six elementary schools that serve grades K–6, two middle schools that serve grades 7 and 8, and three schools that serve grades K–8. Sundown Elementary School (K–5), Del Sur Elementary School (K–8), and Joe Walker Middle School (7–8) are located closest to the eastern boundary of the Project site. Sundown Elementary School is located at 6151 West Avenue J-8 in Lancaster and is approximately 25 miles southeast of the eastern boundary of the Project site; Del Sur Elementary School is located at 9023 West Avenue H in Lancaster and is approximately 21 miles southeast of the Project site; and Joe Walker Middle School is located at 5632 West Avenue L-8 in Quartz Hill and is approximately 25 miles from the eastern boundary of the Project site.

As shown in Table 5.15-2, Westside Union Elementary District School Enrollment and Capacity, the WUSD’s enrollment is 9,070 students in 2015–2016 and current permanent capacity is 8,123 seats. Student enrollment in WUSD exceeds existing permanent capacity at all school levels on a district-wide basis. The WUSD is currently meeting school facility needs through the use of portable classrooms (WUSD 2015, 2016).

## High School

As shown in Exhibit 5.15-1, the AVUHSD is responsible for serving students in grades 9 through 12 in the Project area. The AVUHSD operates 16 schools located throughout the Antelope Valley, including 2 continuation high schools, a community day school, 2 alternative education (independent charter) schools, 2 adult education schools, 1 early college high school, and 8 comprehensive high schools. Quartz Hill High School is the closest comprehensive high school to the Project site and is located approximately 25 miles from the southeastern portion of the Project site.

As shown in Table 5.15-3, the 2015–2016 school year enrollment for Quartz Hill High School was 3,063 students. Currently, there are 54 portable classrooms at the campus. Student capacity at Quartz Hill High School is a maximum of 3,500 students; therefore, with an occupancy rate of 87.5 percent, Quartz Hill High School operates within the limits of its available capacity. As shown in Table 5.15-4, Antelope Valley Union High School District School Enrollment and Capacity, the current enrollment (2015–2016) in the AVUHSD is 24,127 students with capacity for 25,778 students.

**TABLE 5.15-3

## School Transportation

The Antelope Valley Schools Transportation Agency (AVSTA) provides busing for all K–12 students in the Antelope Valley area. The AVSTA is a Joint Powers Authority (JPA) that currently serves four school districts, including the AVUHSD; the WUSD; the Lancaster School District; and the Keppel Union School District. The AVSTA provides home-to-school transportation for regular education, special needs education, and field trips (AVSTA 2015).

## Community College

The Antelope Valley Community College District (AVCCD) serves northern Los Angeles County and southern Kern County. Communities served by the AVCCD include Acton, Antelope Acres, Lake Hughes, Lake Los Angeles, Lancaster, Leona Valley, Llano, Palmdale, Pearblossom, Quartz Hill, Rosamond, and Sun Village. The AVCCD's single college, Antelope Valley College, is located on 135 acres at 3401 West Avenue K in Lancaster, approximately 28 miles from the southeastern corner of the Project site. A second campus is located at 1529 East Palmdale Boulevard in the Palmdale area to better meet the needs of residents of the southern portion of the Antelope Valley. Classes are held at other locations as well, including a Federal Aviation Administration certification program in airframe manufacturing technology at Fox Field in Lancaster.

The AVCCD worked with the AVUHSD to open a high school campus on the main college campus, known as Students on the Academic Rise (SOAR) High School. This high school integrates college courses into the high school curriculum and allows students to work towards a high school diploma and an associate's degree concurrently.

California State University, Bakersfield's (CSUB's) Antelope Valley Regional Center offers classes at their facility in Lancaster, providing educational opportunities for residents of Inyo, southeast Kern, and northern Los Angeles County to obtain bachelor's and master's degrees. The AVCCD has also established a dual admission agreement with CSUB, which allows freshman students who have been admitted to CSUB to complete 56 lower division units and Antelope Valley College and transfer without requiring a second application (AVCCD 2009) (see Appendix 5.15-A).

### 5.15.4 PROJECT DESIGN FEATURES

No project design features have been identified.

### 5.15.5 THRESHOLD CRITERIA

The following significance threshold criterion is derived from the County of Los Angeles Environmental Checklist. The Project would have a significant impact related to school services if it would:

**Threshold 15-1** Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the

construction of which could cause significant environmental impacts, in order to maintain acceptable performance objectives for any of the public services: schools.

## 5.15.6 ENVIRONMENTAL IMPACTS

**Threshold 15-1** **Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable performance objectives for any of the public services: schools?**

### On-Site Impacts

#### *K-8 Public Schools*

Implementation of the Project would result in the generation of new students to be served by the Gorman District and the WUSD, which could result in a significant impact to these school districts without mitigation.

At buildout, the Project site would include as many as 14,098 single-family detached units, 2,643 single-family attached units,<sup>2</sup> and 2,592 multi-family units. In order to estimate the number of new students who would be occupying these housing units, student generation factors for each housing type were obtained from the school districts. In addition, the K-8 school facility needs are based on an assumed standard classroom size of 20 students per classroom for grades K-3 and 30 students per classroom for grades 4-8 and corresponding school capacity of 1,380 students per school.<sup>3</sup>

As described in Section 4.0, Project Description, the Project includes generalized locations for a one K-5 school and five K-8 schools (essentially about 5.5 elementary schools) (MM 15-1); each K-8 school is expected to have a capacity of 1,380 students and the K-5 school would have a capacity of 840 students (based on 7 classrooms for each grade and 20 students in each classroom) for a total elementary school capacity for approximately 7,740 students.

A number of goals and policies in the AVAP address schools and the provision of educational services. In compliance with these goals and policies, the Project Applicant/Developer has coordinated with the school districts serving the site, including K-8 and high school districts, and the Project would provide schools sites to serve residents of the Project. These school sites would be located adjacent to parks and open spaces and would be accessible to planned residential areas or Villages. As discussed in Section 5.8, Land Use, Entitlements, and Planning, the Project would not conflict with goals and policies in the Antelope Valley Area

<sup>2</sup> Single-family attached units are typically defined by school districts as units that share a common wall and are not for rental purposes.

<sup>3</sup> This assumes 6 classrooms for each grade, with 20 students in each classroom for grades K-3 and 30 students in each classroom for grades 4-8.

Plan that address the provision of schools and educational services. An analysis of elementary school facility for the Gorman District and WUSD, separately, is provided below.

### Gorman Joint School District

The School Facilities and Funding Agreement between the Gorman District and the Developer (see Appendix 5.15-B) sets the initial student generation rates for residential land uses and a maximum of 19,000 dwelling units within the service boundaries of the Gorman District. Up to approximately 13,249 dwelling units are proposed within the Gorman District, which is less than the maximum of 19,000 units in the agreement. Table 5.15-4, Centennial Buildout Demand for Gorman District Facilities Based on the School Facilities and Funding Agreement, provides an estimate of student generation using the factors defined in the agreement and shows that slightly more than three K–8 schools would be needed within the Gorman District to serve future residential development on the site.

**TABLE 5.15-4  
CENTENNIAL BUILDOUT DEMAND FOR GORMAN DISTRICT FACILITIES  
BASED ON THE SCHOOL FACILITIES AND FUNDING AGREEMENT**

<b>Residential Use</b>	<b>Full-Time Dwelling Units<sup>a</sup></b>	<b>Generation Rates<sup>a</sup></b>	<b>Total Estimated Students</b>	<b>Required Classrooms<sup>b</sup></b>	<b>Required Schools<sup>c</sup></b>
Single-Family Detached	8,519	0.4778	4,070	160	2.95
Single-Family Attached	2,540	0.1453	369	14	0.27
Apartment	2,190	0.1227	269	11	0.19
<b>Totals</b>	<b>13,249</b>	<b>-</b>	<b>4,708</b>	<b>185</b>	<b>3.41</b>
Formula to calculate required classrooms and required schools (3 steps): 1. Dwelling units x generation rate = estimated number of students 2. Estimated number of students ÷ 25.5 students per classroom = required classrooms 3. Estimated number of students ÷ 1,380 school capacity = required schools.					
<sup>a</sup> Source: Gorman Joint School District (see Appendix 5.15-B).					
<sup>b</sup> Based on an average of 25.5 students per classroom.					
<sup>c</sup> Based on an average K–8 school capacity of 1,380 students.					

The one proposed K–5 and three proposed K–8 schools in the western section of the site within the Gorman District boundaries would have a total capacity for 4,980 students, which would be adequate to accommodate the estimated 4,708 students who would reside within the Gorman District service area. Impacts would be less than significant with the implementation of MM 15-1.

While the first school is planned to be open in the same or nearby residential village within the school year that the first occupancy permit is issued, prior to completion of the first K–8 school on site, students from the Project have the option to attend Gorman Elementary School, based on the District's agreement with the Developer. The agreement generally outlines the mitigation for Project impacts to the Gorman District, in lieu of payment of school impact fees. It includes the formation of a community facilities district (CFD) and the issuance of bonds by the CFD; the use of federal, State, and local funds; the approximate location of school sites; the initial student generation rates; a minimum capacity of 1,248

students in permanent facilities and 8 modular classrooms for 256 students in each school; interim use of relocatable classrooms in existing and new schools; 20-acre school sites; and Developer advances, staffing needs, funding thresholds, school facilities plan, and other terms related to the construction of schools on the Project site. The agreement provides for an amendment process to reflect final changes to the Project, the school site locations, and other related terms of the agreement.

Regarding initial school facilities on the Project site, with the consent of the Gorman District (which includes the first phase of Project implementation), the AVUHSD, and the AVCCD, the first K-8 school campus could provide pre-school through high school classes during the day and offer community college classes in the evenings. As Project buildout occurs, this school would revert to a K-8 school as other schools are constructed and become operational. The proposed K-8 schools would be located in Villages 1, 3, and 5, and the K-5 school would be located in Village 9. One of these schools would open within the first year of occupancy of the first residential units within each Village and adjacent Villages, with the second K-8 school opening in compliance with the school district mitigation agreements. The remaining elementary schools are projected to open during future phases, in compliance with the school district mitigation agreements. The need for school facilities is based on the conceptual plan for the Project, and the timing of school facilities construction would depend on the rate of Project development and the actual demand for school facilities, as determined by the respective school districts. Therefore, with implementation of MM 15-1 and MM 15-2, which requires the Project Applicant/Developer to demonstrate to the County that it has complied with all applicable school district agreements, impacts related to elementary school facilities in the Gorman District would be less than significant.

#### Westside Union Elementary School District

The WUSD has provided student generation factors to estimate the number of students that may be generated by development. Use of these student generation rates for the Project is provided in Table 5.15-5, Centennial Buildout Demand for WUSD Facilities Based on WUSD Rates, below. As shown, as many as 2,551 students are expected from the residential development proposed within the WUSD boundaries on the site, resulting in the need for slightly less than 2 elementary (K-8) schools based on an average school size of 1,380 students.

**TABLE 5.15-5  
CENTENNIAL BUILDOUT DEMAND FOR WUSD FACILITIES BASED ON WUSD RATES**

<b>Residential Use</b>	<b>Full-Time Dwelling Units</b>	<b>Generation Rates<sup>a</sup></b>	<b>Total Estimated Students</b>	<b>Required Classrooms<sup>b</sup></b>	<b>Required Schools<sup>c</sup></b>
Single-Family Units	5,435	0.4407	2,395	94	1.74
Multi-Family Units*	649	0.2411	156	6	0.11
<b>Totals</b>	<b>6,084</b>	-	<b>2,551</b>	<b>100</b>	<b>1.85</b>
<p>* This includes single-family attached and apartment units            Formula to calculate required classrooms and required schools (3 steps): 1. Dwelling units x generation rate = estimated number of students 2. Estimated number of students ÷ 25.50 students per classroom = required classrooms 3. Estimated number of students ÷ 1,380 school capacity = required schools.</p> <p><sup>a</sup> WUSD 2015.  <sup>b</sup> Based on an average of 25.5 students per classroom.  <sup>c</sup> Based on an average K-8 school capacity of 1,380 students.</p>					

The Project has included generalized locations for two K-8 schools in the WUSD. These schools would have a total capacity for 2,760 students, which would be adequate to accommodate the estimated 2,551 students who would reside within the WUSD service area. Two K-8 schools to be located in Villages 7 and 8 would serve students within the WUSD service area. Impacts would be less than significant with the implementation of MM 15-1.

As per MM 15-2, the facilities and funding mitigation agreement with WUSD, to be executed in accordance with Section 65996 of the *California Government Code*, will be completed once planning begins for new development in areas within the WUSD service area. Therefore, with implementation of MM 15-1 and MM 15-2, impacts related to elementary school facilities in the WUSD would be less than significant.

### K-8 School Sites

As discussed previously, the Project has included generalized locations for one K-5 school and five K-8 schools to accommodate the demand for elementary school facilities generated by future residents (see Exhibit 4-1, Centennial Project – Conceptual Land Use Plan). Final school site locations would be determined as future tract maps are prepared and in coordination with the respective school districts (e.g., through interdistrict transfers so that students from the same neighborhood go to the same schools if they choose).

According to the California Department of Education's (CDE's) *Guide to School Site Analysis and Development*, the amount of land recommended to serve a 1,200 student elementary or middle school would generally range from 17.6 to 23.1 acres per school, although the guide allows each school district to tailor its schools to specific needs and as necessary to accommodate unusual conditions. The sizing of school sites would also depend on the grade breakdown of students, the implementation of classroom size reduction, building layout/configuration, and the outdoor facilities that would be provided (CDE 2000). As shown in Table 5.15-6, K-8 School Location/Acres, each of the proposed school sites would occupy between 11 to 15 acres. The purchase of additional land to meet CDE recommendations is at the school district's discretion.

**TABLE 5.15-6  
K-8 SCHOOL LOCATIONS/ACRES**

<b>Village</b>	<b>Acres</b>
1	15
3	15
5	15
7	15
8	15
9	11
<b>Total</b>	<b>86</b>
Source: Placeworks 2017.	

The designation of school sites on the Project site, as each future tract map is developed, will allow the school districts to acquire the sites and provide school facilities as needed. The Project Applicant/Developer has a signed agreement with the Gorman District to facilitate the financing, construction, and operation of new school facilities in the Project area to ensure the timely provision of schools that correspond to the phasing of development on the Project site within its service area. This agreement will be amended to reflect the Project and needed school facilities. The Agreement with WUSD will be completed when planning begins for new development in areas within the WUSD service area (refer to MM 15-3). School site location, sizing, and other details would be subject to Title 5 of the *California Code of Regulations* and will be determined in consultation with the affected school district pursuant to the executed agreement(s). Therefore, with implementation of MMs 15-1 and 15-2, there would be less than significant impacts related to school site selection.

### Public High Schools

Implementation of the Project would result in the generation of new high school students to be served by the AVUHSD, which could result in a significant impact to the school district. Table 5.15-7, Centennial Buildout Demand for High Schools Based on AVUHSD Rates, presents the estimated student generation based on current (2015) AVUHSD student generation rates. As shown, the Project would generate 2,885 students at buildout and would need one high school.

**TABLE 5.15-7  
CENTENNIAL BUILDOUT DEMAND FOR HIGH SCHOOLS BASED ON AVUHSD RATES**

<b>Residential Use</b>	<b>Full-Time Dwelling Units</b>	<b>Generation Rates<sup>a</sup></b>	<b>Total Estimated Students</b>	<b>Required Classrooms<sup>b</sup></b>	<b>Required Schools<sup>c</sup></b>
Single-Family Detached	13,954	0.180	2,512	84	0.88
Single-Family Attached	3,024	0.067	203	7	0.07
Apartment	2,355	0.072	170	6	0.06
<b>Totals</b>	<b>19,333</b>	<b>–</b>	<b>2,885</b>	<b>97</b>	<b>1.01</b>
Formula to calculate required classrooms and required schools (3 steps): 1. dwelling units x generation rate = estimated number of students 2. estimated number of students ÷ 30 students per classroom = required classrooms 3. estimated number of students ÷ 2,850 school capacity = required schools.					
<sup>a</sup> AVUHSD 2015.					
<sup>b</sup> Based on an average of 30 students per classroom.					
<sup>c</sup> The Project provides a high school site to accommodate a school ranging in capacity size of 2,850 to 3,350 students. The required school factor in this table assumes an average high school capacity of 2,850 students.					

The Project has included a generalized location, in the central portion of the development area, for one high school (grades 9–12). The planned high school site, which would be refined during preparation of the future tract map that encompasses the proposed location or an alternate location agreed upon by AVUHSD (MM 15-3), would have a minimum size of 60 acres and be capable of accommodating up to 3,350 students. Thus, the total Project-generated high school students (i.e., 2,885 students) could be fully accommodated within the one high school proposed with the Project.

The first school will be built and operational prior to the first certificate of occupancy. It is anticipated that the K–8 school (initially a K–12 facility) would be opened by the Gorman District at occupancy of the first residential units. The planned approach is to initially construct a K–12 campus in order to provide public school accommodations at all education levels at Project opening. As Project buildout occurs, this school would revert to a K–8 school when the high school is constructed. Students from the Project would also have the option of attending Quartz Hill High School (by busing through AVSTA) or applying for an interdistrict transfer to attend the El Tejon Unified School District’s Frazier Mountain High School, which is located approximately ten miles northwest of the site. Frazier Mountain High School 2015- 2016 enrollment was 286 students (CDE 2017) and has capacity for additional students (ETUSD 2016). The El Tejon Unified School District also allows interdistrict transfers subject to approval of the student’s home district (ETUSD 2015).

The on-site high school (grades 9–12) is anticipated to open in compliance with the school district mitigation agreements required under MM 15-3. This schedule was anticipated on the basis that there would not be enough high school students to justify, on an operational basis, the opening of a comprehensive high school on the site until there would be enough students. The actual development of the high school would depend on the Project’s rate of development, and according to the School Facilities and Funding Agreement between the AVUHSD and the Project Applicant/Developer, with the construction of the high school coinciding with the development of residential uses as specified in the Agreement. The Agreement also includes the construction of interim and permanent facilities, to serve as

mitigation for Project impacts to AVUHSD, in lieu of payment of school impact fees. It includes the formation of a CFD and the issuance of bonds by the CFD; the use of federal, State and local funds; approximate school site locations; initial student generation rates; a minimum capacity of 2,860 students in permanent facilities and 17 modular classrooms for 500 students in each school; 60-acre school sites; Developer advances, interim facilities at a K-8 school site, staffing needs, school facilities plan, and other terms related to the construction of high schools on the Project site. The agreement provides for an amendment process to reflect final changes to the Project, the high school site locations, and other related terms of the agreement. Therefore, with implementation of MM 15-2 and MM 15-3, impacts related to high school facilities in the AVUHSD would be less than significant.

### High School Sites

The CDE has developed a “functional approach” for determining the size of a school site. The approach was based on the amount of area required to support the functions or activities of the proposed educational program. According to the CDEs *Guide to School Site Analysis and Development*, the recommended acreage for a 2,400-student high school is generally 52.7 net usable acres, with sizes of 58.3 to 61.5 acres for 2,401 to 2,600 students and up to 75.1 to 79.8 acres for 3,601 to 3,800 students. The Centennial Project includes a 60-acre high school site in Village 6. The actual sizing of school facilities is ultimately the decision of the school district. However, the Project’s current preliminary sizing of school facilities (i.e., 60 acres minimum) is considered adequate. School site location, sizing, and other details would be subject to Title 5 of the *California Code of Regulations* and determined in consultation with the affected school district pursuant to the executed agreement (MM 15-3). Therefore, with implementation of MMs 15-2 and 15-3, there would be less than significant impacts related to high school site selection.

### ***Student Transportation***

Exhibit 4-1 identifies the conceptual locations for the school sites designated in the Project site. Each of the school sites would be centrally located among the Villages and pedestrian trails (i.e., greenways/paseos) are generally near the school sites. Because these school facilities would be centrally located, a majority of the students on the Project site would not require busing. However, busing would be available to the expected limited number of students outside the Transportation Agency’s established “walk-in” areas (i.e., farther than three miles from the school). Therefore, the increase in the student population would not create transportation problems for anticipated school trips internal to the Project site. No impact would occur and no mitigation would be required.

### ***College (Secondary Education)***

The residents of the Project would be expected to seek higher education that would be provided by various public and private colleges and universities through the County, the State and the nation. As discussed, the Project site is within the service boundaries of the AVCCD and its Antelope Valley College campus. This campus would provide Project residents with educational opportunities to earn a high school diploma and various associates’, bachelor’s, and master’s degrees at their Antelope Valley College campuses in Lancaster, Palmdale and at Fox Field. The AVCCD has indicated that they support the Project and will

provide similar programs and services to the Project in both a traditional classroom setting and using the latest technology (e.g., distance learning supported by broadband internet access). Impacts on AVCCD facilities and other higher education facilities in the County and elsewhere would be less than significant and no mitigation is required.

## Off-site Impacts

The proposed off-site Project features, including intersection improvements with SR-138, utility connections, water wells, and California Aqueduct crossings, do not include residential uses that would directly generate additional students or otherwise create an increased demand for schools. There would be no impact and no mitigation is required.

**Impact Summary:** The Project would increase the population and would result in the generation of new students to be served by the respective school districts. The Project includes generalized locations for one K–5 school site, five K–8 school sites (MM 15-1), and one high school site (MM 15-3). In addition, the Project Applicant/Developer has signed agreements with the Gorman District and AVUHSD, and will sign an agreement with the WUSD to facilitate the financing, construction, and operation of new school facilities on the Project site (MM 15-2). With implementation of MM 15-1, MM 15-2, and MM 15-3, impacts related to public school facilities would be less than significant. With compliance with State regulations, all school sites would be located, sized, and otherwise meet California Department of Education Title 5 requirements and there would be a less than significant impact.

### 5.15.7 MITIGATION MEASURES

- MM 15-1** The Project Applicant/Developer shall designate one K–5 and five K–8 school sites in the Project area in accordance with the conceptual land use plan or alternate location(s) that shall be agreed upon by the authorized school districts.
- MM 15-2** The Project Applicant/Developer shall demonstrate to the County that they have an executed agreement with all school districts that operate within the boundaries of the Project site.
- MM 15-3** The Project Applicant/Developer shall designate one high school site in the Project area in accordance with the conceptual land use plan or alternate location(s) that shall be agreed upon by the authorized school district.

### 5.15.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Implementation of MMs 15-1, 15-2, and 15-3 would reduce potentially significant impacts related to education to levels that are less than significant.

## 5.16 FIRE AND LAW ENFORCEMENT SERVICES

This section of the Draft Environmental Impact Report (EIR) describes the potential impacts to fire and law enforcement services from implementation of the Centennial Project.

### 5.16.1 INTRODUCTION

#### **Purpose**

The County of Los Angeles Department of Regional Planning Environmental Checklist Form, which has been prepared pursuant to the California Environmental Quality Act (CEQA), requires that impacts to fire and law enforcement services be evaluated as part of the environmental documentation process. The impacts of the proposed development on the Project site are analyzed at a project-level of detail; direct and indirect impacts are addressed for each threshold criterion for both the on-site and off-site Project features. Growth-inducing impacts and cumulative impacts are described in Sections 6.0 and 7.0, respectively. Analysis of wildfire hazards is discussed in Section 5.3, Hazards and Fire Safety.

#### **Summary**

The Project would result in the development of a maximum of 19,333 residential units, generating approximately 57,150 residents, and over 10.0 million square feet of non-residential development that would create approximately 23,675 jobs. This anticipated Project-related growth in population and employment would result in an increase in demand for fire and law enforcement services on the Project site.

#### **Fire Services**

Fire services and emergency response for fire incidents during the initial development phases of the Project would be provided from Fire Station 77, located at 46833 Peace Valley Road in Gorman, which is currently staffed with a three-person engine company. This station would serve the Project until such time that the 1,000<sup>th</sup> dwelling unit is built on the site (at which time the first on-site fire station would be operational) (see MM 16-3).

As shown on Exhibit 4-1, Centennial Project – Conceptual Land Use Plan, the Project includes conceptual site locations for up to four new fire stations on the Project site. In Village 1, one fire station is proposed east of the National Cement Plant Road. The second fire station is proposed in Village 4, and the third fire station is proposed in Village 7, with the location of a potential fourth station to be determined. These new fire stations are projected to provide an average five-minute response time for the first arriving unit for fire and eight minutes for the advanced life support (paramedic) unit on the site at Project buildout. This is consistent with the County of Los Angeles Fire Department's (LACFD's) goals for response times in urban areas. Ultimately, the LACFD would approve the final station site locations, and the Applicant would construct and equip the fire stations (MM 16-3). The LACFD has indicated that the proposed fire stations on the site would provide adequate fire service to the Project.

The Applicant would construct fire protection facilities in accordance with the approved Project, in lieu of paying established developer fees at the time building permits are issued (MMs 16-1 through 16-3). The proposed fire stations on the site would be staffed by a minimum four-person engine company. Implementation of MMs 16-1 through 16-3 would provide for fire station sites, construction of fire station facilities, and funding for fire protection apparatus/equipment to serve the Project. Therefore, impacts on fire services would be reduced to a less than significant level.

### ***Law Enforcement Services***

The Project would also result in an increase in the demand for law enforcement services, including those provided by the Los Angeles County Sheriff's Department (Sheriff's Department or LASD) and the California Highway Patrol (CHP). The Project includes the construction of a Sheriff's station on the Project site (in the Business Park area north of State Route [SR] 138). The ultimate location and timing for implementation of this station would be determined by the LASD in coordination with the Project Applicant and would be dependent upon the development rate on the Project site and its location. Prior to development of this permanent Sheriff's station, the LASD would operate out of a "store front" sub-station until the permanent station is required to be developed. This LASD "store front" sub-station would be properly outfitted in accordance with applicable occupancy requirements of the LASD for this type of facility, and would be fully operational prior to the issuance of the first occupancy permit (refer to MMs 16-2 and 16-4) to ensure that response times to the site for emergency and non-emergency calls would be within the County guidelines.

The Applicant may provide the "store front" and/or permanent Sheriff's stations in lieu of part or all the Sheriff Development Impact Fee, as determined appropriate pursuant to Section 22.74.090, "Consideration in Lieu of Fee", of the County Code. The addition of the "store front" and permanent Sheriff's stations, payment of developer fees by the Project Applicant/ Developer, if applicable (refer to MM 16-4) and revenues from taxes generated (for LASD) and vehicle registration fees (for California Highway Patrol [CHP]) would offset increased demands on the LASD and the CHP. Therefore, impacts on law enforcement services would be reduced to a less than significant level.

The analysis in this section focuses on the projected demand for fire and law enforcement services and the facilities necessary to meet this demand. The physical environmental impacts related to the implementation of necessary fire and law enforcement infrastructure are addressed as part of the Project analysis provided throughout this EIR.

### **Section Format**

As described in Section 5.0, Environmental Setting, Impacts, and Mitigation, and in accordance with State CEQA Guidelines Article 9 (Contents of Environmental Impact Reports), each topical environmental analysis includes a description of the existing setting; identification of thresholds of significance; analysis of potential project effects and identification of significant impacts; identification of a mitigation program, if required, to reduce the impacts; and level of significance after mitigation. This information is presented

in the following format (Please refer to Section 2.0, Introduction, and Section 5.0 for descriptions of each of these topics):

- Introduction
  - Purpose
  - Summary
  - Section Format
  - References
- Fire Services
  - Relevant Plans, Policies, and Regulations
  - Environmental Setting
  - Project Design Features
  - Threshold Criteria
  - Environmental Impacts—A separate analysis is provided for each of the following categories of potential impacts:
    - On-Site Impacts
    - Off-Site Impacts
  - Mitigation Measures
  - Level of Significance After Mitigation
- Law Enforcement Services
  - Relevant Plans, Policies, and Regulations

### 5.16.2 FIRE SERVICES

#### Relevant Plans, Policies, and Regulations

##### *Federal*

No federal plans and policies have been identified related to Fire Services.

**State**

California Fire Plan

In a collaborative effort between the State Board of Forestry and the California Department of Forestry and Fire Protection (CDF), the *2010 Strategic Fire Plan for California* (Fire Plan), last revised in April 2016, was prepared to address the protection of lives and property from California wildfires while recognizing that wildfires are a natural phenomenon and can have beneficial effects, particularly on ecosystem health. The Fire Plan is a comprehensive update to the *California Fire Plan* prepared in 1996, the first such collaborative statewide wildfire planning document. The overarching vision of the Fire Plan is to have “A natural environmental that is more resilient and man-made assets which are more resistant to the occurrence and effects of wildland fire through local, state, federal and private partnerships” (CAL FIRE 2016a).

This vision is supported by seven goals and related objectives, and the application of adaptive management as a fundamental strategy of Fire Plan implementation. The purpose of applying adaptive management is to allow for changing conditions and to better meet environmental, social, and economic goals; to increase scientific knowledge regarding wildfires; and to foster understanding among stakeholders over time. The following are the Fire Plan’s seven goals to support the vision of “A natural environment that is more resilient and man-made assets which [sic] are more resistant to the occurrence and effects of wildland fire through local, state, federal and private partnerships” (CAL FIRE 2016a). The Fire Plan states that each sequential goal is meant to build upon the accomplishment of the previous goal.

1. Identify and evaluate wildland fire hazards and recognize life, property and natural resources assets at risk, including watershed, habitat, social and other values of functioning ecosystems. Facilitate the sharing of all analyses and data collection across all ownerships for consistency in type and kind.
2. Articulate and promote the concept of land use planning as it relates to fire risk and individual landowner objectives and responsibilities.
3. Support and participate in the collaborative development and implementation of wildland fire protection plans and other local, County, and regional plans that address fire protection and landowner objectives.
4. Increase awareness, knowledge and actions implemented by individuals and communities to reduce human loss and property damage from wildland fires, such as defensible space and other fuel reduction activities, fire prevention, and fire safe building standards.
5. Develop a method to integrate fire and fuels management practices with landowner priorities and multiple jurisdictional efforts within local, State, and federal responsibility areas.
6. Determine the level of fire suppression resources necessary to protect the values and assets and risk identified during planning processes.

7. Address post-fire responsibilities for natural resource recovery, including watershed protection, reforestation and ecosystem restoration (CAL FIRE 2016a).

### **County**

#### Los Angeles County Fire Department Strategic Fire Plan

The LACFD is one of the six county agencies that executed a contract with the State of California to provide wildland fire protection on State Responsibility Areas (SRAS) and to implement the CDF's *2010 Strategic Fire Plan for California*, discussed above. The LACFD's 2016 Strategic Fire Plan, last updated June 1, 2016, outlines the Department's pre-fire management strategies and tactics for fire prevention, vegetation management, fire suppression, fire protection, and pre-fire projects for fire hazard reduction, habitat restoration, and training (LACFD 2016a).

#### County of Los Angeles Code of Ordinances

The Los Angeles County Code of Ordinances serves as the municipal code for the County. Title 32 of the County Code is the Los Angeles County Fire Code and identifies fire zones, brush clearance requirements, and structure requirements with respect to fire prevention and suppression. In the Los Angeles County Code of Ordinances (specifically, Title 20, Los Angeles County Utilities Code; Division 1, Water; Chapter 20.16, Design and Construction), requirements related to fire flow and fire hydrant placement are identified. Requirements related to parcel and dwelling access are identified in Chapter 21.24 of the Los Angeles County Subdivisions Code.

#### County Fire Department Developer Fee Program

On July 12, 1990, the Los Angeles County Board of Supervisors adopted the County Developer Fee Program (*California Government Code*, Sections 66000–66008) to fund (1) the purchase of fire station sites; (2) the construction of new stations and facility improvements; and (3) the purchase of equipment. The County annually adjusts developer fees to reflect changing costs. The Applicant would pay fees as annually updated in the County Developer Fee Program for the purchase of land for fire station sites; the construction of fire stations; and the provision of certain equipment. As an alternative to fee payment, the Developer Fee Program allows the LACFD and the Applicant to enter into an agreement whereby the Applicant would provide land and would construct and equip some or all fire stations required for the Project.

#### County of Los Angeles General Plan and Antelope Valley Area Plan

The *County of Los Angeles General Plan* and *Antelope Valley Area Plan* address issues that affect the County, including, but not limited to, fire protection and prevention. Relevant goals and policies in the *Antelope Valley Area Plan* include those listed below.

*Land Use Element*

**Policy LU 3.2:** Except within economic opportunity areas, limit the amount of potential development in Very High Fire Hazard Severity Zones, through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

*Conservation and Open Space Element*

**Policy COS 15.2:** Prohibit continuous all-night outdoor lighting in rural areas, unless required for land uses with unique security concerns, such as fire stations, hospitals, and prisons.

**Policy COS 16.2:** Maximize the use of native vegetation in landscaped areas, provided that vegetation meets all applicable requirements of the Fire Department and the Department of Public Works.

*Public Safety, Services and Facilities Element*

**Goal PS 1:** Protection of the public through fire hazard planning and mitigation.

**Policy PS 1.1:** Limit the amount of potential master-planned development in Very High Fire Hazard Severity Zones through appropriate land use designations with very low residential densities, as indicated in the Land Use Policy Map (Map 2.1) of this Area Plan.

**Policy PS 1.2:** Require that all new developments provide sufficient access for emergency vehicles and sufficient evacuation routes for residents and animals.

**Policy PS 1.3:** Promote fire prevention measures, such as brush clearance and the creation of defensible space, to reduce fire protection costs.

**Policy PS 1.4:** Provide strict enforcement of the Fire Code and all Fire Department policies and regulations.

**Goal PS 7:** Emergency services that respond in a timely manner.

**Policy PS 7.1:** Require visible addresses on buildings and at entrances to properties as required by the Fire Code.

**Policy PS 7.2:** Ensure that Fire Stations are adequately staffed.

**Policy PS 7.3:** Strive for a timely response to every call for service.

The Project's consistency with the County's relevant plans, policies, and regulations is analyzed in the Section 5.8, Land Use, Entitlements, and Planning section of this document.

## **Environmental Setting**

### ***County of Los Angeles Fire Department***

Fire protection service is provided to the Project area by the Consolidated Fire Protection District of Los Angeles County, commonly known as the County of Los Angeles Fire Department (LACFD). LACFD Fire Station 77, located at 46833 Peace Valley Road in Gorman, is the jurisdictional engine company for the Western Antelope Valley, including the Project site. This station is located approximately two miles southwest of the site. The response time

from Station 77 to the nearest Project access road is approximately eight minutes. LACFD Station 149, located at 31770 Ridge Route Road in Castaic, provides paramedic services to the Project site. The response time from Station 149 to the nearest Project boundary is approximately 28 minutes (LACFD 2015a). There is also a heliport at Fire Station 77 that is used for refueling and patient pick up. The locations of Stations 77 and 149 are illustrated on Exhibit 5.16-1, Existing Fire Station Locations.

Additional fire protection services would be provided by the closest available LACFD response units listed in Table 5.16-1, Closest County of Los Angeles Fire Stations. Should a significant incident occur within the jurisdiction of the LACFD, the Project would be served by the resources of the LACFD as a whole instead of just the station nearest to the site. A description of the operational characteristics of the stations closest to the site and, therefore, most likely to respond are provided below in Table 5.16-1.

**TABLE 5.16-1  
CLOSEST COUNTY OF LOS ANGELES FIRE STATIONS**

<b>Fire Station</b>	<b>Distance to Project Site</b>	<b>Address</b>	<b>Company Type</b>	<b>Personnel</b>
Station 77	2 miles	46833 Peace Valley Rd Gorman	1 Engine	3-person engine company
Station 149	24 miles	31770 Ridge Route Castaic	1 Engine 1 Paramedic Squad	3-person engine company 2-peron paramedic squad
Station 157	24 miles	15921 Spunky Canyon Rd Green Valley	1 Engine	On-call fire station*
Station 112	21 miles	8812 West Ave E-8 Lancaster	1 Engine	On-call fire station*
Station 76	26 miles	27223 Henry Mayo Dr Valencia	1 Engine 1 Patrol	4 firefighters
* no permanent staff Source: LACFD 2015a, 2015b.				

According to the LACFD, fire protection services in the Project area appear to be adequate for its current rural development (LACFD 2015a).

In response to increased demands for new facilities, equipment, and staffing created by new development, the County of Los Angeles has implemented a Developer Fee Program to fund the purchase of station sites; to construct new stations and facility improvements; and to fund needed equipment. The County annually adjusts the developer fees to reflect changing costs. The Developer Fee, \$0.9180 per square foot of new development (for all land uses) in the Antelope Valley (Area of Benefit 3), is effective February 1, 2017 (LACFD 2016b) and collected at the time building permits are issued. This Developer Fee Program allows for station funding and land dedication in lieu of payment of fees.

As part of this program, the LACFD prepares a Developer Fee Detailed Fire Station Plan to identify anticipated facilities that would be constructed during the LACFD's five-year

  9. Station 58 - 2420 Symonds Drive, Pine Mountain

### Existing Fire Station Locations

Centennial Project

### Exhibit 5.16-1

planning horizon. This plan is updated annually, and the latest plan lists four future fire stations in the Gorman area for the Centennial Project (LACFD 2016b). Funding for staffing and operations of all fire stations would be incorporated into the LACFD annual operating budget. These costs are partially funded through additional property tax revenue as a result of development. Increased property tax revenue associated with the Project would provide additional funding that would offset any increase in the LACFD staffing and operational costs as a result of the Project.

In the case of a significant incident requiring additional fire protection resources, the LACFD participates in a statewide mutual aid system that allows unaffected fire agencies to voluntarily provide aid to other agencies, local governments, operational areas, and the State. The State of California also participates in a nationwide mutual aid system (County of Los Angeles 2012). In addition, the LACFD has automatic mutual aid agreements with the Kern County Fire Department, the Ventura County Fire Department, and the United States Forest Service (USFS), which would allow for these other fire agencies to respond to fire incidents at the site and for the LACFD to respond to fire incidents in Kern County, Ventura County, and the Angeles National Forest (LACFD 2015b).

### ***Kern County Fire Department***

The Kern County Fire Department (KCFD) serves an area spanning over 8,140 square miles, including the unincorporated areas of Kern County and the Cities of Arvin, Delano, Maricopa, McFarland, Ridgecrest, Shafter, Taft, Tehachapi, and Wasco. Over 546 uniformed firefighters are stationed in 46 fire stations throughout Kern County. The KCFD has 14 Mutual Aid Agreements with neighboring fire suppression organizations to further strengthen the emergency response services (KCFD 2015a).

As stated above, the LACFD participates in an automatic mutual aid agreement with the KCFD where the LACFD provides reciprocal services to the KCFD in exchange for the KCFD's response to this area. Under this agreement, the LACFD responds to fire incidents in areas within approximately 6.0 miles north of the County line from Interstate (I) 5 to Edwards Air Force Base, and the KCFD responds to fire incidents in areas within approximately 3.0 miles south of the County line from Edwards Air Force Base to west of I-5 (LACFD and KCFD 2001). This agreement makes the equipment of each Fire Department available to the other on a one to one basis (KCFD 2015c).

Battalion 5 (South Kern County) includes four Kern County fire stations that are located closest to the Project site, as listed in Table 5.16-2, Closest Kern County Fire Stations.

**TABLE 5.16-2  
CLOSEST KERN COUNTY FIRE STATIONS**

<b>Fire Station</b>	<b>Approximate Driving Distance to Project Site</b>	<b>Address</b>	<b>Equipment*</b>	<b>Personnel</b>
Station 56	12 miles	1548 Golden State Hwy Lebec	1 Type 2 engine, 1 Type 3 engine, 1 Type 6 engine	3 firefighters
Station 57	16 miles	729 West End Dr Frazier Park	1 Type 3 engine, 1 Type 6 engine	3 firefighters
Station 55	18 miles	5441 Dennis McCarthy Rd Mettler	1 Type 2 engine, 1 Type 2 truck	6 firefighters
Station 58	29 miles	2420 Symonds Dr Pine Mountain	1 Type 3 engine, 1 Type 6 engine	3 firefighters
* Type 1 and 2 engines typically apply to structural engines and Types 3-7 engines typically apply to wildland engines. Source: KFCFD 2015b, 2015c.				

Battalion 5 serves an area that is mostly in the wildland urban interface, and response times vary due to remote locations. However, the service levels are considered adequate and mirror the staffing levels used in the County's metropolitan areas (KCFD 2015c).

#### ***Existing Fire Conditions on the Project Site***

Information regarding the fire history on the Project site was obtained from CAL FIRE. CAL FIRE, the USFS Region 5, the Bureau of Land Management (BLM), the National Park Service (NPS), Contract Counties, and other agencies jointly maintain a comprehensive fire perimeter geographic information systems (GIS) layer for public and private lands throughout the state. The data includes fires that have occurred on ten acres or more dating from 1878 through 2015 (the most recent data available). According to CAL FIRE, 21 fires on 10 acres or more have occurred on site and within ½ mile of the Project site within the last 137 years. Of those fires, 8 occurred on portions of the site and 12 occurred near the site (see Table 5.16-3, Fire History On and Near Centennial Project Site, below for fire name, date of fire, acres burned and location within the Project site) (CAL FIRE 2016b).

**TABLE 5.16-3  
FIRE HISTORY ON AND NEAR CENTENNIAL PROJECT SITE**

<b>Fire Name</b>	<b>Year of Fire</b>	<b>Total Acres Burned</b>	<b>Acres Burned On Site</b>	<b>Approximate Location of Fire</b>
No Name Given	1917	211.66	0.00	South of the site
No Name Given	1919	1,680.74	715.10	East of Aqueduct
No Name Given	1921	508.61	0.00	Southeast of the site
No Name Given	1923	86.71	0.00	South of the site
No Name Given	1926	489.33	0.00	South of the site
Oakland Ridge Rte 62	1928	1,002.89	857.98	East of Aqueduct and across from SR-138

Pine	2014	117.05	0.00	South of the site
SR: State Route Source: CAL FIRE 2016b.				

The lack of significant historical fire activity on the Project site may be attributed to cattle grazing operations. Cattle operations coincide with the historical fire data. Cattle grazing limits fuel that would otherwise be more abundant, which results in a lower probability that a wildfire would ignite and spread. In addition, ongoing ranching activities ensure that more people are on site and able to extinguish smaller fires quickly.

### **Project Design Features**

No PDFs have been identified for this environmental issue.

## Threshold Criteria

The following significance threshold criterion is derived from the County of Los Angeles Environmental Checklist. The Project would result in a significant impact if it would:

**Threshold 16-1** Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need of new or physical altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services: fire protection.

## Environmental Impacts

**Threshold 16-1** **Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need of new or physical altered governmental facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: fire protection?**
